RAHE BOOKSELLER
MOTI KATRA, AGRA

PREFACE

The first volume of the "Flora of Assam" is presented to the public. A considerable time has elapsed since the first conception of publishing a comprehensive account of the Flora of the province as a botanical unit and an apology is necessary for the delay, but for a large work of this nature it was inevitable. The death of Rai Bahadur U. N. Kanjilal, who originally undertook this work, caused the first interruption and then his son Mr. P. C. Kanjilal, I.F.S., B.Sc., of U. P. who agreed to continue the task from a sense of filial duty, had to return to his province before publication of this work could be taken up. The present writer, who succeeded Mr. P. C. Kanjilal, had to face great difficulties with the selected Press, which proved both highly unsatisfactory and dilatory, so much so that new publishers have had to be found. It is now hoped that the publication of succeeding volumes up to Coniferae will not present any further difficulties.

Monocotyledons will, it is presumed, be an entirely separate publication.

Shillong,

A. DAS

15th April, 1934.

INTRODUCTION

Assam Flora is by no means an untrodden ground. Wallich and Griffith explored parts of the province and Sir Joseph Hooker himself paid a visit to the Khasi Hills. Many enthusiastic collectors namely Klien of Cachar, De Silva of Sylhet, Peal of Sibsagar and Commissioner Jenkins of the Brahmaputra Valley contributed large numbers of specimens to the Sibpur herbarium. In recent times perhaps the most energetic worker in this field was Mr. C. B. Clarke, who traversed the whole province several times on foot and made a very extensive collection. Mr. Gustav Mann (the first Conservator of Forests in Assam) has left for his successors a fairly large collection of specimens besides generally contributing to the Sibpur herbarium. Mr. Burkill visited parts of the Khasi Hills and N.E. F. Tract.

Parties of the Botanical Survey of India have, from time to time, been sent out from Sibpur to collect specimens in selected localities.

What was wanting was that no one collected with any idea of presenting to the public a comprehensive 'Flora of Assam' as a botanical unit. This idea was first conceived by Chief Commissioner Sir Archdale Earle, an ardent lover of plants and a keen amateur botanist, and under his patronage the late Rai Bahadur U. N. Kanjilal began working on the compilation of a 'Flora of Assam'. Unfortunately his death before the publication of even the first volume retarded the progress of the work, but his monumental collection, elaborate field notes and drafts have been invaluable to his successors. In subsequent years the collections of Mrs. N. E. Parry in the Garo and Lushai Hills and that of Dr. N. L. Bor, D.Sc., I.F.S., in the Naga Hills and Aka Hills have been a great asset to the province. Mr. P. C. Kanjilal, I.F.S., B.Sc., whose services were obtained on loan from U. P. on the death of his father and who had to return to his province was concerned chiefly in the determination of species, in replenishing the herbarium

and inaugurating a proper herbarium for Assam out of the material available.

He completed the final draft upto Calycifloræ and described a few families of Apetalæ before leaving Assam. Thanks are due to him for his absorbing interest in this work and labour of love, so much so that he ungrudgingly devoted his entire leave (nearly 10 months) making progress in his work. It fell to the lot of the writer to complete the work up to Conifera, to replenish the herbarium and see it through the Press.

Thanks to the combined labour of many workers, the Assam Flora is fairly well represented in the herbarium of the Royal Botanic Garden at Sibpur through which,—Kew and many other herbaria have received contributions. It may also be mentioned here that the Assam Herbarium has also contributed to the herbaria at Sibpur, Dehra Dun, Gauhati and other places.

The arrangement of the families have been based mainly on Betham and Hooker's *Genera Plantarum* which has been hitherto generally followed in this country. A few modifications have been made in conformity with modern conceptions where necessary and the termination of *acea* has been adopted for all families according to present conventions.

Some herbaceous plants have been included, which are beyond the real scope of this work and also a few, that are properly speaking not indigenous to the province. Their economic value and botanical importance warranted this step.

As far as practicable forest characters have been given for the identification of the important forest species *in situ*.

Many new species have in recent years been recorded from the province in different publications of which there are no specimens in Indian herbaria. As far as practicable these have been included.

A new Magnoliaceæ was discovered by the writer in Digboi Reserve in Lakhimpur District, but as he was then engaged in Divisional Forest work, the investigation of the species could not be taken up by him in time.

At the request of Mr. Dandy of the British Museum, complete specimens were forwarded to him who described the plant as *Pachylarnax pleiocarpa*, Dandy. (*Journal of Botany*, November, 1933.)

The following species, new to science, have recently been described and published (The Assam Forest Records Vol. I, 1934)—

- Eurya japonica* var. *nitida* forma Kanjilali. (Ternstroemiaceae.)
- Sterculia khasiana*. (Sterculiaceae.)
- Gymnocladus assamicus* (Leguminosae-Caesalpinieae.)
- Lagerstrœmia minuticarpa*. (Lythraceae.)
- Agapetes Kanjilali*. (Vacciniaceae.)
- Maba cacharensis*. (Ebenaceae.)
- Symplocos Pealii*. (Styraceae.)
- Chirita mishmiensis*. (Gesneraceae.)
- Strobilanthes furcatus*. (Acanthaceae.)

A new Myrtaceae (*Eugenia*) and some Lauraceae are under investigation and revision of the Assam Phœbes has also been undertaken by the writer and it is hoped that the results of these investigations will be included in the Flora.

The following annexures are given :—

- (1) An Ecological Sketch of the Botany of the Province by the late Rai Bahadur Upendra Nath Kanjilali.
- (2) A Note on the Geology of Assam by Mr. Evans, Geologist to the Burmah Oil Company Limited.
- (3) A Note on Climatology.
- (4) Bibliography.
- (5) Synopsis of Families.
- (6) Glossary of Botanic Terms.
- (7) List of Abbreviations and Signs.

It now remains to acknowledge indebtedness to all those who have rendered assistance in the compilation of this voluminous work.

- (i) Director of Royal Botanic Garden Sibpur ; Directors of Kew and the late Mr. J. S. Gamble contributed enormous help in determination of the species and scrutinising dubia sheets.
- (ii) Most of the Forest Officers of the province have contributed by supplying good collections of specimens and furnishing vernacular names which enabled me to make it comprehensive.
- (iii) Mr. Evans has contributed a most interesting Geological note of the province and the Director

Meteorological Department, Poona, has supplied details of records of humidity and temperature of the different stations in the province.

I am personally grateful to Messrs C. C. Calder, Superintendent, Royal Botanic Garden, Sibpur, K. Biswas, M.A., Curator, Sibpur Herbarium, and C. E. Parkinson, Forest Botanist, Forest Research Institute and College, for their ungrudging help in all possible directions, to Mr. C. Purkayastha for going through the proofs and also to the authorities in Assam for their encouragement without which it would not have been practicable for me to complete and publish this voluminous work.

Shillong,
1st May, 1934.

A. DAS.

A BRIEF ÉCOLOGICAL SKECTH OF THE BOTANY OF ASSAM.

Rainfall and the configuration of the ground are the two chief factors which control the distribution of the plants and their grouping into the main types of forests association.

The province consists of two large valleys, the Brahmaputra and the Surma, separated by a range of comparatively low hills.

The Surma Valley is almost due north from the apex of the Bay of Bengal and is directly open to the N.-W. monsoon. The hills on the northern border of this valley are cliffy almost throughout and present an abrupt barrier to the ruin clouds, with the result that extraordinarily heavy precipitation takes place over the cliffy region which subjects the valley to very heavy floods. The notoriously wet Cherrapunji is situated on the brow of one of the cliffs of this region.

The Brahmaputra Valley is much less open as it presents only its mouth at the western end rather tangentially to the monsoon current. It receives its rain partly from the half-spent clouds that soar above the Mikir Hills and drift northward and partly from those which enter the valley at Dhubri. In the angle formed by the Mikir and the Naga Hills there is a belt which is away from the main direction of the Brahmaputra current and over which the Surma Valley clouds pass without precipitating. This belt is the driest region in the whole province, the rainfall being as low as only about 40 inches. Another belt of low rainfall lies along the foot of the Himalayas extending from the Champamati river in Goalpara to the Panch Nadi in Darrang. The Brahmaputra clouds pass up away from this belt and it can get no benefit from the Surma clouds. Both currents impinge on the next range or Hills, the Himalayas, at a point opposite Tezpur and they combine to drift towards the apex of the valley giving very heavy rains to Sadiya, Dibrugarh and adjoining tracts.

The two dry belts mentioned above are characterised by having a pre-eminently deciduous type of forest, whereas the regions of heavy rainfall are clothed with evergreen forests.

The Sal-bearing areas of the Province are intermediate between the above two extremes where the rainfall is well below 100 inches. As might be conjectured some Sal tracts are so wet as to partake of the character of evergreen forests, for example, those near Haltugaon in Goalpara and some parts of the Boko Range in Kamrup, but the main Sal areas belong to the deciduous type.

Swamp forests own their origin chiefly to configuration of the ground sometimes aided by the occurrence of an impervious substratum such as clayey or rocky beds.

Extensive grass lands occur in the deciduous tracts, also in the riparian areas of the Brahmaputra and its tributaries.

It will be seen from the above that the flora of Assam comprises the following types of forest.

1. Evergreen Forests
2. Deciduous Forests
3. Swamp Forests
4. Grass-lands

1. The Evergreen Forests

This type of forests occupies the major parts of the Frontier District, Lakhimpur, Sibsagar, Sylhet, Cachar, also in a more or less continuous narrow belt along the foot of the Himalayas from the extreme N.-E. corner of the Province as far west as the Panch Nadi in the Darrang District. It also occurs in the S.-E. portion of the Nowgong District along the A. B. Railway and in the greater parts of the Khasi Hills including the tracts covered by the Khasi Pine (*Pinus Khasya*), also in isolated pockets in the deciduous types of forests throughout the province.

The evergreen forests consist of a bewildering number of species, chiefly of the following Families:—Dilleniaceæ, Anonaceæ, Magnoliaceæ, Guttiferæ, Leguminosæ, Myrtaceæ, Styracæ, Ebenaceæ, Myristicaceæ, Lauraceæ, Euphorbiaceæ, Fagaceæ, Palmæ and Graminæ and in the hills Coniferæ, Vacciniaceæ, Ericaceæ, and Ternstroemiaceæ, also a much larger number of Fagaceous species. The actual species of the above Families occur in different tracts in varying proportions so that a particular species may form gregarious forests in some localities and at the same time be totally absent in adjoining parts.

The forests generally present a three-storied appearance of which the top storey is very often constituted by one or two deciduous species of enormous size such as *Dipterocarpus*

pilosus, *Artocarpus Chaplasha*, *Tetrameles nudiflora*. These trees tower above the rest of the forest more or less in an isolated manner. They are generally fast-growers and also deciduous; they can easily work their way through the crowns of the storeys now below them. The middle storey is formed either by a gregarious species, such as *Mesua ferrea*, or by a large number of mixed species of the families mentioned above. This storey determines the economic value of a forest. Where *Mesua ferrea* grows it is considered the principal species, but recently Bonsum which comprises two or three species of *Phabe* has fairly established itself in the Calcutta market and is very much more in demand than *Mesua ferrea*. *Lagerstramia Flos-Regine* is another well known timber tree, but strictly speaking it is not confined to the evergreen type of forests. *Terminalia myriocarpa*, *Amoora Wallichii*, *Duabanga sonneratioides* are other well-known timber trees in this type of forests. The third or lowest storey consists of small trees and shrubs, generally of no great economic value.

This type is characterized by a very large number of climbers notably the climbing *Acarias* and *Bauhinias*, several species of *Vitis*, *Unona*, *Uria*, *Mezoneurum*, *Calamus*, *Tapiria hirsuta*, *Entada scandens*, *Dalhousiea bracteata*, *Gnetum Gneton* and many others.

As indicated above the pine areas in the Khasi Hills fall under evergreen type of forests. The Khasia pine forms even-aged pure forests on moderately sloping hill-sides between 2500 and 6000 ft. A complete leaf canopy is formed at a very early stage and maintained till the high pole stage is well passed. This type of forest is remarkably free from climbers. Natural regeneration is easy to secure, but the Synteng Village Communities in the Jawai Sub-Division prefer to obtain new crops by sowing. All that is necessary after sowing is to close the plots against fire and grazing for a suitable period. Once the pine is established, the grass very soon disappears so that nothing is left to attract browsing animals. The pine is associated with several species of *Quercus* and *Castanopsis* with birch and in some places with yew, hornbeam and *Podocarpus neriifolia*.

Besides the pine areas we have in the Khasi Hills a very interesting type of forests commonly known as sacred forests. They generally occupy hill-tops and cool aspects as a rule above the pine zone. They belong to local chiefs or village communities and represent what may be called nature's

primeval forests. Until recently people did not dare to make fellings in these forests or obtain anything from them except fallen fruits and dead timber for fear of annoying the Sylvan gods believed to preside over them, with the result that we possess in them very rich store-houses of botanical treasures. It is indeed to these fascinating groves that the Khasi Hills owe the reputation they enjoy of being the richest botanical area not only in India, but perhaps in the world. Magnoliaceous, Fagaceous, and Lauraceous trees, generally of enormous sizes, are the predominating arboreal species besides such characteristic trees as *Dendropanax japonicum*, *Randia Wallichii*, *Croton lavigatus*, *Myrsine capitellata*, *Tournefortia baccata*, *Podocarpus neriifolia*, *Daphniphyllum himalayense*, *Eriobotrya bengalensis* and many others. But botanically speaking shrubs, undershrubs and herbs, if less showy are far, far more interesting. These however are so numerous that the writer is obliged to refrain from mentioning them in this very brief paper, and he frankly confesses that he is acquainted with only a very small proportion of them.

It is a great pity that the black foot of destruction is already visible in some parts; the ultimate disappearance of these charming groves is therefore only a question of time.

2. The Deciduous Forests

This type comprises all the Sal tracts as well as the major part of scrub forests in the province. It therefore takes in nearly the whole of the Goalpara and Garo Hills Districts and the greater part of Kamrup, Nowgong and the North Cachar Hills, also the western half of Darrang and the drier tracts of the plains of the Surma Valley.

In the Sal areas the usual companions of Sal occur with local variations. *Lagerstramia parviflora*, *Kydia calycina*, *Schinus Wallichii* and *Careya arborea* being perhaps more constant than the rest. *Gmelina arborea*, *Cassia fistula*, *Albizia lucida* and *odoratissima*, *Millettia velutina*, *Stereospermum chelonoides* occur in some localities.

Where there is no Sal as in the North Cachar Hills, and in the drier parts of Cachar and Sylhet, the forest is very mixed and consists chiefly of *Bombax malabaricum*, *Adina cordifolia*, *Stephegyne diversifolia*, *Cassia nodosa*, several species of *Ficus*, besides most of the associates of Sal mentioned above.

The differentiation of storeys is not so clear in deciduous forests as in the evergreen type. A certain amount of grass

is almost everywhere present, but no canes occur except in evergreen or marshy pockets here and there.

3. Swamp Forests

This type includes undrained depressions generally known as *Bils*. Swamps and Bils abound in the plains of Sylhet and Cachar some of the latter being so large as to deserve to be called lakes. If much smaller in size they are not uncommon in the Brahmaputra Valley chiefly in the grass lands in the riparian tracts and the Sal areas in Kamrup and Goalpara. Some of the latter are up to 5 miles in length and about 3 miles in breadth. Depressions of the former kind are mostly abandoned river channels but those in the Sal areas appear to owe their origin to earthquakes.

The following trees and shrubs are characteristic on the border of the larger Bils, especially of those situated in hilly tracts:—*Cratogeomys lophosperma*, *Eugenia cuneata*, *Duabanga sonneratioides*, *Terminalia myriocarpa*, *Lagerstrœmia Flos-Regina*, *Hyptianthera stricta*, *Symplocos Pealii*, *Ardisia khasiana*, *Rhabdia lycioides*, *Litsa ceylanica* and *angustifolia*, *Homonoia riparia*, *Antidesma Bunius*, *Trewia nudiflora*, *Ficus pyriformis*, *heterophylla*, *Cunia*, and *glomerata*, *Engelhardtia polystachya*, *Dracœna spicata*, *Clinogyne dichotoma*, etc., as well as the following grasses, *Hygrophysa aristata*, *Vossia procera*, *Panicum proliferum*, *kashianum*, *interrupum*, *plicatum*, *Myurus*, *Crus-galli* and *casum*, *Phragmites communis* and *Karka*, *Arundo Donax*, *Arundinella arenæa*, *Thysanotum Agrostis* etc. Some of the above grasses (*Hygrophysa*, *Vossia*, etc.) float on the surface and cover considerable parts of the water along the borders.

The following aquatic families are also well represented *Nymphaeaceæ*, *Araceæ*, *Lemnaceæ*, *Alismaceæ*, *Naiadaceæ*, *Eriocaulaceæ* and *Cyperaceæ*.

4. Grass-Lands

Pure grass lands are of two types in Assam, viz., the riparian tracts of both valleys and the belts of low rainfall mentioned above. Nearly the whole of the former is under water during the rains, and the permanent water-level is never so low as to be beyond the reach of the roots of the grass. Grasses of the following genera are characteristic of the riparian areas, *Saccharum*, *Anthisteria*, *Erianthus*, *Arundo*, *Phragmites*, etc. They cover extensive tracts along the

large rivers, especially where the banks are low. Most of them are remarkable for the enormous size their haulms attain, some being up to 20 ft. in height and nearly 2 inches in diameter at the base, so that they can easily hide large herds of buffaloes and even of elephants.

In the dry belts grasses generally smaller in size but of a more hardy nature predominate. In the Sub-Himalayan dry belt the permanent water-level is in places as low as 300 to 500 ft. below the surfaces so that the roots of the grasses have to draw sustenance entirely from the hygroscopic moisture of the surface soil.

The following grasses are characteristics of the dry tracts, *Imperata arundinacea*, *Apluda varia*, *Andropogon Icarancusa*, *Nardus contortus* and *squarrosus*, *Pollinia ciliata*, *Erianthus elephantinus*, *Panicum assamicum*, *Anthistiria giganta* and *strigosa* ; *Setaria glauca*, *Rottboellia protensa*, *Isachne australis* *Saccharum Narenga*, *Neyraudia madagascariensis* *Paspalum serobiculatum*, *Ischaemum ciliare* etc.

Shillong,

4th December, 1922.

U. N. KANJILAL

The Himalayan *sub-alpine* forests on the Northern Frontier of the Province has, of late years, been explored by Dr. N. L. Bor, who has made many interesting records of plant life from the area.

PREFACE

Mr. H. M. Sale, Senior Geologist to the Burmah Oil Company in India, and Mr. P. Evans, the author of this note, have generously offered to regard this note, after modifications or amplification in the Geological Survey of India, as a joint production by an officer of this Department and Mr. Evans, so as to give expression to the fact that it is in part based on the pioneer work of the Geological Survey of India. This admirable summary of the geology of Assam has, however, been compiled entirely by Mr. Evans, and it is appropriate that he should be credited with the full authorship. Reference to the more important papers of his predecessors is provided by the appended Bibliography.

L. L. FERMOR,

Director,

GEOLOGICAL SURVEY OF INDIA

A SUMMARY OF THE GEOLOGY OF ASSAM

INTRODUCTION

Geological Formations

1. The geological formations of the province of Assam may be grouped as follows :—

Alluvium	}	Sedimentary
Tertiary		
Cretaceous		
Gondwana		
Igneous and Metamorphic.		

The major divisions are separated by unconformities.

Sedimentary Rocks

2. A large part of the province is covered by *alluvial deposits* of a very varied character—pebbles, sand, clay, and very commonly a mixture of sand and clay, often with much decomposed vegetable material. The *Tertiary beds* include a similarly varied assemblage of rocks—hard sandstones, soft loose sands, hard conglomerates, soft loose pebble beds, coal seams, shales, clays; clayey and shaly sandstones and sandy shales and sandy clays are very common. In several areas the more porous sands contain oil—usually present only in small quantities. The lowest Tertiary beds of some parts of Assam include thick limestones. A classification of the Assam Tertiaries has been worked out by the Eurmah Oil Company's geologists starting from the basis laid down by F. R. Mallet, one of the pioneers of the Geological Survey of India. The major divisions are

Dihing Series
(Probable unconformity)
Tipam Series
Surma Series
(Unconformity)
Barail Series
Jaintia Series
Diang Series.

These are placed in order of age (the Dihing Series being the youngest) excepting that the Disang Series is thought to be partly equivalent to the Jaintia Series. The *Cretaceous* beds are mainly sandstones and conglomerates but include some shales and thin coal seams. The *Gondwana* beds include quartzites and shales also with thin coal seams.

Igneous and Metamorphic Rocks

3. Igneous rocks, other than those forming part of a metamorphic complex, are not very abundant, basalt being the most important rock. Serpentine is found in association with slightly metamorphosed shales and amongst the older metamorphic rocks are gneisses, schists and quartzites. Granite, peridotite and dolerite are found intruded into the metamorphic rocks.

Topographical Divisions

1. The topography and geology of Assam are so intimately related that it is convenient for descriptive purposes to adopt the usual topographical divisions of the province. Assam may conveniently be divided into five parts—

From north to south:—

- (i) The Aka, Abor, Mishmi and neighbouring hills forming the eastern part of the Himalayas
 - (ii) The Brahmaputra Valley
 - (iii) The Central Assam Range—including the Garo Hills, Khasi and Jaintia Hills, North Cachar Hills, Mikir Hills
 - (iv) The Surma Valley
- and forming the eastern and south-eastern portions of the province—
- (v) The Naga Hills, Manipur, and the Lushai Hills

5. In general, the two valley areas are largely alluvial; the Central Assam Range is mainly gneiss with a fringe of Tertiaries on the south and east; the northern ranges include metamorphic rocks with a fringe of Tertiaries on the south; and the remaining area—the eastern, south-eastern, and the southern part of the province—is composed principally of Tertiary rocks.

6. The connection between geology and topography is so very close that the geologist visiting Assam soon recognizes that in the greater part of the province every major hill range and valley is a direct or indirect expression of some geological feature. The geology of the province has not yet been sufficiently elucidated to permit a full reconstruction of the geological history, but for the more accessible areas it is possible to indicate with certainty the general process by which the present topographical features have been developed.

7. In many parts of the country there is, too, a close connection between the geology and the type of jungle, but this is to some extent masked by the recent history of the area, as for example, the extent of recent Jhum operations, and by the variations in climatic conditions. The type of relationship found may be illustrated by the distribution of thorny canes which, in the hilly tracts, often occur in quantity in association with sandstones, not on the scarp faces but on any water-logged level stretched above the actual scarp.

8. The following notes describe the strata and structure and give some account of the topography of the five areas enumerated above, taken for convenience in the following order:—Surma Valley, South-Eastern Hills (Naga-Manipur-Lushai Hills), Assam Valley, Eastern Himalayas, Shillong Plateau (including the Mikir Hills, etc.). Following this is a summary of the geological history of the whole province.

9. The information utilized in this summary is derived, for the older rocks, from the observations of the Geological Survey of India and for the Tertiaries mainly from the work of the Burmah Oil Company's geological staff.

TOPOGRAPHY, STRATA, AND STRUCTURE

The Surma Valley

10. The main part of the Surma Valley consists largely of swampy flats broken by numerous low isolated hills (tilas) and low ranges. Northwards it ends abruptly against the foot of the Garo and Khasi and Jaintia Hills but the south-eastern boundary is of a different character—long spurs of high land project from the Lushai and Tripura Hills, and between them are broad valleys usually diversified with many low isolated hills and low ranges. The difference results from the difference in geological structure: the

northern boundary is determined by the existence of an east-west 'monoclinial' fold separating the Tertiaries of the Surma Valley from the older rocks of the Shillong Plateau, but along the southern boundary the strata have been buckled or folded into north-south wave-like 'corrugations' which give rise to the alternations of lines of hills and valleys; not every line of hills is a line of uplift ('anticline'), nor is each valley a line of depression ('syncline') for the folding has led to the development of long, nearly straight, north-south valleys by the wearing away of the less resistant beds, particularly clays and shales, leaving parallel ridges where the harder strata have more successfully withstood the denuding action of the rain and streams; in a few instances, where the beds exposed in the centre of an anticline are relatively soft, a valley may coincide with an axis of uplift. Thus, although the very clearly-marked suite of parallel north-south valleys and hills is due primarily to the trend of folding, it is in part an indirect result.

11. In the corrugations, the tops of the arches are usually narrower than the bottoms of the troughs and the inclined flanks separating crest from trough are very steep, the strata dipping at high angles. In many instances one of the flanks of the fold is much steeper than the other, and in these asymmetric anticlines it is common to find strike-faulting accompanied by vertical and inverted strata.

12. The strata of the Surma Valley belong entirely to the newer divisions; even the oldest series of the Tertiaries is not found in the valley itself, although it occurs in the low foot-hills of the Shillong Plateau. The oldest rocks found within the valley are the sandstones of the Barail Series, but these occupy a very small area. The lower beds of the Surma Series form fairly high and usually compact groups of hills; these are generally unsuited to tea-growing and are mostly covered with jungle; the Harargaj range between the Juri and Manu valleys forms a typical example. The beds include alternating groups of impure sandstones and impure shales. The upper beds of the Surma Series are mainly soft sandy shales with thin sandstones; they naturally give rise to long strips of low swampy ground broken by lines of tilas. Many of the lower more scattered hills of the Surma Valley are made up of sands and subordinate sandy and mottled clays belonging to the Tipam Series. The lower beds of the Tipams are usually much harder than the upper beds, and as they are also harder than the immediately underlying strata of the Surma

Series, the lowest part of the Tipams usually forms a prominent strike ridge. Most of the tea cultivation in 'tila' gardens in the Surma Valley is on the Tipam beds or the uppermost Surma beds. The highest division of the Tertiaries, the Dihing Series, which is made up largely of pebble beds, is found in a few low hills on the north and east of the valley.

13. An interesting feature is the occurrence of plateau gravels, deposited when the Barak and its tributaries were flowing at a level several hundred feet higher than to-day. There is an extensive plateau near Dewan (east of Silchar) and a higher more dissected plateau near Kumbhir (north-east of Silchar). On these there is a thick nearly horizontal capping of pebbles with some sands and sandy clay; most of the plateau is, or has been, under tea cultivation.

14. The flat ground is largely occupied by a rather clayey alluvium; most of this is utilized for rice but, especially in Sylhet, there are large areas too low-lying for any cultivation, and many of these contain large 'bils' or 'haors'—broad expanses of perennial water. In this alluvial ground the large streams have cut deep beds following very tortuous and unstable courses. Changes in these courses have led to the formation of many crescent-shaped lakes (frequently named Anua Bil) which in course of time become silted up, but remain easily recognizable by their characteristic shape. These old stream channels are commonly marked by a line of homesteads following very closely the former bank of the river.

The South-eastern Hill Country (Naga Hills to Lushai Hills).

15. The large area of hills forming the eastern and south-eastern borders of Assam and including the Naga Hills, Manipur, and the Lushai Hills is made up principally of Tertiary strata but it is possible that older formations occur in the areas furthest from the plains. Parts of this hill country have been examined in some detail but the geology of the more remote parts awaits investigation. Included in this area, both topographically and geologically, is the south-eastern part of the North Cachar Hills.

16. In the south—the Lushai Hills, western Manipur, and eastern Cachar—the structure is similar to and in continuation of that of the south-eastern part of the Surma Valley. Further north there is an interesting difference; the folding

in the Surma Valley was referred to as a series of north-south corrugations in which the arches are steep-sided, the strata in the steepest parts of the fold being vertical or even inverted, but in the Naga Hills, simple anticlines are rare and the folding has reached a much more advanced stage in which the steep limbs of the folds have become entirely or almost entirely replaced by strike-faults so that the country is traversed by a series of large overthrust faults. The most important of these is the Haflong-Disang fault which begins in the hills bounding the Surma Valley to the north of Sylhet and runs through Haflong, towards Piphima (near Kohima) and thence roughly parallel to the edge of the hills as far as the headwaters of the Dihing.

17. On the south-east side of this large fault, in the extremely hilly country between Haflong and Imphal, is a broad synclinal area composed chiefly of sandstones—these form an impressive escarpment south-east of the 'Hill Section' of the Assam Bengal Railway from Ditokchara to Mahur, and from the name of this range these beds have been termed the Barail Series. Further north-east around Kohima and Mokukchung in the Naga Hills District are lower beds—the Disang Shales—which are of great thickness and cover an immense area. In the interior of the hills the shales pass into slates and are traversed by abundant quartz veins, and in the extreme east by serpentine intrusions. They are everywhere very sharply folded and faulted and no details of the structure of the shale area have as yet been deciphered although it is clear that here and there there must be large 'outliers' of the Barail Series.

18. The Naga Tribal Area and the Frontier Tracts near the Patkai Range have naturally not been examined in much detail. The Patkai Range near the pass over to the Hukong Valley is a scarp of the sandstones of the Barail Series—one of the many ridges bounded on the north-west by a strike valley due to Disang Shales and to one of the overthrust faults. It is probable that most of the Naga Tribal Area is occupied by Disang Shales and the lower beds of the Barails.

19. In the area north-west of the Disang fault, that is, in the ranges bordering the Dhansiri and Upper Assam plains, there are numerous strike-faults roughly parallel to the Disang Fault. The dip of the strata is towards the south-east and the beds, which include Dihing, Tipam, Surma and Barail strata, are repeated by the faults; this has given rise to a series of nearly parallel ridges, not as well marked as

in the simpler structure of the Surma Valley, but very well seen from many points along the Manipur Road—Tinsukia section of the Assam Bengal Railway. The ridges are the escarpments of the harder beds—Tipam and Barail sandstones—and the intervening valleys mark the outcrop of softer beds and the position of the strike-faults.

20. In this area the Barail Series shows an interesting development; in the south-western part of the Naga Hills, interspersed amongst the sandstones in the middle part of the series, are considerable thicknesses of shale and carbonaceous shale. A few thin coal seams occur and when traced north-eastwards it is found that the seams thicken and become more numerous, until at Nazira they are of workable thickness. Further north-east they are still thicker and are worked on a large scale near Margherita and Ledo.

21. Above the Barail Series there is an important unconformity which represents an interval during which a large part of the Tertiary area of Assam was uplifted to form land and subjected to denudation. The emergence was greatest in the north-east, and here, not only is the upper part of the Barail Series missing, but the overlying Surma Series is very poorly represented, and in places the sandstones of the Tipam Series rest on the Barails.

22. With the exception of the Manipur plain, there is very little flat ground within the area of hills; the valleys are narrow and steep-sided and there are but few level stretches of alluvium in the valley bottoms. There are a few accumulations of high level 'gravels' or boulder beds in several parts of the Naga Hills, as for example near Ghaspani on the Kohima cart-road, and parts of the Disang Shale outcrop below the Barail scarp are almost completely covered by a thick mantle of sandstone boulders. These boulders form a useful source of road metal and ballast and are extensively worked at Ditokchara in the Hill Section.

The Assam Valley

23. The Assam Valley may be divided into two parts; in Lower Assam the plains are broken by isolated groups of hills but in Upper Assam almost unbroken plains stretch from the Himalayas on the north-west to the Naga Hills on the south-east.

24. The numerous low hills of Dhubri, Goalpara, Gauhati, and Tezpur are actually outlying portions of the Shillong metamorphic complex and are composed for the most part of gneiss. The surrounding plains have been

formed by the alluvial material brought down by the Brahmaputra and its tributaries. The Assam Valley is narrowest near the Mikir Hills, where the river first encounters the gneiss, and above this point the valley is entirely devoid of tilas. The extensive plains of Sibsagar and Lakhimpur are the alluvial deposits of the Brahmaputra and its tributaries; there are distinct traces of deposits of different ages, the most recent alluvium within the present flood plain, and various patches of older deposits at a slightly greater elevation. The geology of the alluvial area has not been worked out in any detail; on the whole, the alluvium is more sandy than in the Surma Valley. Towards the head and sides of the valley the surface is slightly undulating, and there occur, as for example near Dum Duma, examples of broad gently sloping alluvial 'cones' with irregular almost dry channels marking the site of old courses of tributary streams.

25. River terraces flank some of the streams; good examples are to be found along the Dihing at Margherita and much further upstream.

26. At the head of the Assam Valley there are low spurs (such as the Tipam Hills of Jaipur and Digboi) which are structurally a part of the Naga Hills.

27. The foot-hills bounding the valley on the north-west and south-east are composed of Tertiary deposits (as mentioned in the adjacent sections of this note) and deeply buried beneath the alluvium there must be a floor of similar Tertiary beds. The thickness of the alluvium is unknown but it probably amounts to some thousands of feet in the centre of the valley.

The Eastern Himalayas

28. North of the Brahmaputra Valley the hills curve round from an east-west direction in the Balipara Frontier Tract to a north-east trend which continues to the Dibang north of Sadiya. Thence there is a big sweep round the head of the valley to the Mishmi or Miju Hills.

29. The structure of these hills has not been worked out, although some of the main outlines are known. A belt of Tertiary beds occurs in the first ranges of the Aka, Dapla, and Abor Hills, but is absent further east; beyond the Tertiary belt there occur beds of Gondwana age, corresponding approximately to the coal-bearing beds of the Bengal coal-fields and indeed containing thin but crushed coal seams. In the Dihang Valley these are associated

with volcanic rocks—basalts and tuffs. Beyond the Gondwana beds are schists, slates, limestones, and dolomites of very great age.

30. The structure is undoubtedly complex for the beds dip north-westwards so that the Tertiaries appear to underlie the much older rocks. From evidence in Himalayan areas that have been examined in more detail it appears that the belts of different beds are separated by very large overthrust faults, similar to, but greater than, those which have been proved by detailed investigations in the Naga Hills. The successive sheets of rock have been thrust forward and upward from a north-westerly direction during the building up of the Himalaya.

The Central Assam Range

31. In the west, the Central Assam Range consists of a large broken plateau, usually termed the Shillong plateau; eastward, this merges into the more irregular hills of North Cachar and thence joins the Naga Hills. Geologically the two portions are quite distinct, the western part being an area which has undergone very little Tertiary folding and the eastern part belonging to the area of very intricate faulted and folded structure already described. Near Haflong the junction of the plateau country and the hill country is very sharply marked, coinciding with the Haflong-Disang overthrust fault, but in the northern part of the Assam Bengal Railway Hill Section the transition is more gradual.

32. The plateau reaches a height of over 6000 feet near Shillong; it has a general northerly slope but is much dissected by deeply cut valleys and is traversed by step-like scarps. The valleys are often notably straight and steep-sided and there are many large waterfalls in the rivers. The southern edge of the plateau overlooks the Surma Valley and is remarkably abrupt.

33. A large part of the area is occupied by metamorphic rocks of great age—schists, quartzites, and gneisses, with granites, peridotites and dolerites intruded into them. The details of the greater part of the metamorphic area have not yet been investigated. The gneiss is composed mainly of quartz and feldspar (orthoclase predominating) with subsidiary magnetite and very little hornblende and mica. Less ancient are the schists, slates, quartzites and conglomerates which have been grouped together as the Shillong Series. These rocks (especially the schists) have been invaded by basic dykes

and, apparently subsequently, there were the intrusions of granite.

34. The metamorphic rocks of the Shillong plateau extend northwards across the Brahmaputra Valley, forming low isolated hills at intervals west of Tezpur and higher hills near Gauhati and Goalpara. (The gneiss is very clearly seen near Gauhati in railway cuttings and in the river bank). Similar gneiss forms the greater part of the Mikir Hills.

35. Of much later age is the Sylhet Trap, an andesitic or basaltic lava found along the extreme southern margin of the plateau. This lava is associated with volcanic 'ash' and intrusive dykes.

36. Overlying the trap and the gneiss are Cretaceous beds—sandstones with conglomerates. These rest on a very irregular surface, filling up old valleys eroded in the metamorphic rocks in pre-Cretaceous times. The Cretaceous beds occur in the southern foot-hills and as isolated outliers scattered over a large part of the southern portion of the plateau; they form a belt extending across the plateau from near Jaintiapur north-eastwards towards the Mikir Hills. They occur near Lumding but are unknown further north-east. Coal seams occur locally and in places these are of workable thickness.

37. The Cretaceous beds are overlain by the lowest Tertiaries. These contain thick limestones (Sylhet Limestone) which provide an important source of lime; these beds are of considerable interest as their solubility in rain water has given rise to caves and underground rivers—phenomena that are characteristic of limestone areas. The outcrop is marked by numerous swallow-holes and at the base of the limestone cliffs there are often to be found copious springs of water. Associated with and above the limestones are sandstones and shales with a few thin coal seams. These beds lie almost horizontally (but with a very slight south-easterly inclination) over a large area in the eastern part of the plateau and extend north-eastwards into the Mikir Hills.

38. In the north-western part of the North Cachar Hills, sandstones of the Barail Series predominate and the beds are no longer nearly horizontal but have an undulating dip and are traversed by zones of disturbance; further east the disturbances increase and higher members of the Tertiaries appear in the synclinal areas: in this way the plateau zone passes into the parallel ranges of the Naga Hills.

FOSSILS

39. The strata of Assam are notable for the paucity of fossil remains. The Cretaceous beds contain a small fauna which has affinities with the Cretaceous fossils of Madras. The lowest beds of the Tertiaries contain a large number of fossils but the remaining, and by far the greater, portion of the Tertiary strata is almost barren, thus contrasting strongly with the very fossiliferous Tertiary beds of Burma.

40. The Sylhet Limestone is in places very largely made up of the hard shells of Nummulites but other fossils are much less abundant; the beds immediately overlying the Sylhet Limestone have also yielded a number of fossils in a few localities. In the upper Tertiaries, fossiliferous beds occur in the Garo Hills and at Kanchanpur in Cachar; these belong to the Surma Series. A few fossiliferous localities in the Tipam Series have been reported from the Naga Hills but the fauna is very poor.

41. This paucity of fossil beds makes it very difficult to correlate the strata of different portions of Assam and also prevents any very exact correlation between the Assam Tertiaries and those of the rest of India. The fossils of the Jaintia Series show that this belongs to the Eocene and is approximately of Kirthar (Lutetian) age. The Kanchanpur and Garo Hills fossil beds contain species characteristic of the lower parts of the Miocene.

HISTORY

42. It is not possible to reconstruct with any certainty the conditions under which the older rocks were formed, but it is clear that during a large part of Tertiary time almost the whole of the south-eastern part of Assam was under water: either open sea, coastal lagoon, or river estuary. (A possible exception is the east of Manipur, about which little is known). It is likely that during much of this period there existed land to the north-west—i.e., part of the Shillong Plateau.

43. It seems probable that during the earlier Tertiary times there was a shore line running roughly from south-west to north-east, through the Garo, Khasi, Jaintia, and Mikir Hills. To the south-east lay a broad sea which was continuously receiving sediments from the denudation of the neighbouring land. At some time in the Oligocene period part of the sea became almost silted up and coal-

forming conditions prevailed over a large area in north-eastern Assam. At the end of Oligocene times important earth-movements took place and large areas of the sea covering most of Assam were converted for a time into land and were subject to weathering and denudation. Subsidence set in and during the Miocene period the shore line ran again through the Garo, Khasi and Jaintia, and Mikir Hills. The water lying to the south-east was very shallow and received vast quantities of sediment from the neighbouring shores, but the water-covered area was not completely silted up, as subsidence, on the whole, kept pace with deposition. Whether the water ever completely covered the Assam plateau is not known, but it is clear that at times there must have been very little of the province that was not submerged. The Tertiary sediments in places attained a thickness of over 40,000 feet.

44. Towards the end of the Miocene period very extensive earth-movements began ; there was a great change in the material brought down by the streams, widespread pebble deposits show the proximity of large rivers draining from the newly forming land. As these changes continued the land began to assume something of its present shape, but with far higher elevations than now exist. During this period the strata were in the south folded into the broad corrugations so typical of the Surma Valley, and in the Naga Hills (where they were subjected to stronger forces) the strata became broken up along immense faults, areas scores of miles in length and several miles wide being pushed forward many miles over their north-western neighbours and having in turn similar large fault masses pushed over them from the south-east. Somewhat similar but even more intense movements occurred in the Eastern Himalayas, the forces being in this case from the north and north-west. In this way great hills were piled up, leaving a broad depression between—the original of the Brahmaputra Valley. As these mountain-building movements proceeded, denudation removed tens of thousands of feet of rock from the hills, so in the course of time lowering them to their present level, the material removed being carried out to sea or deposited in the lower reaches of the streams.

45. That the mountain-building movements are still in evidence is shown by the frequent earthquakes. During the 1897 earthquake many changes of level took place and subsequent measurements indicated that the Shillong

Plateau as a whole had moved appreciably towards the plains on the south. In some of the streams in the Patkai range there are a number of partly silted up lakes and marshes which show that there, too, there has been quite recent movement along a line crossing the course of these streams. Similar comparatively recent earth-movements have produced smaller but important changes of level in the plains resulting in obstructions to drainage, and consequent water-logging of large areas.

46. The activity of present-day denudation of the hilly areas is indicated by the vast quantity of sediment carried down the rivers during the monsoon and by the abundance of landslips showing as prominent scars in the jungle-covered hills.

47. Although the larger valleys and hills owe their origin to the earth-movements that have folded and broken the Tertiary strata of the province, their present form is entirely due to weathering and to erosion by streams. It is often popularly supposed that the deep gorges traversing the hills (for example, the immense ravine seen from the Cherrapunji road, or the narrow valley of the Jatinga above Damchara) are rifts produced in the earth's crust by destructive earthquakes. This is not so; the gorges, as well as the less impressive valleys, are due to the erosion by the streams which are now, or were at some previous time, flowing through them. During the monsoon, the streams with their loads of sediment erode their beds and banks and, according to local conditions, either deepen or broaden their valleys. The harder more resistant strata tend to remain as ridges whilst the weaker beds rapidly get worn down into low ground, possibly getting completely covered by the debris resulting from the weathering of the harder beds.

CLIMATE

In Assam the annual revolution of the seasons is not marked by the strongest contrast of temperature and of rainfall.

The climate of Assam in virtue of its constant high humidity has an alternation of summer and winter of which neither is extreme in its temperature.

The rise of temperature which in most parts of India follows rapidly on the vernal equinox, is, in Assam checked by frequent showers and thunderstorms, giving it a heavy rainfall during the spring or hot weather months.

The perpetual humidity, frequent and heavy rainfall and moderate temperature changes of a warm summer and cool winter especially distinguish the Valley of Assam.

The annual rainfall figures shown in the following table against each rainfall recording district in the province of Assam have been compiled from the record of five years from 1927-1931, supplied by the Agricultural Department, Assam.

District.	Normal rainfall.
Goalpara	109.05
Kamrup	81.12
Darrang	87.38
Nowgong	68.39
Sibsagar	88.19
Lakhimpur	113.17
Sylhet	135.45
Cachar	121.15
Garo Hills	107.05
Khasi & Jaintia Hills	229.23
North Cachar Hills	109.17
Sadiya Frontier Tract	143.82
Balipara Frontier Tract	96.54
Naga Hills	86.90
Manipur	59.91
Lushai Hills	108.02

The following average mean maximum and mean minimum temperatures have been calculated from the statements of the five years from 1927-1931.

Station.	M. Maximum.	M. Minimum.
Dibrugarh	81.39	65.77
Sibsagar	78.32	66.28
Tezpur	83.99	66.56
Gauhati	83.81	66.36
Dhubri	80.50	66.86
Silchar	85.57	67.41
Srimangal	86.92	66.00
Shillong	69.85	53.22
Cherrapunji	68.77	57.88

Average relative humidity calculated from figures
from 1927 to 1931

Station.	Average relative humidity.
Dibrugarh	89
Sibsagar	90
Tezpur	85
Gauhati	86
Dhubri	83
Silchar	86
Srimangal	85
Shillong	73
Cherrapunji	76

SYNOPSIS OF THE FAMILIES.

The distinguishing characters of the families have been selected with special reference to the plants described. In the body of the work under each family an account of the family as a whole will be found. The plants here mentioned all belong to the Phanerogams or flowering plants. They are divided as follows :—

Cotyledons, two or more	...	A. Dicotyledons.
Ovules in closed ovary, fertilized through stigma	a. Angiosperms.
Calyx and corolla both present.		
Corolla of distinct petals	...	i. Polypetalæ.
Calyx of distinct sepals ; petals hypogynous.		
Torus small or elongate, not expanded	...	1. Thalamifloræ.
Torus thickened or expanded into a fleshy disk	...	2. Discifloræ.
Calyx of combined sepals ; disk thin ; petals inserted on the calyx.	...	3. Calycifloræ.
Corolla of combined petals	...	ii. Gamopetalæ.
Calyx or corolla or both wanting	...	iii. Apetalæ.
Ovules naked, fertilized by direct contact with pollen	...	b. Gymnosperms.
Cotyledon one	...	B. Monocotyledons.

A. DICOTYLEDONS**a. Angiosperms****i. Polypetalæ****1. THALAMIFLORE.**

1. **Ranunculaceæ.** Sepals deciduous, often petaloid. Stamens numerous, anthers adnate, longitudinally dehiscent. Carpels numerous, free, 1-celled.

2. **Dilleniaceæ.** L. alternate, simple, penninerved, petioles sheathing. Fl. large, white or yellow. Sepals 5, imbricate, persistent, petals 5, caducous. Carpels one or many, more or less cohering, styles free.

3. **Magnoliaceæ.** Trees, shrubs or climbers. Leaves alternate, simple. Sepals and petals alike in whors of three, imbricate, deciduous. Stamens numerous. Carpels numerous, free or slightly cohering. Fruit a cone or spike.

4. **Anonaceæ.** Trees or shrubs, often scrambling. Leaves alternate, entire, exstipulate. Sepals 3. Petals 6. Stamens numerous, free. Carpels numerous, free or (Anona) confluent. Fruit succulent.

5. **Menispermaceæ.** Climbing shrubs or small trees. Leaves alternate, entire or lobed, usually palminerved, often peltate. Flowers small, unisexual, trimerous. Stamens as many as and opposite the petals or anthers sessile on a column. Ovaries 1 or 3, free. Fruit a drupe.

6. **Berberidaceæ.** L. alternate, glabrous. Sepals and petals alike, usually trimerous, caducous. Stamens opposite to petals, anthers adnate, as a rule opening by valves. Carpels distinct, often one only. Endosperm fleshy.

7. **Nymphæaceæ.** Aquatic-herbs. Leaves usually peltate. Sepals 4-5. Petals and stamens usually numerous. Carpels many in pits of the torus or confluent with it. Ovary 1 or more ovuled. Fruit a spongy berry or of nuts sunk in pits of the torus.

8. **Papaveraceæ.** Annual or perennial herbs. Leaves radical or alternate, stipules 0. Flowers often large, nodding in bud, regular; perianth and stamens very caducous. Sepals 2, hypogynous. Petals 4, 2-seriate, large, crumpled. Stamens very many. Carpels dehiscent by pores or valves.

9. **Fumariaceæ.** Annual or perennial herbs. Leaves usually divided, segments not jointed. Flowers small, racemed, irregular. Sepals 2, small, deciduous. Petals 4. Fruit a 2-valved, many-seeded capsule.

10. **Cruciferae**. Herbs, rarely undershrubs. Leaves cauline and radical, exstipulate. Flowers racemed. Sepals 4, free, imbricate. Petals 4, free, hypogynous. Stamens 6. Fruit either a 2-celled 2-valved pod, the valves deciduous and leaving the seeds on the persistent placentas (*replum*), or indehiscent, or transversely jointed.

11. **Capparidaceae**. Trees or shrubs. L. as a rule alternate, stipules often present and spinescent. Fl. usually bi-sexual, often zygomorphic. Sepals usually 4, petals 4. Stamens 4-5 or numerous, filaments filiform. Carpels connate into a 1-celled ovary with 2-4 parietal placentas, often on an elongated gynophore. Fruit baccate or capsular.

12. **Violaceae**. L. as a rule alternate, stipules small or leafy. Fl. regular or zygomorphic, sepals 5, imbricate, persistent, petals 5. Stamens 5, filaments short or 0, connective broad and often produced above, anthers connivent or connate round the ovary. Carpels connate into a one-celled ovary with usually 3 parietal placentas. Seeds small, embryo straight in a fleshy endosperm.

13. **Bixaceae**. L. alternate, simple, mostly dentate, stipules small or 0. Fl. regular, 4- or 5-merous, stamens usually numerous. Ovary 1-celled, seeds few, arillate or with pulpy testa.

14. **Flacourtiaceae**. Trees or shrubs, usually thorny. Leaves toothed or crenate. Flowers small, usually dioecious. Stamens numerous. Fruit a drupe with several 1-seeded pyrenes.

15. **Pittosporaceae**. L. alternate, simple, entire, stipules 0. Fl. regular, pentamerous and pentandrous; sepals free, as well as petals imbricate, anthers versatile. Embryo small, in copious endosperm.

16. **Polygalaceae**. L. alternate, simple, quite entire, stipules 0. Fl. bisexual, zygomorphic, sepals 5, the 2 inner larger, petaloid, petals 5 or 3. Stamens as a rule 8, filaments usually connate in a cleft sheath, anthers mostly opening by terminal pores.

17. **Tamaricaceae**. L. alternate, small, generally scale-like. Fl. regular, in spikes, racemes or panicles, sepals and petals usually free, pentamerous, sometimes tetramerous. Stamens as many as petals or twice their number. Capsule 3-5-valved, seeds tufted or winged.

18. **Hypericaceae**. L. opposite, often gland-dotted, stipules 0. Fl. regular, bisexual, sepals 5, imbricate, petals 5, contorted in bud. Stamens numerous, filaments usually connate into 3 or 5 bundles, anthers versatile. Endosperm 0.

19. **Guttiferae.** Juice resinous, yellow or greenish. L. opposite, simple, entire, usually coriaceous, stipules 0. Fl. regular, unisexual or polygamous, sepals 2-6, mostly in decussate pairs, petals as a rule 2-6, imbricate or contorted. Fr. usually indehiscent, seeds large, endosperm 0.

20. **Ternstroemiaceae.** L. alternate, simple, generally coriaceous, stipules 0. Fl. regular, as a rule bisexual, sepals and petals usually pentamerous and imbricate. Stamens generally numerous, ovary 3-5-celled.

21. **Dipterocarpaceae.** Resinous trees. L. alternate, usually coriaceous, simple, penninerved; stipules large, enclosing the bud. Fl. bisexual, regular, calyx-segments 5, some or all as a rule much enlarged in fr. Petals 5, contorted; stamens 5, 10, or more, anthers adnate to filaments. Fruit indehiscent, 1-seeded.

22. **Ancistrocladaceae.** Glabrous, woody climbers, not resinous. L. entire, stipules minute, caducous. Fl. bisexual, regular, pentamerous, calyx adnate to the 1-celled ovary, segments much enlarged in fr.

23. **Malvaceae.** Wood soft and light. L. alternate, mostly stipulate, generally palminerved, hairs usually stellate. Fl. as a rule bisexual, regular, supported by 3 or more bracteoles. Sepals 5, valvate, more or less connate, petals 5, base adnate to staminal-column, contorted in bud. Stamens numerous; filaments variously connate; anthers 1-celled.

24. **Sterculiaceae.** L. alternate, mostly stipulate, hairs often stellate. Sepals 5, valvate, more or less connate, petals 5 or none. Stamens commonly monadelphous, anthers 2-celled. Fr. a dehiscent capsule or a whorl of distinct carpels.

25. **Tiliaceae.** L. alternate, simple, stipules deciduous. Fl. regular, almost always bisexual. Sepals 5, usually connate, valvate in bud. Stamens numerous, anthers 1-celled. Ovary 2-10-celled.

26. **Elaeocarpaceae.** Trees. Leaves simple. Flowers usually hermaphrodite, rarely polygamous, in axillary racemes. Sepals 5, distinct. Petals 5, often 5-lobed torus. Stamens usually indefinite, never less than 10. Ovary sessile, 2-5-celled. Seeds pendulous.

2. DISCIFLORÆ.

27. **Linaceae.** Shrubs. Leaves alternate, glabrous, stipules minute. Flowers yellow, regular, bisexual. Sepals and petals 5 each, free. Stamens 5, connate at the base with small interposed staminodes. Disk inconspicuous of 2-3

glands adnate to the staminal-tube. Ovary 3-5-celled, cells spuriously 2-locellate. Fruit a capsule.

28. **Malpighiaceæ.** L. usually opposite, simple, entire, stipules small or 0. Fl. often zygomorphic, calyx 5-lobed, petals 5, often fimbriate. Stamens 10, sometimes unequal. Fr. usually of one or more winged samaras.

29. **Oxalidaceæ.** Generally herbs or undershrubs, rarely trees. Leaves alternate, compound. Flowers regular. Fruit a loculicidal capsule or a 5-lobed berry.

30. **Rutaceæ.** L. aromatic, dotted with translucent glands, stipules 0. Fl. regular, sepals and petals 4 or 5, stamens 4-5 or 8-10, filaments inserted on the outside of the disk.

31. **Simarubaceæ.** Bark bitter. L. alternate, stipules deciduous or 0. Fl. regular, small, often unisexual, sepals 3-5, usually connate, petals 3-5. Stamens as many as petals or double their number, inserted outside the disk.

32. **Ochnaceæ.** L. alternate, simple, glabrous, stipulate. Fl. regular, bisexual. Sepals 4 or 5, free, imbricate, persisting, petals 5 or more, deciduous, stamens 10 or many, anthers basifixed. Fr. of 3-10 one or few-seeded drupes.

33. **Burseraceæ.** Resinous. L. alternate, imparipinnate, sometimes 1-foliolate. Fl. small, regular, calyx 3-5-lobed, petals 3-5. Stamens as many as petals or twice their number, inserted on the disk or outside at its base. Ovary 2-5 celled, ovules 2 in each cell.

34. **Meliaceæ.** L. alternate, generally pinnate, stipules 0. Fl. regular, in cymose panicles, calyx small, 4-5-cleft, petals 4-5, stamens twice the number of petals, filaments generally united into a tube, disk between stamens and ovary often tubular.

35. **Chailletiaceæ.** L. alternate, entire, simple, stipules deciduous. Fl. 1-sexual or polygamous, petals 5, notched or bifid; stamens 5, disk of 5 glands, alternating with stamens. Ovary pubescent, 2-3-celled, ovules 2, collateral in each cell. Endosperm 0; cotyledons thick.

36. **Olcaceæ.** L. alternate, stipules 0. Fl. small, as a rule bisexual, calyx small or wanting, stamens opposite of petals or many. Ovary at base often 2-5-celled, ovules from a free axile placenta. Drupe 1-seeded.

37. **Icacinaceæ.** L. generally alternate, stipules 0. Fl. small, 1-sexual or polygamous, calyx small or wanting, stamens alternating with petals. Ovary 1-celled. Drupe 1-seeded.

38. **Aquifoliaceæ.** L. alternate, simple, usually coriaceous and evergreen, stipules minute. Fl. regular, usually 1-sexual, calyx 4-5-lobed, petals 4-5, connate at base. Stamens 4-5, alternating with petals, disk 0. Fr. a drupe, supported by the persistent calyx, stones 1-seeded, 2 or more.

39. **Celastraceæ.** L. simple, as a rule opposite, stipules minute or none. Fl. regular, small, bisexual or polygamous, calyx small, 4 or 5-lobed, persistent. Disk large, surrounding the base of the 3-5-celled ovary or partially enclosing it, stamens 3-5, rarely 10, inserted on the disk.

40. **Hippocrateaceæ.** Small trees or scandent shrubs. Leaves opposite, petioled; stipules small, caducous. Flowers small, white or greenish. Fruit of 3-flattened carpels connate at the base, usually dehiscent. Seeds compressed.

41. **Rhamnaceæ.** Branchlets or stipules often spinescent. L. simple. Fl. small, regular, calyx 4-5-cleft, lobes triangular, valvate in bud, disk lining or filling the calyx-tube. Petals inserted at the mouth of calyx-tube. Stamens opposite to petals, often enclosed by them.

42. **Ampelidaceæ.** Climbers. L. alternate, often compound. Fl. regular, calyx small, entire or 4-5-dentate; petals 4-5, valvate in bud. Stamens opposite of petals, inserted outside or between the lobes of the disk. Fr. a berry.

43. **Staphyleaceæ.** L. opposite, stipulate, compound, leaflets stipellate. Fl. regular, bi-sexual, pentamerous, stamens 5, inserted outside the disk. Ovary 3-celled.

44. **Aceraceæ.** L. opposite, stipules 0. Fl. regular, polygamous, calyx 5-12-parted, deciduous. Stamens 8, inserted outside or upon (rarely inside) the disk. Fruiting carpels winged.

45. **Sapindaceæ.** L. alternate (opposite in *Æsculus*), stipules 0. Fl. sometimes zygomorphic, mostly polygamous. Stamens inserted between disk and ovary, filaments usually hairy, disk frequently unilateral. Ovary 3-celled, often 3-lobed.

46. **Sabiaceæ.** L. alternate, stipules 0. Fl. small, calyx 4-5-partite, stamens 4-5, opposite to petals, anther-cells distinct, usually adnate to a large connective.

47. **Anacardiaceæ.** L. in most genera alternate, stipules 0. Fl. regular, calyx 3-5-cleft (spathaceous in *Gluta*), petals 3-5, rarely 0. Stamens alternating with petals, inserted under, rarely on the disk. Ovary in 2 genera inferior, drupe 2-5-seeded.

48. **Moringaceæ.** Wood soft. L. deciduous, alternate, bi- or tri-pinnate, pinnæ and leaflets opposite, glands at base of petioles and pinnæ. Fl. large, bisexual, pentamerous, petals unequal. Fertile stamens 5, opposite to petals alternating with sterile stamens. Fr. a long 1-celled 3-valved pod.

3. CALYCIFLORÆ.

49. **Connaraceæ.** L. alternate, imparipinnate or 1-foliolate, leaflets entire, coriaceous, stipules 0. Fl. usually bisexual and regular, pentamerous, petals linear-oblong, stamens 10, the epipetalous stamens generally shorter and often sterile. Carpels 5, free, mostly hairy, ovules 2, collateral. Fruiting carpel one, 2-valved.

50. **Leguminosæ.** L. stipulate, as a rule alternate and compound. Fl. bisexual, petals 5, in the majority of genera zygomorphic, stamens 10 or many. Carpel one, free, ovules usually numerous, attached to the inner suture. Fr. a 1-celled pod, endosperm generally 0.

51. **Rosaceæ.** L. stipulate, usually alternate. Fl. pentamerous, as a rule regular and bisexual, stamens usually numerous. Carpels mostly distinct, often adnate to and enclosed in the calyx-tube albumen 0 or scanty.

52. **Saxifragaceæ.** L. simple. Fl. regular, 4- or 5-merous, calyx free or adnate to ovary, stamens free, as many as petals, twice the number or numerous. Carpels 2 or numerous, usually connate, ovules numerous. Seeds small, embryo minute, in copious albumen.

53. **Droseraceæ.** Perennial herbs. Leaves rosulate or alternate, usually circinate in veneration. Calyx free from the ovary. Petals 4-8. Stamens as many as the petals. Capsule loculicidally 2-5 valved. Seeds numerous.

54. **Hamamelidaceæ.** L. alternate, stipules usually deciduous. Fl. in compact heads or spikes, usually bracteate, calyx-tube more or less adnate to ovary. Ovary 2-celled, styles 2, usually persistent. Testa shining.

55. **Rhizophoraceæ.** L. opposite, usually coriaceous and entire, scars of petioles mostly prominent, stipules interpetiolar, deciduous. Fl. regular, generally bisexual, calyx more or less adnate to ovary, limb 4-14-lobed, lobes as a rule persistent, petals as many as sepals, stamens usually twice the number of petals. Fr. coriaceous, usually 1-seeded.

56. **Combretaceæ.** L. simple, entire, stipules 0. Fl. usually bisexual and regular, calyx-tube adnate to ovary

and produced beyond it, segments 4-5, valvate, petals often wanting. Stamens as many as calyx-segments or twice their number, perigynous. Fr. generally angled or winged.

57. **Myrtaceæ.** L. simple, generally quite entire, either opposite with translucent glands or alternate without glands. Stipules 0. Fl. regular, generally bisexual. Ovary enclosed in and generally adnate to calyx-tube. Stamens many, inserted with the petals in the mouth of calyx-tube.

58. **Lecythidaceæ.** Usually trees. Leaves alternate not gland dotted, entire or toothed. Flowers regular, 2-sexual. Calyx-tube adnate to the ovary; lobes usually 1-6, valvate or imbricate. Petals usually 4-6. Stamens numerous, in many series, few sometimes sterile. Ovary inferior, 2-6, rarely more celled. Fruit indehiscent, usually a woody, fleshy or fibrous berry.

59. **Melastomaceæ.** Herbs or shrubs. Leaves opposite, simple, exstipulate. Flowers regular, showy, 4-5-merous. Calyx-tube partially adnate to the ovary. Petals free. Stamens twice as many as the petals; anthers longer than the filaments, curved, opening by apical pores. Ovary usually 4-celled. Fruit a capsule. Seeds many, minute.

60. **Lythraceæ.** L. generally opposite, simple, entire, calyx cup-shaped, persistent, segments valvate, often with intermediate teeth, petals when present imbricate and crumpled in bud. Ovary as a rule superior.

61. **Onagraceæ.** Herbs or undershrubs, sometimes aquatic. Flowers usually regular, 2 sexual. Calyx adnate or 1/2-adnate to the ovary (Trapa); lobes 2-5, usually 4, valvate. Petals alternating with sepals, rarely 0. Stamens as many or twice as many as the sepals. Ovary usually 2-4-celled. Fruit capsular and many seeded or indehiscent and 1-seeded (Trapa).

62. **Passifloraceæ.** L. alternate, usually lobed. Fl. regular, unisexual in Papaya, bisexual in Passiflora.

63. **Cucurbitaceæ.** Large climbing herbs. Leaves petioled, cordate, ovate, 5-angular or lobed. Flowers monœcious, all solitary, yellow, very large. Fruit fleshy, indehiscent, often large. Seeds ovoid or oblong.

64. **Begoniaceæ.** Flowers not symmetrical; stamens numerous, free or conjoined, anthers ovoid; placentas projecting from inner angle into carpellary chamber; styles free or only united at base; herbs or shrubs with more or less succulent leaves and stems.

65. **Datisceae.** L. deciduous, petiolate, broadly ovate. Fl. dioecious, male flowers—calyx deeply 4-lobed, petals 0, stamens 4. Capsule crowned by the persistent calyx-segments, the valves terminating in the persistent styles.

66. **Cactaceae.** Stems and branches succulent, prickly. Fl. regular, bisexual, solitary, calyx-tube adnate to ovary, petals numerous, imbricate, stamens many. Fr. fleshy, seeds numerous.

67. **Umbelliferae.** Herbs; fruit dry separating spontaneously into two dry indehiscent carpels with usually glandular vittae containing an essential oil.

68. **Araliaceae.** L. alternate, simple or compound. Fl. regular, usually pentamerous and umbellate. Calyx adnate to ovary, usually entire, petals caducous. Stamens inserted outside the epigynous disk, anthers didymous.

69. **Cornaceae.** L. entire, stipules 0. Fl. regular, calyx-tube adnate to ovary, limb persistent, segments small, petals 4 or 5, inserted with stamens round an epigynous disk. Fr. drupaceous.

ii. Gamopetalae.

70. **Caprifoliaceae.** L. opposite, stipules usually 0. Fl. bisexual, calyx-tube adnate to ovary, limb 3-5-toothed, corolla often zygomorphic, lobes 5. Stamens inserted on the corolla-tube.

71. **Rubiaceae.** L. opposite, sometimes whorled, stipules as a rule interpetiolar. Fl. as a rule bisexual and regular, calyx-tube adnate to ovary, corolla inserted round the epigynous disk, stamens inserted on the corolla-tube, alternating with its lobes. Ovary as a rule 2-celled.

72. **Valerianaceae.** Herbs or shrubs. Leaves opposite, exstipulate. Flowers sessile, cymose, sometimes polygamous or dioecious, bracteate. Stamens 1-4, on the corolla-tube. Fruit indehiscent, dry, 1-seeded. Seed pendulous.

73. **Dipsaceae.** Herbs or rarely shrubs. Leaves opposite or whorled, exstipulate, sometimes connate at the base, entire, toothed. Flowers scattered in cymes, whorled in spikes. Stamens 4 or 2. Seed pendulous, albumen copious.

74. **Compositae.** L. as a rule alternate, stipules 0. Inflorescence a dense head of many small fl., sessile on a broad receptacle and enclosed in an involucre of whorled or imbricate bracts. Calyx usually a pappus of hairs on the top of the ovary, stamens on the corolla-tube, anthers usually connate, connective produced upwards.

75. **Campanulaceæ.** Herbs or undershrubs, sometimes twining. Leaves alternate or opposite, entire, toothed or rarely lobed; stipules 0. Inflorescence axillary or terminal. Stamens 4-6, alternating with the corolla-lobes. Fruit capsular. Seeds very many.

76. **Vacciniaceæ.** Shrub or small trees. Leaves alternate or falsely whorled, entire or serrate; stipules 0. Flowers racemose or axillary and solitary. Stamens 10. Fruit a berry, rarely dry, 5-or falsely 10-celled. Seeds many, albuminous.

77. **Ericaceæ.** L. alternate, simple, stipules 0. Fl. bisexual, 4-or 5-merous, stamens as a rule twice the number of corolla-lobes, anther-cells opening at the top by pores or short slits. Ovary inferior or superior, 4-5-or many-celled, ovules numerous on an axile placenta.

78. **Plumbaginaceæ.** Herbs or undershrubs. Flowers in terminal scapes or peduncles, capitate, racemed or paniced. Petals 5. Stamens 5, opposite the petals, filaments rarely united into a linear tube. Stamens 5, opposite the petals. Capsule membranous.

79. **Primulaceæ.** Perennial, rarely annual herbs. Leaves all radical, or if cauline opposite, alternate or whorled, exstipulate. Flowers hermaphrodite, regular. Stamens on the corolla-tube, opposite its lobes. Capsule dehiscent transversely or by valves. Seeds minute, usually angular.

80. **Myrsinaceæ.** L. alternate, simple, gland-dotted, stipules 0. Calyx persistent, often enlarged in fr. Corolla-tube short or none, stamens opposite the corolla-segments. Ovary 1-celled, ovules on a free central placenta.

81. **Sapotaceæ.** L. entire, usually alternate and coriaceous. Fl. bisexual, calyx persistent, segments 1-8, almost distinct, corolla-tube short, lobes 4-24. Fr. a 1-8-seeded berry, seeds oily, with a crustaceous shining testa.

82. **Ebenaceæ.** L. entire, as a rule alternate, stipules 0. Fl. regular, usually dioecious, calyx gamosepalous, persistent and generally enlarged in fr.; segments 3-6, corolla-segments 3-6, stamens usually twice the number of corolla-lobes, filaments variously connate at base, often in pairs, anthers basifixed. Rind of fr. coriaceous, seeds embedded in soft or viscid pulp.

83. **Styraceæ.** L. alternate, stip. 0. Fl. bisexual, regular, 4-5-merous, calyx superior or inferior, limb persistent, petals free or connate, stamens 10 or numerous. Ovary 2-5-celled, ovules 1 or few on the inner angle.

84. **Oleaceæ.** L. as a rule opposite, stip. 0. Fl. regular, as a rule bisexual, in trichotomous panicles, calyx small, often truncate. Stamens 2, filaments usually short, ovary free, 2-celled, ovules 1 or 2 in each cell.

85. **Apocynaceæ.** L. entire, as a rule opposite or whorled, stipules 0 or small, sometimes intrapetiolar. Fl. regular, bisexual, usually pentamerous. Calyx free, corolla-lobes spreading, mostly contorted in bud, stamens 5, inserted in the corolla-tube. Carpels 2, usually distinct. Seeds often with a tuft of hairs. Endosperm scanty.

86. **Asclepiadaceæ.** L. entire, as a rule opposite, stipules 0. Fl. regular, bisexual, pentamerous. Calyx inferior, sepals imbricate in bud. Stamens 5, inserted on the base of the corolla, anthers cohering or connate, enclosing the stigma, pollen-grains as a rule united into waxy masses. Corona corolline or staminal. Carpels 2, distinct. Seeds usually winged and surmounted by a dense brush of hairs. Embryo large, in copious endosperm.

87. **Loganiaceæ.** L. opposite, simple, generally connected by interpetiolar stipules or by a raised line. Fl. regular, usually bisexual, ovary free, 2-celled. Embryo straight, in copious endosperm.

88. **Gentianaceæ.** Herbs, rarely minutely hairy. Leaves opposite, rarely alternate, entire, or alternate and 3-foliate in Menyanthes. Fl. cymose, capitate or umbelled, rarely solitary, regular. Stamens on the corolla-tube, as many as its lobes; filaments linear. Capsule membranous, rarely fleshy and berried. Seeds numerous, small.

89. **Polemoniaceæ.** Herbs, shrubs, or trees. Leaves exstipulate. Flowers showy, regular, hermaphrodite, 5-merous. Calyx inferior. Stamens 5, on the corolla-tube, alternate with its lobes. Capsule septicidal, 3-valved. Seeds many, aluminous; embryo straight.

90. **Hydrophyllaceæ.** Herbs, rarely shrubs, usually hairy, sometimes glandular hairy. Leaves simple or compound, exstipulate, usually alternate, rarely opposite. Flowers bisexual, regular, usually 5-merous. Fruit usually a loculicidal capsule. Seeds minute, embryo small.

91. **Boraginaceæ.** L. as a rule alternate and simple, stipules 0. Fl. bisexual, as a rule regular and pentamerous, in unilateral spikes or racemes, calyx free, persistent, lobes valvate in bud. Ovary superior, cells 2, each with 2 ovules, or 4, each with one ovule. Fr. a drupe or consisting of 4 nutlets.

92. **Convolvulaceæ.** L. alternate, stipules 0. Fl. large, bisexual, regular, pentamerous, sepals distinct, persistent. Fr. a berry or capsule, seeds 2-4.

93. **Solanaceæ.** L. as a rule alternate, stipules 0. Fl. regular, pentamerous, calyx usually gamosepalous, ovary free. Fr. a berry or capsule, seeds numerous.

94. **Scrophulariaceæ.** L. usually opposite, stip. 0. Fl. usually bisexual, corolla bilabiate, stamens 4, didynamous. Fr. a capsule, seeds numerous.

95. **Lentibulariaceæ.** Herbs, aquatic or in wet places. Leaves radical, rosulate, or capillary multifid or obsolete. Flowers hermaphrodite, purple, yellow, or white. Stamens 2, attached to the base of the corolla. Capsule globose, 2-4 valved. Seeds numerous, small.

96. **Gesneraceæ.** Herbs or undershrubs. Leaves opposite, alternate or solitary, undivided, entire or toothed; stipules 0. Flowers hermaphrodite, rarely regular. Fruit capsular or berried, dehiscent or indehiscent. Seeds very many.

97. **Bignoniaceæ.** L. usually opposite, compound, leaflet-opposite, stip. 0. Fl. bisexual, generally zygomorphic, calyx gamosepalous, truncate, split or toothed. Ovary free, supported by an annular disk. Fr. often elongated, generally dehiscent, the two valves separating from the dissepiment, to which numerous seeds are attached.

98. **Pedaliaceæ.** Herbs or undershrubs. Leaves opposite, or the upper alternate, entire, toothed or divided. Flowers irregular, axillary, solitary or rarely clustered. Stamens 4, didynamous; rarely 2. Capsule 2 or 3-4-celled. Seeds wingless, exalbuminous.

99. **Acanthaceæ.** L. opposite, stip. 0. Fl. bisexual, mostly irregular. Ovary free, 2-celled, style filiform, bifid, one branch often obsolete. Capsule loculicidal, seeds seated on hard curved acute supports.

100. **Verbenaceæ.** L. usually opposite or whorled, stip. 0. Fl. bisexual or by abortion polygamous, usually zygomorphic. Calyx as a rule gamosepalous and persistent, lobes imbricate, stamens usually 1, ovary 2-or 4-celled, 1 ovule in each cell.

101. **Labiataæ.** Mostly aromatic, branches usually 4-sided, L. opposite or whorled, stip. 0. Fl. zygomorphic, calyx persistent, corolla usually 2-lipped, lobes imbricate in bud. Stamens didynamous, the 2 upper sometimes imperfect or wanting. Ovary free, usually 4-lobed, supported by the annular disk. Fr. of 4 one-seeded nutlets.

102. **Plantaginaceæ.** Scapigerous herbs. Leaves usually radical. Flowers small, greenish, spicate, often dimorphic. Stamens 4, inserted on the corolla-tube; filaments capillary. Capsule 1-4-celled. Seed usually peltate, testa thin.

iii. Apetalæ.

103. **Nyctaginaceæ.** L. as a rule entire and opposite, stip. 0. Fl. usually bisexual, often involucrate, perianth small, petaloid. Ovary free, 1-celled, ovule 1. Fr. indehiscent, enclosed in the persistent perianth-tube.

104. **Amarantaceæ.** Stip. 0. Fl. usually bisexual, perianth of 5 persistent sepals, imbricate in bud. Stamens opposite the sepals, ovary free, 1-celled. Seed one, embryo horseshoe-shaped or annular, surrounding a mealy endosperm.

105. **Chenopodiaceæ.** L. alternate, rarely opposite, simple, stip. 0. Fl. small, perianth of 3-5 sepals, stamens opposite the sepals. Fr. generally enclosed in the perianth, seed one, embryo curved, annular or spiral.

106. **Phytolaccaceæ.** Glabrous trees, shrubs or herbs. Leaves alternate, quite entire, stipules small or 0. Flowers racemed, bracteate and 2-bracteolate. Stamens 4, alternate with the petals. Carpels 1 or more, superior, free or connate. Seeds erect, often arillate.

107. **Polygonaceæ.** L. alternate, simple, stipules scarious or membranous, usually sheathing. Fl. small, usually bisexual, perianth of 4-6 persistent segments, imbricate in bud, stamens opposite the segments. Ovary free, 1-celled, compressed or trigonous. Fr. a small hard nut, seed one.

108. **Podostemonaceæ.** Aquatics, growing on stones in tropical streams, annual or perennial. Flowers 1-sexual, rarely dioecious, usually enclosed in a spathe. Stamens definite or not, free or connate. Capsule 1-3-celled. Seeds minute; embryo straight.

109. **Nepenthaceæ.** Climbing or prostrate evergreen undershrubs. Leaves alternate, exstipulate, midrib stout. Stamens 4-16, united in a column crowned by the usually connate anthers with extrorse dehiscence. Capsule coriaceous. Seeds very numerous.

110. **Cytinaceæ.** Leafless brown reddish or yellowish parasites, or with leaves reduced to scales. Flowers solitary. Stamens 8 or more. Ovary 1-celled. Fruit fleshy, 1-celled. Seeds innumerable, very minute.

111. **Aristolochiaceæ.** L. alternate, stip. 0. Fl. bisexual, perianth campanulate or tubular, 3-lobed or 2-lipped, ovary inferior, placentas parietal, ovules numerous.

112. **Piperaceæ.** L. alternate, entire, basal nerves 3 or more, stipules membranous, enclosing the buds. Fl. usually dioecious or polygamous, in catkinlike spikes, perianth 0, stamens 1-4, hypogynous. Berry 1-celled, seed globose.

113. **Chloranthaceæ.** Herbs, shrubs or trees, usually aromatic. Leaves opposite, usually toothed, petioles often connate and forming a sheath. Flowers in terminal or pseudo-axillary spikes, heads or panicles, 1-sexual. Stamens 1 or 3 connate. Ovary 1-celled. Seed pendulous, testa membranous.

114. **Myristicaceæ.** Aromatic. L. entire, penninerved, stip. 0. Fl. 1-sexual, perianth as a rule 3-lobed, valvate in bud, anthers 6-30, usually sessile, ovary free, ovule 1, erect. Seed arillate, endosperm oily, ruminant.

115. **Lauraceæ.** Aromatic. L. as a rule entire and evergreen, stip. 0. Perianth regular, deeply 6-cleft, segments biseriate, tube often enlarged in fr., stamens perigynous, normally 12 in 4 circles, those of the innermost circle often wanting, those of the two outermost circles opposite to perianth-segments, anther-cells 2 or 4, opening by valves. Ovary free, 1-celled. Fr. a berry or drupe, seed one, cotyledons thick, oily.

116. **Hernandiaceæ.** L. alternate, stip. 0. Perianth of 4-10 segments, stamens 3-5, anther-cells 2, opening by valves.

117. **Proteaceæ.** L. hard, mostly alternate, stip. 0. Fl. bisexual, perianth of 4 segments, in bud valvately cohering into a cylindrical tube, tips free, recurved. Stamens 4, filaments inserted on perianth-segments. Ovary free, 1-celled. Seeds few.

118. **Thymelæaceæ.** L. simple, quite entire. Fl. usually bisexual, perianth tubular or campanulate, lobes 4 or 5, imbricate in bud. Stamens inserted on the perianth, usually twice the number of lobes. Ovary free, usually 1-celled.

119. **Elæagnaceæ.** Often spinescent, with silvery or brown stellate scales or hairs. L. alternate, quite entire, stip. 0. Fr. indehiscent, entirely enclosed within the lower fleshy part of perianth, seed 1, radicle inferior.

120. **Loranthaceæ.** Parasitic on stems and branches. L. entire, usually opposite, sometimes wanting. Fl. regular, perianth simple or double, stamens equal to and opposite

the petals or perianth-lobes. Ovary inferior, 1-celled, ovule 1, adnate all round to the ovary walls. Fr. usually viscid.

121. **Santalaceæ**. Mostly root-parasites. L. entire, stip. 0. Perianth usually adnate to ovary, 5-8-lobed, stamens opposite to lobes, ovary 1-celled, ovules several. Drupe or nut 1-seeded.

122. **Balanophoraceæ**. Flowers monœcious or diœcious, small or minute, crowded on spadix-like peduncled heads or cones. Stamens 1-2 in the naked flowers; in the flowers with a perianth as many as its lobes and opposite them or more, filaments 0. Fruit minute, crustaceous or coriaceous, 1-seeded. Seed usually adherent to the pericarp.

123. **Euphorbiaceæ**. L. in most genera alternate, undivided and stipulate. Fl. as a rule unisexual. Perianth calycine, several genera with petals. Ovary superior, as a rule of 3 carpels, more or less united, styles 3, ovules 1 or 2 in each cell, pendulous from the inner angle.

124. **Ulmaceæ**. L. distichous, undivided, stipulate. Perianth 4-9-lobed or of 4-5 sepals, stamens opposite to perianth-segments, rarely twice their number. Ovary of 2 carpels, usually 1-celled, ovule 1, pendulous.

125. **Moraceæ**. L. usually alternate, stipules large, often amplexicaul. Fl. unisexual, crowded on receptacles, which are globose, cylindric or hollow. Female flowers-perianth of 4 sepals or segments, often fleshy in fr. Ovary 1-celled, ovule 1, usually pendulous.

126. **Urticaceæ**. L. alternate, stipulate, as a rule dentate, basal n. 3. Fl. unisexual, sessile, usually in compact heads or clusters, stamens 4 or 5, opposite to perianth-segments, filaments inflexed in bud. Ovule erect, orthotropous.

127. **Juglandaceæ**. L. alternate, pinnate, stip. 0. Fl. monœcious; male flowers in lateral pendulous catkins. Female flowers in few- or many-fl. spikes, perianth adnate to the 1-celled ovary, ovule 1, erect. Cotyledons oily, endosperm 0.

128. **Myricaceæ**. Aromatic. L. alternate, coriaceous, stipules 0. Fl. unisexual, in catkins, stamens 3-6 in the axils of broad bracts. Fr. fleshy, endocarp bony, seed 1, endosperm 0.

129. **Fagaceæ**. L. alternate, simple, penninerved, stip. deciduous. Fl. monœcious, male flowers in drooping catkins or in erect spikes, anther-cells not distinct. Female flowers in spikes, each fl. or group of fl. enclosed in an involucre of numerous bracts, coalescing in fr., perianth adnate to ovary. Ovary 2-6-celled, 2 pendulous ovules in each cell.

130. **Betulaceæ.** L. alternate, undivided, as a rule serrate, stipules deciduous. Fl. early in spring, male fl. in drooping catkins, anther-cells as a rule distinct, female fl. in spikes, ovary 2-celled, 1 pendulous ovule in each cell, style 2, long, filiform, perianth 0 or adnate to ovary.

131. **Salicaceæ.** L. deciduous, alternate, simple, stipulate. Fl. dioecious, in catkins similar in both sexes, 1 fl. in the axil of each bract, a disk at the base of stamens and ovary, perianth 0. Ovary 1-celled, ovules many on 2-4 parietal placentas. Seeds many, minute, enclosed by long silky, deciduous hairs.

b. Gymnosperms.

132. **Gnetaceæ.** Stem and branches jointed at the nodes. L. opposite or reduced to a short sometimes 3-4-dentate sheath. Fl. unisexual, ♀ one erect ovule, integument single, prolonged into a tube. ♂ Ovule enclosed in a perianth, which usually becomes fleshy in fr.

133. **Taxaceæ.** L. mostly narrow, linear or lanceolate. Fl. mostly dioecious. Carpels usually few or even 1 terminal, with 1-2 ovules each.

134. **Pinaceæ.** L. usually needle-like or scaly. Fl. mostly monœcious. Male flowers in deciduous catkin consisting of numerous sporophylls which are usually scale-like. Female flowers in cones consisting of scale-like open carpels which are flat or peltate.

135. **Cycadaceæ.** Trunk cylindric, sometimes branched, with terminal tufts of rigid, pinnate leaves, pith and bark large. Fl. dioecious, at the apex of trunk among the leaves, male fl. in erect cones with numerous thick scales, bearing on the under-surface many globose anther-cells. Female fl. carpophylls densely woolly in crowded whorls around the top of trunk, each with 1-5 pairs of ovules on its edge.

GLOSSARY

OF

BOTANIC TERMS.

A

Abortion, imperfect development or ~~non~~-development of an organ;
abortive, obsolete; imperfectly developed.

Accrescent, increasing in size with age; usually said of parts of the calyx or corolla that persist and enlarge after flowering.

Achene, a small dry indehiscent 1-celled 1-seeded fruit or a 1-seeded indehiscent carpel of an apocarpous fruit.

Acicular, needle-shaped; long and slender.

Acorn, fruit of the oak. *i.e.*, a nut enclosed within a cup formed of an involucre of thickened bracts.

Actinomorphic, divisible into similar halves by two or more planes; said of flowers.

Aculeate, abounding with prickles.

Acumen, a sharp tapering point more or less prolonged.

Acuminate, terminating in an acumen.

Acute, evenly tapering and ending in a narrow angle, but without a prolongation.

Adnate, said of dissimilar organs when congenitally united.

Adpressed, lying close throughout the entire length against the surface.

Adventitious, occurring in an unusual position; usually applied to buds and roots.

Æstivation, the mode in which the parts of a flower are folded in the bud, also their relative position.

Albumen, the nutritive substance found within the seed coats of some seeds outside the embryo.

Amplexicaul, said of a sessile leaf or the base of a petiole when clasping the stem.

Anastomosing, reticulately united.

Anatropous, said of an inverted ovule, *i.e.*, one with the micropyle close to the hilum, and the chalaza at the opposite end, the axis of the ovule itself remaining straight.

Androphore, the tube or column on which some stamens are supported.

Androecium, the male organs of a flower collectively.

Androgynous, said of an inflorescence bearing both male and female flowers.

Angiosperm, a subphylum (which includes the two classes Monocotyledons and Dicotyledons) in which the ovules are enclosed in the ovary and are fertilized through the stigma.

Annulate, marked transversely by rings.

Anterior, said of that part of a flower which faces outwards from the axis of inflorescence; inferior.

Anther, the part of a stamen that bears the pollen.

Antipetalous, inserted opposite the petals.

Apetalous, without petals.

Apiculate, with a short pointed tip.

Arborescent, tree-like, growing to the size of a tree.

Apocarpous, with the carpels free and distinct.

Arcuate, shaped like a bow, *i.e.*, moderately curved.

Areola, a small space with clearly defined outline *e.g.*, the spaces between the reticulating veinlets of a leaf.

Aril, **arillus**, an accessory seed-covering or an appendage growing from or about the hilum of a seed. **Arillate**, having an aril.

Arillode, a false aril growing from the micropylar end.

Aristate, bearing an awn, or bristle *e.g.*, glumes of some grasses.

Articulate, jointed in such a manner as to separate at maturity.

Ascidium, a pitcher-like cavity formed by a modification of the leaf stalk or blade.

Ascending, directed obliquely upward.

Attenuate, narrow and gradually tapering.

Auricle, an appendage like the lobe of an ear. **Auriculate**, **auricled**; having an auricle.

Awn, a bristle-like appendage, especially of the glumes of grasses.

Axil, the upper angle formed by a leaf or a similar organ and the supporting stem or axis. **Axillary**, relating to the axil.

Axile, relating to the axis; generally said of a kind of placentation in which the ovules are borne on the axis at the inner angles of the cells of a syncarpous ovary.

Axis, the central line or support round or on which parts of an organ are arranged.

B

Baccate, berry-like, pulpy.

Basifixed, fixed by the base, especially said of an anther attached at its lower end to the top of the filament; innate. **Basal**, **basilar** attached to the base.

Bast, fibrous inner bark.

Beak, a sharp tip like the bill of a bird.

Berry, a simple fruit succulent throughout, without a stone, and generally with more than one seed.

Bifarious, in two opposite vertical rows.

Bifid, divided into two segments with a narrow sinus.

Bifurcate, two-forked, having two prongs or branches.

Bilabiate, having two lips, a term usually applied to gamosepalous calyces and gamopetalous corollas.

Bipinnate, twice pinnate.

Biseriate, in two series or rows, generally one above or within the other.

Bisexual, having both stamens and pistil in the same flower; hermaphrodite.

Biternate, twice ternate.

Blade, the expanded portion of a leaf or a clawed petal.

Bole, the main axis or trunk of a tree.

Brachiate, widely spreading, a term applied to branches.

Bract, a rudimentary or modified leaf subtending a flower or an inflorescence. **Bracteate**, having bracts.

Bracteole, a secondary bract or one of the ultimate grade subtending each flower of an inflorescence. **Bracteolate**, having bracteoles.

Bulb, a short, usually underground stem, consisting of a short axis, bearing a bud or buds enclosed in fleshy scales or coats.

Bulbiform, formed like a bulb. **Bulbous**, of the nature of bulbs. **Bulbil**, small axillary bulbs.

Buttressed, said of stems with vertical ridges or projections.

C

Caducous, falling off very early.

Cæspitose, tufted or growing in tufts, e.g., many species of bamboos.

Callus, the new tissue which forms over the wounds of plants.

Calyx, the outer whorl of floral leaves, immediately below or outside the corolla. **Calycine**, relating to the calyx.

Calyptra, a cap or hood. **Calyptrate**, hooded.

Cambiumlayer, a zone of tender thin-walled cells separating the wood from the bark in Dicotyledons and Gymnosperms, by the division and growth of which new wood and bark are formed.

Campanulate, bell-shaped—deeper than cupshaped.

Canescent, with very short grey hairs or pubescence giving the epidermis a greyish white hue.

Capillary, slender, hairy or thread-like.

Capitate, having a globose head.

Capitulum, a globose head or cluster or sessile or shortly pedicellate flowers.

Capsule, a dry syncarpous fruit, which opens at maturity to discharge the seed.

Carpel, one of the component parts of a syncarpous or apocarpous pistil. **Carpellary**, relating to a carpel.

Carpophore, the part of the axis of a flower situated between or above the Carpels, and to which the Carpels are attached.

Caruncle, a wart-like appendage, produced at the base of a seed.

Cartilaginous, firm and tough, like parchment.

Caryopsis, a grain; the seed-like fruit of Gramineæ with thin pericarp, which is usually adnate to the contained seed.

Catkin, a scaly spike or raceme of unisexual flowers, pendulous or drooping, and generally deciduous.

Caudate, furnished with a tail, or with a slender tail-like terminal appendage.

Cauline, pertaining to the stem.

Cell, the living vegetable unit; the structural unit in the formation of a plant. Also one of the cavities of an ovary or of an anther.

Chalaza, that part of the ovule where the base of the nucellus is confluent with the coats of the ovule.

Chartaceous, having the texture of writing paper, thin and flexible.

Cilia, marginal hairs forming a fringe like eye-lashes.

Ciliate, having cilia; dim. **ciliolate**.

Circinate, coiled inwards from the tip.

Cirrhose, **cirrose**, bearing tendrils.

Circumsciss, dividing or opening circularly or transversely.

Cladode, a branch more or less flattened which assumes the form and functions of a leaf.

Clavate, club-shaped, slender below and gradually thickened upwards.

Claw, the narrowed base of certain petals.

Cocci, pl. of **coccus**, the seed-like dehiscent or indehiscent segments of the dry fruit which separate at maturity.

Cogener, one of the same genus.

Coherent, similar parts united together but separable without rupture.

Collateral, side by side.

Coma, a tuft of soft hairs or cotton borne on a seed. **Comose**, having a coma.

Commissure, the union line between two parts.

Concolor, **Concolorus**, of the same colour throughout.

Confluent, blending together.

Conduplicate, folded once upon itself lengthwise.

Conc, the multiple fruit of Conifers forms mostly of imbricated scales by which the seeds are subtended.

Connate, said of similar organs or parts of the same organ when congenitally united.

Connective, the portion of a stamen that connects the two lobes or cells of an anther.

Connivent, **conniving**, said of sepals, petals or anthers having the apex arching over or converging in the centre of the flower.

Contorted, **convolute**, twisted in one direction upon itself; said of leaves or petals in a bud with one margin within and the other outside the whorl.

Convergent, said of lateral nerves of leaves curved from base to apex.

Cordate, heart-shaped; when applied to the base of a leaf or other organ—with two broad rounded lobes on either side of the axis.

Coriaceous, leathery, tough and thick.

Corm, a solid fleshy underground stem more or less jointed and naked or with thin scales, such as is characteristic of certain families, e.g., Aroideæ.

Corolla, the inner whorl of floral leaves.

Corona, a whorl of process from the corolla, or from stamens in some families like *Asclepiadaceæ*.

Cortical, relating to the cortex or bark.

Corymb, an inflorescence of the indefinite or centripetal kind in which the lower branches or pedicels, are longer than the upper, and thus although starting from different points, all attain almost the same level.

Costate, furnished with one or more primary ribs or veins.

Cotyledons, the seed lobes or first leaves of an embryo.

Crateriform, shaped like a shallow cup.

Crenate, with rounded teeth.

Crustaceous, hard and brittle; said of a covering which splits and breaks off easily.

Cruciform, in the form of a cross; generally said of flowers with four petals arranged crosswise.

Culm, the hollow and jointed stem of grasses, especially of bamboos.

Cuneate, wedge-shaped, acute angled at the base.

Cupula, cupule, a cup-like involucre of thickened bracts supporting the nut of the oak.

Cupular, cup-shaped.

Cusp, a long and tapering rigid point. **Cuspidate**, furnished with a cusp.

Cuticle, the outermost layer of the epidermis.

Cyathiform, wine-cup shaped.

Cyme, an inflorescence of the definite or centrifugal type in which the main axis and all the lateral axis are each terminated by a flower so that flowering proceeds from the centre outwards.

Cypsela, a dry inferior achene invested with the adnate calyx: the fruit of *Compositæ*.

Cystolith, a crystalline concretion usually of calcium carbonate in the cells of some plants.

D

Decandrous, with ten stamens.

Deciduous, said of trees or shrubs which are leafless for a part of the year; also of leaf or parts of a flower which fall off normally.

Declinate, bent to one side.

Decomound, compound or divided more than once.

Decumbent, inclined downwards but with the tip ascending.

Decurrent, produced down, as a sessile leaf when the blade is prolonged below the insertion along the stem forming a winged appendage.

Decurved, bent or directed outwards.

Decussate, in pairs alternately crossing at right angles.

Deflexed, bent downward.

Dehiscence, the mode of opening of a capsule or of an anther.

Deltoid, triangular in outline or in section.

Dentate, with margins cut into triangular salient teeth directed outward. **Denticulate**, minutely toothed.

- Dextrorse**, turning or twining from left to right, *i.e.*, in the anti-clockwise direction.
- Di, Dis** (prefix), two, twice, double.
- Diadelphous**, said of stamens united by their filaments into two sets of bundles.
- Dichasium**, a falsely dichotomous cyme of which the main axis ends in a flower and branches below the latter into two lateral axes of almost equal strength.
- Diclinous**, having the stamens in one flower and the pistil in the other.
- Didymous**, slightly 2 lobed or occuring in pairs.
- Didynamous**, said of a flower with two long and two short stamens, and also of stamens when they are such.
- Diffuse**, widely spreading;—stems, procumbent and also very much loosely branched.
- Digitate**, finger-like; said of a compound leaf with the leaflets all borne on the apex of the common petiole.
- Dimorphic, dimorphous**, having two forms, generally said of hermaphrodite flowers having one form with long styles and short stamens, and another with short styles and long stamens.
- Diœcious**, unisexual with the male and female flowers on separate individuals.
- Disk, Disc**, an enlargement of the receptacle of a flower in the form of a cup or of a cushion, ring or glands. **Discoid, disciform**, disk-like; circular and flat. **Disc-florets**, those borne on the central portion of a capitulum.
- Dissepiment**, a partition in an ovary or pericarp in the direction of its length.
- Distal**, furthest from the base.
- Distichous**, arranged in two opposite vertical rows.
- Divaricate**, spreading widely apart.
- Dorsal**, relating to, or inserted on, the back.
- Dorsifixed**, said of an anther attached to the top of the filament by a part not the whole of the back.
- Drupe**, a stone fruit, *i.e.*, one with a fleshy or pulpy pericarp and a bony or crustaceous endocarp. **Drupaceous**, like a drupe.
- Drupelet**, drupel, a diminutive drupe.

E

- E, Ex** (prefix), without or out of.
- Ebracteate**, without bracts. **Ebracteolate**, without bracteoles.
- Echinate**, set all round with sharp bristles like a hedge hog.
- Effuse**, very widely spreading.
- Elliptic, elliptical**, oblong with rounded ends. **Ellipsoid**, a solid with an elliptical outline.
- Emarginate**, with a notch at the apex.
- Embryo**, the rudimentary plantlet formed in a seed.
- Endocarp**, the inner layer of the pericarp.

Endosperm, the albumen of a seed.

Ensiform, in the shape of a sword.

Epi- (prefix) upon.

Epicalyx, a whorl of bracts below the calyx proper and somewhat resembling it in shape and colour.

Epicarp, the outer layer of a pericarp.

Epidermis, the outermost layer of tissue or skin of a plant.

Epigynous, inserted on the top of the ovary.

Epipetalous, said of stamens which are borne on, or adnate to the petals or corolla.

Epiphyllous, growing on leaves or perianths.

Epiphyte, a plant growing on, but not nourished by another plant.

Epiphytic, having the habit of an epiphyte.

Equitant, said of two ranked leaves, or leaves in bud, when folded lengthwise, the outer ones at their base folding over the inner.

Erose, with an irregularly toothed margin.

Exalbuminous, without albumen.

Excavate, hollowed into broad deep pits.

Exocarp, the external layer of the pericarp when an endocarp is present.

Exserted, projecting outwards as anthers beyond the corolla.

Exstipulate, without stipules.

Extra-axillary, growing outside the axil, *i.e.*, above, below or one side of it.

Extrorse, applied to anthers that dehisce outwards, *i.e.*, away from the axis of the flower.

F

Falcate, curved like the blade of a sickle or scythe.

Family, a group of co-related genera.

Farina, starch or anything resembling it or analogous to it.

Farinaceous, consisting of or resembling starch.

Fascicled, fasciculate, in dense clusters.

Fastigate, said of branches which are nearly parallel and point upwards.

Ferruginous, coloured like iron rust.

Fibro-vascular, said of a tissue consisting of woody fibres and ducts or vessels.

Filament, the stock of an anther.

Filiform, thread-like.

Fimbriate, having a fringe or border of fine thread-like processes.

Fistular, hollow tubular.

Flabellate, fan-shaped.

Flaccid, soft, flabby, wanting in stiffness.

Floccose, woolly with locks of dense soft hairs that are easily detached.

Foliaceous, of the form or texture of a leaf.

Follicle, a dry fruit resulting from a single carpel opening by only

one usually the inner suture. **Follicular**, pertaining to or resembling a follicle.

Foramen, the minute aperture in the coats of an ovule corresponding to the micropyle of a seed.

Free, distinct, not adnate to any other organ. **Free central**, said of the placenta of an one-celled ovary when it forms a central ovule bearing column arising from the base.

Fugacious, falling off or fading very early.

Fulvous, tawny.

Funicle, the stalk of an ovule or seed.

Furcate, forked.

Fuscous, brown or greyish brown.

Fusiform, spindle-shaped; solid and tapering at both ends.

G

Gamopetalous, having combined petals.

Gamophyllous, said of a flower having a perianth of united leaves or segments; also applied to such a perianth.

Gamosepalous, having combined sepals.

Geminate, growing in pairs.

Geniculate, bent abruptly.

Genus, pl. genera, a group of closely related species indicated by the first name of a plant.

Gibbous, having a pouch-like swelling or protuberance on one side.

Glabrous, without hairs of any kind. **Glabrate**, somewhat glabrous.

Glabrescent, becoming glabrous.

Glands, small wart-like bodies or round excrescences of any kind found on stems, petioles, etc., or inside flowers. Small raised superficial dots, or minute vesicles imbedded in the substance of leaves, etc., usually filled with oil. **Glandular**, having glands or relating to glands.

Glaucous, of a bluish-grey colour, often covered with a fine bloom.

Globose, nearly spherical.

Glochidia, barbed bristles.

Glomerate, compactly clustered.

Glumes, the chaffy bract-like scales of the inflorescence of grasses and their allies. **Glumaceous**, resembling or relating to glumes.

Glutinous, sticky.

Gonophore, a stipe or stalk supporting both stamens and ovary in a flower.

Gymnosperm, with naked seeds, i.e., not enclosed in a seed-vessel: a group comprising the Fir, Gnetum and Cycas families, the naked seeds of which are fertilised by direct contact with the pollen; see angiosperm.

Gynobase, a short and broad elongation of the torus on which the pistil rests. **Gynobasic**, resting on a gynobase.

Gynophore, the stipe or stalk supporting an ovary.

H

- Hastate**, spear-head shaped, usually said of leaves with a pointed apex, and basal lobes directed outwards.
- Haustrorium**, pl. **haustoria**, a sucker at the end of a parasitic root; a root-like sucker.
- Head**, a form of inflorescence consisting of a more or less dense cluster of sessile flowers which are centripetal in evolution.
- Helicoid**, coiled in a spiral.
- Hermaphrodite**, bisexual; having both stamens and pistil in the same flower.
- Heter**, **hetero**, (prefix) different.
- Heterogamous**, said of flower heads when male, female, bisexual and neuter florets, or any two or three of these, are borne on the same head.
- Hilum**, the place of attachment of an ovule or seed to the placenta or funicle.
- Hirsute**, thickly covered with long and rather coarse hairs.
- Hispid**, beset with rigid or bristly hairs.
- Homogamous**, said of a flower head with the florets all of the same sex.
- Hyaline**, transparent or translucent and colourless.
- Hypanthium**, an enlargement of the torus of the flower under the calyx or perianth.
- Hypocrateriform**, salver-shaped; said of a corolla with a slender tube abruptly expanded into a flat horizontal limb.
- Hypogynous**, inserted below the ovary.

I

- Imbricate**, overlapping.
- Imparipinnate**, unequally pinnate; pinnate with a terminal leaflet or pinna.
- Impressed**, marked with small depressions, **nerves**, those slightly below the surface of the leaf.
- Incised**, cut sharply and irregularly.
- Included**, not protruding beyond the surrounding organs, usually said of stamens or styles that are not produced beyond the corolla.
- Incomplete**, said of a flower wanting calyx or corolla or both.
- Incumbent**, leaning upon.
- Indehiscent**, said of fruits the pericarp of which does not open to discharge the seeds.
- Indumentum**, a general term for any kind of hairy covering or coating.
- Induplicate**, with the margins folded inwards.
- Induplicate-valvate**, said of members of a whorl when they touch one another with margins of each folded inward.
- Indurated**, hardened.
- Inferior**, inserted below the ovary and free from it, if said of the

calyx: adnate to, or situated below the calyx, if said of the ovary; also anterior, when said of the relative position of the parts of a flower in an inflorescence.

Inflorescence, the mode in which flowers are arranged on the stem. Also used as a collective term for the whole flowering portion of the stem of a plant with its branches, bracts, bracteoles and flowers.

Infundibuliform, funnel-shaped.

Innate, said of an anther borne on the apex of the filament and with usually marginal dehiscence.

Innovation, a newly formed shoot.

Integuments, the coats of an ovule or seed.

Inter, (prefix) between.

Interpetiolar, said of stipules of opposite leaves when they are inserted between the petioles, *i.e.*, across the stem.

Intra, (prefix) within.

Intrapetiolar, is applied to stipules of single leaves when they are connate by their margins so as to form apparently one stipule.

Introrse, applied to anthers that dehisce or are turned towards the axis of the flower.

Intruded, projecting inward.

Involucre, a circle of bracts subtending a flower cluster.

Involute, rolled inward.

Irregular, wanting in symmetry of form, said of flowers with the petals or perianth segments unequal in size and shape.

Isomerous, having an equal number of members.

K

Keel, the central dorsal ridge, like the prow of a boat, formed by the two anterior and innermost petals of a Papilionaceous corolla.

Kernel, the contents of the putamen of a drupe.

L

Labiate, two-lipped.

Lacerate, irregularly cleft as if torn.

Laciniate, irregularly cut or fringed into narrow lobes or segments with narrow sinuses.

Lacunose, marked with minute pits or depressions.

Lamina, the blade of a leaf; the expanded portion of a clawed petal.

Lanate, woolly.

Lanceolate, shaped like a lance-head, *i.e.*, 2-4 times as long as broad, narrowed at both ends towards the apex, and broadest below the middle.

Latex, milky sap.

Lax, diffuse, said of an inflorescence when the flowers or fruits are not closely arranged on it.

Legume, a fruit of a single carpel usually opening by both sutures when ripe. See Pod.

- Lenticel**, a corky dot or protuberance on the bark. **Lentincellate**, having lenticels.
- Lenticular**, lentil shaped, *i.e.*, like a double convex lens.
- Lepidote**, scurfy with minute scales.
- Ligule**, anything shaped like a strap, such as the limb of the ray-corolla in some Compositæ; a thin and scarious projection from the summit of the sheath of the leaf of grasses; an outgrowth from the inner face of the base of some petals.
- Ligulate**, strap-shaped, usually applied to the ray-flowers of Compositæ.
- Limb**, the expanded part of a gamosepalous calyx or a gamopetalous corolla as distinguished from the tube; the blade of a clawed petal.
- Linear**, narrower than lanceolate, at least five times as long as broad.
- Lineolate**, marked with fine lines.
- Lip**, one of the two divisions of a bilabiate calyx or corolla.
- Littoral**, growing on or along the seashore.
- Lobulate**, divided into small lobes.
- Loculicidal**, applied to a kind of dehiscence of a capsular fruit in which splitting takes place through the cells.
- Locus**, the cell of an ovary; the sac or cell of an anther.
- Lodicule**, one of the small scales which represent the perianth in the flower of a grass, occurring usually in pairs.
- Lomentum**, a form of legume which breaks up at maturity into one-seeded indehiscent segments.
- Lyrate**, pinnately lobed with a large terminal lobe and one or more pairs of small basal lobes, so as to resemble a lyre.

M

- Macro**, large or long (prefix).
- Mamillate**, having nipple-like prominences.
- Marcascent**, withering without falling off like the petals of some flowers.
- Marginate**, having a border, with a distinctive texture.
- Median**, relating to the middle, in a plane radial to the axis of a plant.
- Medullary rays**, verticular plates of cellular tissue which radiate from the centre of a dicotyledonous plant towards the cambium.
- Membranous**, thin, pliable like a membrane.
- Meristem**, tissue of cells capable of reproducing themselves by division.
- Mesocarp**, the middle layer of the pericarp.
- Micro**, small (prefix).
- Micropyle**, the minute orifice in the coats of a seed represented by a scar; the opening through the coats of an ovule at the apex of the nucellus.
- Mon**, **mono**, single, alone (prefix).

Monadelphous, said of stamens united by their filaments into one bundle forming a tube or column or sheath.

Moniliform, cylindrical and constricted at regular intervals so as to resemble a necklace of beads.

Monœcious, unisexual with the male and female flowers on the same plant.

Monopodial, pertaining to or of the nature of a monopodium, *i.e.*, a simple axis prolonged by means of a terminal bud.

Mucro, a short straight stiff and sharp point.

Mucronate, abruptly terminating in a mucro.

Multi, many (prefix).

Multifarious, in many vertical rows.

Multifid, cleft into many lobes or segments.

Multiseriate, in many series or rows.

Muricate, rough with sharp straight points.

Muticous, blunt.

N

Needles, the acicular leaves of conifers.

Nerves, the principal lateral ribs of a leaf. **Nervose**, with strongly developed nerves.

Nodose, with swollen joints; knotty, chiefly said of roots.

Nucellus, the central part of an ovule containing the embryo sac.

Nucleus, the solid portion of a winged seed or fruit; a clearly defined and comparatively dense portion of the cytoplasm which controls all activities of the cell.

Nut, a hard indehiscent 1-seeded fruit resulting from a syncarpous ovary.

O

Ob, reversed or inverted (prefix).

Obconic, inversely conical, *i.e.*, with the attachment at the pointed end.

Obcordate, inversely cordate, *i.e.*, broadly two-lobed with a notch at the apex.

Obdiplostemonous, having twice as many stamens as petals in two series, the outer being opposite the petals.

Oblanceolate, inversely lanceolate, *i.e.*, long, narrow and tapering at both ends, but broadest above the middle. **Oblanceoloid**, said of a solid having an oblanceolate outline.

Oblique, one-half larger than the other, unequal-sided—nerves, those making acute angles with the midrib.

Oblong, much longer than broad with the sides nearly parallel.

Obovate, inversely ovate, *i.e.*, egg-shaped in outline with the broad end towards the apex.

Obovoid, said of a solid which is inversely egg-shaped in outline.

Obsolete, rudimentary, imperfectly developed.

Obtuse, blunt or rounded at the apex.

Ochrea, Ocrea, a membranous tubular stipule or a pair of membranous stipules forming a sheath round the stem.

Oid, (suffix) resembling.

Opérculum, a lid; a top which separates by a transverse line of separation.

Orbicular, orbiculate, flat with the outline circular or nearly so.

Order, a group of closely-related Families of plants.

Osseous, of bony texture.

Ovary, that portion of the pistil which includes one or more cavities or cells containing one or more ovules.

Ovate, egg-shaped in outline with the broad end towards the base.

Ovoid, said of a solid with an ovate or oval longitudinal section.

Ovule, the embryonic seed in the ovary.

P

Palea, or pale, a chaffy scale; the inner glume of the flower of a grass; the chaffy scales on the receptacles of many Compositæ.

Paleaceous, chaff-like.

Palmate, with the midribs of the lobes or leaflets all radiating from the apex of the petiole, the segments like the spread fingers of the hand.

Palmatifid, palmate with the sinuses reaching half way down.

Palmatilobed, palmately lobed.

Palmatisect, deeply cut in a palmate manner.

Palmatipartite, with the segments palmately cut almost to the base.

Palminerved, with nerves radiating like the ribs of a palmate leaf.

Pandurate, Panduriform, fiddle-shaped.

Panicle, a compound inflorescence in which the main axis is racemose and the secondary and tertiary ramifications are racemose or not.

Papilionaceous, butterfly-like; applied to the kind of corolla characteristic of Papilionaceæ (the Pea Tribe) of Leguminosæ. See *Keel, Wings & Standard*.

Papillose, bearing minute nipple-shaped projections.

Pappus, thistle-down, the hairy tufts on achenes and other fruits.

Paraboloidal, said of a solid having a parabolic, i.e., ovate-oblong outline.

Parasite, a plant that grows on or in another plant, and draws nourishment from it.

Parietal, said of placentas attached to the wall of a more than 1-carpelled ovary.

Paripinnate, Syn. **abruptly pinnate**, evenly pinnate; pinnate without the terminal leaflet or pinna.

Patent, widely spreading.

Pedate, Palmately divided with the lateral segments 2-cleft.

Pedicel, the ultimate stock supporting a single flower in an inflorescence. **Pedicellate**, having a pedicel.

Peduncle, the stalk supporting a solitary flower or fruit or a cluster of flowers or fruits. **Pedunculate**, having a peduncle.

Pellucid, transparent or translucent.

Peltate, shield-shaped; said of a flat body (e.g., a leaf) attached to the stalk by the lower surface and not by the margin or base.

Penicillate, bordered or tipped with brush-like hairs.

Penninerved, pinnately nerved; with nerves spreading laterally from various points on the midrib.

Penta, five (prefix).

Pentadelphous, said of stamens arranged in 5 bundles

Pentamerous, having the members in each whorl of the flower in fives.

Penultimate, next to the ultimate.

Perianth, a floral envelope; a term especially used when the calyx and corolla are similar in form and texture, or are represented by a single whorl.

Perfoliate, said of a sessile leaf the basal lobes of which pass round the stem and are connate on the other side of it.

Pericarp, the portion of the fruit formed of the ovary and whatever adheres to it, exclusive of, and outside, the seeds.

Perigynous, inserted around but away from the ovary; said of the sepals, petals and stamens of a flower when these are inserted on a tube formed by the torus (the calyx-tube) above the level of the base of the ovary.

Persistent, remaining attached, generally said of a calyx or a corolla which remains attached until the fruit is mature.

Perisperm, the outer endosperm of some seeds derived from the nucellus, e.g., Piperaceæ.

Perulate, wrapped in scales as many winter buds

Petal, one of the divisions of the corolla.

Petiole, the stalk of a leaf. **Petiolate**, having a petiole. **Petiolule**, the stalk of a leaflet. **Petiolulate**, having a petiolule.

Phloem, the soft tissue of the inner bark.

Phylloclade, **Phyllocladium**, a modified branch that resembles a leaf in form and function C[p. **Cladote**.

Phyllodium, a petiole having the form and function of leaves.

Pilose, thinly sprinkled with long soft simple hairs.

Pinna, pl. *pinnæ*, the primary division of a bipinnate or tripinnate leaf. **Pinnule**, the secondary division of a tripinnate leaf.

Pinnate, a compound leaf is so called when the leaflets are arranged on either side of a common axis.

Pinnatifid, deeply pinnately lobed to about half way down.

Pinnatisect, pinnately cut nearly to the common axis.

Pisiform, pea-shaped.

Pistil, the female organ of a flower consisting normally of ovary style and stigma. **Pistillode**, a rudimentary or barren pistil.

Placenta, that portion of the interior of an ovary on which the ovules are borne. **Placentation**, position of the placenta.

Plaited, plicate, folded in longitudinal plaits.

Plumose, feathered; branches on either side like the plume or webs on the shaft of a feather.

Pod, the same as legume, but has a wider application, being used to denote any dry dehiscent many-seeded fruit, especially when it is much longer than broad.

Pollen, minute powder-like grains contained in the anther cells, the fertilizing agent of a plant.

Poly, many (prefix).

Polyadelphous, having the stamens united by the filaments into many sets or bundles.

Polygamous, with hermaphrodite and unisexual flowers on one or different plants.

Polyphyllous, said of a perianth having distinct leaves or segments.

Pome, a succulent fruit with seeds in many cartilaginous dry cells. e.g., the apple and the pear.

Pore, a minute passage or orifice.

Posterior, said of that part of a flower which is nearest to the axis of inflorescence; superior.

Prickle, a sharply pointed stiff outgrowth of the epidermis.

Procumbent, } lying flat or close to the ground.

Prostrate,

Proximal, nearest the base or starting point.

Pruinose, covered with a whitish waxy bloom or powder.

Pseudo, **Pseudo**, false (prefix).

Pseudocarp, a false fruit; one which has some portion other than the ovary so developed as to resemble a fruit.

Pubescent, covered with short soft straight simple hairs.

Puberulous, puberulent, minutely pubescent.

Pulvinate, cushion-shaped.

Pulvinus, the swollen base of petioles or petiolules.

Punctate, dotted with small punctures or glands. **Punctulate**, minutely punctate.

Pungent, terminating in or tapering gradually to, a hard sharp point.

Pustular, with small blister-like elevations.

Putamen, the shell of a nut; the hard endocarp of a drupe.

Pyrene, one of the small stones of a drupaceous fruit having more than one stone.

Pyriform, pear-shaped; obovoid with a tapering base.

Q

Quadrangular, four-cornered.

Quadrate, square

Quinequefoliolate, with five leaflets

R

Raceme, an inflorescence of the indefinite kind in which the flowers are borne on pedicels of more or less the same length along a

- single undivided axis or rachis, the oldest flowers being lowermost.
- Rachis**, the principal axis of a pinnate leaf or of an inflorescence.
- Rachium**, **pl. rachilla**, the secondary rachis of a compound spike; the rachis of a spikelet of grass.
- Radical**, relating to or springing from the root.
- Radicle**, the axis of an embryo below the cotyledons.
- Raphe**, the cord or ridge formed by the funicle along the side of some ovules.
- Raphides**, needle-shaped crystals found in the cells of some plants.
- Ray**, one of the radiating branches of an umbel. **Ray-florets**, the flowers borne on the rim or circumference of the heads in Compositæ usually differing in structure from those of the disk.
- Receptacle**, the torus of a flower; hence also what is commonly known as the fruit of figs.
- Reflexed**, bent abruptly backward or downward.
- Regular**, symmetrical, generally said of flowers with the petals or perianth-segments alike in size and shape.
- Reniform**, kidney-shaped; i.e., broader than long, broadly cordate at the base, and with the auricles rounded.
- Repand**, having a wavy margin.
- Replum**, a septum joining the sutures of two carpels from which the carpels or valves finally separate, e.g., Cruciferae.
- Resupinate**, turned or twisted so that parts are eventually turned to the opposite direction from their normal position, generally spoken of flowers.
- Reticulate**, having the veins connected together like the meshes of a net.
- Retinaculum**, a persistent hook-like, upcurved and subsequently hardened process from the placenta in most Acanthaceæ on which the ovules and seeds are borne.
- Retorse**, directed backwards or downwards.
- Retuse**, with a small shallow notch in a rounded or truncate apex.
- Revolute**, having the margins or apex rolled backward upon the under-surface.
- Rhizome**, an underground or prostrate stem of root-like appearance which sends off roots at the nodes and bears, like a true stem, buds, leaves or scales.
- Rhomboid**, **rhomboidal**, with four sides more or less equal, and the lateral angles obtuse.
- Rostrate**, beaked, narrowed into a slender tip or process.
- Rotate**, wheel-shaped; said of a regular gamo-petalous corolla with a short tube and a flat spreading limb.
- Rotundate**, circular or nearly so in outline.
- Rufous**, reddish brown.
- Rugose**, full of wrinkles. **Rugulose**, minutely wrinkled.
- Ruminatè**, marked by transverse lines of divisions, said of albumen of some seeds, e.g., Anonaceæ.

Runcinate, toothed or incised with the teeth or segments pointed backwards.

Runner, a very slender prostrate branch arising from the base of a stem, rooting at the nodes or tip and sending up shoots which form new plants.

S

Saccate, bulged into a small bag or cavity.

Sacciform, in the form of a bag.

Sagittate, shaped like an arrow-head; tapering towards the apex, two lobed at the base with the lobes pointed and directed downwards.

Salver-shaped, with a long tube and horizontally spreading limb, C/p. *hypocrateriform*.

Samara, an indehiscent dry fruit with a wing developed from the pericarp.

Saprophyte, a plant that is nourished by dead organic matter.

Sarmentose, producing long straggling woody branches.

Scabrous, very rough to the touch owing to short stiff hairs. **Scabrid**, **Scaberulous**, somewhat scabrous.

Scalariform, joined by transverse bars or with transverse markings like the rungs of a ladder.

Scandent, climbing.

Scape, a leafless and generally unbranched flower-stem arising from the ground.

Scarious, **scariose**, thin, dry, membranous, somewhat stiff and not green.

Schizocarp, a general name for a dry fruit which on maturity splits into one-seeded portions.

Sclerotic, hardened or stony in texture.

Scorpioid, said of a form of unilateral inflorescence which is coiled inward from the apex to the base in the bud like the tail of a scorpion.

Scurf, loosely adherent epidermal scales.

Secund, said of parts of organs all of which are turned in the same direction.

Sect, (suffix) deeply cut nearly to the axis.

Sepal, one of the parts of leaves of the calyx, especially when not combined; **Sepaloid**, green and resembling a sepal in structure.

Septicidal, a form of dehiscence of a ripe carpel when it opens through the dissepiments or lines of junction of the carpels.

Septifragal, a form of dehiscence of a ripe carpel when the valves break away from the dissepiments and leave the latter attached to the axis.

Spetum, pl. *septa*, see Dissepiment. **Septate**, divided by one or more partitions.

Seriate, in rows transverse or lengthwise.

Sericeous, covered with silky straight hairs.

Serrate, toothed like a saw with the teeth directed forward.

Serrulate, minutely serrate.

Sessile, without a stalk.

Seta, a bristle. **Setaceous**, bristle-like. **Setose**, bristly. **Setulose**, bearing minute bristles.

Sheath, a close fitting tubular or enrolled case, e.g., the lower portion of the leaf of grasses.

Simple, undivided; consisting of one blade when said of a leaf; resulting from a single pistil when said of a fruit; unbranched when said of a stem, tendril, or style.

Sinistorse, turning or twining from right to left i.e., clock-wise.

Sinus, the space between the divisions or lobes of a leaf. **Sinuate**, with an irregular deeply wavy margin.

Spadix, a spike with a thickened or fleshy axis bearing 1-sexual flowers generally sheathed in a spathe.

Sparse, arranged at some distance from each other.

Spathe, a large sheath-like bract enclosing an inflorescence or part of it. **Spathaceous**, spathe-like.

Spatulate, **Spathulate**, shaped like a spatula, i.e., oblong with a broad and rounded apex and gradually narrowed base.

Species, a group of individuals alike in all essential particulars; the subdivisions of a genus.

Spike, a racemose inflorescence bearing sessile flowers, on an undivided axis. **Spicate**, in the form of or resembling a spike, or disposed in spikes. **Spikelet**, a secondary spike; an ultimate branchlet of the inflorescence of grasses and **Cyperaceæ** generally consisting of one or more flowers subtended by glumes.

Spine, a strongly pointed woody process consisting of a modified branch but sometimes of a modified leaf. **Spinescent**, terminating in or resembling a spine-like sharp point; also becoming spinous. **Spinose**, **spinous**, furnished with or of the nature of spines.

Sporadic, occurring scattered here and there.

Spore, a minute unicellular body which detaches itself at maturity and is instrumental in the process of sexual reproduction, in Cryptogams.

Squamose, beset with scales.

Stamen, the male organ of a flower, consisting of a filament and an anther. **Staminode**, an abortive or antherless stamen.

Standard, the posterior or odd petal of Papilionaceous corolla.

Stellate, star-shaped; with radiating rays like points of a star.

Stigma, that part of the pistil which is specially adapted for the reception of the pollen for the fertilization of the ovules.

Stigmatic, relating to the stigma. **Stigmatose**, resembling or of the nature of the stigma.

Stipe, any stalk-like support; the stalk of an ovary above the floral whorls. Syn. gynophore. **Stipitate**, having a stipe.

Stipule, an appendage of a leaf, usually one on either side of the

- petiole. **Stipulate**, having stipules. **Stipel**, a secondary stipule, the appendage of a leaflet. **Stipellate**, having stipels.
- Stolon**, a prostrate or reclined branch rooting at intervals, or only at the tip and giving off shoots which become independent plants.
- Stone**, the hard endocarp of a drupe. Syn. Putamen.
- Striate**, marked with thin longitudinal lines or minute furrows.
- Strigose**, covered with sharp pointed straight stiff hairs of unequal length lying close along the surface and all in the same direction.
- Strophiole**, a crest-like appendage about the hilum or the base of a seed, C/p Caruncle.
- Style**, a stalk-like outgrowth from the summit of the ovary supporting the stigma.
- Stylopodium**, a fleshy disk at the base of some styles as in many Dipterocarpaceæ.
- Subulate**, shaped like a cobbler's awl; narrow, tapering and somewhat stiff.
- Succulent**, with abundant cellular tissue full of juice.
- Suffruticose**, said of plants when low woody and branching from near the base.
- Sulcate**, grooved or furrowed with the depressions more or less parallel.
- Superior**, inserted on the ovary or adnate to it, if said of the calyx: above the calyx and free from it, if said of the ovary; also posterior in position.
- Superposed**, placed one above the other.
- Suture**, a seam indicating the line of union of two parts; a line of opening.
- Symmetrical**, said of a flower having the same number of members in each whorl.
- Syncarpous**, composed of two or more combined carpels.
- Syncarpium**, a fruit formed by the union of several carpels which have become compacted and fleshy.
- Syngenesious**, said of stamens united by their anthers, as in Compositæ.

T

- Tap-root**, primary root resulting from the direct prolongation of the radicle.
- Tendril**, a slender process usually belonging to the axis and serving as a support in climbing.
- Tepal**, a division of a perianth; a word applicable to either a sepal or a petal. "An anagram of petal," Jackson.
- Terete**, cylindrical, rounded in cross section.
- Ternate**, arranged in threes in a cluster of whorl.
- Tesselated**, divided up into small squares.
- Testa**, the outermost coat of a seed.
- Tetra**, (prefix) four.
- Tetradynamous**, with four long and two short stamens.

Tetramerous, said of a flower having the parts or members in each whorl in fours.

Tetrandrus, with four stamens.

Thalamus, that part of the axis of a flower which supports the floral whorls and the pistil. Syn. Torus.

Thyrus, a contracted panicle, ovate or lanceolate in outline, usually with cymose branches. **Thyriform**, of the shape of a thyrus.

Thyrroid, somewhat like a thyrus.

Tigellum, **Tigellus** (plu.), the central embryonic axis consisting of radicle and plumule.

Tiller, a sucker from the base of a stem.

Tissue, an aggregation of cells differentiated from surrounding aggregations.

Tomentose, covered with short, soft, rather dense and more or less tangled hairs.

Tortuous, bent irregularly in different directions.

Torulose, cylindrical with contractions at regular intervals.

Torus, same as thalamus.

Tri, (prefix) three.

Tribe, a division of a family, comprising a number of closely-related genera.

Trichotomous, with the divisions always in threes and of more or less the same length.

Tricuspidate, with three cusps or sharp points.

Trimerous, said of a flower having the parts or members in each whorl in threes.

Triplinerved, with a strong secondary nerve on either side of the midrib proceeding from near the base.

Triquetrous, sharply 3-cornered.

Tristichous, in three vertical rows.

Truncate, ending abruptly, as if with the end cut off.

Tuber, a thickened underground stem bearing buds or 'eyes.'

Tuberous, swollen like a tuber.

Tumid, swollen.

Turbinate, top-shaped; like an inverted cone.

Turgid, swollen and more or less firm.

U

Umbel, a form of racemose inflorescence in which several branches or pedicels radiate from the top of a common peduncle and are of nearly the same length.

Umbonate, bearing a boss, or conical or rounded protuberance.

Undulate, with a wavy margin.

Uni, (prefix) one.

Unicellular, formed of, or consisting of, only one cell.

Unilateral, arranged on one side of the axis.

Unisexual, of one sex; having the stamens and the pistil in separate flowers.

Urceolate, urn-shaped.

Urticle, a 1-celled 1-seeded fruit with a thin and more or less loose pericarp.

V

Valvate, with the margins of the members of a whorl only meeting without overlapping. Also dehiscing by valves.

Varicose, irregularly swollen at intervals.

Variety, a group of individuals differing from others of the same species in certain striking particulars which, however, are not of a nature to justify specific rank; sub-divisions of a species.

Venation, the mode in which the veins are disposed in a leaf.

Ventral, relating to, attached to the, or opening by the inner angle, or anterior face of a carpel.

Venulose, closely and finely veined.

Ventricle, a lateral swelling or bulging out. **Ventricose**, having a ventricle; unequal swollen.

Verrucose, covered with wart-like excrescences.

Versatile, swinging to and fro; said of an anther attached by the back to the attenuated top of the filament on which it swings.

Verticillate, arranged in whorls.

Villous, **Villose**, more or less thickly covered with long soft simple hairs.

Virgate, with slender erect rod-like stems or branches.

Vitta, pl. **Vittæ**, one of the oil receptacles in an umbellifer fruit.

Viviparous, said of plants, the seeds of which germinate before falling; also sometimes of such seeds.

W

Whorl, a collective name for all similar members that are arranged in a circle, round an axis.

Wing, any thin membranous appendage. **Wings**, the side petals of a papilionaceous corolla.

X

Xerophyte, said of plants that grow naturally in dry hot places.

Xylem, woody tissue.

Z

Zygomorphic, capable of being bisected into similar halves by the median plane only; said usually of irregular flowers.

LIST OF ABBREVIATIONS AND SIGNS USED IN THE FLORA.

Ass.	Assamese.

!	Added after a locality, but without the name of collector or herbarium signifies that the author has himself seen the plant in the locality named.		
!	The same sign following the name of a person in italics signifies that the author has either not seen it or is uncertain of the identification.		
=	Equal to or Synonym.		
?, (?)	Doubtful.		
+	The plus sign when used for parts of a flower. e.g., petals 3+3, indicates separate whorls. In the example two whorls of 3 petals in each whorl.		

FLORA OF ASSAM

THALAMIFLORÆ.

FAM. 1. RANUNCULACEÆ.

Herbs or climbing shrubs. *Leaves* alternate, rarely opposite, usually ex-stipulate, simple or compound; petiole sheathing. *Flowers* usually regular, generally ebracteate. *Sepals* 4-5 or more, usually caducous, often coloured. *Petals* hypogynous, generally imbricate, 3-5 or more, often reduced or deformed, sometimes absent. *Stamens* hypogynous, usually numerous, often in many rows; anthers adnate and usually dehiscing laterally. *Ovary* apocarpous, rarely syncarpous; carpels many or few, free, 1-celled with one or more anatropous, erect or pendulous ovules. *Fruit* either of many achenes or of follicles, rarely a berry seeds small with copious albumen and minute embryo.

I. Flowers regular. Carpels 1-ovuled:—

Erect or climbing shrubs:—

Leaves opposite. *Sepals* petaloid, valvate.

Ovules pendulous:

Leaves various, not terminating in a tendril. *Petals* 0. 1 **Clematis.**

Leaves consisting of two opposite leaflets and a terminal tendril. *Petals* many, linear. . . . 2. **Naravolia.**

Herbs:—

Petals 0. *Sepals* 4-5, petaloid. *Ovule* pendulous:—

Flowers in umbelliform cymes, involucrate. . . . 3. **Anemone.**

Flowers paniced, not involucrate. . . . 4. **Thalictrum.**

Petals and *sepals* both present. *Flowers* paniced.

Ovule erect. . . . 5. **Ranunculus.**

II. Flowers irregular, racemed. Carpels many-ovuled. . . . 6. **Delphinium.**

1. CLEMATIS, Linn.

Shrubs, mostly woody, climbing by means of their petioles. *Leaves* opposite, exstipulate, usually compound; leaflets often lobed and irregularly toothed. *Flowers* in axillary fascicles or panicles, rarely solitary or terminal. *Sepals* usually 4, valvate, petaloid. *Petals* 0. *Stamens* and *carpels* indefinite. *Fruit* a head of achenes usually with elongated feathery styles.

1. Flowers not paniced:—

Flowers axillary, solitary, bluish; pedicels long bracteate. Achenes without feathery tails. *Leaves* ternately compound. . . .

1. **C. Cadmia.**

Flowers axillary, 1-3 in each axil, brownish; pedicels short, ebracteate. Achenes with feathery tails. *Leaves* 2-pinnate. . . .

2. **C. acutangula.**

Flowers axillary fascicled white; pedicels long, ebracteate. Achenes with feathery tails. *Leaves* 3-foliolate. . . .

3. **C. montana.**

II. Flowers in axillary panicles. Achenes with feathery tails :—

- A. Sepals spreading from the base :—
 Leaves usually simple. Flowers large ; sepals brown outside, purple or white inside. ... 4. *C. smilacifolia*.
 Leaves 3-foliolate, long petioled. Flowers very small. ... 5. *C. apiculata*.
 Leaves once pinnate. Flowers small ; sepals 3-nerved. ... 6. *C. puberula*.
 Leaves 2-pinnate or 2-ternate. Flowers small ; sepals greenish-white. ... 7. *C. gouriana*.
 B. Sepals erect with recurved tips :—
 Leaves 3-foliolate, rarely simple, shining. Flowers fairly large. ... 8. *C. acuminata*.
 Leaves pinnately 3-5-foliolate. Flowers large ; sepals brown-tomentose outside, pubescent inside ; not ribbed ; anthers very long, twisted after flowering. ... 9. *C. grewiczfoiia*.
 Leaves pinnately 5-7-foliolate. Flowers large, brownish ; sepals linear-oblong, ribbed, tomentose throughout ; anthers not twisted after flowering. ... 10. *C. Buchananiana*.
 Leaves decomposundly pinnate. Flowers large, pale yellow ; sepals many nerved. ... 11. *C. nutans*.

1. *Clematis Cadmia*, Ham. Vern. *Bon-jalukia*, Ass. (Lakh.)
Bon-marich, Ass. (Goal).

A slender sub-herbaceous climber. *Leaves* 3-9 in. long, ternately decomposed ; ultimate leaflets, 7-2 by 25-1 in. narrow-lanceolate to ovate or rhomboid, entire or minutely crenulate, acuminate, more or less ciliate along the margins otherwise glabrous, 3-5-nerved from the acute, cuneate or rounded, rarely sub-cordate base ; other nerves 1-3 on either half, much arched, anastomosing, very indistinct. *Flowers* axillary, solitary ; peduncles 3-4 in. long, with a pair of opposite, leaflike, sessile or short-petioled bracts about the middle. *Sepals* 5-6, bluish-white, 8-1 by 2-5 in. longitudinally veined, softly tomentose behind. *Filaments* numerous, short flat, glabrous ; anthers 1-15 in. long, dehiscing laterally. *Achenes* many, ovate, with a long straight beak and no feathery tail.

BRAHMAPUTRA VALLEY generally with reeds along edges of open swamps, also in SYLHET. *G. Mann* !
 Fls. 1-4. Fr. 2-6.

2. *Clematis acutangula*, Hk. f. & Th.

A slender woody climber ; stem deeply furrowed, sparingly puberulous, shining. *Leaves* 2-pinnate 5-9 in. long ; common petiole 2-5 in. long ; pinnæ generally 3-foliolate ; petiolules of pinnæ 1-5-3 in. long. *Leaflets* 5-2 by 15-8 in. ; ovate or ovate-lanceolate, acute, or acuminate, deeply serrate or lobed, coarsely hairy on both surfaces. *Flowers* brownish-yellow, about 7 in. diam. ; pedicels 1-3 from each axil, 1-15 in. long, not bracteate. *Sepals* 4 or 5, about 4 in. long, oblong, acute, puberulous outside. *Filaments* pilose ; anthers introrse. *Achenes* ovate, strongly margined, pubescent ; feathery style about 1 in. long, brownish.

KHASI HILLS, 4-5,000 ft., not very common.

Fls. 9-12. Fr. 10-1

3. Clematis montana, Ham. Vern. **Jarmai-thobawa*, Synt. A large, but not very heavy, woody climber; young parts pubescent. *Leaves* 3-foliate, fascicled at the nodes; common petiole 1·5-2·5 in. long. *Leaflets* 1-4 by ·5 to 2 in., ovate, distantly cuspidate-serrate, acute, membranous, scattered hairy or glabrescent, 3-5-nerved from the base; tertiary nerves few, distant, indistinct; lateral petiolules 1-3 in. long. *Flowers* white, axillary, solitary, 2-3 in. diam., faintly scented; peduncles 2·5-4 in. long, terete, pubescent. *Sepals* 4, 1-1·5 by ·5-8 in., acute or acuminate, longitudinally veined, softly tomentose along the margins. *Filaments* short; anthers shorter than the filaments, introrse. *Achenes* glabrous or hairy; style 6-12 in. long, rather stout; densely hairy.

KHASI HILLS. 4-5,000 ft., e. g., Shillong, Nong-kasem, Sutunga, etc. NAGA HILLS. C. B. Clarke!

Figs. 4-5. Fr. 5-6.

4. Clematis smilacifolia, Wall. Vern. *Mei-long-kydup*, Khasi.

A large woody climber; branches sulcate glabrous, green or purplish. *Leaves* usually simple; blade 3-9 by 1-6 in. ovate-cordate, acuminate, gradually smaller and narrower and with a cuneate base towards the ends of the branches, entire or distantly serrate, coriaceous, glabrous, 5-9-nerved from the base, tertiary nerves faint, more or less transverse; petioles 3-6 in. long, terete, often much coiled and functioning as tendrils. *Panicles* axillary, 6-12 in. long; pedicels 1·5-2 in. long, with linear bracteoles at the base. *Flowers* 1-1·5 in. across, sweet-scented. *Sepals* 4-5, ·7-1 in. long, oblong, greenish-brown tomentose outside, glabrous and purplish or whitish inside. *Filaments* linear, membranous, glabrous gradually shorter towards the centre of the flower; connectives produced. *Achenes* ·3-4 by ·1 in., flat, acute at both ends, with thickened margins which coalesce and prolong to form a slender feathery tail 1·5-2·5 in. long and of a cream colour.

LOWER ASSAM, e.g., Bijni Reserve, GOALPARA, also KHASI HILLS up to 4,000 ft., e.g., Nonghulen.

FIS. 9-10. Fr. 11-1.

5. Clematis apiculata, Hk. f. & Th.

A slender woody climber; branches, sulcate, patently grey, hairy. *Leaves* 3-foliate, sometimes simple and 3-lobed; common petiole 2-3 in. long, slender, patently hairy. *Leaflets* ·8-3 by ·6-2 in., ovate-cordate, acuminate, crenate-serrate, membranous, sparsely pubescent on both surfaces, ciliate; lateral petiolules 2-7 in. long. *Flowers* small in many-flowered axillary panicles. *Sepals* 15-25 in. long, oblong, tomentose outside. *Filaments* short, linear. *Achenes* oval, hairy.

KHASI HILLS near Beadon Falls! also Nongkhlaw. Griffith! and Cherra, Hk. f. & Th. Apparently not very common.

Fig. & Frg. time not known.

6. Clematis puberula, Hk. f. & Th.

A slender climber; stem deeply grooved, downy. *Leaves* pinnate. *Leaflets* 1-1·5 in. long, ovate-lanceolate, remotely toothed

sparsely hairy. *Flowers* rather small in few-flowered axillary panicles; pedicels slender. *Sepals* about 5 in. long, linear-oblong, 3-nerved, silky outside. *Filaments* narrow; anthers short. *Achenes* silky.

KHASI HILLS. 2-4,000 ft. Rather rare.

Fig. & Frg. time not known.

7. *Clematis gouriana*, Roxb. Vern. *Jyrm-bytengdoh*, Khasi.

A large spreading climber; branches purple, sulcate, pubescent when young. *Leaves* 2-pinnate or 2-ternate. *Leaflets* 1.3-5 by 3.1-3 in., ovate, oblong or lanceolate, acuminate, entire or distantly toothed, rounded or cordate at the base, chartaceous or membranous, wholly glabrous or sometimes pubescent beneath. *Flowers* greenish-white, small, in dense axillary panicles; ramifications of panicle bracteate at the base. *Sepals* 2-3 in. long, oblong, revolute; margins tomentose; *filaments* narrow. *Achenes* about .05 in. long, narrow-oblong or lanceolate, densely grey-hairy; feathery tails 1.5-2 in. long, very slender.

¹⁰ Common in LOWER ASSAM, especially GOALPARA, also up to 4,000 ft in the KHASI HILLS.

Fls. 10-11. Fr. 11-1.

8. *Clematis acuminata*, DC. Vern. *Tulli-tymen-khla* Synt.

A large woody climber; branches slender, terete, smooth, glabrous. *Leaves* 3-foliolate, very rarely simple; common petiole 1-1.5 in. long, slender, terete. *Leaflets* 1.5-3.5 by .5-1.3 in. ovate, or oblong-lanceolate, caudate-acuminate, usually quite entire, membranous or subcoriaceous, glabrous; lateral nerves slender, irregular, very indistinct. *Flowers* 1-1.5 in. across, in decompound axillary panicles. *Sepals* oblong-lanceolate, more or less pubescent outside, suberect. *Filaments* clothed with long spreading hairs. *Achenes* silky.

Evergreen forests in UPPER ASSAM, e.g., near Tippu in LAKHIMPUR and possibly in many other similar localities.

Fig. and Frg. time not known.

Var. sikkimensis, distinguished by larger leaflets and more numerous flowers, occurs at Nongpoh in the KHASI HILLS, also in the MISHMI HILLS.

9. *Clematis grewifolia*, DC. Vern. *Mei-iung* (black climber), *Mei-su-ing*, Khasi.

A large woody climber; branches closely sulcate and more or less densely dun-pubescent. *Leaves* 3-5 foliolate; common petiole 3-4 in. long, stout, often curled, as well as the rest of the rachis, densely brown-tomentose. *Leaflets* 2-3.5 by 1.5-2.5 in. broadly ovate-cordate, dentate, serrate, often lobed, membranous or softly subcoriaceous, coarsely scattered-hairy or sub-glabrous above, more densely hairy especially along the nerves beneath, 5-nerved from the base; lateral petiolules .5-1 in. long, with a tendency to curl. *Panicles* 4-8 in. long, on peduncles 1.5-4 in. long; buds globose or ovoid; pedicels 1-2 in. long, often twisting, supported by bracts resembling variously lobed miniature leaflets. *Sepals* .8-1.2

in., ovate or oblong, greenish-brown and densely tomentose outside, pubescent or puberulous inside. *Filaments* .7-1 in. long, tapering from a narrow linear base, densely covered with ascending hairs; *anthers* .25-.3 in. long, very narrow, twisted after flowering. *Achenes* scarcely .1 in. long, flat, ovate, velvety; feathery tail about 1 in. long, densely white-silky.

North Cachar and Khasi Hills, 3,500 ft. *e. g.*, Maibong, Kynshi, Mairong, Mawsynrang, etc.

Fls. 11-12. Fr. 12-1.

10. Clematis Buchananiana, DC. Vern. *Mei-byteng-doh*, *Mei-lih* (white climber), Khasi; *Jermai-sniuh*, *Tilli-kynsaw-blai*, Synt.

A woody climber; branches sulcate, pubescent while young. *Leaves* pinnately 5-7-foliate; common petiole 2-3.5 in. long, often twisted. *Leaflets* 2-4 by 1.5-2.7 in. broadly ovate or suborbicular, generally cordate, coarsely dentate-serrate, often irregularly lobed, subcoriaceous or membranous, glabrescent above, pubescent beneath chiefly along the nerves, 3-5-nerved from the base; lateral petiolules .6-1.2 in. long, often curled. *Flowers* about 2 in. across, usually sweet-scented, in large axillary panicles. *Sepals* linear-oblong fleshy, longitudinally many-ribbed, softly silky-tomentose. *Filaments* hairy. *Achenes* ovate-lanceolate, densely hairy; hairy tail elongating in fruit to about 2 in.

North Cachar Hills at about 4,000 ft. Khasi and Jaintia Hills, 4,000-5,500 ft. Very common in the Mantadu valley in the Jawai Sub-Division.

Var. *vitifolia* distinguished by pubescent stems and membranous pubescent leaves, is fairly common in the above tracts.

Fls. & Fr. 12-1.

11. Clematis nutans, Royle.

Stem slender, woody, angled, sulcate, with leaves very pungent to the taste. *Leaves* twice or thrice, pinnate. *Leaflets* 1-3 in. long, ovate or lanceolate, usually deeply 3-5-lobed, rarely entire, silky-pubescent; veins slender. *Flowers* 1-2 in. across, cream-coloured in much-branched panicles. *Sepals* .5-.7 in. long, oblong, closely nerved, silky outside, erect at the base, recurved at the tip. *Filaments* tapering, silky along the lower half; *anthers* short, *Achenes* large, ovate, covered with silky hairs; hairy tail 1-1.5 in. long in fruit, very slender.

Occurs chiefly in the Jawai Sub-Division, Khasi and Jaintia Hills, in the neighbourhood of Nartiang.

The leaves when smelt after bruising produce violent sneezing.

Fls. 11-12.

Clematis tortuosa, Wall. Cat. 4675. ex. C. E. C. Fischer, Kew Bulletin 1929 p. 4. Incl. C. *Buchananiana*. DC. var. *tortuosa*, Wall. Cat. 4675 and var. *vitifolia*, Wall. Cat. 4676.

Branches pilose with long spreading fulvous hairs. *Leaf rachis* and *petiole*, pilose or pubescent with brown hairs. *Leaflets* 2-5 by .7-4.5 in. ovate-lanceolate to suborbicular, acuminate base 5-7-nerved, margins irregularly coarse dentate, or crenate-dentate, teeth apiculate, membranous or subcoriaceous, thinly pilose on both surfaces or only on the nerves; petiolules .5-4 in. long, often twining. *Panicles* axillary, densely to thinly fulvous pilose; pedicels .7-1.5 in. long. *Sepals* 4, erect, oblong, apex recurved, .5-.8 in. long, densely clothed with light brown hairs outside. *Carpels* pilose, styles long, slender densely silky.

Very closely allied to *C. Buchananiana* of which it has been regarded as a variety in F. B. I.

SYLHET Wall. Cat. 4675 ! KHASI HILLS Wall Cat. 4676 ! Hooker and Thomson, NAGA HILLS—Kingdon Ward, LUSHAI HILLS Mrs. Parry.

2. NARAVELIA, DC.

Naravelia zeylanica, DC. Vern. *Gorap-choi*, Ass. ; *Ohhagal-lati*, Beng. ; *Ramnam-riube*, Miri ; *Khoro-soi-rikang*, *Nongnongbiki-ringkang*, Mik. ; *Jyrmal-lasam*, Khasi ; *Sangongri*, *Shamgangri*, *Behalisham*, Garo.

A woody climber generally spreading on bushes in scrub jungles ; branches sulcate, adpressed pubescent. *Leaves* pinnately 5-foliolate on seedlings, but on mature plants the upper three leaflets become reduced to tendrils ; common petiole 1·5-3 in. long. *Leaflets* usually only two, often in unequal pairs, 2-6 by 1·7-4·5 in., ovate-rotundate, acuminate, rounded or cordate and often abruptly cuneate at the base, entire or distantly toothed subcoriaceous, glabrous and somewhat shining above, more or less pubescent along the nerves and nervules beneath, 5-7 nerved from the base, nervules reticulate, very close ; petiolules 3-1·5 in. long, usually more or less twisted, densely pubescent. *Panicles* terminal and axillary, 4-18 in. long. *Flowers* greenish, 5-7 in. across ; pedicels 5-8 in. long, slender, pubescent. *Sepals* 4-5, 2-3·5 in. long, densely buff-tomentose outside, caducous. *Petals* usually 12, about 5 in. long, greenish, club-shaped. *Stamens* numerous. *Fruit* a head of tailed achenes. *Achenes* 2-2·5 in. long, pointed at both ends, shortly stipitate, more or less twisted, brown when mature ; tail 2-3 in. long, very slender, finely hairy.

Throughout the BRAHMAPUTRA VALLEY and both slopes of the GARO and KHASI HILLS up to 2,500 ft.

The stems are used as tooth-sticks to cure toothaches and can be twisted into rough but strong ropes,

Fls. 10-11. Fr. 12-3.

3. ANEMONE, Linn.

Perennial herbs. *Leaves* radical, more or less lobed or divided. *Flowers* single or several together on simple or branched scapes, supported by a 3-partite involucre ; bracts free or connate. *Sepals* 4-20, petaloid, white or bluish, imbricate. *Petals* 0. *Stamens* numerous, outer sometimes petaloid. *Carpels* many, 1-ovuled ; ovules pendulous. *Fruit* a head of sessile achenes, beaked with short or long, hooked or straight, naked or bearded, persistent styles.

Stems branched. Ultimate segments of involucre linear-oblong. Achenes large, oblong. Beak hooked, naked.

1. *A. rivularis*.

Stems elongate usually not branched. Ultimate segments of involucre oblong, or cuneate. Achenes compressed, broadly oval. Beak straight, naked.

2. *A. elongata*

1. *Anemone rivularis*, Ham. Vern. *Batsoh-plia*, Khasi.

Stem branched, 1-3 ft. high; rootstock woody, sheathed in fibres. *Leaves* radical, 2-6 in. diam., silky pubescent beneath, palmately 3-partite, inducing sneezing if smelt after bruising; segments primarily 2-or 3-lobed and serrate; nerves straight, prominent beneath sparingly anastomosing; petiole 4-6 in. long.

Flowers about 1 in. across in compound cymes, 2-bracteolate; sepals white within, generally bluish and silky outside. *Involucre leaves* large, 3-partite; ultimate segments linear or linear oblong, inciso-serrate. *Achenes* oblong glabrous; style hooked.

Common in shady or dampish place in the KHASI HILLS between 4,000 and 4,500 ft.

Fls. 4-7.

2. *Anemone elongata*, Don.

Stem slender, unbranched or sparingly branched 2-3 ft. high, pubescent. *Radical Leaves* 2-4 in. diam., orbicular in outline cordate, 3-partite, sparingly hairy; segments 2-3-lobed; lobes, dentate. *Flowers* white, smaller than of the above, in fascicles of 2-3 in few-flowered elongate compound cymes. *Involucre leaves* oblong or cuneate, irregularly toothed.

Fairly common in the KHASI HILLS. 5,000 ft.

4. THALICTRUM, Linn.

Erect perennial herbs; stem hollow. *Leaves* ternately or pinnately once to thrice or more times compound, rarely simple; petioles sheathing, often auricled or stipuled. *Flowers* generally paniced, rarely racemed, never involucre, often polygamous. *Sepals* 4-5, petaloid, imbricate in bud. *Petals* 0. *Stamens* numerous. *Carpels* few or many; ovule 1, pendulous. *Fruit* a head of small achenes; style persistent or deciduous.

Filaments filiform. Achenes small:—

Leaves 1-2-ternate: leaflets 5-2 in. diam.

... 1. *T. punduanum*.

Leaves pinnately decomposed; leaflets

usually not exceeding 5 in. in diam.

... 2. *T. foliolosum*.

Filaments club shaped. Achenes large—

Leaves ternately decomposed: leaflets not

exceeding 5 in. in diam.

... 3. *T. javanicum*.

1. *Thalictrum punduanum*, Wall.

Stem erect about 2 ft. high. *Leaves* ternate or 2-ternate; leaflets 1-2 in. in diam., more or less orbicular, cordate or truncate at the base, 5-lobed, crenate, glaucous, or tomentose beneath; sheath auricled. *Panicle* much branched. *Flowers* white; filaments filiform. *Achenes* numerous, small, ribbed, sessile or stalked.

Two varieties occur almost side by side, in the KHASI HILLS.

Var. 1. *glaucum*. Leaflets membranous, glabrous, glaucous beneath. Achenes sessile, glabrous.

Var. 2. *glandulosum*. Leaflets coriaceous, viscid-pubescent beneath. Achenes stalked or subsessile, glandular hairy.

2. *Thalictrum foliolosum*, Bl. Vern. *Popum*, Khasi.

By far the tallest plant in the genus reaching up to 8 ft. in height; stem glabrous. *Leaves* pinnately decomposed up to the

fourth degree; leaflets 15-25 lin., but sometimes up to 8 in. in diam., sub-orbicular, membranous, glabrous, glaucous beneath sheath auricled. *Panicle* axillary and terminal, profusely divided bracts and bracteoles minute. *Flowers* 1-15 in. long, polygamous, on filiform pedicles, dull bluish or greenish-white; filaments filiform. *Achenes* few, 12 in. long, sharply 8-ribbed.

KHASI HILLS, 3-6,000 ft., e. g., Borpani, Happy Valley, Nongbri, etc.

The root is good for fever and eye diseases and is used in the form decoction, extract or powder. In the last named form it is known as *Surma mamira* in Kashmir.

Fls. Rainy season.

3. *Thalictrum javanicum*, Bl.

Stem erect, 2-3 ft. high, glabrous. *Leaves* several times ternately decomposed; leaflets 2-8 in. diam., ovate or orbicular, membranous, glabrous, somewhat glaucous beneath, 3-7-toothed; base, rounded or cordate. *Panicle* laxly branched; stipules adnate, imbricate. *Flowers* about 2 in. long, white, on filiform pedicels 4-6 in. long; filaments club-shaped. *Achenes* up to 15, about 25 in. long, strongly ribbed; beak short.

KHASI HILLS, 5-6,000 ft.

May be used as a substitute for *T. foliolosum*.

Fls. 7-9.

5. RANUNCULUS, Linn.

Annual or perennial herbs generally gregarious in habit. *Leaves* simple, lobed or dissected; petiole sheathing; stipules membranous or 0. *Flowers* paniced, or single. *Sepals* 3-5, imbricate in bud, caducous. *Petals* usually 5, often with a nectary near the base. *Stamens* many, *Carpels* numerous; styles very short; ovule 1, ascending. *Fruit* generally a head of beaked or apiculate achenes.

An aquatic herb. Flowers small not paniced.

Receptacle of achenes hairy.

... 1. *R. scleratus*.

Terrestrial herbs:—

A much-branched diffuse herb. Flowers solitary, Receptacle small, elongated, not hairy.

... 2. *R. diffusus*.

A sparingly branched tall herb. Flowers laxly paniced. Receptacle small, pilose.

... 3. *R. pensylvanicus*.

1. *Ranunculus scleratus*, Linn.

An annual herb, 1-2 ft. high, generally growing along the edge of water, stem fleshy, hollow, usually glabrous, *Radical leaves* 3-partite, segments cuneate; cauline sessile. *Flowers* 5-6 in. diam. *Sepals* as long as the petals reflexed. *Receptacle* 5 in. long, hairy. *Achenes* about 1 in. long, with a continuous intermarginal ridge all round.

Goalpara, W. R. Fisher

This plant has an acrid juice and is used for medicinal purposes.

2. Ranunculus diffusus, DC.

A perennial diffuse or prostrate herb with spreading hairs and fibrous roots, often shooting from the nodes. *Leaves* 3-partite, softly hairy; segments cuneate. *Flowers* 5-1 in. diam., solitary on terminal or leaf-opposed peduncles 1-2 in. long. *Sepals* hirsute, smaller than the petals. *Petals* white or yellow. *Receptacle* small. *Achenes* compressed, cuneately sub-orbicular, margined.

KHASI HILLS, G. Mann 1 5, -6,000 ft.

3. Ranunculus pensylvanicus, Linn.

An erect or prostrate plant 2-3 ft. long. *Radical leaves* 3-foliate, long-petioled, leaflets 3-partite deeply cut into linear segments; cauline with petioles of decreasing lengths, the uppermost being sessile. *Flowers* about 1 in. long. *Sepals* reflexed, hirsute. *Receptacle* pilose. *Achenes* compressed, with an intramargined ridge.

A weed of rice-fields in the KHASI HILLS and the plains of ASSAM.

6. DELPHINIUM, Linn.

Delphinium altissimum, Wall. Vern. *Rad-sohplih-rit*, Khasi.

Stem 2-4 ft. much branched. *Leaves* few, palmately lobed, 5-7 fid; segments broadly cuneate, 3-lobed, coarsely toothed, few-nerved, sparsely hairy above, ciliate along the nerves beneath, cauline 3-lobed, or entire; petiole up to 1 ft. in length. *Flowers* 1-1.5 in. long including the spur, in lax racemes, irregular, purple or lurid-blue, very foetid; pedicels 5-2 in. long; bracts and bracteoles linear. *Sepals* 5, golden-hairy, strongly ciliate, dorsally spurred behind; spur 6-8 in. long, subulate, incurved. *Petals* 4, the two dorsal with long slender spurs within the spur of the dorsal sepal; anterior petals 2-lobed, hairy. *Stamens* many; filaments about 3 in. long, glabrous. *Fruit* of 3 pubescent follicles.

KHASI HILLS, 5,500-6,000 ft., e. g., Mawphlang, Sohiong, etc.

Coptis Teeta, Wall.

A stemless herbaceous plant of this Family which grows in the temperate regions of the Mishmi Hills and yields the drug *Mishmi-tita* much used in Bengal and elsewhere. The roots are gathered towards the end of the rainy season and are carried in tiny little wicker baskets to Sadiya where dealers from other provinces go to buy them.

Many other medicinal plants, such as *Aconitum*, *Pulsatilla*, *Cimicifuga*, etc., belong to this Family, but they do not occur in Assam.

FAM. 2. DILLENIACEÆ.

Trees or climbing shrubs. *Leaves* simple, alternate, ex-stipulate, close and parallel-veined, generally rough and hard. *Sepals* 5, broadly overlapping, persistent. *Petals* usually 5, rarely 2-4, deciduous. *Stamens* numerous. *Carpels* 1 or 5-20, in the latter case generally cohering in the axis; ovules 100 or few or many, attached to the ventral suture. *Fruit* follicular or baccate. *Seeds* arillate, albuminous; embryo minute.

Climber. Fr. dry, of 1 carpel and 1 seed. 1. *Delima*.
Trees. Fr. fleshy, of 5-20 many-seeded carpels. 2. *Dillenia*.

1. DELIMA, Linn.

Delima sarmentosa, Linn. Vern. *Ou-lota*, *Oua-lota*, *Panlewa* Ass.; *Bau-taruk*, Daff.; *Samphot-rikang*, Mik. *Aithlang shrui*, Kuki; *Hruisen*, Tipp.; *Thegdi-douka*, Cach.

A harsh evergreen climber. Stem cinnamon coloured, exfoliating in square or rectangular pieces. L. 3-6 by 2-2.5 in. elliptic or oblong, more or less cuneate at base, scabrid on both surfaces, unchanged in colour when shed; pet. 6-8 in. long, pilose, channelled; lateral nerves 14-16 pairs, almost straight and parallel, depressed above, raised beneath. *Flowers* white, in terminal panicles. *Sepals* reflexed. *Petals* obovate, ciliate. *Ovary* of one carpel only. *Follicle* 1-seeded. *Seed* arillate.

Common in evergreen forests throughout the province.

The stem quickly cut into pieces gives copious and wholesome potable water. The leaves can be used as a substitute for sand-paper in polishing wood, horn or ivory.

Fls. 5-7. Fr. 7-9.

2. DILLENNIA, Linn.

Trees with large leaves crowded at the ends of branches. *Flowers* large, white or yellow, more or less scented. *Sepals* 5, persistent, much thickened in fruit. *Petals* 5. *Anthers* opening by terminal slits or pores. *Fruit* of 5-20 carpels cohering in the axis, enclosed in the thickened sepals. *Seed* generally immersed in pulp.

I. Each pedicel bracteate about the middle. Leaves flat:—

Fls. white, solitary, 6-8 in. diam. Fr. 3-5 in. diam. ... 1. *D. Indica*.

Fls. yellow, fascicled, not exceeding 2-3 in. in diam.

Fr. less than 1 in. in diam. ... 2. *D. scabrella*.

II. Individual pedicels ebracteate (fascicles of them bracteate only at the base). Leaves V-shaped in transverse section.

... 3. *D. pentagyna*.

1. *Dillenia indica*, Linn. Vern. *Ou-tenga*, *Panchkol*, Ass., *Chalta*, *Chalita*, Beng.; *Sompa*, *Sampa*, Miri; *Chumpa*, Abor; *Pumplang*, Mik.; *Thegdi bapahng*, *Thardi*, Cach.; *Bau-changne*, Daff., *Aithlong*, Lushai; *Aitrang* Kuki; *Aitang*, *Jongphang*,

Tipp.; *Hægri*, Manip.; *Thagi*, Mech. Dieng-soh-karbam, Kh. Dong-phang-thai, Naga.

An evergreen* tree up to 60 ft. in height and 6 ft. in girth, often fluted or buttressed at the base, with a large oval crown. Bark cinnamon coloured or reddish-grey, peeling off in more or less papery and fragile flakes reddish inside with fine and close veins of deeper red. Leaves 6-12 by 3-5 in., petioled, oblanceolate or narrow-elliptic, more or less V-shaped in transverse section, glabrous above, pubescent beneath, sharply serrate; lateral nerves 30-40, very prominent beneath making a narrow angle with the midrib. Flowers 6-8 in. across. Petals white, very tender. Fruit 3-5 in. in diam., always green, with 16-20 carpels tightly enclosed inside the much-thickened sepals. Seeds compressed.

Very common and often gregarious in damp places and round swamps in all Districts.

Wood reddish-brown, elastic. The timber is considered very good for ridge, poles and is durable under water. The fruit (fleshy calyx) is eaten raw or cooked and also used medicinally.

Fls. 6-8. Fr. 2-4.

2. *Dillenia scabrella*, Roxb. Vern. *Banji-ou*, Ass. *Mandiphang* or *Munde-phang*, Kach.; *Chirimso*, Mik. *Mangie-thing*, Kuki; *Agatchi-bádura*, Garo.

A deciduous tree up to 50 ft. in height and 5 ft. in girth with a fluted trunk and more or less horizontal branches. Bark brown and rather rough outside, light-pink inside with rather coarse brownish radial veins, turning darker brown after exposure. Leaves 8-15 by 4-7 in., flat, oblanceolate to elliptic, cuspidate-serrate, rather membranous for the genus, hispid above, harshly pubescent beneath; * lateral nerves 25-40, often almost horizontal, slightly arcuate; base acute; petiole winged, dilated at the base to clasp the stem. Flowers 1.5-2.2 in. across, appearing shortly before the leaves; pedicels 2-2.5 in. long, 3-bracteate about 1 in. above the base. Sepals concave, translucent, cohering at the base, nearly glabrous, palegreen. Petals .8-1.2 by 4-6 in. golden-yellow. Fruit globose, about .8 in. across, pale-green, with 5-7 carpels.

Foot of the MIKIR HILLS, Doigurung Reserve in SIBSAGAR; Chansiri Reserve also Sildharampur in NOWGONG.

Wood light reddish-brown, rather light, moderately hard, not much used. The fruit is eaten.

Fls. 3-5. Fr. 5-7.

Dillenia pentagyna, Roxb. Vern. Generally the same as of the preceding species. *Akshi*, *Okshi*, *Oua*, Ass.; *Tantri*, *Tatera*, Nep.; *Chirimpi*, Mik. *Boncholla*, Cach.; *Dieng-sah-bar*, Kh.

A deciduous tree about 50 ft. in height; branches generally ascending; branchlets marked with V-shaped leaf scars. Bark greyish-white outside, green underneath the corky layer, light red inside, finely purple-veined. Leaves 12-40 by 4-12 in., oblanceolate, very narrow at the base which is often stem-clasping, serrate, coriaceous and hard, glabrous above, glabrescent beneath; lateral nerves up to about 40, almost straight, making an angle of about

50 degrees with the midrib, tertiary nerves very fine, sub-parallel; petiole short or 0. *Flowers* about 1.5 in. across, in fascicles of 3-8 from short bracteate protuberances, appearing before the leaves; pedicels .8-1.5 in. long, without any bract. *Sepals* broadly ovate, concave, pale-green, glabrate, slightly ciliate. *Petals* about 1 in. long, obovate, light greenish-yellow. *Fr.* .6-.8 in. in diam., of 5 carpels (whence the specific name).

A characteristic tree of deciduous forests, therefore rather scarce in UPPER ASSAM, which area it just touches by occurring along the foot of the MIKIR HILLS, e.g., Luming, Barpathar, Kukrakata, etc.

Wood reddish-grey, moderately hard and fairly durable, but is liable to warp and crack, hence not much used. The fruit is eaten. In Western India the leaves are used as a substitute for thatching grass. They might be so used in parts of Assam also where thatching grass is scarce.

Figs. 3-5. Fr. 5-7.

FAM. 3. MAGNOLIACEÆ.

Trees, shrubs or climbers, more or less aromatic. *Leaves* simple, alternate, usually entire, generally with stipules which leave a transverse scar on the branchlets. *Flowers* solitary, generally showy. *Sepals* and *petals* similar, deciduous, arranged in whorls of 3. *Stamens* many. *Carpels* many, arranged often spirally on an axis which generally elongates as the fruit ripens.

1. Trees with large but caducous stipules. Carpels spirally arranged on an axis:

- A. Flowers terminal (axillary in *Talauma phellocarpa*) with little or no interval bet. stamens and carpels:—

Carpels persistent on the axis:—

Carpels separate, each with 2 ovules. ...

Carpels co-hering, each with 6 or more ovules. ...

Carpels separating from the axis, with 2 ovules in each. ...

Carpels confluent with 2 ovules in each cell. ...

- B. Flowers axillary with a distinct interval between stamens and carpels: ovules 2-6 in. each carpel.

- II. Shrubs without stipules.

Carpels in only one whorl, each with 2 or more

- III. Climbers without stipules. Carpels with 2 or more ovules:—

Carpels in fruit distant forming a long spike ...

Carpels in fruit closely packed forming a globose head. ...

1. *Magnolia*
2. *Manglietia*.

3. *Talauma*.
4. *Pachylarnax*

5. *Michelia*.

6. *Illicium*.

7. *Schizandra*.

8. *Kadsura*.

1. MAGNOLIA, Linn.

Generally trees. *Leaves* entire; buds enclosed in large convolute stipules which are connate in pairs. *Flowers* terminate usually large. *Sepals* 3, as a rule not brightly coloured. *Petals* 6-12, in series of 3. *Stamens* numerous, filaments flat, with little or no interval between them and the carpels. *Carpels* many, persistent 2-ovuled, the stigmas running down along their ventral

suture. *Fruit* with an elongated axis. *Seeds* pendulous with a long cottony cord, only.

Leaves large, generally 9-16 in. long, very closely reticulate, hairy at least when young :—

Leaves very coriaceous glabrous when mature, pet. long with a narrow V-shaped scar; sepals and petals broad. . . .

1. *M. pterocarpa*.

Leaves moderately coriaceous, felted-tomentose beneath; pet. short, channelled; sepals and petals narrow. . . .

2. *M. Griffithii*.

Leaves medium-sized, 6-9 in. long, chartaceous, generally glabrous :—

Leaves elliptic, glabrous and green beneath, petiole at least 1 in. long. . . .

3. *M. spiciocarpa*.

Leaves oblong, glabrous when mature, petiole scarcely 3 in. long. . . .

4. *M. Pealiana*.

Leaves small, 4-6 in. long, thinly chartaceous, quite glabrous, very closely reticulate, pet. short. . . .

5. *M. Gustavi*.

1. *Magnolia pterocarpa*. Roxb Vern. *Thouthua*, Ass. (N. Lakh.) *Baramphur-sopa*, Ass.; *Doloi-champa*, Cach; *Utham-ban*, Manip.; *Phapitenhaya*, Kuki; *Lairouthou-buphang*, Cach.; *Chapite-jamja*, Tipp. and Kuki; *Thang-Ksem*, Dieng-long-krop, Dieng-soh-wur-synring, Dieng-soh-dkhar, Khasi.

A middle-sized ever-green tree generally with a large crown, branchlets green, annulate. *Bark* grey, rough with warts, inside fibrous, light brown with distant white streaks, soon turning dirty-brown, 5-7 in. thick. *Leaves* 9-16 by 5-7 in., elliptic or obovate, very coriaceous, felted rusty-tomentose beneath while young, glabrous and shining above, young light-green, old pale-yellow; lateral nerves 20-25 on either side, raised underneath, tertiaries raised on both surfaces (rather depressed above when green), closely reticulated in crocodile pattern; base cuneate; petiole 1.2-2 in. long, flattened above with a narrow V-shaped scar; stipules 4-5 in. long, caducous, adnate by their edges to the petiole, greenish-white, grey-canescens, with a tuft of hairs at the apex. *Flowers* 3-6 in. across; buds ovoid, 2.2-2.5 by 1.5 in., enveloped in a concave coriaceous puberulous caducous bract, *Sepals* 3, 3 by 2 in., very concave, green outside, greenish-white inside. *Petals* 6, dull-white very fleshy but with a sharp margin, aromatic, gradually smaller but scarcely narrower inwards obovate, emarginate. *Stamens* very numerous with no interval between them and the carpels, together forming a continuous conical mass 1.5 by 1 in.; anthers long with purple tips. *Stigmas* feathery. *Fruit-spike* 6-10 by 2-2.5 in. *Mature carpels* with a recurved terminal wing 1.1-1.7 in. long; axis much thickened and somewhat spongy. *Seeds* orange.

North Lakhimpur and Charduar. Somewhat rare in Upper Assam but possibly generally mistaken for *Talauma Hodgsoni* which it closely resembles in foliage.

The wood is white, rather soft and even-grained and suitable for tea-boxes. It is considered excellent as fire wood in N. Lakhimpur. The stipules, while

tender, are chewed to blacken the gums and teeth in the same way as those of *Talauma Hodgsonii*.

Fls. 4-5. Fr. 10-12. L. renewal 10-12.

2. *Magnolia Griffithii*, Hk. f. & Th. Vern. *Gauri-sopa*, *Gahori-sopa* or *Bar-gahori-sopa* Ass. (Lakh. and Darr.); *Pansopa*, *Kola-sopa*. Ass. (Sibs.); *Lakap*, Naga.

A middle-sized tree with a more or less oval crown; branchlets thickly rusty-pilose. Bark grey, fairly plain but with shallow horizontal wrinkles and fine vertical fissures, dark-brown and fibrous inside, turning darker brown after exposure about .5 in. thick. Leaves 6-12 by 4-6 in., elliptic thinly coriaceous, glabrous and somewhat shining and very finely reticulate above, densely felted tomentose and often variegated beneath; lateral nerves 20-28 on either side, straight or very slightly arcuate, base gradually or suddenly cuneate, petiole .3-5 in. long, hairy channelled. Flowers about 6 in. across pale-white faintly scented; buds enclosed in silky scales 2 by .8 in., oblong silky on silky peduncles 1.2-1.8 in. long. Sepals 3. Petals 6, 2.5-3 by .8-3 in.; fleshy, brittle creamy-white or pale-yellow. Stamens about 90, crowded a little below the carpels which are adpressed in fl. and form a cylindrical column. Carpels about 110, styles slender and slightly recurved. Fruit-spike 5-10 by 1-1.2 in.; carpels speckled when mature, compressed, 1-2-seeded, scarcely woody; axis scarcely thickened. Seeds reddish-brown.

Fairly common in the evergreen forests of LAKHIMPUR, SIBSAGAR and DARRANG DISTRICTS.

The wood is greyish-brown, rather soft and light, not used for timber.

Fls. 4-5. Fr. 11-1.

3. *Magnolia sphenocarpa*, Roxb. Vern. *Pansōpa*, Ass. (Sibs.) *Parokbithi-arong*, Mikir.

An evergreen tree up to 70 ft. in height and 5 ft. in girth. Bark grey, fairly smooth, with very fine vertical fissures and shallow horizontal wrinkles, inside brown and mottled, soon turning dirty green, aromatic. Leaves 8-12 by 4-6 in., aromatic, elliptic, membranous, quite glabrous, shining above; lateral nerves 10-12 on either side with often a few intermediate ones, tertiaries finely and closely reticulate; base rather suddenly cuneate; petiole 1-1.2 in. long channelled swollen at the base, with no V-shaped scar; stipules about 2 in. long, hairy at the tip.

The above description refers to my No. 3887 which was identified at Sibpur as this species. Sir George King, however, has made *M. sphenocarpa* Roxb., synonymous with *M. pierocarpa* Roxb., but if the Sibpur identification of my specimen is correct, the two trees must be kept distinct. My specimen agrees exactly with Mr. Haines' No. 505 from Lower Tondou, W. Duars. Unfortunately I have seen no flower or fruit.

Barpathar, SIBSAGAR.

4. *Magnolia Pealiana*, King. Vern. *Gahori-sopa*, Ass. (Lakh.) Apparently a middle-sized tree; young shoots hairy. Bark

dark-grey with longitudinal wrinkles. *Leaves* 6-10 by 2-3 in., oblong or oblanceolate, suddenly acuminate, chartaceous, glabrous and shining above, pubescent on the midrib and nerves beneath; lateral nerves about 18 on either side often with shorter intermediate ones, reticulations much closer and finer than in the preceding species; base cuneate or rounded; petiole 2-3 in. long, channelled, stipules 1.25 in. long, strap-shaped with a subulate tip, pale-yellow, silky. *Flowers* solitary, leaf-opposed, 3-4 in. across, on a yellow-silky pedicel 1.5-2 in. long; buds oblanceolate in outline; involucre covered with yellow silky hairs. *Sepals* 3, oblong, coriaceous with undulate margins near the apex. *Petals* 6, oblong or oblanceolate, coriaceous, smaller than the sepals. *Stamens* 5 in. long; filaments about one-tenth the length of the sharply pointed anthers; gynæcium cylindrical with a short stalk above the stamens. *Fruit* 3-5 in. long; carpels 6 by 1.5 in., 2-seeded, slightly speckled outside.

Makum Forest, LAKHIMPUR. Mann.

The wood is white throughout, soft and even-grained, light but fairly strong.

5. *Magnolia Gustavi*, King. Vern. *Khorokia-sopa*, Ass. (Lakh.)

An evergreen tree 70 to 80 ft. in height and 5 to 6 ft. in girth, closely resembling *Talauma phellocarpa* in habit and foliage. *Leaves* 5-8 by 1.2-2 in., elliptic-lanceolate, acute, chartaceous, quite glabrous; main lateral nerves 14-16 on either side, reticulations very fine and close; base acute; petiole 3-5 in. long. *Flowers* 3-4 in. across, terminal and axillary, solitary, on peduncles 1.5-2 in. long; buds 1.5 in. long, oblong-ovoid; bracts ovoid, smooth, coriaceous. *Sepals* 3, oblanceolate, membranous. *Petals* 6, of the size and shape of sepals, coriaceous. *Stamens* about 6 in. long, not very numerous, with no interval between them and the carpels. *Carpels* sessile, suborbicular, smooth, dorsally compressed when young, 6-7 in. long when mature, not beaked. *Young fruit* club-shaped.

Makum Forest. LAKHIMPUR.

2. MANGLIETIA, Bl.

Some characters as of *Magnolia* excepting that the *leaves* are generally more laxly veined, the *gynophore* is always sessile, the carpels are more congested and cohering, and with 6 or more ovules in each carpel. Scar of stipules is always present on the petiole and is of the shape of a narrow U.

Large trees. Leaves at least thrice as long as broad, generally finely acuminate, pale beneath; petiole stout:—

Fruit-spike ovoid-oblong. Leaves lanceolate.
Fruit-spike globose-ovoid. Leaves oblanceolate. ...

1. *M. Caveana*.

2. *M. Hookeri*

Middle-sized tree. L. not more than twice as long as broad, obtuse or suddenly obtusely acuminate, glaucous beneath petiole slender.

3. *M. insignis*.

1. *Manglietia insignis*, Bl. Vern. *Pan-sopa Phul-sopa*, Ass. (Lakh. and Sibs.). *Dieng-rhi-basaw*, also *Dieng-rhi-balih*, Khasi; according as the flowers are pink or white.

An evergreen tree 80-90 ft. high and 5-7 ft. in girth. *Bark* plain, greyish white to reddish brown outside with faint vertical fissures and fine horizontal wrinkles, green underneath the thin layer of cork, fibrous, inside dirty-brown, faintly mottled, soon turning darker brown. *Leaves* 6-9 by 2-3 in., elliptic-lanceolate, generally thickly coriaceous, quite glabrous; main lateral nerves about 18 on either side alternating with shorter ones; main reticulation lax, raised on both surfaces in dry but impressed above in green leaves; base acute or cuneate; petiole 1-2-1½ in. long, more or less stout. *Flowers* 4-6 in. across scented. *Sepals* 3, 3 by 2 in., pink. *Petals* 9, white, gradually narrower towards the centre, very fleshy. *Anthems* sessile or nearly so. *Carpels* slightly beaked, warty, each with about 6 ovules. *Fruit* narrowly ovoid or almost cylindrical, 3-5 in. long. *Seed* red, faceted, suspended by a very slender cord.

Fairly common in evergreen forest along the foot of the Naga Hills in LAKHIMPUR to Geleki and in the Diroi Reserve in SIBSAGAR. Also near Gagaldhubi, in N. LAKHIMPUR, and Pabhoi in DARRANG; *KHASI HILLS* below 2,500 ft.

The wood is yellowish-white, even-grained and smooth and takes a very fine satiny polish. It is very good for indoor work.

Fls. 5-6. Fr. 910.¹

Var. 1. *LATIFOLIA*. Leaves shorter but rather broader than in the type, acute.

Occurs in the same localities and has the same vernacular names.

2. *Manglietia Hookeri*, Cubitt and Smith, Rec. Bot. Surv. Ind. IV. 273. Vern. *Pansopa*, *Phulsopa*, Ass. (Lakh. and Sibs.)

Apparently a large tree; young parts rufous-silky. *Bark* grey outside, fairly smooth, light brown and fibrous but soft inside, 7-9 in. thick. *Leaves* 6-8 by 2-2½, elliptic or oblanceolate, finely acuminate, membranous or very thinly coriaceous, minutely ferruginous-pubescent beneath when young, glabrous when mature; main lateral nerves 10-14 on either side, very slender, with a few more slender intermediate ones; reticulations inconspicuous in green, but distinct and slightly raised on both surfaces in dry leaves; base acute; petiole rather slender 1-1½ in. long; stipules 2-3 in. long lanceolate, brown-silky outside. *Flowers* 5-6 in. across, scented. *Sepals* 2½-3 by 8 in., oblanceolate, green tinged with pink. *Petals* white, soon turning pale-yellow. *Carpels* with 3-4 ovules. *Fruit* 2-3 by 1½-2 in., ovoid; carpels without beak.

Evergreen forests of LAKHIMPUR and SIBSAGAR from Makum to Sapakathi
Fls. and new lvs. 2-3 Fr. 6-7.

The heart wood is greenish-brown, fine and even-grained, fit for furniture and indoor work. It is said to be very durable.

3. *Manglietia Caveana*. Hk. f. and Th. Vern. *Pansopa*, *Phul-sopa*, Ass. (Lakh. and Sibs.); *Larsej-Kynthei*, Khasi.

Generally a middle sized tree with ashy-grey fairly smooth bark green underneath the corky layer, inside dirty-brown and faintly mottled, 3 in. thick. *Leaves* crowded at ends of branchlets, 4-9 by 2.2-3.5 in., broadly or oblong-elliptic, finely acute or bluntly acuminate, chartaceous, shining above, more or less glaucous beneath, main lateral nerves 10-15 on either side, almost regularly alternating with shorter intermediate ones slightly arcuate; midrib depressed above, prominent beneath reticulations close, distinct in dry, but somewhat indistinct in green leaves; base rounded or obtuse; petiole 1.3-1.5 in. long; stipules very sparingly rusty-silky pubescent. *Flowers* 4-6 in. across, scented. *Sepals* 3, dull-red with green veins, 2-3 in. long. *Petals* 9, gradually narrower, white, fleshy. *Anthers* sessile. *Carpels* congested, each with about 6 ovules, not or very slightly beaked when mature. *Fruit* narrowly ovoid; seeds faceted, red.

Jaipur and similar localities in LAKHIMPUR; Sapekathi and Abhaipur Reserve in SIBSAGAR; also KHASI HILLS upto 2000ft.

Wood appears to be soft, not used as timber.

Fls. 2-3. Fr. 6-7.

3. TALAUMA, Juss.

(Generally trees. *Leaves* entire; buds enclosed in large convolute stipules. *Flowers* terminal. *Sepals* 3. *Petals* in whorls of 3. *Anther* linear, introrse. *Gynophore* sessile. *Carpels* indefinite, each with 2-4 ovules, woody or corky when mature, finally separating from the axis; seeds suspended by an elastic cord.

Carpels not confluent, woody. *Leaves* glabrous.

Sepals and *petals* broad and fleshy:—

A small tree. *Sepals* and outer whorl of *petals* never fully expanded. ...

1. *T. Hodgsoni*.

A tall tree. *Sepals* and outer whorl of *petals* reflexed when flower is fully open. ...

2. *T. Rabaniana*

Carpels confluent externally, spongy. *Leaves* adpressedly grey-pilose beneath. *Sepals* and *petals* narrow, not fleshy. ...

3. *T. phillocarpa*.

1. *Talauma Hodgsoni*, Hk. f. & Th. Vern. *Boronthuri*, *Boronthuri*, Ass.; *Dat-bhola*, Ass. (Charduar); *Dieng-soh-pydem*, Khasi; *Tetere-asing*, Miri.; *Burbang-asing*, Abor. *Boron-thari-asing*, Mik.; *Laigerau*, Kach.; *Langungron*, Mech.

A small tree with a few spreading branches. *Bark* greenish-grey, warty, otherwise smooth, with distant horizontal wrinkles, often with large white patches; inside brownish-yellow, fibrous, 2-3 in. thick. *Leaves* 8-20 by 4-8 in., oblanceolate, rounded or suddenly apiculate, thinly coriaceous, quite glabrous, red and erect when young; secondary nerves 15-25 on either side, almost straight, tertiaries more or less transverse to the secondaries, quaternaries reticulate; base very acute; petiole 1-2.5 in. long, terete, with a faint scar of fallen stipules, much swollen at the base. *Flowers* large, terminal. *Sepals* greenish-purple. *Petals* greenish-white at base, bright-red above. *Filaments* short. *Fruit* ovoid, 4-6 by 2.5-3.5 in. *Carpels* beaked, woody, dehiscent by the ventral suture, separating from the axis leaving the red seeds

attached to it at the upper end of the empty pits by an elastic cord.

Fairly common in the evergreen forests of all the DISTRICTS of UPPER ASSAM.

The wood is grey, soft, light and even-grained.

It is used for handles of knives, etc., in Darjeeling, but only as firewood in ASSAM. The stipules are chewed by young girls to blacken their teeth and gums.

Fls. and new leaves 4-5. Fr. 8-9.

2. *Talauma Rabaniana*, Hk. f. & Th. Vern. *Sopa*, Ass.; *Lai-makhan-phang*, Kach.; *Kobaraiching*, Naga.

A tall tree with a conical crown attaining 70ft. in height and 6ft. in girth, closely resembling *T. Hodgsoni* in general appearance, young parts fugaciously tawny-tomentose. *Bark* 5-7 in. thick, dark-grey and rough outside, fibrous and uniformly pale-brown inside. *Leaves* 8-14 by 2-4 in., elliptic or oblanceolate, shortly acuminate, gradually narrowed to the base, coriaceous, dark-green and shining above light-green underneath; midrib stout; lateral nerves 12-24 on either half, nearly straight; reticulations fine and close. *Flowers* solitary, terminal, 2-3 in. long; peduncles about 1 in. long and 4-5 in. thick, annulate; bracts densely adpressed tomentose. *Sepals* 3, sub-orbicular, rough outside, caducous. *Petals* 9 in three whorls, broadly elliptic or obovate, concave, the outer whorl reflexed after the fall of the sepals. *Filaments* very short; anthers ½-7 in. long. *Fruit* about 3-6 in. long and 1½-1½ in. diam.; carpels not so numerous as in the last species, woody, dehiscent by the ventral suture; axis woody; pits somewhat shallow, rhomboidal.

GARO, KHASI and NORTH CACHAR HILLS upto 4,000 ft., also near Patgaon in GOALPARA.

The timber is greyish white and moderately hard, weighing about 30 lb. per c. ft. It is suitable for furniture and planking.

Fls. 4-6. (?).

3. *Talauma phellocarpa*, King. Vern. *Khorika-sopa*, *Titu-sopa*, Ass. (Lakh. & Sibs.); *Dieng-lari*, *Dieng-rewi*, Synt.; *Karo-phang*, *Dauthu-kundu-phang*, Kach.; *Champa*, Cach.; *Bol-mring*, Garo; *Langlu-chikong-arong*, Mik.

A large evergreen tree up to 100 ft. in height and 8 ft. in girth, with grey pubescent branchlets which are gracefully pendulous in mature trees; crown narrow and conical till full height is attained, oval afterwards. *Bark* ashy-grey, somewhat rough, exfoliating in rectangular flakes; inside fibrous, yellowish tan-brown, mottled with coarse strands of amber-brown, soon turning darker tan-brown, 4-5 in. thick, aromatic, bitter. *Leaves* 3-8 by 1½-2 in., elliptic lanceolate or oblong-lanceolate, acute or acuminate, thinly coriaceous, glabrous and shining above, densely grey-pilose beneath when young, glabrescent when mature, pale-yellow before falling; main lateral nerves about 14 on either half, slender, straight or more or less arcuate, reticulations very close

and fine, base acute; petiole 4-7 in. long, pubescent; stipules 4-6 in. long, brown-silky outside; scar inconspicuous. *Flowers* axillary, solitary, erect, pale-white, about 1 in. across; buds ovoid-elliptic, 5-7 in. long, enclosed in silky scales; peduncles 4-5 in. long, jointed about the middle. *Sepals* and *petals* 12, narrow-lanceolate to strap-shaped, pale-white. *Fruit-spike* continuous, 3-4 by 1-2-1-4 in., speckled with large grey corky lenticels, aromatic, somewhat bumpy indicating the position of the carpels which ultimately fall off leaving empty oval cavities and falcate stalks attached to the persistent axis.

Fairly common in the LAKHIMPUR and SIBSAGAR DISTRICTS from Makum to the Diroi Reserve; also found in the MIKIR HILLS and in the Dhansiri Reserve, NOWGONG; KHASI HILLS upto 4000ft; CACHAR and GARO HILLS.

The tree has a large heartwood of a greenish-brown colour turning darker brown when dry. It takes a good polish and is used for planking, doors and windows and furniture. Annual rings marked by a very fine ring of softer tissue.

Fls. 5-7. Fr. 7-9. Occasionally flowers and fruits out of season.

4. PACHYLARNAX, Dandy.

Pachylarnax pleiocarpa, Dandy. Sp. nov. Vern. *Phulsopa*, *Kothalpathia sapa*, Ass.

A large evergreen tree, young shoots dark green, tubercled. *Bark* rough with longitudinal furrows. *Blaze* brownish yellow marked with dark dots. *Leaves* alternate, somewhat crowded towards the ends of branchlets 6-9 by 2-3 in. elliptic oblong to oblanceolate oblong, entire, obtuse or rounded, rarely subacuminate, sometimes slightly emarginate, thickly coriaceous, shining, green above, pale beneath, glabrous; lateral nerves 10-18 on either half, conspicuous, midrib prominent beneath; nerves laxly reticulate, base cuneately attenuate, occasionally unequal; petiole 1-1-2 in. long, thick, flattened above (not channelled); stipules deciduous, elliptic oblong. *Flowers* fragrant, generally solitary, rarely in pairs, about 4 in. across; flower buds lanceoloid or narrowly ovoid oblong, covered by 1-3 deciduous bracts; peduncles thick, 8-1-2 in. long. *Permanth* 4-5-merous; tepals 13-15, fleshy, whitish yellow or cream coloured, 4-5 outer ones oblanceolate or narrow elliptic oblong, 9-10 inner ones spatulate, smaller towards interior. *Stamens* numerous (53-57), 5-8 in. long; filaments short; anther cells produced into a short acute appendix, gynoecium elipsoid; carpels concrescent, 5-8; ovules 4-8 in each carpel. *Fruit* capsular, woody, ellipsoid, 3-4 by 3 in., dorsally dehiscent, (upper most separating from the conical central axis), each valve being composed of united halves of 2 adjacent carpels. *Seeds* about 3 in. across; with an orange coloured fleshy coat.

LAKHIMPUR (Digboi, Upper Dehing and Jaipur Reserves).

Wood moderately hard, takes a fine polish and is very valuable for cabinet work.

Fls. 10-12. Ft. 8-9 (persists long on the tree).

E. Dandy in the *Journal of Botany*, November, 1935.)

5. *MICHELIA*. Linn.

Evergreen trees. *Leaves* enveloped by stipules in bud with prominent reticulate veins, generally bitter and aromatic. *Flowers* axillary (terminal in *M. Cathcartii*), solitary, with sepals and petals similar and in whorls of 3. *Filaments* flat, with a distinct interval above them and below the carpels, anthers introrse. *Carpels* terete or compressed, usually white-speckled, contiguous in flower but generally distant in fruit owing to elongation of the axis, dehiscent dorsally, each with 2-4 ovules, but mostly 1-seeded in fruit. *Styles* short.

I. Carpels numerous :—

A. Flowers mostly terminal.

Leaves 3-5 by 1·5-2 in.,
chartaceous, glabrous except
the midrib, lateral nerves
10-15 on either half. Fruit-
spike 3-5 in. long ; ripe
carpels compressed, congested.

... 1. *M. Cathcartii*.

B. Flowers axillary :—

1. Young parts hairy :—

a. Leaves more or less pubescent beneath. Young parts densely ferruginous-tomentose :—

Leaves 5-8 by 2-3·5 in.,
thinly coriaceous ; lateral
nerves 8-10 on either half.
Fruit-spike 5-8 in. long ;
ripe carpels terete, rather
distant. ...

... 2. *M. excelsa*.

Leaves densely grey-tomentose
beneath, 6-10 by 2-3·5 in.,
sub-coriaceous ; lateral
nerves up to 18 on each half.
Fruit-spike 2-5 in. long ;
ripe carpels compressed,
stalked. Flowers pale-white,
not scented. ...

... 3. *M. lanuginosa*.

Leaves usually puberulous
beneath, 8-10 by 2·5-4 in.,
thinly coriaceous ; lateral
nerves about 15 on either
half. Fruit-spike 4-8 in.
long ; ripe carpels terete,
sub-sessile, rather distant.
Flowers pale-yellow, strongly
scented. ...

... 4. *M. Champaca*.

b Adult leaves glabrous :—

Leaves 2·5-6 by 1·5-3 in.,
chartaceous ; lateral nerves
10-15 on either half, slender.
Fruit-spike 2-4 in. long ;
ripe carpels much compressed,
orbicular, sessile. Flowers
pale-yellow, delightfully
scented. ...

... 5. *M. Kisopa*.

Leaves 3-6 by 1·5-2 in.,
thinly coriaceous ; lateral

nerves 8-12 on either half.
Fruit-spike 2-4 in. long;
ripe carpels compressed,
obovoid

... 6. *M. punduana*.

2. All parts glabrous:—

Leaves 3·5-5 by 1·5-2·5 in.,
thinly coriaceous. Fruit-
spike 5-7 in. long; ripe
carpels terete obovoid
sessile, somewhat distant.

7. *M. oblonga*.

Leaves 5-7 by 3·5-4·5 in.,
coriaceous, strongly reticu-
late. Fruit-spike 5-7 in.
long; ripe carpels terete,
oblong, slightly apiculate

8. *M. Mannit*.

II. Carpels few:—

Leaves 4-6 by 1·5-2·2 in.,
oblong-lanceolate, coriaceous,
glabrous, glaucous beneath;
lateral nerves 9-11 on either
half. Fruit-spike 2-4 in. long,
ripe carpels slightly com-
pressed, shortly beaked.

9. *M. manipurensis*.

Leaves 3-7·5 by 1·5-4 in., lanceolate,
thinly coriaceous, shining above, closely
but not very strongly reticulate; lateral
nerves 10-12 on either half. Fruit-spike
1·7-2 in. long; ripe carpels usually
only one, as long as the fruit,
obovoid, not terete.

... 10. *M. montana*

1. *Michelia Cathcartii*, Hk. f. & Th. Vern. *Dieng-rai*, Kh.

A large evergreen tree; young branches silky-hairy; bark dark-grey. *Leaves* 3-5 by 1·5-2 in., lanceolate or oblong-lanceolate acuminate, more or less rounded at the base, quite entire, chartaceous, shining on both surfaces; midrib densely silky-hairy above, brown-pilose beneath; lateral nerves 10-15 on either half, very slender, tertiaries finely reticulate; petiole 2-3 in. long, slender, densely yellow-hairy; stipules 6-8 in. long, densely silky. *Flowers* white, mostly terminal, 3-4 in. diam.; buds oblong, rounded at both ends; peduncle 1 in. long. *Sepals* and *petals* 9 in 3 whorls, each 1·5-2 in. long. *Stamens* about 1 in. long, overtopping the carpophore; filaments one-fourth the length of the anthers. *Carpels* sessile, beaked and densely imbricate while young. *Fruit-spike* 3-5 in. long; ripe carpels 3-4 in. diam., sub-orbicular, compressed, closely lenticellate; seeds 2-3.

KHASI HILLS, e.g., Nong-ryng-koh. Also NAGA HILLS.

Wood compact and moderately hard, fit for planking and tea-boxes, weighing about 40 lbs. per c. ft. Annual rings distinct.

Fls. 3-5. Fr. Rainy season.

2. * *Michelia excelsa*, Bl. Vern. *Dieng-rai*. Khasi.

A lofty deciduous tree. *Bark* 7 in. deep, dark-grey, corky outside with irregular lines of fat lenticels and with very fine horizontal wrinkles, inside uniformly dun-yellow but for a few deep-brown specks; fibres very fine. Young parts densely ferruginous-tomentose. *Leaves* 5-8 by 2-3·5 in., ovate-elliptic or oblong-lanceolate, acuminate, cuneate or lightly rounded at

the base, thinly coriaceous, glabrous and shining above, glaucous often minutely silky-puberulous underneath; lateral nerves 8-10 on either half, arched, tertiaries very closely reticulate; petiole .5-1 in. long; stipules 1.5-2 in. long oblong-acuminate, silky outside. *Flowers* white, axillary, sometimes spuriously terminal, 3-4 in. diam, faintly scented. *Sepals* and *petals* 12, of the outermost whorls 3 by 13 in., gradually narrower towards the centre. *Stamens* about 50, shorter than the gynœcium; filaments .1 in. long. *Carpels* about 40, tipped with persistent recurved styles. *Fruit-spike* 5-8 in. long; ripe carpels .4-6 in. long, obliquely ovoid, shortly beaked; ovules 2-4 in each carpel, fascicled on a tubercle on the placenta, only 1-2 developing into seed in each ripe carpel, seeds red, faceted, oily.

KHASI HILLS, e.g., Lum-suair near Dampet and similar other localities —not common.

Sapwood small, white, soft: heartwood yellow when freshly-cut, afterwards turning brown. Medullary rays very numerous, mostly very fine, showing a satiny silver-grain on a radial surface. Weight about 35 lbs. per c. ft. The timber is remarkably durable and is very suitable for furniture and planking.

Fls. 4-5. Fr. Rainy season.

3. *Michelia lanuginosa*, Wall. Vern. *Dheng-lali*, Khasi; *Gogoi-champ*, Nep.

A fast-growing deciduous tree up to 90 ft. in height and 7 ft. in girth with a broad crown. *Bark* about 1 in. thick, rather plain, grey corky outside, dun-brown inside, the whole soon turning on exposure to deeper brown, very fibrous. Young parts including stipules and bracts covered with pale grey-tomentum. *Leaves* 6-10 by 2-3.5 in., oblong-lanceolate acute at both ends or sometimes more or less rounded at the base, thinly coriaceous, glabrous and somewhat shining above, mattedly grey-tomentose beneath, turning yellow before falling; lateral nerves 14 to 17 on either half, slender, reticulations very close but distinct only on the upper surface; petiole .5-7 in. long, rather short, grey-tomentose; stipules oblong. *Flowers* pale-white, 2.5-3 in. diam., axillary, solitary on short stout hairy pedicels; bracts very densely grey-silky. *Sepals* and *petals* 1-1.5 by .2-.3 in., oblanceolate. *Stamens* 60-70, much shorter than the gynœcium; filaments glabrous. *Carpels* about 45, very woolly; styles glabrous. *Fruit-spikes* 2-5 in. long; ripe carpels about .5 in. diam., shortly stalked, slightly compressed, densely lenticellate; seeds 1-3, faceted, deep-orange.

KHASI HILLS, 5,000 ft., e.g., Kynshi. Not very common.

Wood greyish-white, soft, weighing 30-35 lbs. per c. ft. Medullary rays fine and numerous. Might be used for planking.

Fls. 8-9. Fr. 9-11.

4. *Michelia Champaca*, Linn. Vern. *Champa*, Beng. & Hind.; *La-champa*, Synt.; *Tita-sopa*, Ass.; *Champari-phang*, Kach., *Serjo-asing*, Miri; *Bol-nabat*, Garo; *Ching-kappa*, Naga.; *Shap*, Khasi

Usually a middle-sized evergreen tree up to about 70ft. in height. *Bark* ashy-grey or brownish, rather rough outside, inside light dun-brown with thick strands of amber brown tissue, soon turning reddish brown, .5-.7 in. thick. *Leaves* 4-9 by 2-3.5 in., lanceolate, sometimes ovate, finely acuminate, thinly coriaceous, glabrous and more or less shining above, glabrescent underneath with usually some pubescence at least along the nerves; lateral nerves about 16 on either side of the midrib with often a few intermediate ones, slender but conspicuous, tertiaries finely reticulate in square or rectangular pattern; base very gradually cuneate; petiole .7-1.2 in. long, slightly channelled, usually pubescent; leaf-buds lanceolate, ferruginous-pubescent outside; old leaves yellow. *Flowers* axillary, rarely terminal, solitary, 1.2-1.8 in. long, pale-yellow to deep dun-yellow, very fragrant; buds ovoid; bract spathoid, broadly ovate, about 1 in. long, as broad as, or broader than long, often silky outside. *Sepals* and *petals* 15-21, oblong or oblanceolate, gradually narrower towards the centre. *Fruit-spike* 3-6 in. long; ripe carpels .6-8 in. long, ovoid or ellipsoid, generally sessile, white-speckled, woody when dry.

Occurs sporadically in all DISTRICTS generally along the foot of the HILLS, but not at all common. Much cultivated for its flower.

Heartwood light olive-brown, very durable, seasons and polishes well, useful for cabinet work and building.

Fls. 4-6. Fr. 4-6. of the following year.

5. *Michelia Kisopa* DC. Vern. *Chubsi*, Nep.

A tall deciduous tree with plain grey bark and thin lenticelled branchlets. *Leaves* 9.5-6.5 by 1.5-3 in., ovate, elliptic, oblong-or elliptic-lanceolate, acute or shortly acuminate, abruptly cuneate, rarely rounded at the base, thinly coriaceous, glabrous on both surfaces, shining above, dull underneath, turning yellow before falling; lateral nerves 10-15 on either half, only slightly arched towards the outer extremities; reticulations very close and fine; petiole .8-1.5 in. long, rusty-puberulous when young, stipules .6 in. long, oblong, grey or rusty-pubescent outside. *Flower* pale-yellow, axillary, shortly-stalked, 1-1.5 in. diam., delightfully scented; buds .5 in. long; bracts 2, fleshy, grey-pubescent outside. *Sepals* and *petals* 12-15, obovate or oblanceolate, glabrous. *Stamens* shorter than the gynoecium. *Carpels* silky-hairy; styles recurved. *Fruit-spikes* 2-4 in. long; ripe carpels sessile, .3-.4 in. diam., compressed, closely lenticelled; seeds 3-4.

Cultivated at Shillong.

Wood yellowish, suitable for use as door-frames and planking.

Fls. 7-9. Fr. 11-1.

-6. *Michelia punduana*, Hk. f. & Th. Vern. *Dieng-rtiang-khlaw*, Synt.; *Dieng-soh-niar*, *Dieng-rai*, Khasi.

A middle-sized tree; young parts densely red-silky. *Bark* grey, .5-.7 in. thick, thinly corky and with horizontal wrinkles outside, inside aromatic, granular yet fibrous, hard, brown,

mottled with coarse streaks of darker brown, soon turning uniformly deep-brown after exposure. *Leaves* 3-6 by 1·5-2 in. oblong, elliptic, obovate or oblanceolate, abruptly acuminate, base acute or cuneate; coriaceous, glabrous on both surfaces, shining above, pale or sub-glaucous beneath; lateral nerves 8-12 on either half, obscure, reticulations open, visible on both surfaces; petiole 5-75 in. long, rather stout; stipules about as long as the petiole, narrowly oblong. *Flowers* axillary, solitary, rarely in pairs, 1·3-1·5 in. across, on short, thick, rufous stalks; buds 5-7 in. long, ovoid, sharply pointed densely rufous-velvety. *Sepals* and *petals* 9-12, white, of the outer whorls obovate-cuneate, of the inner narrowly oblanceolate, pointed, not much scented. *Stamens* about 80, slightly shorter than the gynœcium. *Carpels* about 50, beaked. *Fruit-spike* 2-4 in. long; ripe carpels 3-4 in. diam., obovate or sub-globular, compressed, lenticellate, not beaked; seed solitary, aromatic with a scarlet arillus and black testa.

Appears to be confined to the KHASI HILLS, 4-5,000 ft., e. g., Cherapunji lawai, Jarain, etc.

Wood of a dull grey colour, compact, even grained, little liable to warp or split, weighing about 37 lbs. per c. ft., capable of being used for planking and furniture. Medullary rays close and uniform.

Fls. 10-11.

7. *Michelia oblonga*, Wall. Vern, *Phul-sopa*, *Bor-sopa* Kothal-sopa, Ass.; *Dheng-ta-roi*, Khasi; *Chamti-ver-ang*, *Bewo-chhamphe*. Garo: *Serio asing*, Miri & Abor.

A lofty tree up to 150 ft. in height, generally buttressed at the base. *Bark* grey, rough and warty outside, more or less plain and with horizontal wrinkles on young trees, green below the corky layer, inside light-brown with close and reticulating streaks of darker brown, turning dirty brown on exposure (when the streaks become invisible), 7-1·5 in. thick, aromatic. *Leaves* 3·5-7 by 1·5-2·7 in., oblanceolate, sometimes ovate, suddenly shortly acuminate, thinly coriaceous, shining above, pale and often glaucous beneath, turning yellow before falling; lateral nerves 10-12 on either half, sometimes with shorter intermediate ones; tertiaries laxly reticulate, the reticulations being conspicuous on both surfaces on dry leaves; base acute; petiole 6-1 in. long, rather slender, channelled, slightly swollen at the base; stipules narrow-oblong, as long as the petiole. *Flowers* white, scarcely scented, axillary, solitary, on short annulate peduncles; buds 8-1 in. long, elongate-ovoid. *Sepals* and *petals* 12 in all, white, fading to pale-yellow, 1-1·5 in. long, oblanceolate or spatulate. *Stamens* about 50; filaments 1 in., anthers 6-8 in long, turning brown after opening. *Carpels* about 40, glabrous, generally 4-ovuled. *Fruit-spike* 6-7 in. long; ripe carpels lax, sessile, obovoid, terete, speckled, upto 8 in. in length.

Fairly common in evergreen forests excepting NOWGONG, KAMRUP and GOALPARA: also in the GARO and KHASI HILLS.

Timber greyish-white with greenish grey, very fine-grained with close uniform medullary rays; weight about 40 lbs. per c. ft. Much prized for planking and cabinet work, as it does not warp or split.

Fls. 2-3. Fr. 8-10,

8. *Michelia Mannii*, King. Vern. Kothalua-sopa, Ass. (Lekh.)

A middle-sized evergreen tree, wholly glabrous; branches lenticelled. *Leaves* 4-7 by 2-4 in., oblanceolate to obovate with a subacute apex, firmly coriaceous, glabrous, shining above somewhat dull underneath; lateral nerves rarely more than 10 on either half, tertiaries conspicuously but broadly reticulate; base acute; petiole .8-1.2 in. long finely channelled, swollen at the base; stipules narrowly oblong, smooth. *Flowers* white, axillary, solitary, 2.5-3 in., across, on short peduncles; buds 1.2 in. long, oblong, smooth. *Sepals* 3, .6-8 by .1-1.5 in., linear. *Petals* 6, oblanceolate, in two series those of the inner series slightly smaller. *Stamens* as long as, or overtopping the gynoecium. *Carpels* sessile, smooth; style short. *Ripe-fruit* 5-7 in. long, with a fleshy rachis; ripe carpels up to an inch in length, oblong or obovoid, sparsely lenticellate, 2-seeded.

Makum Forest Range, LAKSHIMPUR DISTRICT, not very common.

Nothing is known about the quality of the timber, but it is likely to be as useful as most of its other co-geners.

Fls. 11-12. Fr. 4-5.

9. *Michelia manipurensis*, Watt. Mss. ex. Brandis Ind. Trees Vern. Dieng-rai Khasi; Sopa, Ass.

An imperfectly known middle-sized evergreen tree, young parts rufous-silky. *Bark* grey-corky outside with vertical lines of larger lenticels, soft inside white mottled with brown specks, turning uniformly brown on exposure .3-4 in. thick, not bitter. *Leaves* 3-7 by 1.5-2.3 in. oblong or oblong lanceolate, acuminate, cuneate at the base, coriaceous, glabrous, not particularly shining above, dull or sub-glaucous beneath, lateral nerves 10-12 on either half, conspicuous underneath, reticulations fairly close, equally distinct on both surfaces; petiole .75-1.2 in. long, margined. *Flowers* axillary, solitary, shortly stalked; buds about 1 in. long, lanceolate in outline, apiculate, slightly falcate, densely silky-rufous outside. *Fruiting-spike* 2.5-4 in. long; ripe carpels few generally at the extremity of the spike, with many barren carpels below, and sometimes with a few between them, .35-.4 in. diam., sub-globose compressed, beaked, lenticellate.

SIBSAGAR-Baruasali; LAKHIMPUR; KHASI HILLS upto 6000 ft. e, Lum Suar,

Timber not seen,

Fls. Oct. Fr. remains fully a year on the tree.

10. *Michelia montana*, Bl. Vern. Pan sopa, Ass. (Sibs.)

A fairly large evergreen tree. *Bark* grey outside, smooth but with close horizontal wrinkles, inside dark-brown, fibrous and much mottled, aromatic. *Leaves* 3.5-7.5 by 1.3-3 in., ovate elliptic or obovate, somewhat suddenly acute coriaceous, glabrous

and shining on both surfaces; main lateral nerves 9-11 on either half, slender, often with a few intermediate ones between. Tertiary veins closely reticulate and distinct on both surfaces (at least on dry leaves); base cuncate; petiole 7-1 in. long, slender, finely channelled, slightly swollen at the base. Flowers white, axillary, solitary or sometimes 2 from a short peduncle; pedicels slender, 8-1 in. long; buds cylindrical. Sepals and petals about 8, 8-1 in. long, oblanceolate or linear. Stamens overtopping the velvety gynoecium of 2-4 carpels. Ripe carpels 1-3, 2-2.5 by 1.2-1.5 in., obovoid, sessile or shortly stalked, woody, speckled with large white lenticels; seeds 3-4, 5 by 3 in., reddish-brown, faceted, suspended by an elastic cord.

Makum Range, LAKHIMPUR; CACHAR-Owden! Cultivated at Jorhat. Apparently not very common. Mann's Longai specimens are probably not this species.

The timber is probably as good in quality as of most other species of the genus, although not much known owing to the scarcity of the tree.

Fls. 7-9. Fr. 8-9 of the following year.

1. *Michelia excelsa*, Bl. and *M. manipurensis*, Watt, have been reduced to *M. doltsopa*, Buch-Ham. by Dandy (Journal of Botany Vol. LXV (1927) P. 277-279).

It is possible that an allied species which is not covered by this, exists, in N. E. Frontier District and Manipur which further field observations may bring to light.

2. *Michelia Kingii*, Dandy.

Dandy maintains (Journal of Botany, Novr. 1928) that the Indian plant included under this name is a new species, and describes it under the above name. He has drawn up the following key for separating it from *M. montana* proper:—

Tepals sub-similar in texture, all rather fleshy;
penultimate bract inserted well below the
middle of the peduncle; valves of mature
fruiting carpels not very convex outside. . . .

M. Kingii

Tepals very dissimilar in texture, those of the
outer whorl membranous, those of the inner
two whorls fleshy; penultimate bract inserted
usually about half way up the peduncle;
valves of mature fruiting carpels convex outside. . . .

M. montana.

Michelia Wardii, Dandy. A large tree. Leaves about 6.2 by 1.5 in. oblanceolate, narrowly oblong to elliptic oblong acuminate or sometimes acute, glabrous above, undersurface glaucescent and glabrous to thinly adpressed pubescent on the nerves, base decurrent into the petiole which is up to about 5 in. long; stipules adpressed grey tomentose or pubescent outside. Spatheoid bracts, grey, sericeo-tomentose, peduncles thick, 2-2.5 in. long. Perianth cream coloured, 1.75-2.5 in. long, segments 9-12, pubescent outside. Carpels numerous adpressed pubescent at least when young.

Allied to *M. excelsa*, Wall, and *M. manipurensis*, Watt., from which it differs by grey indumentum of the stipules, spatheoid bracts and peduncles grey, and the narrower leaves, and the absence of many or rufous hairs which are conspicuous in the earlier species.

Chibaon-Delei valley.

6. ILLICIUM, Linn.

Illicium Griffithii, Hk. f. and Th.

A large aromatic evergreen shrub 10-15 ft. high, without stipules; branches somewhat angular, glabrous, shining. *Leaves* 2-4 by 8-17 in. ovate, elliptic or lanceolate, shortly acuminate, acute at the base, coriaceous, glabrous, pellucid-dotted, shining above, dull-brown beneath, margins slightly recurved; lateral nerves 6-7 on either half, very obscure; petiole 4-6 in. long, channelled. *Flowers* axillary or terminal, solitary, about 1 in. in diam.; pedicels 5-1 in. long, recurved. *Sepals* 4-6, orbicular, acute. *Petals* 12-20, orbicular, not pointed, fleshy. *Stamens* 20-24, erect; filaments very short; anthers broad, blunt. *Carpels* about 20, in a single whorl, 1-ovuled with recurved styles. *Fruit* of spreading compressed beaked follicles; ripe carpels 8-12; seeds about 2 in. diam., sub-rotund, slightly compressed, glossy-brown.

KHASI HILLS. 4,500-5,500 ft., chiefly in gorges and deep ravines at Cherpunji and its neighbourhood.

The fruit is aromatic and has carminative properties.

Fls. Rainy season. Fr. Oct.

7. SCHIZANDRA, Michaux.

Sinistrorsely climbing glabrous shrubs. *Leaves* exstipulate. *Flowers* axillary, 1-sexual and dioecious, white, yellow or red. *Sepals* and *petals* 9-12, imbricate, generally in 3 series. *Stamens* 5-15 or more, spirally arranged; filaments monadelphous and short, or connate into a fleshy tube; anthers free, or sessile and half-buried in the head of connate filaments, cells small, remote. *Carpels* many, densely imbricated; stigma sessile; ovules 2, pendulous. *Fruit* an elongated spike of 1-seeded, rarely 2-seeded carpels; seeds albuminous.

Filaments free above; anthers free:—

Pedicels slender, 1-2.5 in. long. ... 1. *S. elongata*.

Filaments in one globose mass; anthers sessile:—

Pedicels stout 2-7 in. long:—

Branchlets verrucose, rather thick. ... 2. *S. Propinqua*.

Branchlets plain, thin. ... 3. *S. axillaris*.

1. *Schizandra elongata*, Hk. f. and Th. Vern. *Soh-mijarian*, Khasi.

A deciduous woody climber; branchlets thin, lenticelled, scaly at the base. *Leaves* 1.5-3.5 by .7-1.5 in., ovate or oblong-lanceolate, membranous, rather soft, glabrous above, minutely verrucose and sub-glaucous underneath, margins cartilaginous, with or without minute, distant, cartilaginous teeth; base acute or rounded, somewhat unequal; main lateral nerves 4-6 on either half, oblique, arched, reticulations open, faint; petiole .6-8 in. long, slender, channelled above. *Flowers* yellowish; .5-.7 in. diam.; pedicels 1-2.5 in. long, slender. *Sepals* 3, orbicular, green outside, yellow within. *Petals* 6, ovate-orbicular, larger than the sepals. *Stamen*

spirally arranged; filaments monadelphous below, free and tubular above; anthers with a thick connective. *Carpels* 20-24, imbricated on a conical receptacle. *Fruit-spike* 2-3 in. long, rachis slender at the base, swollen at intervals above; ripe carpels sessile, globose, not beaked.

KHASI HILLS, 5,-6,000 ft., e. g., Shillong Peak, Elephant Falls. etc.

Fls. 5-6. Fr. 8-9.

2. *Schizandra propinqua*, Hk. f. and Th.

A woody climber; stem dark-brown; branchlets succulent, brown, verrucose and lenticellate. *Leaves* 3-6 by 1-2 in., ovate-lanceolate, acuminate, somewhat fleshy and soft, glabrous, dark-green and shining above, pale and minutely gland-dotted underneath, margins with minute distant gland-teeth; base cuneate or more or less rounded, slightly unequal; lateral nerves 8-12 on either half, arched, not prominent, reticulations open, obscure; petiole .4-.6 in. long, rather stout. *Flowers* .5-.9 in. diam., yellowish, axillary, solitary, slightly scented; pedicels .4-.7 in. long, stout, minutely bracteolate. *Sepals* and *petals* ovate or obovate, concave in bud. *Filaments* connate into a globose brick-red fleshy mass, about .3 in. diam., anthers 12-15 or more, embedded in the mass of filaments. *Fruit-spike* 4-6 in. long, with a fleshy cylindrical rachis; ripe carpels globose, shortly stalked, baccate, 2-seeded.

KHASI HILLS, e. g., Laitkor Forest, 5,200 ft. Rather scarce.

Fls. 8-9. Fr. 10-11,

3. *Schizandra axillaris*, Hk. f. & Th.

A slender woody climber; old stems with thick corky reticulations, branches lenticellate, branchlets plain, angular. *Leaves* 2.5-4 by .8-1.3 in., narrowly oblong-lanceolate, long-acuminate, minutely gland-toothed at irregular intervals along the margins, tapering at the base, thinly coriaceous and somewhat succulent, glabrous, deep green above, pale beneath; lateral nerves 6-8 on either half, slender, reticulations very open, faint; petiole .4-.6 in. long, narrowly margined. *Flowers* dull-scarlet, axillary, solitary, about .5 in. diam., sessile, or on short bracteolated pedicels. *Sepals* orbicular, rather fleshy, concave. *Petals* ovate. *Stamens* as in *S. Propinqua* but generally with fewer anthers. *Fruit-spike* 1-2 in. long; ripe carpels sub-sessile globose. 1-2-seeded.

KHASI HILLS, 4,-5,000 ft.; ravines near Shillong, not at all common.

Fls. 7-9. Fr. 10-11.

Schizandra sphenanthera, Rehd & Wils. A large glabrous rambling shrub. *Leaves* 2.7-3.7 by 1-2 in., ovate or ovate-elliptic, acuminate distantly lenticulate, base broadly cuneate, often unequal, membranous main lateral nerves 6-8 on either half; petioles .5-1 in. long. *Flowers* deep cherry red, about .7 in. across, pedicels slender axillary 1-1.7 in. long, outermost perianth segments much smaller than the inner ones. *Fruit* in short compact purple hanging spikes—*Kingdon Ward*.

· Mishmi Hills--Delei Valley, Kingdon Ward. A Chinese plant.

8 KADSURA, Kæmp.

Kadsura Roxburghiana, Arn. Vern. *Mi-ja-ngeir*, Khasi ; *Kang-ma-ri*, Manip.

A woody evergreen climbing shrub ; branches generally with elongated lenticels. *Bark* on old stems grey-corky and deeply reticulately furrowed ; pith large. *Leaves* 3-6 by 1·3-2·4 in. elliptic to ovate-lanceolate, acute or shortly acuminate, distanty, dentate-serrate on young plants, entire on mature ones, soft and rather fleshy when fresh, but membranous when dry, quite glabrous ; main lateral nerves 10-12 on either half, often with shorter intermediate ones between, tertiaries obscure on fresh leaves but fairly distinct on the under surface of dry leaves, reticulations with large meshes ; base subacute ; petiole 6-8 in. long, slender, sharply margined ; stipules 0. *Flowers* 1-sexual, whitish, axillary, solitary, about 5 in. across, on peduncles 3-5 in. long, with as many as a dozen ciliate bracteoles, the uppermost passing into the sepals, elongating as the fruit matures to about 1 in. *Sepals* and *petals* 12, the largest 25 in. long, orbicular. *Stamens* about 12 ; outer filaments free, inner connate. *Carpels* many, imbricated ; stigma sessile ; ovules 2. *Ripe fruit* 1-1·5 in. diam., globose ; ripe carpels 3 in. long, oblong and faceted, red, juicy, more or less coalescing, shortly mucronate. seeds orbicular, compressed. The fruits sometimes run into galls which assume the shape and size of small plantains.

Jaipur Reserve in LAKHIMPUR ; Diroi Reserve and Garampani, SIBSAGAR, Charduar Reserve (Belsiri), DARRANG ; also KHASI HILLS. Not rare, neither abundant.

Figs. 9-10. Fr. 10-11.

Magnolia globosa, HK, f. & T. A small tree, branchlets deciduously silky pubescent with reddish brown hairs. *Leaves* 5-8 by 2·7-5 in. ovate or elliptic acute or obtuse, and mucronate, base rounded or subcordate, thin or subcoriaceous, glabrous above, except the puberulous midrib, glaucous and pubescent beneath on the nerves, main lateral nerves 8-10 on either side ; petiole 1-1·75 in. rufous tomentose like the stipules which are about 1·5 in. long. *Flowers* white solitary, 4-5 in. across each covered by a spatheoid caducous rufous tomentose bract ; pedicels stout, leaf opposed up to 25 in. long. *Sepals* and *petals* 3 ovate, the latter smaller. *Ripe fruit* 1·5-2·7 in. long ; oblong or ovoid cylindric ; carpels with short recurved deciduous beaks.

Mishm—Delei valley, 9000 ft. Kingdon Ward.

FAM. 4. ANONACEÆ.

Trees or shrubs, erect or climbing, sometimes aromatic. *Bark* usually with layers of anastomosing fibres inside, of branchlets marked by close reticulated longitudinal ridges. *Leaves* alternate, bifarious, simple, entire, exstipulate. *Flowers* 3-numerous, usually 2-sexual. *Sepals* 3, usually valvate. *Petals* 6, in two series, or the inner obsolete. *Stamens* usually numerous, seated with the ovaries in the centre on a more or less conical or convex

torus ; anthers 2-celled, sessile or subsessile, extrorse, connective enlarged or dilated. *Carpels* 1-celled, generally numerous and hairy. *Fruit* of numerous dry or succulent carpels on stalks which elongate as the fruit ripens, rarely united into a fleshy berry-like fruit. *Seeds* large with a hard shining testa and ruminated albumen.

I. TREES OR ERECT SHRUBS :—

A. Outer petals more or less flat, valvate :—

1. Petals uniform, flat :—

Ripe carpels baccate, with one basal seed.

Ripe carpels indehiscent with many ventral seeds and constrictions between them.

1. Polyalthia.

2. Unona (partly)

2. Petals subequal :—

a. Ripe carpels 6 or more usually with one sub-basal seed :—
Inner petals concave at the base, not clawed nor arching.

3. Popawia.

b. Ripe carpels many :—

i. Inner petals clawed and arching :—

Ripe carpels 1-seeded.
Ripe carpels with 2 or more seeds in two series.

4. Goniothalamus

5. Mitrephora.

ii. Inner petals saccate at the base (in the species here described), not clawed.

6. Alphonsea

c. Ripe carpels usually solitary, berries, many seeded. Petals saccate at the base.

7. Cyathocalyx.

3. Petals very dissimilar, valvate, outer small sepaloïd, inner much larger, flat. Ripe carpels generally 1-2 seeded.

8. Miliusa.

B. Outer petals, thin, imbricate, subequal. Ripe carpels 3 or more, 1-seeded in fruit.

9. Sageræa.

C. Outer petals triquetrous, valvate. Ripe carpels many, confluent into a many-seeded berry-like fruit.

10. Anona.

II. CLIMBING OR STRAGGLING SHRUBS :—

A. Petals imbricate in bud. Ripe carpels with 2 rows of seeds.

11. Uvaria.

B. Petals valvate in bud :—

1. Ripe carpels constricted between the single row of ventral seeds.

12. Unona (partly)

2. Ripe carpels not constricted :—

Petals nearly equal, concave and conniving at base. Flowers on hooked peduncles.

13. Artabotrys.

b. Outer petals larger than the inner.

Outer petals thin and flat
(in the species described here).
Carpels 1-seeded.

14. Oxymitra.

All petals thick and concave. Carpels with 2 or more seeds.

15. Melodorum.

1. POLYALTHIA, Bl.

Trees or shrubs, erect in all Assam species. *Flowers* axillary or leaf-opposed, bracteate, solitary or in few-flowered fascicles from axillary tubercles. *Sepals* 3, valvate or sub-imbricate. *Petals* 6 in two series, ovate or linear, flat or the inner slightly vaulted. *Torus* convex. *Stamens* cuneate; anther-cells remote. *Carpels* indefinite; ovules 1-2, basal or sub-basal. *Ripe carpels* berry-like, 1-seeded.

- I. Flowers 1·5 in. or more in diameter :—
 A. Flowers fascicled or umbelled. Petals linear, yellowish green :—
 Leaves narrow-lanceolate and taper-pointed with wavy edges. ... 1. *P. longifolia*.
 Leaves ovate-oblong with even edges. ... 2. *P. simiarum*.
 B. Flowers solitary or in pairs. Petals broadly lanceolate, white or pale-yellow. ... 3. *P. Jenkinsii*.
 II. Flowers under 1 in. in diameter :—
 Sepals scarcely shorter than the petals. ... 4. *P. cerasoides*.
 Petals greenish-white. ...
 Sepals much shorter than the petals. ... 5. *P. suberosa*.
 Petals red, ...

1. *Polyalthia longifolia*, Benth. and Hk. f. vern. *U'uboi*, Ass.; *Debdaru*, Beng.

A handsome evergreen tree with a conical crown and dark greyish-brown bark. *Leaves* 3·5-9 by 1·5 in., narrowly lanceolate, taper-pointed, rather membranous, quite glabrous, shining above, subpellucid-punctate, with wavy edges, somewhat aromatic; main lateral nerves up to about 30 on either half, faint, very oblique, base cuneate; petiole 2·5 in. long. *Flowers* yellowish-green, 1·1-2 in. long, in fascicles or very short umbels from axils of fallen leaves; pedicels slender, 1-2 in. long, with 1 or 2 minute bracts about the middle. *Sepals* about 2 in. long, ovate-triangular, densely-pubescent. *Petals* about 1 by 2 in., tapering from a slightly expanded base puberulous. *Ripe carpels* numerous, black, 7-9 by 5-6 in., on glabrous stalks 3-5 in. long; seed smooth, shining.

Cultivated as an ornamental tree in almost all the towns of ASSAM.

Wood whitish, fairly even grained but not strong. Suitable for pack, cages, barrels, etc.

Fls. 3-5 Fr. 7-9.

2. *Polyalthia simiarum*, Benth. & Hk. f. Vern. *Bor-koliori*, Ass. (Makum); *Boga-khamlou*, Ass. (Darr.); *Deing lar-sei*, Deing-ja-roi, Khasi; *Silem-phang*, Senem-phang, Kach.; *Mengchuri-arong*, Phangpit-arong, Mik.; *Jethou*, Kuki; *Jathou*, Tipp.; *Mikar-asing*, Miri; *Khandou*, Mech; *Bolang-banchihok*, Jira, Borsthi, Garo.

A large tree up to 100ft. in height and 8 ft. in girth, practically evergreen, with a simple stem, thin horizontal branched and very thin branchlets. *Bark* light or dark-grey and smooth nearly outside except for horizontal wrinkles and very fine vertical fissures, blaze light-brown or white with often a shade of purple,

in thin lace-like concentric layers, about 1 in. thick. *Leaves* bifarious, 5-10 by 2-4.5 in., oblong, obovate, elliptic or lanceolate, rather abruptly acuminate, thinly coriaceous, glabrous and shining above, sometimes more or less pubescent along the midrib and nerves beneath, pinkish-brown and drooping when young; lateral nerves 12-18 on either half, arcuate, conspicuous beneath, tertiaries transverse to the secondary nerves, parallel, very slender; base rounded, rarely suddenly cuneate; petiole about .2 in. long. *Flowers* yellowish green, 1-1.5 in. long, in fascicles from axils of fallen leaves or from tubercles on the branches; pedicels as long as the flowers, slender, minutely pubescent with a bract about the middle. *Sepals* 1-1.5 in. long, bluntly ovate, recurved, pubescent outside. *Petals* 1-1.25 in. long, strap-shaped or linear-lanceolate, spreading, puberulous outside, equal or the inner somewhat longer. *Ripe carpels* about 40, 1.25-1.5 in. long, obovoid, glabrous, turning orange-red to blue-black in ripening, gradually narrowed to a stalk 1-2 in. long. *Seed* ovoid, grooved and transversely ribbed.

Fairly common throughout UPPER ASSAM but very common in the MIKIR HILLS and forests along the foot of the HIMALAYAS in DARRANG, e.g. Pabhoi, Nanduar, Balipara, etc.

Fresh-cut wood is white outside but yellowish towards the centre. Annual rings indistinct; medullary rays close and equidistant; pores of various sizes and of irregular shape. Weight about 35 lbs. per c. ft. The wood seems to be suitable for tea-boxes and such other purposes. The fibres of the bark are made into ropes.

Figs. 6-11. Fr. 5-8.

3. *Polyalthia Jenkinisii*, Benth. and Hk. f. Vern. *Koliori*, *Tita-hachi* (*sachi*), *Kola-khamton*, Ass.; *Dieng-ther*, Khasi; *Theng-piopsu*, Mik.; *Khem-judi*, *Thaisin-jola*, Kach.; *Jong-mochal*, Jathu, Kuki; *Bol-jakru-ehhen*, Garo.; *Kalikath*, Nep.

A middle-sized evergreen tree with a simple stem often fluted at the base and thin but long horizontal branches; young shoots generally rusty pubescent. *Bark* black or very dark-brown and fairly smooth outside, yellowish or brown inside, .2-.3 in. thick. *Leaves* 4-7 by 1.2-3 in., oblong-lanceolate, elliptic or ovate, acute or acuminate, membranous or chartaceous, dark-green, glabrous except the midrib above which is puberulous, shining above; lateral nerves 7 on either side, slender, arching, forming an intramarginal nerve away from the edge, tertiaries finely reticulating; base generally acute or subacute; petiole .2-.3 in. long, puberulous. *Flowers* axillary, generally solitary, spreading, 2-3 in. diam., scented, white to pale-yellow; pedicels .6-.8 in. long, expanding towards the apex, bracteate at the base. *Sepals* very small, suborbicular, puberulous. *Petals* sub-coriaceous, oblanceolate, narrowed at the base, faintly longitudinally nerved. *Ripe carpels* 30-50, .4-.5 by .25-.3 in., oblong, apiculate, verruculose, on slender stalks as long as the carpels. *Seeds* smooth.

Found in all the Districts specially of UPPER ASSAM. Fairly common in some parts of the SIBSAGAR DISTRICT including the MIKIR HILLS; also in the GARO, KHASI and N. CACHAR HILLS and the SURMA VALLEY.

The wood is used for house-posts and ridge poles. The Kacharis consider poles of this tree indispensable for carrying their dead bodies.

Fls. 8-10, Fr. 12-6.

4. *Polyalthia cerasoides*, Benth. & Hk. f.

A shrub about 10 ft. high with black or pale-grey lenticellate bark; young parts rusty-tomentose. *Leaves* 3-7 by 1-1.5 in., oblong-lanceolate, generally long-acuminate, membranous, glabrous above except the midrib which is puberulous, glabrescent beneath; main lateral nerves 8-10 on either side besides a few intermediate ones, very slender and arched, forming loops away from the edge, indistinct above; base more or less rounded; petiole .1 in. long, stout. *Flowers* axillary, greenish-white, .3-5 in. diam. *Sepals* membranous, ovate-lanceolate, hairy outside, glabrous inside, as long as or slightly shorter than the petals. *Petals* .2-3 in. long, coriaceous, puberulous, incurved. *Ripe carpels* about .4 in. long, ellipsoid or ovoid, on stalks .5-7 in. long.

Nizamghat, N. E. FRONTIER DISTRICT.

Fls. 10-12.

5. *Polyalthia suberosa*, Benth. & Hk. f. Vern. *Makhanisra-phang*, Kach.; *Hahida-cha* (wild tea), Mik.

A large handsome shrub branched almost down to the base branchlets rusty-pubescent; older ones lenticellate; stem dark-brown with reticulately furrowed cork. *Bark* reddish inside, about .1 in. thick. *Leaves* 2-5 by .8-1.6 in., oblong, obtuse, or sub-acute usually thin glabrous and shining above, sparsely pubescent or glabrescent beneath. *Flowers* .3-4 in. across, on slender extra-axillary peduncles .5-1 in. long, which are puberulous and with minute bracts at the base. *Sepals* much smaller than the petals, spreading, pubescent. *Petals* reddish-brown, ovate, silky outside, the outer shorter than the inner. *Ripe carpels* subglobose, .2 in. diam., on stalks .2-3 in. long; seed globose, smooth.

NOWGONG; KHASI HILLS.

Deserves to be planted in gardens on account of its ornamental appearance.

Fls. 4-5, Fr. 10-12.

2. UNONA, Linn.

Trees or shrubs, the latter erect or climbing. *Leaves* generally thin. *Flowers* axillary, leaf-opposed or terminal, often solitary. *Sepals* 3, valvate. *Petals* 6, valvate, in two series (the inner wanting in *U. longiflora*), long or elongated. *Stamens* cuneate; anthers exserted. *Carpels* numerous; styles recurved, grooved. *Ripe carpels* generally elongate and constricted between the seeds. *Seeds* 1-5.

A tree. Leaves upto 5 in. in length; petals strap-shaped, thin.

... 1. *U. præcox*.

Shrubs erect, sarmentose or climbing:—

Flowers red usually on very long axillary peduncles:—

Petals 3 (sometimes 2), 3-5 in. long, very narrow.

fleshy with no constriction between claw and limb.

Leaves up to a foot in length.

... 2. *U. longiflora*.

4. ANONACEÆ.

Unona.

Flowers yellow or yellowish-green on long or short extra-axillary peduncles:—

Petals 6 in 2 series, more or less broad and narrowed above the claw:—

- | | | |
|--|-----|-----------------------|
| Generally sarmentose. Flowering peduncles 2-7 in. long. Leaves up to 9 in. in length. | ... | 3. <i>U. Desmos</i> |
| Erect shrub, often climbing. Flowering peduncles 1-2 in. long. Leaves up to 7 in. in length. | ... | 4. <i>U. discolor</i> |
| Climbing shrub. Flowering peduncles up to 1½ in. in length. Leaves up to 5 in. in length. | ... | 5. <i>U. dumosa</i> . |

1. *Unona præcox*, Hk. f. & Th. Vern. *Porteng-phang*, Kach.

A deciduous tree up to 90 ft. in height and 4 ft. in girth with a narrow conical crown; young shoots puberulous. Bark grey fairly smooth except for warts, shallow vertical fissures and faint horizontal wrinkles; inside light-brown, very fibrous and in thin lace-like plates. Leaves 2-5 by 1-1.8 in., elliptic ovate or lanceolate, finely acuminate, membranous, glabrescent, minutely punctate underneath; main lateral nerves 10-12 on either half, very slender, arcuate, tertiaries exceedingly fine and closely reticulate; base cuneate; petiole 2-3 in. long, slender, channelled. Flowers light-green, 2.5-3.5 in. long, from bases of current year's shoots, pendulous, sweet-scented; peduncles 1 in. long, slender, ebracteate. Sepals 4-7 in. long, linear-oblong, membranous, reflexed. Petals—outer 2.5 by .25, inner 3.2 by 3 in., linear, membranous, glabrous, pale-green. Stamens truncate. Carpels glabrous; styles oblong, pilose.

Banks of the Burisoti in the N. E. FRONTIER DISTRICT also Dhansiri Reserve in NOWGONG DIVISION, and other parts of the MIKIR HILLS,—not very common.

Wood light-grey; medullary rays fairly broad, not very close, annual rings marked by larger and more numerous pores.

Figs. 4-5.

2. *Unona longiflora*, Roxb. Vern. *Jor-lewa*. Ass.; *Dieng-phallam*, Khasi; *Dieng-sa-la-tyrkai*, Synt.; *Theseming*, Mikir; *Meruang-omak*, Garo.

Usually an erect glabrous shrub with a simple stem 10-12 ft. high and slender spreading branches; branchlets minutely verrucose when dry; leaf-buds silky. Leaves 5-12 by 1.7-4 in., narrowly oblong or oblong-lanceolate, acute or acuminate, chartaceous, green and more or less shining above, glaucous beneath; lateral nerves 12-16 on either half, tertiaries sub-parallel and more or less transverse to the secondary nerves, the spaces between them closely reticulate with very slender quarternary nerves; base rounded or subcuneate; petiole 3-5 in. long somewhat swollen, finely channelled, verrucose. Flowers red, horn-shaped in outline, pendulous; peduncles axillary, 1-4 in. long, elongating in fruit, bracteate and jointed near the base, expanded at the upper extremity. Sepals 3, very broadly triangular, acute, pubescent outside. Petals 2 or 3, 3-6 in. long, very gradually tapering from a broad base, red, fleshy, puberulous outside, inner wanting. Connectives of stamens produced but truncate. Carpels few in

flowers with long peduncles, but up to about 60 in short-peduncled-flowers. *Ripe carpels* 7-60 (varying inversely with the length of the peduncle), moniliform, on stalks '6-1 in. long which are channelled above; joints 1-4, '5-'7 by '2-'3 in. elongate-ellipsoid, verrucose.

In ravines of the MIKIR HILLS near Barpathar also Daiang Reserve, SIBSAGAR DIVISION; Kulsi reserve KAMRUP : CACHAR : and KHASI HILLS upto 3500 ft.

Fls. 4-5. Fr. 10-12.

3. *Unona Desmos*, Dunal.

A straggling or climbing shrub : branchlets rufous-pubescent. *Leaves* 4-9 by 1·5-3·5 in., oblong-lanceolate, acute or acuminate thinly coriaceous, glabrous above, puberulous beneath ; lateral nerves 12-14 on either half ; base rounded ; petiole '3-4 in. long. *Flowers* solitary, about 2 in. long, yellow, odorous, pendulous ; peduncles extra-axillary, 2-7 in. long, slender, 2-bracteate. *Sepals* '3-4 in. long, ovate, acuminate, pubescent. *Petals* coriaceous, obovate to ovate-lanceolate, golden-pubescent, longitudinally 3-6 nerved, outer up to 2 by 1 in., inner shorter and narrower. *Ripe carpels* numerous, '5-'7 in. long on stalks of the same length, glabrous, constricted between the 1-6 joints, glossy-green when young.

In evergreen forests between Makum and Lumding

4. *Unona discolor*, Vahl.

A spreading ever-green erect shrub, 6-8 ft. high, often also climbing, with rough grey bark ; young branches slender, more or less pubescent. *Leaves* 2-farious, 3-7 by 1-2 in., oblong, oblong-lanceolate or oblanceolate, acuminate, rounded at the base membranous, glabrous above, pale and more or less pubescent beneath, (in var. *pubescens* densely so) ; lateral nerves 8-12 on either half, very oblique, slender, free at the outer extremity. *Flowers* leaf-opposed or extra-axillary, solitary, about 2 in. long on peduncles 1-1·5 in. long, with a small linear bracteole below the middle, slender in flower, thickening in fruit. *Sepals* '4-'6 in. long, ovate-acuminate, spreading. *Petals* about 2 in. long, narrow-lanceolate coriaceous, glabrous or adpressedly silky. *Anthers* with a spreading top. *Ripe carpels* numerous, '75-1·5 in. long, 2-5-seeded, constricted between the ovoid joints, on stalks '2-2·5 in. long.

UPPER ASSAM, SYLHET and the KHASI HILLS ; fairly common in evergreen forests.

Fls. 4-6. Fr. 9-12.

5. *Unona dumosa*, Roxb.

A large woody climber ; young shoots softly rufous-tomentose. *Leaves* 2-5 by 1·3-2·5 in., ovate-oblong, obovate or lanceolate, subacute, membranous, glabrescent above, softly rufous-tomentose beneath ; lateral nerves 8-12 on either half, straight or slight-

ly arched; base rounded or subcordate; petiole .25-.4 in. long, rusty-tomentose. *Flowers* 2-3 in. long, solitary, yellowish-green, pendulous; peduncles leaf-opposed or terminal, 1-1.5 in. long, slender, tomentose, with a bract below the middle resembling a sepal. *Sepals* .4 in. long, ovate, tomentose, longitudinally nerved. *Petals* elliptic or spatulate, 3-7-nerved, velvety-pubescent; outer 2-3 by .7-1.5 in., inner somewhat smaller. *Ripe carpels* about 20, glabrous, 1-4-seeded, on stalks .5-.7 in. long, much constricted between the ovoid or ellipsoidal seeds.

Daïang to Kalioni in the SIBSAGAR DISTRICT, possibly also in LAKHIMPUR between Jaipur and Margherita.

3. POPOWIA, Endl.

Evergreen erect shrubs or small trees. *Flowers* small, extra-axillary or leaf-opposed, often polygamous, never fully open. *Sepals* 3, ovate, valvate. *Petals* 6, in two series, valvate (inner imbricate in *P. Kurzii*), outer spreading, inner thick, concave, acute. *Anther-cells* dorsal, remote. *Carpels* generally few, ovoid; ovules 1-2, ventral or basal, erect. *Ripe carpels* berry-like.

Leaves wholly glabrous, silvery underneath; tertiary nerves transverse to the secondary. Inner petals valvate

1. *P. Hookeri*

Leaves sparsely adpressed-pubescent on both surfaces, granulate above; petiole tomentose; midrib strigose; tertiary nerves transverse to the midrib. Inner petals imbricate

2. *P. Kurzii*.

1. *Popowia Hookeri*, King. Syn. *Polyalthia argentea*, Hk. f. & Th. Fl. Br. Ind. I. 67.

A wholly glabrous shrub; branches dark-brown or black. *Leaves* 4-7 by 1.2-2.5 in., oblong or oblanceolate, abruptly acuminate, thinly chartaceous, glabrous, dull-silvery beneath; lateral nerves 8-10 on either side, slender, arcuate, tertiaries transverse to the secondary nerves, more or less parallel; base acute; petiole .12-.16 in. long, terete. *Flowers* very small, polygamous, solitary or in fascicles of 2-3 from extra-axillary tubercles. *Ripe carpels* .7-.8 by .3 in., oblong, rugose, faintly transversely ribbed when dry, minutely apiculate, on stalks .2-.35 in. long.

Banks of the Dihou. SIBSAGAR DISTRICT, towards the foot of the NAGA HILLS; also Balipara in DARRANG. Very possibly in similar localities elsewhere.

2. *Popowia Kurzii*, King.

A shrub 6-8 ft. high; young shoots tawny-pubescent. *Leaves* 4-9 by 1.5-3 in., obovate, oblanceolate or elliptic, thinly coriaceous, sparsely adpressed-pubescent on both surfaces, minutely granulate above, pale beneath; lateral nerves 8-12 on either side of the strigose midrib, arcuate, tertiaries faint, transverse to the midrib; petiole .2-.25 in. long, stout, tomentose. *Flowers* extra-axillary, solitary or in pairs, sub-globose, subsessile. *Sepals* smaller than the petals and like them tomentose outside. *Petals* concave, outer valvate, slightly larger than the inner which are imbricate.

Fruit 8 in. by 3 in., rugose; seed with two longitudinal channels, otherwise smooth.

Only found hitherto at Garampani, DISTRICT SIBSAGAR.

Fls. 5-8. Fr. 10-12.

4. GONIOTHALAMUS, Bl.

Small trees or shrubs. *Leaves* generally large, oblong, coriaceous; lateral nerves short, anastomosing to form intramarginal loops. *Flowers* axillary, solitary or fascicled; peduncles with scaly distichous bracts at the base. *Sepals* 3, valvate. *Petals* 6, valvate, in two series; outer thick, flat; inner smaller, shortly clawed, cohering to form a volt over the stamens and carpels. *Stamens* many; anther-cells distant; connective prominent and produced beyond the anthers into variously shaped processes. *Carpels* many; ovules 1 or 2, in the latter case superposed, sub-basal. *Ripe-carpels* 1-seeded.

Leaves glabrous. Ripe carpels sub-sessile. ... 1. *G. sesquipedalis*.

Leaves brown-tomentose along nerves beneath.

Ripe carpels long-stalked. ... 2. *G. Simonsii*.

1. *Goniotalamus sesquipedalis*, Hk. f. & Th. Vern. *Soh-um-synrang*, *Skum-synsar*, Khasi; *Leikham*, Manipur; *Kham*, Lushai.

A sparingly branched undershrub 4-8 ft. high. *Leaves* 10-15 by 2-3.5 in., oblong, bluntly acuminate, narrowed at the base, coriaceous, glabrous, dark-green above, pale and minutely punctate beneath, margins revolute, midrib stout; lateral nerves 15-18 on either half, anastomosing to form large intramarginal loops; petiole about .5 in. long, stout, channelled. *Flowers* greenish-yellow, axillary or supra-axillary, solitary; buds triquetrous. *Sepals* 2-3 in. long, glabrous, green, shining inside. *Outer petals* 1 in. long, glabrous, or slightly pubescent outside, inner .7-.8 in. long, pubescent. *Carpels* usually 5, sometimes more, with golden hairs; styles slightly recurved. *Ripe carpels* solitary or 2-4, .7 by .3 in., slightly tapering, shortly stalked, supported by the persistent calyx, red to cherry-coloured while ripening; seed large.

KHASI HILLS up to 4,000 ft. Also on the Bhuban Hill in CACHAR, 2,400 ft., c. g., Mainadhar, Bhubandhar, etc.

The dry leaves are burnt as an incense in temples in Manipur.

Fls. 5-6. Fr. 11-12.

2. *Goniotalamus Simonsii*, Hk. f. & Th.

A large shrub or small tree; young parts brown-pubescent. *Leaves* 10-15 by 3-5 in., narrowly elliptic or obovate-oblong, caudate-acuminate, rounded or sub-acute at the base, thinly coriaceous, glabrous and glossy above, brown-tomentose chiefly along the midrib and nerves beneath, minutely punctate; lateral nerves 13-20 on either half, almost straight, anastomosing at their extremities to form a continuous wavy intramarginal nerve; reticulations strong but rather open; petiole .4-.6 in. long, channelled, tomentose. *Flowers* axillary, solitary, 1-1.5 in. long.

peduncles 2-3 in. long, supported by a pair of bracts. *Sepals* 5 in. long, ovate or triangular, persistent. *Outer petals* 1.5-2 in. long, cream-coloured, oblong-lanceolate, pubescent; inner 5 in. long, forming a triquetrous cone, pubescent; style cylindrical. *Ripe carpels* 5 in. long, oblong, mucronate; torus elongated.

KHASI HILLS, 2-3,000 ft., chiefly along shady streams, e. g., Umran, Nongpoh, etc.

Fls. 5-6. Fr. 8-9.

5. MITREPHORA, Bl.

Mitrephora tomentosa, Hk. f. & Th. Vern. *Kolh, Koliori*, Ass.; *Jeithuh-ang-thing*, Kuki. *Thingpi-ikso-arong*, *Golthi-arong*, Mik.; *Sinam-jola*, Kach.

Usually a small evergreen tree, but individual trees have been seen up to 70 ft. in height and 5 ft. in girth. *Bark* smoothish excepting for very shallow and distant vertical fissures, dark-brown or very nearly black outside, generally with large white blotches; blaze very light dun-brown with distant broad strands of white and softer granular tissues, otherwise finely fibrous and in thin concentric layers. *Leaves* 3-7 by 1-3 in., varying in shape from ovate to narrow-lanceolate even on the same twig, acute or acuminate, subcoriaceous, dark-green, glabrous and shining above (except the pubescent midrib); undersurface velvety rusty-tomentose on young trees, glabrescent and pubescent along the nerves on older individuals; lateral nerves 10-15 on either half, slender, very oblique but only slightly arched, tertiary invisible; base rounded; petiole 2-3 in. long, stout, tomentose. *Flowers* 2-3 in. across, in short leaf-opposed cymes, each supported by a large broad bract. *Sepals* 3, 2-3 in. long and as broad, acute, densely rusty-tomentose. *Outer petals* 1-1.5 by .7 in., yellow with faint purple veins outside, inner 5-7 by .5 in. clawed, closely purple-veined and velvety outside, white-hairy and ribbed inside, cohering by margins to form a vault over the anthers and stigmas. *Ripe carpels* 1 in. long, sub-globose, densely rusty-tomentose; seeds 2, plano-convex.

GARO HILLS, NOWGONG, N. CACHAR HILLS, KAMRUP, etc.

Wood even-grained, compact, dun-white, in regular thin concentric bands; medullary rays very fine, regular, about 125 to the inch; weight about 50 lbs. per c. ft. It is liable to split, but is used for posts and such other purposes in NOWGONG.

Fls. 3-5. Fr. 8-10.

6. ALPHONSEA, Hk. f. & Th.

Tall evergreen trees with tough fibrous bark. *Leaves* coriaceous, glabrous and shining above. *Flowers* generally in leaf-opposed fascicles; buds conical; pedicels bracteolate. *Sepals* 3, small, valvate. *Petals* 6, in 2 series, valvate, much larger than the sepals, of the inner whorl usually slightly smaller. *Stamens* indefinite; anther-cells dorsal; connective apiculate. *Carpels*

1-12; ovules 4-10 in 2 series. *Ripe carpels* 4-6, sessile or stalked, ovoid or oblong-ovoid.

Leaves 6-10 in. long, narrow-oblong. Sepals free.

Carpels long-stalked.

Leaves 3-6 in. long, ovate-oblong. Sepals connate.

Carpels very shortly stalked.

1. *A. ventricosa*.

2. *A. lutea*.

1. *Alphonsea ventricosa*, Hk. f. & Th. Vern. *Noga-kola*, Ass., *Norlok-arong*, *Jhingpu-arung-otirang*, Mik. (near Bar-pathar); *Thaisen-phang*, *Rulany-buphang*, Kach.; *Thet-look-ek*, *Jong-mot*, Kuki; *Pakna-kala*. Cach.

A tall tree with a short conical crown, attaining 100 ft. in height and 7 ft. in girth; branches at first softly tomentose but become speedily glabrous and blackish. *Leaves* 6-10 by 1.5-2.8 in., oblong to oblong-elliptic, shortly acuminate; cuneate or rounded at the base, coriaceous, glabrous except for a little pubescence on the midrib beneath when young, shining above, turning yellow before falling; lateral nerves slender, irregular, 12-18 on either half, reticulations fine and open; petiole 1-2.5 in. long, stout, pubescent. *Flowers* greenish-white, 3-4 in. long, in short leaf-opposed extra-axillary racemes; pedicels 4-5 in. long, rusty-tomentose, with a bracteole at the base and another about the middle. *Sepals* very small, broadly ovate or deltoid, acute, tomentose outside. *Petals* 4-5 in. long, sub-equal, oblong, acute, sub-cordate and more or less saccate at the base, pubescent on both surfaces. *Stamens* broad, pointed. *Carpels* oblong, tapering to the apex, densely pubescent; ovules many. *Ripe-carpels* 1.5-2.5 by 1.2-1.8 in. diam., ovoid, minutely pubescent, yellowish when ripe, up to 4-5 from a single flower; stalk 4-5 in. long. *Seeds* compressed, in two rows, immersed in an aromatic yellowish pulp; testa horny, brown.

Along the foot of the NAGA HILLS in LAKHIMPUR and SIBSAGAR; CACHAR including the NORTH CACHAR HILLS; Singa Reserve in SYLHET; NOWGONG; Khaling-duar in DARRANG; GOALPARA—Guma res.; and KHASI HILLS—Raikhwang; probably all over the province.

Wood greenish brown, even-grained. Medullary rays of varying thickness, rather broader than in most other Anonaceous trees, tangential bars very close; pores large, often sub-divided. It is very elastic and is used for posts, poles, etc. Weight about 40 lbs. per c. ft. The aromatic pulp of the ripe fruit is eaten.

Figs. 3-4. Fr. 7-9.

2. *Alphonsea lutea*, Hk. f. & Th. Vern. *Jong-mot-kung*. Tipp. The Vernacular names of *A. ventricosa* are also loosely applied to this species.

Apparently a somewhat smaller tree than the foregoing species; young parts minutely rufous-tomentose. *Leaves* 2.5-6 by 1.2-2.3 in., ovate-oblong to elliptic, obtusely acuminate, sub-cuneate or rounded at the base, coriaceous, glabrous and shining above, sparsely strigose beneath; lateral nerves 8-10 on either half, faint and irregular. *Racemes* very short, leaf-opposed, subsessile, each with 2 or 3 flowers and many small bracts. *Flowers*, 6-7 in. diam.; pedicels tomentose, with only one bracteole rather

above the middle. *Sepals* connate into a 3-cornered shallow cup, tomentose outside, glabrous inside. *Stamens* short, broad, flat in three rows. *Carpels* oblong, compressed, strigose; style very short glabrous. *Ripe carpels* 2-4, open solitary, 1.3-1.5 by .8-1.2 in., broadly ovoid, pointed, puberulous; stalk .2-.4 in. long, very stout. *Seeds* 3-6, in two rows, oval-oblong, pointed.

Occurs along the south-eastern boundary of the PROVINCE chiefly in CACHAR and SYLHET, and is very liable to be mistaken for young individuals of the other species.

Economic uses and flowering and fruiting time are Probably the same as of *A. ventricosa*.

7. CYATHOCALYX, Champion.

Cyathocalyx martabanicus, Hk. f. & Th. Vern. *Bolong*, Garo; *Hrieroth*, Lushai.

A tall and graceful evergreen tree with a narrow crown attaining about 140 ft. in height and 6 ft. in girth. *Bark* .3-.5 in. thick, grey and fairly plain but with a few horizontal wrinkles outside, dun-brown and faintly mottled inside, innermost layers in fibrous plates. *Leaves* sub-bifarious, 4-9 by 1.2-3 in. elliptic or elliptic-oblong, bluntly acuminate, cuneate or sometimes rounded at the base, coriaceous, glabrous, dark-green and shining above, somewhat pale beneath, turning yellow before falling; lateral nerves 8-12 on either half, very oblique, arching, slightly impressed above; reticulations very fine but distinct; petiole .3-.5 in. long, margined. *Flowers* extra-axillary, sometimes opposite the axils, usually solitary, .8-1.5 in. long, densely buff-pubescent throughout, pedicels .3-.5 in. long. *Calyx* as long as the pedicel, deeply divided; lobes oblong-lanceolate, reflexed. *Petals* in two whorls of three each, .7-1.2 in. long, oblong-lanceolate, spreading, somewhat fleshy, of the inner whorl slightly smaller. *Stamens* numerous truncate; anthers extrorse. *Mature carpel* solitary, 2.5-3 by 2-2.5 in., oblong, transversely depressed between the seeds, greenish-white, turning to cherry-colour when fully ripe. *Seeds* 6-10, transversely set in two rows, 1-1.2 by .7-.9 in., oblong, flat, with a blunt ridge right round, brown shining; albumen mottled.

LUSHAI, NORTH CACHAR and the GARO HILLS, up to 3,000 ft. Rather rare.

The timber, though soft appears to be very elastic. The sweetish-aromatic pulp of the ripe fruit is eaten.

Fls. 4-5. Fr. 10-11.

8. MILIUSA, Lesch.

Trees or shrubs. *Flowers* usually 2-sexual, rarely polygamous, green or red, axillary or extra-axillary, solitary fascicled or cymose. *Sepals* 3, small, valvate. *Petals* 6 in 2 series, valvate outer small like the sepals, inner larger but thinner, at first cohering by their margins, ultimately free. *Stamens* definite or indefinite; anthers extrorse; connective slightly apiculate. *Carpels*

indefinite ; style usually very short. *Ripe carpels* globose, 1-2- or many-seeded.

Leaves velvety-tomentose on both surfaces, apiculate ;—

Flowers 2-sexual, *Ripe carpels* puberulous, 2-seeded. ... 1. *M. velutina*.

Leaves glabrous and shining above, acuminate.

Ripe carpels, 1-seeded ;—

Flowers 2-sexual. Leaves up to 7 in. in length, sub-

coriaceous.

... 2. *M. macrocarpa*.

Flowers polygamous. Leaves up to 5 in. in length.

membranous.

... 3. *M. Roxburghiana*.

1. *Miliusa velutina*, Hk. f. and Th. Vern. *Bor-Samphol*, Garo.

Rather a small-sized deciduous tree usually not exceeding 40ft. in height ; young branches and all other parts grey-tomentose. *Bark* dark-greyish-brown, rough, inside dun-brown, soft, 7-1 in. thick, fibrous. *Leaves* very variable in size and shape, 4-10 by 2.5-6 in., ovate-elliptic oblong or obovate, acute or shortly acuminate, more or less cordate at the base, sub-coriaceous, aromatic, thinly velvety-tomentose above, more densely beneath, turning yellow before falling ; lateral nerves 12-16 on either half, slender, slightly arched ; petiole 1-2 in. long. *Flowers* pale-yellow, about 4 in. diam., on 2-4 in. long slender ebracteolate pedicels, which arise singly or 2-3 together from short leaf-opposed peduncles. *Sepals* and *outer petals* similar, 1-in. long ovate, valvate in bud ; inner petals 2-3 in. long, broadly ovate, dark-brown, densely tomentose outside, glabrous inside. *Stamens* short ; filaments stout shortly apiculate ; anthers distinct and distant. *Carpels* 2-ovuled ; stigma sessile. *Ripe carpels* 5-7.5 in. in diam., ovoid or oblong, bluish-purple, on stalks 25-35 in. long. *Seeds* 2 on a parietal placenta.

Foot of the GARO HILLS in Sal-bearing tracts e. g. near Fulbari ; also on the Tokrabhandha and Chandordinga Hills of the North bank of the Brahmaputra in GOALPARA. Rare except in the above localities.

Wood weighs about 40 lbs per c. ft. and is moderately hard and durable, but being liable to warp is seldom used as timber.

Fls. 2-5, Fr. 8-10.

2. *Miliusa macrocarpa*, Hk. f. and Th.

A small tree ; branchlets thin dark-brown, lenticellate when old. *Leaves* 2-7 by 1-2.4 in., bifarious, oblong, oblong-lanceolate or oblanceolate, caudate-acuminate, more or less acute at the base, membranous or chartaceous, dull and glabrous above except the midrib which is puberulous or muricate, pale but perfectly glabrous and shining underneath ; main lateral nerves about 8 on either half, arcuate, slender but conspicuous, anastomosing to form a looped intramarginal nerve ; petiole 12-2 in. long, stout, channelled. *Flowers* 7 in. across, extra-axillary or leaf-opposed, solitary or in few-flowered cymes on pedicels 1.25-2 in. long, which expand towards the upper extremity ; buds globose or ovoid. *Sepals* and *outer petals* alike, ovate, acuminate, reflexed, glabrous and granulate outside, dull rusty-pubescent within. *Inner petals* obovate, 5-6 in. long, erect, reddish-brown with red veins, glabrous except for a few rugacious hairs near the margins

and extremities on the inner surface. *Stamens* numerous intermixed with hairs; anthers linear. *Carpels* numerous, pubescent, stalked, 1-2-ovuled. *Ripe carpels* .6-.8 by .3-.4 in., oblong or obovoid, terete, generally 1-seeded; pericarp pulpy.

KHASI HILLS e.g., Wah Mawkhap, and similar other localities 3-5,000 ft. Fls. 3-5.

3. *Miliusa Roxburghiana*, Hk. f. and Th. Vern. *Bon-ponial*, (Makum); *Chhag-loti*, *Chhag-ladoi*, Ass. (N. Lakh); *Jora-bhanora*, Ass. (Darrang), *Dieng-khong*, Khasi, *Dieng-jwat*, Synt. *Tase-mayang-changne*, Daff.

A small deciduous tree scarcely more than 20 ft. in height with spreading branches and pubescent young shoots. *Bark* grey, fairly smooth but often with vertical rows of lenticels, inside dark-brown, turning deeper brown after exposure. *Leaves* 2-farious, somewhat aromatic 2-5 by .8-2 in., elliptic, oblong or lanceolate, acuminate, thinly coriaceous, upper surface glabrous except the puberulous midrib, lower at first pubescent, glabrescent with age; main lateral nerves about 10 on either side of midrib, arched and looped to form an intramarginal nerve away from the edge, tertiary veins inconspicuous; base more or less rounded; petiole about .1 in. long, pubescent. *Flowers* dioecious or polygamous about .5 in. long, axillary, solitary or 2-3 together on pedicels .5-1.5 in. long. *Sepals* and *outer petals* alike, small, lanceolate, reflexed, tomentose outside; *inner petals* red, .5-.6 in. long, ovate, subacute, more or less saccate at the base. *Ripe carpels* oblong or subglobose, .3-.35 in. long, glabrous, verrucose, on slender stalks .4-.8 in. long, generally 1-seeded.

Occurs in most DISTRICTS ascending to 4000 ft. in KHASI HILLS.

Wood greyish-white, hard; tangential bars close, numerous, wavy; medullary rays of various thickness, very numerous; pores very scanty; weight about 50 lbs. per c. ft. The wood is fit to be used for agricultural implements and such other purposes. The bruised leaves are used by the Daffias as smelling salt when they get headache.

Figs. 3-4. Fr. 11-12.

9. SAGERÆA, Dalz.

Sageræa laurina, Dalz. Syn. *Bocagea Dalzellii*, Hk. f. and Th.

A middle-sized tree up to 60 ft. in height and over 3 ft. in girth with a conical crown and thin glabrous branchlets. *Bark* grey and fairly plain outside with very faint vertical fissures .25-.5 in. apart, inside dull-white, consisting of alternate broad bands of fibrous tissue and similar bands of granular tissue. *Leaves* binarious, 3-5 by 1-1.4 in., elliptic or oblanceolate, often somewhat unequal-sided, bluntly caudate-acuminate, abruptly cuncate at the base, chartaceous, glabrous and shining above, with minute translucent dots, and resinous mango-like smell when bruised, turning yellow before falling, midrib prominent beneath, puberulous; lateral nerves about 10-12 on either half, faint and irregular; petiole .2-.25 in. long flattened above, sub-verrucose beneath. *Flowers* dull-yellow, sweet-scented, .25-.3 in., in diam.,

from axile of previous year's leaves, solitary or in fascicles of 2-10, on sessile or stalked tubercles; pedicel 15-5 in. long with scaly bristles at the base. *Sepals* about 15 in. long, ovate, concave. *Petals* of both whorls similar in every respect, 5 by 16 in., thin in texture, more or less spreading. *Anthers* indefinite, dorsal. *Carpels* about 12; ovules about 12 in two rows; style short, lateral. *Ripe carpels* 4-10, shortly stalked, about 1 in. long, 1-seeded.

Only found so far on the Sanitarium Hill near Tura, GARO HILLS.

Wood of a slaty-grey colour even-grained, hard, weighing about 47 lb per c. ft; medullary rays moderately broad, very regular; appears to be suitable for cabinet work.

Fls. & Fr. 2-4.

10. ANONA, Linn.

Shrubs or small trees. *Leaves* pellucid-punctate. *Flowers* terminal or leaf-opposed solitary or in fascicles of 2-3, drooping, yellowish-green. *Sepals* 3, small, valvate. *Petals* 3 or 6; of the outer whorl fleshy and 3-quetrous above with a thinner concave base; of the inner whorl, if present, very small, strap-shaped. *Carpels* partly free in flower, afterwards confluent into a large syncarpous fleshy fruit, 1-ovuled, 1-seeded. *Seed* with fleshy albumen.

Leaves 1.5-5 in. long, dark-green. Fruit greenish-white, deeply areolate and tubercled.

Leaves 5-8 in. long, light-green. Fruit reddish-brown, faintly areolate, not tubercled.

1. *A. squamosa*.

2. *A. reticulata*.

1. *Anona squamosa*, Linn. Vern. *Ata*, Beng.; *Ata-Kothal*. Ass.; *Sitaphal*, Hind. The Custard Apple.

Small tree with a somewhat bushy habit: branches thin, glabrous. *Leaves* 1.5-5 by 1-2 in., oblong or oblong-lanceolate, obovate, obtuse or rounded at the extremity, acute at the base, membranous, glabrate, aromatic; lateral nerves about 8 on either half, slender, oblique; petiole 3-5 in. long. *Flowers* about 1 in. long, pubescent. *Fruit* 2-3 in. in diam., globose deeply white-areolate when ripe; pulp white, sweet, aromatic; seeds 4-5 in. long, oblong-lanceolate in outline, testa horny glossy-black.

Cultivated in LOWER ASSAM and SURMA VALLEY for the fruit.

The roots, bark, leaves and seeds have valuable medicinal properties.

Fls. 3-5. Fr. 8-11.

2. *Anona reticulata*, Linn. Vern. *Nona*, Beng. *Ramphal*, Hind.

A larger tree with longer branches and more open crown than the foregoing; branches thin dark-brown or black, glabrous; fibres reticulate. *Leaves* 5-8 by 1.5-2.5 in., lanceolate or oblong-lanceolate, acuminate, subcoriaceous glabrous, dark-green. *Flowers* 2-3 together. 1-1.3 in. long; inner whorl of petals usually present. *Fruit* 3-4 in. diam. ovoid in outline reddish-brown when

ripe, smooth, faintly areolate, pulp pale, not so sweet or tasty as of the other species; seeds similar.

Sometimes cultivated, but often runs wild in the same localities as the other species. The wood of neither species has any timber value.

Fls. 7-8. Fr. 11-3.

11. UVARIA, Linn.

Scandent or straggling shrubs usually stellately pubescent, *Flowers* 2-sexual, terminal or leaf-opposed, solitary or in fascicles of 2-4, or cymose, yellow, purple or brick-red. *Sepals* 3, valvate, often connate below. *Petals* 6, large, orbicular, oval or oblong in two rows, imbricate, often connate at the base. *Stamens* indefinite; connective concealing the anthers. *Torus* depressed. pubescent or tomentose. *Carpels* indefinite, linear-oblong; style short; ovules usually many in two series. *Ripe carpels* many. ovoid or oblong, stalked, dry or baccate, few or many-seeded.

1. Outer stamens sub-foliaceous :—

A. Leaves variously hairy. Ripe carpels tomentose :—

Peduncles extra-axillary, 1 flowered.

Flowers brick-red, 2 in. in diam.

1. *U. Hamiltoni*.

B. Leaves glabrous or nearly so. Ripe carpels

glabrous :

Peduncles leaf-opposed. Flowers pale yellow, 3 in. diam.

2. *U. bracteata*.

Peduncles extra-axillary or terminal.

Flowers purple, 1.5 in. in diam.

3. *U. macrophylla*.

II. Stamens all cuncate :

Leaves glabrous. Peduncle leaf-opposed or

terminal. Flowers brick red, 2 in. in diam.

Ripe carpels glabrous.

4. *U. lurida*.

1. *Uvaria Hamiltoni*, Hk. f. & Th.

A large woody climber : branchlets rusty-tomentose, often circinate. *Leaves*, 4-8 by 1.8-1 in., elliptic-oblong or obovate, acuminate, rounded or slightly cordate at the base, membranous, adpressed-pubescent, ultimately glabrescent above, softly stellate-pubescent beneath; lateral nerves 11-20 on either half, prominent beneath; petiole 1.5-2 in. long. *Flowers* about 2 in. in diam., extra-axillary, solitary or 2-3 together; peduncles 1.5-1.8 in. long; bract basal, suborbicular. *Sepals* broadly triangular, mucronate, membranous. *Petals* about 1 in. long, red, obovate, coriaceous, minutely tomentose, incurved. *Anthers* about 2 in. long, subsessile. *Carpels* compressed, pubescent. *Ripe carpels* red, about 1.5 in. long, obovoid, tomentose; stalks slender, 1-1.5 in. long, tomentose.

Var. *Kurii*, King which differs from the type by having leaves with semi-cordate broader base and fewer nerves, somewhat smaller and yellowish flowers and shorter pedicels, has been found in the Guma Reserve in GOALAPARA and probably occurs in similar localities in other DISTRICTS.

The type occurs in all DISTRICTS in the BRAHMAPUTRA VALLEY and possibly also the SURMA VALLEY.

Fls. 6-7. Fr. 9-12.

2. *Uvaria bracteata*, Roxb.

A large woody climber; young branchlets rusty-tomentose otherwise dark-brown. *Leaves* 3·5-7 by 1·25-2·5 in. oblong, oblong-lanceolate or oblanceolate, acute or shortly acuminate, tapering towards the rounded or subcordate base, chartaceous, thinly pubescent when very young chiefly along the midrib and nerves, afterwards glabrescent; lateral nerves about 11-13 on either side of the midrib, slender, oblique, slightly arched; petiole 1·5-3 in. long, glabrescent, shining. *Peduncles* extra-axillary, very short, generally 2 flowered; pedicels 3-7 in. long, rusty-tomentose; bracts 2 or 3, rather unequal, leafy. *Flowers* pale-yellow, 6-7 in. in diam. *Sepals* about 1·5 in. long, suborbicular or broadly ovate, connate at the base, pubescent, recurved when the flower is fully open. *Petals* green at first, fading to pale-yellow, 3-4 in. long, broadly ovate, fleshy but with thin margins, concave, shining. *Anthers* sub-sessile, oblong. *Carpels* 10-18, linear, pubescent. *Ripe Carpels* about 2 by 1·3 in., oblong, rounded at both ends, yellow when ripe, glabrous; seeds discoid.

SYLHET and GOALPARA, chiefly in shady ravines.

Fls. 5-6. Fr. 8-10.

3. *Uvaria macrophylla*, Roxb.

A stout woody climber; young parts and petioles rusty-tomentose. *Leaves* 5-10 by 2·5-4 in., elliptic-oblong or ovate, abruptly acuminate, coriaceous, glabrous or glabrescent above except the tomentose midrib and main nerves, rusty stellate-tomentose below; lateral nerves 11-18 on either half, very prominent; base rounded or slightly cordate; petiole 2-3 in. long. *Flowers* purple, 1·5 in. diam. on few-flowered extra-axillary or terminal bracteate peduncles. *Sepals* connate in to a 3-toothed cup about 3 in. in diam. *Petals* 5-6 in. long, purple fleshy, tomentose outside, pubescent inside. *Anthers* sessile. *Ripe carpels* 7-1·5 in. long, oblong, glabrous, on stalks 5-1 in. long from a woody hemispherical torus 1 in. in diam. often with one or two shallow transverse depressions. *Seeds* numerous oval, compressed, shining.

Holongapar Reserve, SIBSAGAR DISTRICT, and possibly elsewhere in similar localities.

The ripe carpels are eaten.

Fls. 5-6. Fr. 9-11.

4. *Uvaria lurida*, Ilk. f. & Th.

A large woody climber; young parts with rusty-stellate scales. *Leaves* 4-7·5 by 1·25-2·4 in., oblong, oblong-lanceolate or oblanceolate, acute or shortly acuminate, rounded or subcuneate at the base, coriaceous, adult glabrous, dark-green and shining above, dull-green underneath; main lateral nerves 8 to 10 on either half with often a few shorter ones between; petiole 1·5-2·5 in. long incurved, verrucose. *Peduncles* terminal or leaf-opposed, 1-2 flowered, about 1 in. long, elongating in fruit, ebracteolate rough with scales; buds globose (club-shaped with the peduncle). *Flowers* 1·5-2·25 in. across. *Sepals* 3, connate at the base, verrucose

outside, pubescent inside. *Petals* 6, uniform, in 2 series and imbricate until fully open, afterwards apparently in a single whorl with valvate margins, broadly ovate, with inflexed tips; brick-red, densely scaly-pubescent outside, minutely pubescent within. *Anthems* about .15 in. long, cuneate with truncate tips. *Carpels* numerous, stalked. *Ripe carpels* 1.2-1.7 by .6-.7 in. cylindrical but narrowed and strongly 3-quetrous at the base, 3-6 seeded; stalks 4-6 in. long. *Seeds* in a single row compressed or globose.

Northern slopes of the KHASI HILLS. up to 2,500 ft., e. g., near Um-Ran.

Fls. 3-5. Fr. 8-11.

12. ARTABOTRYS, R. Br.

Artabotrys caudatus, Wall. Vern. *Dhupa-lota*, Ass.

A large woody climber; young shoots pubescent. *Leaves* 3-5 by 1.2-2.2 in. oblong or elliptic, abruptly bluntly-acuminate, margins often slightly recurved, subcoriaceous, glabrous; lateral nerves 8-12 on either half arched and looped to form intermarginal veins, tertiaries laxly reticulate; base cuneate; petiole .2-.3 in. long. *Flowers* .6-.8 in. long, brown-silky 2-6 from the extremities of recurved and laterally-compressed peduncles. *Sepals* about .15 in. long, broadly triangular-ovate, pubescent. *Petals* .6-.8 in. long, narrowed to the apex, rusty-silky. *Ripe carpels* .4-5, 2 in. long, elliptic, dark-purple. *Seeds* 2, 1 by .6 by .25 in., brown, compressed, rugose, with shallow grooves along the faces and

Garampani SIBSAGAR DISTRICT: Makum Range, LAKHIMRUR DISTRICT. and possibly in all evergreen forests between those two localities.

Fls. 3-5. Fr. 10-12.

13. OXYMITRA, Bl.

Oxymitra fornicata, Hk. f. & Th. Vern. *Mota-bokol-bih*, Ass; *Dumakhal*, Garo; *Rampun-kung*, *Hruirang-monlai*, Tipp.

A woody climber, somewhat gregarious in habit; young shoots brown silky-pubescent, stem dark-brown. *Leaves* 4-7 by 1.3-2.5 in., obovate, oblong or oblanceolate, membranous, glabrescent above, softly pubescent especially along the midrib and nerves beneath; lateral nerves 14-18 on either half, nearly straight, tertiaries transverse to the secondaries, more or less straight and parallel; base subacute or abruptly rounded, sometimes slightly cordate; petiole .2-.3 in. long, densely rusty-tomentose. *Flowers* large, 6-7 in. across when fully-developed, green to pale-yellow, solitary and leaf-opposed or 2-3 on short leafless shoots; peduncles .5-.8 in. long, rusty-pubescent, bracteate at the middle, or sometimes only a little above the base. *Sepals* .6 by .2 in. ovate, acuminate, membranous, pubescent, deciduous. *Petals* membranous, pubescent, outer 2-4 by 1-1.7 in., flat, 5-7 nerved, inner much varying in size from .3 by .2 to 3.2 by 1 in.,

—conniving by a flexure at the base over the carpels and stamens. *Ripe carpels* about 10, subsessile, '6-1 by '2-3 in., cylindrical, verrucose, coppery-puberulous.

There appear to be two varieties of this plant.—1. *Leaves* elongate, sub-acute at base, sparsely pubescent underneath when mature; *inner petals* small.—2. *Leaves* ovate or obovate, with a rounded or subcordate base, more densely pubescent underneath; *inner petals* only slightly smaller than outer.

The commonest Anonaceous plant in all evergreen forests of ASSAM.
Fls. 4-6. Fr. 10-12.

14. MELODORUM, Dunal.

Climbing shrubs. *Flowers* terminal, axillary or leaf-opposed solitary or fascicled; buds triquetrous. *Sepals* 3, small, valvate connate below. *Petals* 6, valvate in two series; of the inner series, triquetrous above, hollowed and concave below. *Stamens* numerous; anther cells contiguous, dorsal. *Carpels* many, free style oblong; ovules 2 or more. *Ripe carpels* berried.

- I. Leaves usually densely pubescent on both surface :—

A. Flowers solitary or fascicled :—

Stalk of ripe carpels 4-8 in. long.

Stalk of ripe carpels '2-3 in. long.

B. Flowers solitary and axillary or in false terminal panicles of 4-6 flowers :—

Stalk of ripe carpels 1-1'6 in. long.

- II. Leaves wholly glabrous at least above :—

Flowers solitary or in fascicles of 2-3, stalk

of ripe carpels 1 in. long.

Flowers cymose, about '25 in. long,

Flowers cymose, minute.

1. *M. verrucosum*.

2. *M. bicolor*

3. *M. rubiginosum*.

4. *M. Wallichii*.

5. *M. polyanthum*.

6. *M. rufinerve*.

1. *Melodorum verrucosum*, Hk. & Th. Vern *Jyrmisoh-ram-khlaw*, Khasi.

A large woody climber; young shoots rusty-tomentose; stem lenticelled. *Leaves* 4-6 by 1'2-2 in., oblong or oblong-lanceolate, acute or acuminate, thinly coriaceous, glabrous above except on the puberulous midrib, softly rusty-tomentose beneath, pinkish-brown when very young; lateral nerves 15-18 on either half, very oblique, almost straight, open with a few very short intermediate nerves, tertiaries very fine, about '05 in. apart, sub-parallel; base rounded or sub-acute; petiole '3-4 in. long, rusty tomentose. *Flowers* solitary, generally leaf-opposed, pale-yellow, delightfully scented, '5 in. long, on bracteate peduncles '6-1 in. long. *Sepals* '2 in. long, broadly ovate spreading, tomentose outside. *Petals* minutely tomentose or puberulous outside. *Carpels* strongly tubercled, rusty pubescent, young club-shaped, ripe globose, 1'5-2 in. in diam., often with a sharp ventral ridge; stalk '1-6 in. long, stout, expanding upward. *Seeds* in two rows closely packed ridges along the edge; pulp aromatic, edible.

MIKIR HILLS and the Nambor Res. SIBSAGAR DISTRICT; Dirju, NORTH LAKHIMPUR; Nongstion, Raliang, Shongdain, etc. about the foot of KHASI HILLS; possibly in all ever-green forests of Assam especially near hills. The ripe berries are eaten with much relish.

Fls. 3-5. Fr. 10-1.

2. *Melodorum bicolor*, Hk. f. & Th. Vern. *Hed-bheduli*, Ass. (Sibs.) ; *Moja-kotta* Waff. ; *Rhuibom* Kuki.

A large woody climber ; stem black ; bark fibrous, brown inside, turning deeper-brown on exposure ; young shoots rufous-hairy. *Leaves* 3-7 by 1·3-3 in., oblong or elliptic-oblong, generally rounded at both ends, thinly coriaceous, glabrous above except on the midrib ; pilosely adpressed hairy underneath, the hairs sometimes varying in colour from light-grey to dark purplish-brown ; main lateral nerves 16-20 on either side of the midrib ; often with shorter intermediate ones between, slightly arched, not looped, tertiaries sub-transverse and sub-parallel ; petiole 2·5 in. long, swollen, slightly channelled, densely rufous-tomentose. *Flowers* generally leaf-opposed, 7·9 in. long, on peduncles 2·3 in. long which are bracteate at the base. *Sepals* ovate, spreading, rufous or grey pubescent outside ; glabrous inside. *Petals* leathery ; outer 6-8 in. long, ovate, yellowish, densely rufous or tan-silky outside, glabrous inside ; inner smaller, deep-red, glabrous. *Carpels* densely tan-silky. *Ripe carpels* about 1 in. diam., globose, mucronate, pubescent, on stalks 25-35 in. long ; torus spherical ; seeds 4-8 oblong.

Fairly common in ever-green forests in LAKHIMPUR, SIBSAGAR and DURRANG, also in the SURMA VALLEY.

Fls. 3-4. Fr. 8-10 (?)

3. *Melodorum rubiginosum*, Hk. f. & Th. Vern. *Thir Kalwang* (*Gahwang*) Garo.

A large woody climber ; young parts rusty-tomentose. *Leaves* 3-10 by 1-4·5 in. oblong or elliptic, acute or abruptly cuneate or rounded at the base, coriaceous, pubescent or tomentose along the stout midrib and nerves otherwise glabrous above, densely rusty-velvety beneath ; lateral nerves 12-14 on either side of the midrib very prominent, oblique, only curving at the outer extremity otherwise straight ; tertiary nerves, transverse to the secondary, parallel ; petiole stout, 4-5·5 in. long, densely rusty tomentose. *Flowers* axillary, solitary or in pairs, sometimes in false terminal panicles of 4-6 flowers due to the fall of the upper leaves, delightfully scented ; pedicels 8-12 in. long with 1 or 2 small ovate bracteoles. *Sepals* 1 in. long broadly ovate, acute, spreading. *Petals* with a broad concave base, outer 1-1·2 in. long, oblong, acuminate, inner more fleshy, smaller and narrower with a thick triquetrous limb. *Stamens* numerous ; anthers linear ; connective with a thin spatulate apical process. *Carpels* 8-10 densely silky ; style short ; ovules many, in 2 rows. *Ripe carpels* 1-1·2 in. long, obliquely ovoid, tomentose ; stalks 1-1·5 in. long.

Chandkhira in SYLHET : Rongrengiri, GARO HILLS : and possibly in all other similar intermediate localities between those two points.

Fls. 11-1.

4. *Melodorum Wallichii*, Hk. f. & Th.

A large woody climber ; branchlets often cirrhiform ; young parts slightly yellow-pubescent. *Leaves* 3-5·5 by 1-1·5 in.,

oblong-lanceolate, acuminate, slightly rounded or sub-cuneate at the base, thinly coriaceous, glabrous and green above, sparsely adpressed-pubescent and pale beneath; lateral nerves 10-12 on either half, oblique, slightly arched; petiole 2-25 in. long, terete, slightly channelled. *Flowers* about 7 in. long, generally leaf-opposed, solitary or in fascicles of 2-3, with 1-3 bracteoles at the base; pedicels 15-3 in. long, elongating in fruit. *Sepals* 25 in. long, ovate, connate at the base, puberulous. *Petals* fleshy, outer 65 in. long, oblong-lanceolate, densely rufous-velvety outside, glabrous inside, inner shorter. *Stamens* numerous; filaments short; anthers linear with short, conical connectives. *Carpels* oblong, oblique. *Ripe carpels* about 1 in. long and 75 in. diam., ovoid, mucronate; stalks 1-14 in. long.

CACHAR. *e. g.*, Phuleria; UPPER ASSAM and the KHASI HILLS.
Fls. 11-12.

5. *Melodorum polyanthum*, Hk. f. & Th. Vern. *Karle-phingnu*, Mik.

A large woody climber; young shoots very minutely puberulous or glabrous; stem dark coloured. *Leaves* 3.5-7 by 1.5-2.4 in., oblong, elliptic or obovate, finely acute or shortly acuminate, subcoriaceous, minutely puberulous along the closely reticulated tertiary and quaternary nerves above, more palpably on the larger nerves and beneath; lateral nerves 16-20 on either half, slender but raised and conspicuous underneath, only slightly curved near the free outer extremities, tertiaries very fine, parallel, transverse to the secondaries; base rounded or subacute; petiole 3-4 in. long, swollen, finely channelled. *Cymes* short, leaf-opposed or often slightly below the level of the axils, usually 4-8-flowered; pedicels 2-3 in. long, densely buff-pubescent, bracteate about the middle. *Flowers* 3 in. long, pale-orange, sweet-scented. *Sepals* 15 in. long, broadly ovate-triangular, spreading, puberulous. *Petals* 2-25 in. long, broadly ovate, leathery, buff-silky outside, inner smaller, buff-puberulous outside especially at the tips. *Carpels* and their styles hairy.

Barpathar, Garampani and Tengalibam, SIBSAGAR and possibly in similar localities, generally along edges of glades or streams in ever-green forests.

The ripe fruit is eaten by the Mikirs.

Fls. 11-2. Fr. 7-9. (?)

6. *Melodorum rufinerve*, Hk. f. & Th.

An imperfectly known large woody climber with slender dark-coloured glabrous branchlets. *Leaves* 5-10 by 2-4 in., elliptic, tapering to an obtuse or acute point, rounded or retuse at the base, thinly coriaceous, glabrous above, minutely pubescent and glaucous beneath; lateral nerves 12-14 on either half, slender, arching; petiole 5-65 in. long, glabrous. *Flowers* minute in few-flowered, leaf-opposed pubescent cymes; pedicels 25 in. long with a small bracteole about the middle. *Sepals* broadly ovate. *Petals* fleshy.

Believed to occur in SYLHET and CACHAR.

FAM. 5. MENISPERMACEÆ.

Usually climbing or twining shrubs ; wood with broad, medullary rays and large pores in wedge-shaped groups. *Leaves* alternate, simple, entire or lobed, rarely distantly toothed, usually palminnerved, exstipulate. *Flowers* small, dioecious or polygamous. *Sepals* generally 6 in two whorls of 3, rarely 4-12, those of the outer whorl minute. *Petals* generally 6, similar to the sepals, exceptionally 3, or 3-5-8. **MALE FLS :** *Stamens* usually 6, opposite to the petals, free, or forming a column on which the anthers are borne. **FEM. FLS :** *Carpels* 3, distinct, rarely 1, 6 or more, usually 1-ovuled. *Staminodes* 6 or 0. *Style* terminal in flower, generally lateral or sub-basal in fruit. *Ripe carpels* drupaceous, 1-seeded. *Seed* curved, with a woody endocarp ; albumen even or ruminant or 0.

- I. *Leaves* ovate or orbicular, generally not much longer than broad :—

• A. *Leaves* peltate or sub-peltate, style scar basal or sub-basal :—

1. *Petals* free :—

Leaves generally glabrous.

Flowers in axillary pedunculate umbels, style 3-6 partite.

Leaves pubescent. *Flowers* in axillary panicles ; style 2-partite.

2. *Petals* connate in male flowers, solitary in female :—

Male flowers cymose, female racemed ; sepals 4 free ; style 3-fld. ✱

Flowers in axillary panicles :—

Male calyx 4-5 lobed. Male

petals 4-6.

Male calyx 4-lobed. Male petals 0.

- B. *Leaves* not peltate :—

1. *Style* scar terminal or sub-terminal ;

Flowers racemed, or paniced, generally axillary :—

Leaves glabrous. *Filaments* connate ; stigma capitate, seed flat.

Leaves glabrous or not. *Filaments* free : stigmas forked ; seed curved or ventrally grooved.

2. *Style* scar sub-basal. *Flowers* in axillary panicles. *Leaves* hairy at the nerve axils.

- II. *Leaves* oblong or oblong-lanceolate, generally 2-3 times longer than broad :—

- A *Leaves* coriaceous, acute or more or less rounded at the base glabrous (in the species here dealt with.) :—

Leaves 3-nerved at the base. *Flowers* paniced *Style*-scar sub-basal :—

Anthers cells bursting vertically. *Style* compressed.

• *Anther* cells, bursting transversely. *Style* cylindrical.

1. *Stephania*.

2. *Pericampylus*.

3. *Cissampelos*.

4. *Cyclea*.

5. *Lophophyllum*.

6. *Aspidocarya*.

7. *Tinospora*.

8. *Anamirta*.

9. *Limacia*.

10. *Cocculus*.

Leaves 3-nerved. Flowers racemed.

Leaves penninerved. Flowers in axillary fascicles or panicles.

B. Leaves membranous, generally sagittate at the base, softly pubescent beneath: style-scar sub-terminal.

1. **Exc.**—Leaves often elongate in some species of *Stephania* not included in this Flora and often not peltate in *Cissampelos Pariera*.

11. *Hæmatocarpus*.

12. *Pycnarrhena*.*

13. *Parabona*.

1. STEPHANIA, Lour.

(Glabrous climbers. Leaves peltate, orbicular or deltoid. Flowers in simple or compound axillary umbels. MALE FLS.: *Sepals* 6-10, free. *Petals* 3-5, fleshy. *Anthers* 6, forming a ring on the top of the column formed of connate filaments. FEM. FLS.: *Sepals* and *petals* 3 each. *Carpel* solitary; style 3-6 partite. *Drupe* globose, glabrous; endocarp horse-shoe shaped, dorsally tubercled.

Leaves elongate-deltoid, petiole not exceeding 2 in. in length; umbels lax, long-peduncled.

Leaves ovate-deltoid; petiole up to 4 in. in length; umbels capitate.

Leaves orbicular; petiole up to 7 in. in length; umbels cymose.

1. *S. elegans*.

2. *S. bernandifolia*.

3. *S. glandulifera*.

1. *Stephania elegans*, Hk. f. & Th. Vern. *Mi-soh-iong-rit*. Khasi.

A small climbing shrub; main stem spirally fluted; branchlets slender, slightly angled, glabrous. Leaves 2.5-4 by 1-1.7 in., peltate, deltoid, acute, usually truncate at the base, thinly coriaceous, glabrous, pale beneath; main nerves 4-6 beside the midrib, all basal; petiole 7-1.5 in.; slender. Flowers small, purple or greenish, in umbels with many rays; peduncles 1-2 in. long, very slender. *Drupe* red when ripe of the size of a pepper-corn, endocarp tubercled on the periphery.

KHASI HILLS, 5,000 ft.

Fls. 8-9. Fr. 3-4.

2. *Stephania bernandifolia*, Walp. Vern. *Tuhuk-lot*, Ass. (Siba.); *Galdun*, Ass. (Garó Hills) *Nimukha*, Beng. *Kharkha*, (Siba).

A climber winding clockwise round supports; branchlets glabrous, striate. Leaves 3-6 in. long, often as broad as long or broader, broadly ovate-deltoid, peltate membranous, wholly glabrous, or glabrous and vivid-green above and pubescent or thinly felted especially along the nerves, or pale or glaucous beneath, margins even or wavy; basal nerves 8-10, tertiary very finely reticulate; petiole 1-4 in. long. Flowers yellow; ultimate umbels often head-like with sessile flowers; peduncle axillary, 1-3 in. long. *Sepals* obovate. *Petals* 3-4. *Fruit* red when ripe, 3 in. diam., globose.

* Fairly common especially in the SIBSAGAR DISTRICT.

The roots have medicinal properties and the leaves are applied on boils and septic inflammations.

Fls. 2-4. Fr. 3-12.

3. *Stephania glandulifera*, Miers. Syn. *S. rotunda* Lour. Vern. *Gana-grjo*, Nep.; *Soh-pung-um-lang-sang*, Khasi.

A large climber with tuberous roots, and rather fleshy branches; tubers globose, deep-yellow inside. *Leaves* 3-6 in. diam., orbicular, sometimes broader than long, usually peltate often with repand or lobed margins, membranous, glabrous; basal nerves generally 9, intermediate nerves very slender and finely reticulate; petiole 3-7 in. long. *Flowers* about 2 in. diam., yellow; peduncles axillary, 1.5-4 in. long. *Sepals* narrow-cuneate, puberulous; *petals* shorter. *Drupe* globose, 1.5-2.5 in. diam.

Laluk, NORTH LAKHIMPUR; Nauduar Reserve, DARRANG; KHASI-HILLS; Bamba block, GOALPARA.

The tubers are medicinal and the leaves are eaten by cattle and goats.

Fls. 11-1. (?) Fr. 4-5.

2. PERICAMPYLUS, Miers.

***Pericampylus incanus*, Miers. Vern. *Goria-loti*, Ass. *Baral-prati* Nep.; *Mi-syntneg*. Khasi.**

A climber, grey-tomentose all over. *Leaves* 2-4 in. diam., orbicular or very broadly ovate, very narrowly peltate or not peltate at all, acute or obtuse, mucronate, membranous, pubescent or soon glabrescent above, grey-tomentose beneath, densely ciliate along the margins; basal nerves usually 5, tertiaries and quarter-naries very fine, minutely reticulate; base truncate or subcordate; petiole 1-2 in. long, tomentose. *Flowers* small in 2-3 crotomons cymes; peduncles axillary, fascicled, often superposed, 1-2 in. long, tomentose. *Sepals* 6 in 2 whorls, villous, inner spatulate. *Petals* 6, shorter than the sepals, cuneate, with recurved margins, pale-green. **MALE FLs.**: *Stamens* 6, free; anthers bursting transversely. **FEM. FLs.**: *staminodes* 6, clavate; *carpels* 3; style 2-partite. *Drupe* red, subglobose; style-scar sub-basal; endocarp horse-shoe-shaped, crested and echinate on the back.

Fairly common in NOWGONG and DARRANG, possibly also higher up the Valley; KHASI HILLS; CAHAR; GOALPARA.

The long branches are used in NOWGONG for tying purposes in house-building and are considered to be stronger and more durable than cane.

Fls. 4-5, Fr. ?

3. CISSAMPELOS, Linn.

***Cissampelos Pareire*, Linn. Vern. *Tubaki-lota*, or *Tubaki-lot*, Ass. (Sibs. & Lakh.); *Jyrmis-salla*, Khasi.; *Baral-panrhe*, Nep.; *Tupri-lewa*. Ass. (Kam.).**

A dextrorse climber which grows annually from perennial rootstocks; young parts usually tomentose or pubescent. *Leaves* 1-4 in. diam., orbicular, peltate or not, obtuse or sometimes retuse, mucronate at the apex, membranous or subcoriaceous, pubescent above, grey-tomentose beneath, or both surfaces glabrate especially the upper; base cordate or truncate, 5-7-nerved with minute reticulations between, yellow before falling; petiole as long as, or longer than the blade, tomentose or glabrate.

MALE. FLS. : cymose. *Sepals* 4-6. *Petals* 4, connate into a cup; *filaments* connate into a column with 4 connate *anthers* on top, which burst transversely. **FEM. FLS. :** racemed and crowded in the axils of leaf-like bracts. *Sepals* 2; *petals* 0 (or sepal 1 and petal 1), 2-nerved. *Carpel* 1; style 3-fid. *Drupe* '15-2 in. diam., obovoid-globose, compressed, hirsute, scarlet when ripe; style-scar near the base; endocarp horse-shoe-shaped with 4 rows of tubercles along the back.

Fairly common in all the DISTRICTS, especially on the MAJULI. (where however the variety with peltate leaves is rare). ascending to 2000 ft. in the KHASI hills.

The leaves and roots, are in used medicine.

Fls. 10-1. Fr. 3-5.

3. CYCLEA, Arnott.

Cyclea peltata, Hk. f. & Th.

A slender climber; branches longitudinally ribbed and pubescent or glabrate. *Leaves* 2-4 by 1·8-3 in., sometimes upto 7 by 5 in., deltoid or ovate, peltate, thinly coriaceous, glabrous or sparsely pilose above, glaucous and thinly pubescent beneath; basal nerves 9-13; petiole 1-2·5 in. long. *Flowers* small in axillary panicles 5-8 in. long. *Sepals* and *Petals* more or less connate; calyx exceeding the corolla. *Anthers* 4-6, connate and borne on the edge of the column formed by connate filaments. **FEM. FLS. :** *Sepal*, *Petal* and *carpel* 1 each, style with 3-5 radiating lobes. *Drupe* about '15 by '12 in., globose or obovoid, pilose; endocarp horse-shoe-shaped, tubercled; style-scar sub-basal.

The climber undoubtedly occurs in UPPER ASSAM but is liable to be mistaken for *Cissampelos Pareira* or *Pericampylus incanus*.

Fls. 7-9. Fr. 11-1.

5. LOPHOPHYLLUM, Griffith.

Lophophyllum bicristatum, Griff.

A large climbing shrub. *Leaves* 3-7 by 2·5-5·5 in., ovate, broadly cordate acuminate, firm and coriaceous, glabrous above rusty-pilose beneath, palmately 7-9-nerved from the base; petiole 1·5-4 in. long, thickened at both extremities. *Inflorescence* a slender tomentose compound panicle, axillary or from leafless nodes of the stem; *Flowers* minute. **MALE;** apetalous; **FEM.:** with 2 opposite lobed saccate sepals; buds '03 in. diam. *Anthers* 4-5, connate into a peltate disk. *Carpel* 1. *Drupe* '15-25 in. diam. orbicular, compressed, tubercled.

KHASI HILLS. *Hk. f. Th.* Apparently not very common. Distrib.—SIKKIM, BHUTAN, MANIPUR and BURMA.

Fls. 4-6. Fr. 8-10.

6. ASPIDOCARYA, Hk. f. & Th.

Aspidocarya uvifera, Hk. f. & Th.

A large evergreen climber; branches longitudinally ribbed. *Leaves* 4-6 by 3-5 in., ovate-cordate, tapering to an obtuse or

fine point, sometimes very narrowly peltate, thinly coriaceous, dark-green, glabrous or pubescent along the nerves beneath; basal nerves 5, tertiary laxly, but quaternaries very finely and closely reticulate; petiole 3-4 in. long. *Flowers* in very slender panicles from axils of fallen leaves. *Sepals* 12 in several rows, greenish, ciliate; *petals* 6, cuneate, concave. MALE FLS: *anthers* 6, on the top of the staminal column. FEM. FLS: *staminodes* 6, club-shaped. *Carpels* 3. *Drupe* '7-1 in. long, compressed, keeled on the back, surrounded by a toothed wing; seed oblong, flat.

Raigarh, near Dilmoor, N. E. FRONTIER; Jaipur Res., LAKHIMPUR, and possibly in other similar localities in those two DISTRICTS. Also Dikran Valley, DARRANG.

Fls. 2-4' Fr. 6-8.

7. TINOSPORA, Miers.

Succulent deciduous climbers with corky or papery bark, generally sending down long aerial roots from the branches of the tree on which they spread. *Leaves* generally cordate, not peltate, rather fleshy. *Flowers* in axillary or terminal racemes or panicles when the climbers are leafless. MALE FLS.: *Sepals*, *petals* and *stamens* 6 each, all more or less free; anthers oblique. FEM. FLS.: *Sepals* and *petals* 0; *staminodes* 6, club-shaped. *Carpels* 3. *Drupe* 1-3; style-scar terminal. *Seed* curved.

Leaves and new shoots glabrous:—

Bark corky, Stamens free. *Drupe* '3 in. long, globose; endocarp smooth.

1. *T. cordifolia*.

Bark warted. Stamens adnate to the base of petals.

Drupe 1 in. long, ellipsoid; endocarp tubercled.

2. *T. crispa*.

Leaves on both surfaces and young shoots hairy. Bark

papery. *Drupe* '4-5 in. diam., sub-globose; endocarp tubercled.

3. *T. malabarica*.

1. *Tinospora cordifolia*, Miers. Vern. *Hoguni-lot*, Ass.; *Gulanha*, Beng.

A large succulent climber with corky bark; young shoots glabrous. *Leaves* 3-4 in. long and as broad, orbicular or broadly ovate-cordate, acute or shortly cuspidate-acuminate, glabrous; petiole 1'5-2'5 in. long. *Flowers* greenish-yellow, glabrous. MALES fascicled: FEMALES solitary on longer pedicels. Bracts boat-shaped, the lower ones often leaflike. *Petals* cuneate. *Stamens* free; anthers oblong. *Drupe* 1-3, about '3 in. diam., globose, shortly stalked, red and glossy when ripe.

Not uncommon in riparian forests e.g., Majuli, DISTRICT SIBSAGAR.

A starchy extract is obtained from a cold infusion of the aerial roots and the thicker parts of the stem of this plant, which is much valued by Hindu physicians as a tonic febrifuge. Elephants are very fond of the aerial roots which act as a good tonic on them.

Fls. 2-4. Fr. 3-4.

2. *Tinospora crispa*, Miers. Vern. *Hoguni-lot*, Ass.

A large glabrous climber; stem warted. *Leaves* 2-6 by 1-4 in., ovate-oblong, shallowly cordate at base, glabrous; petioles

1-3 in. long. *Flowers* yellowish-green: bracts 15 in. long, subulate fleshy. *Stamens* adnate to the base of the petals; anthers square. *Drupe* about 1 in. long, ellipsoid, pale-yellow.

Occurs in similar localities as the foregoing species and probably possesses the same economic utility.

3. *Tinospora malabarica*, Miers. Vern. *Hoguni-lot*, Ass; *Pherua-mek-rikang*, *Phuroi-rikang*, Mikir; *Daoihuli*, Kach; *Wapel-ek-rang*, Kuki.

A large fleshy climber; bark papery, usually with lenticels which are often 4-fid; young shoots pubescent. *Leaves* 3-5 in. long and nearly as broad, broadly ovate or orbicular, cordate but abruptly truncate or cuneate and 5-7 nerved at the base, suddenly acute or acuminate; pubescent above and whitish-tomentose beneath; main lateral nerves 1 or 2 on either side of the midrib; ultimate reticulations minute; petiole 2.5-4 in. long. *Flowers* green, on racemes 1.5-4 in. long. *Mature carpels* 1.3, 4-5 in. diam., globose, turning at first yellow then bright crimson in ripening; endocarp tubercled.

Throughout UPPER ASSAM: the commonest species of this genus. The stem ~~is~~ sweetish but is likely to possess the same medicinal properties as *T. cordifolia*.

Fls. 2-3. Fr. 3-5.

Tinospora Masterellii, Diels. Pflanzenreich 46. Heft. p. 140 Syn. *T. crispa*, Miers. in part.

A climber with reddish brown warted bark. *Leaves* suborbicular acuminate membranous usually glabrous, 4-6 in. across, base retuse or subcordate, 5-7 nerved, lateral nerves usually 2 above the basal, prominent beneath. *Flowers* unknown. *Female* inflorescence racemose, 2-3 in. long, pedicels 5-8 in. long, stout. *Drupe* juicy and fleshy, endocarp crustaceous, subreniform about 6 in. long.

Griffith, ASSAM!

Fls. 8.

8. ANAMIRTA, Colebr.

Anamirta paniculata, Colebr. Vern. *Kakmari*. Beng. *Kakamari*, (crow's bane). Sans.

A powerful climber, wholly glabrous (except the axils of the nerves on the undersurface of the leaves); bark on old stems spongy outside and deeply cracked, smooth on branches, often sending down numerous rootlets. *Leaves* 3-10 by 2.5-8 in., ovate, shallowly cordate or truncate, bluntly sub-acute, coriaceous, glabrous, 3-5 nerved at the base, with 4-5 lateral nerves on either side of the midrib the axils of which are hairy, tertiaries indistinct; petiole 1-5 in. long, generally twisted at the base. *Panicles* 12-15 in. long, drooping from the old branches. *Flowers* green, scented, about 2 in. diam, glabrous; buds globose, 1 in. diam. MALE: apetalous but with 6 deciduous sepals; stamens numerous with 2 celled anthers round the top of a central column. FEMALE: with 9 club-shaped staminodes, all in one series; *carpels* usually 3 on a short gynophore; style lateral. *Drupe*s

usually in pairs, 4-6 in. long, subglobose or reniform, black, on stout stalks; endocarp rugose; albumen oily.

Occurs in the same localities as *Tinospora cordifolia* and liable to be mistaken for it: also in the Khasi Hills.

The fruit is very bitter and is used to poison crows and fish. The oil of the seeds is said to be used for industrial purposes. An ointment prepared from the berries is used as an insecticide and in cases of obstinate skin diseases.

Fls. 5-9. Fr. 11-12.

9. LIMACIA, Lour.

Limacia cuspidata, Hk. f. & Th.

A somewhat stiff climbing shrub of the habit of *Smilax*; branchlets striate; very young shoots pubescent. Leaves 2-4 by 8-15 in., ovate elliptic or lanceolate, acuminate, coriaceous, glabrous, glossy, 3-nerved and more or less rounded at the base with only 1 or 2 lateral nerves on either side of the midrib; petiole 4-6 in. long. Panicles:—MALE: 8-13 in. FEM.: 5-6 in. long, from supra-axillary villous tubercles; rachis hairy; bracts minute. Sepals 6 in two series. Petals 6, much smaller than the sepals. Stamens 8-12 (Kurz).; carpels 3. Drupes 4 in. long, globose, slightly compressed; style-scar near the base; seed curved; endocarp faintly tubercled.

Only once found by the writer on the western bank of the Gaurisagar tank. SIBSAGAR DISTRICT.

Fls. 6-7. (?) Fr. 9-10.

10. COCCULUS, DC.

Climbing shrubs, often sub-herbaceous, rarely small trees. Flowers axillary or infra-axillary, in short cymes or panicles, rarely racemose. Sepals 6 in two series, the inner larger. Petals 6, auricled at the base. Stamens 6, embraced by the auricles of the inner petals; anthers sub-globose, cells bursting transversely. Carpels 3-6; drupes compressed, horse-shoe-shaped, keeled and tubercled on the back; style-scar sub-basal.

Climbing shrubs:—

Leaves broader than long, glabrous. Panicles 6-24 in. long from old stem. Drupe 1 in. long, obovoid-oblong.

1. *C. macrocarpus*.

Leaves ovate glabrate. Panicles axillary, shorter than the leaves. Drupe 2 in. diam., tubercled.

2. *C. mollis*

A small tree:—

Leaves lanceolate, shining. Panicles axillary, Drupe minute, globose.

3. *C. laurifolius*.

1. *Cocculus macrocarpus*, W & A.

A large woody climber; old stem with papery outer bark; branches dark-grey, striate. Scales 2-3.5 by 2.2-4.5 in. generally broader than long, rhomboid to broad-ovate, chartaceous, glabrous, shining above, glaucous or pale beneath; base truncate or cordate, 5-nerved; petiole 1-2.4 in. long. Panicles

6-24 in. long, pendulous from the old stem. *Flowers* small, pale-yellow. *Ripe carpels* obliquely obovoid. '8-1 by '4-5 in., drying with an elongated depression in the centre; stone with transverse ridges.

KHASI HILLS, *Brandis* !

Fls. 2-5. Fr. 7-9.

2. *Cocculus mollis*, Wall, Vern. *Jyrm-mailum*, Khasi.

Branchlets blackish, slender, striate, pubescent. *Leaves* 1'5-4 by 1-2'2 in. ovate, acute or acuminate, truncate or suddenly cuneate, 3-5-nerved at the base, rarely cordate, thinly chartaceous, bright-green above, glaucous beneath, glabrate; lateral nerves 2-3 above the basal; petiole '6-1 in. long, slender. *Panicles* usually axillary never exceeding the leaves, few-flowered. *Petals* notched. *Drupe* '2-25 in. diam., very shortly pedicelled, laterally compressed, sculptured on the back and with four lines of tubercles along the sides.

KHASI HILLS, 5,-6,000 ft., e. g., Sadew, Mawphlang etc.

Fls. 6-7. Fr. 9-10.

3. *Cocculus laurifolius*, DC.

A small evergreen tree with short trunk; branchlets grey or dark-brown, angled, uniformly striate, often pendulous, with a tuft of hairs at the base. *Leaves* 3-6 by 1-2 in., oblanceolate or elliptic, firm and chartaceous, glabrous, dark-green above, lighter green beneath, cuneate and 3-nerved at the base; petiole '15-5 in. long, often bearded at the base, *Panicles* axillary, solitary or 2 together, corymbose. *Flowers* minute; petals 2-lobed. *Styles* reflexed. *Drupe* '15 in. diam., black when ripe; endocarp rugose.

Amteka in the Bijni Reserve, GOALPARA. Probably also in other similar Sub-Himalayan swamps.

The wood has belts of bast tissue alternating with woody bands, simulating annual rings. They often anastomose or are spirally disposed on a transverse section. The wood can only be used as fuel.

Fls. 4-6. Fr. 9-12.

HÆMATOCARPUS, Miers.

Hæmatocarpus Thompsoni, Miers. Vern. *Inramji-dukha*, Kach.

A very large woody climber spreading over the tallest trees; bark pale grey or brown somewhat rough, branches stout, wood consisting of consecutive layers of thin radiating plates. *Leaves* 3-6 by 1'5-2'5 in., oblong, bluntly acuminate, with an acute or obtuse 3-5-nerved base, rigidly coriaceous, glabrous, pale beneath; basal nerves running nearly to the apex, minor nerves conspicuous. *Flowers* dioecious, small, in axillary or supra-axillary solitary or fascicled racemes; pedicels slender. *Sepals* 9-12 in the male flowers, ciliate. *Petals* 6, concave, with an auricled base. *Stamens* 6; anthers 2-celled. *Female flrs.* not seen. *Fruiting racemes* woody and stout, up to 15 in. long. *Drupe* solitary or 2-4 together, 1'5-2 in. long by 1-1'3 in. diam., on stout stalks '5 in.

long, oblong, oblique, dark-red outside and full of copious blood-red juice when ripe; style-scar about half way down the drupe; endocarp somewhat flat, crustaceous, densely fibrous.

Barail Reserve, NORTH CACHAR HILLS; also KHASI HILLS. Not common.

The ripe fruit which is full of a sweetish blood-red juice is eaten by the local people.

Fr. 4-5.

12. PYCNARRHENA, Miers.

Pycnarrhena pleniflora, Miers. Vern. *Holok-lota*, Ass. (N. Lakh.)

A woody climber which generally creeps on its supports; branches finely striate, pubescent. *Leaves* 5-7 by 1.5-2.5 in., oblong-lanceolate or oblanceolate, abruptly blunt acuminate, thinly coriaceous, wholly glabrous or puberulous on the midrib beneath, shining above; main lateral nerves 7-9 on either side of the midrib, the lowest pair subbasal, depressed above, very prominent beneath, interlacing to form intermarginal loops, tertiaries laxly and quaternaries very minutely reticulate (meshes about 50 along an inch length); base cuneate; petiole 4-5 in. long, swollen and channelled below, sub-terete. *Flowers* white, diœcious, axillary, fascicled. **MALE**: fascicles sometimes forming short congested panicles, *bracts* 3. *Sepals* 6, inner 3 larger, orbicular, concave. *Petals* 6, sometimes 5, small lobed; *anthers* 6-9, 4-lobed subsessile. **FEMALE**: on 1-2 flowered fascicled, bracteate, filiform, pubescent peduncles about .25 in. long; *bracts* 9, hairy; *sepals* 3, concave; *petals* 6, much smaller; *staminodes* 6 (?). *Drupe*s .5 in. (?) long, broadly oblong, smooth style scar lateral, endocarp and seed reniform.

Mahmora, Gaurisagar tank and Majuli, SIBSAGAR DISTRICT: Panigaon and Bhoreli Reserve, NORTH LAKHIMPUR.

Fls. 2-4. Fr. 5-6 (?)

13. PARABÆANA, Miers.

1. *Parabœna sagittata*, Miers. Vern. *Chabailai-daugurung-gedebe*, Kach.

A rather slender climber, with milky juice; branches longitudinally ribbed. *Leaves* 3-8 by 2-4 in. ovate-cordate or sagittate, acuminate, entire or distantly toothed, membranous, glabrous or glabrescent above, softly tomentose beneath, basal nerves 7 besides 3-5 lateral nerves on either side of the midrib; petiole 1-4 in. long. *Flowers* small, axillary or slightly supra-axillary, solitary or geminate, few or many flowered, dichotomous cymes; common peduncles up to 1 in. long. *Sepals* 6, sub-equal, subacute. *Petals* cuneate, often lobed. **MALE**: *anthers* 6, horizontal on the top of the staminal column. **FEMALE**: *staminodes* 6, *Carpels* 3; *style* recurved. *Drupe*s 2-2.5 in. long, globose; style-scar subterminal; endocarp subglobose, sharply tubercled on the back.

Lanka and other places in the neighbourhood of Lumding. DISTRICT NOWGONG; also KHASI HILLS up to 2000 feet.

Fls. 5-7. Fr. 10-11.

Tinomisium micranthum, Diels in *Pflanzenreich*. Heft 46, P. 119.

A climber with deeply sulcate branches, young parts ferruginous pilose. *Leaves* 5.5-6.5 by 2.5-3 in. ovate oblong or narrowly ovate lanceolate, acuminate, glabrous above puberulous specially on the nerves beneath, chartaceous, base rounded to broadly cuneate, with 3-5 nerves, lateral nerves 2-3 (above the basal) on either side, ascending prominent on the undersurface; petioles 2-2.5 in. long. *Male flowers* in pubescent spicate racemes 1.5-2.5 in. long, several of which are fascicled together from nodes on old wood. *Sepals* 9, 3 outer small, externally pubescent, inner 6 oblong, about .05 in. long. *Petals* 6, with involute margins, glabrous, slightly smaller than the sepals. *Stamens* 6, opposite the petals, free, subequal; filaments short, thick, dilated towards the apex; anthers introrse. *Female flowers* and drupe not seen. (In the genus, the female flowers have the sepals and petals similar to those of the male flowers; staminodes 6. *Carpels* 3, glabrous, stigma peltate-capitate. *Drupe* 3 or few aborted, compressed, exocarp fleshy, endocarp crustaceous dorsally convex, ventrally flat or slightly concave, not intruded; seeds with large flat cotyledons).

Rajbari, Assam, Watt. 11267 (the type for the species)!

Flrs. 3.

FAM. 6. BERBERIDACE.

Erect or climbing glabrous shrubs. *Leaves* alternate or fascicled, simple or compound, exstipulate. *Flowers* regular, yellow green or white. *Sepals* and *petals* free, hypogynous, caducous, in several series, usually imbricate. *Stamens* hypogynous, usually as many as the petals and opposite to them. *Carpels* 1-3, oblong; *style* short or 0; *stigma* dilated. *Fruit* usually baccate.

Climbing shrubs: leaves digitate. Flowers 1-sexual:

carpels 3:—

Stamens monadelphous. Leaflets up to 7.

Stamens free. Leaflets up to 9.

Erect shrubs. Leaves simple, pinnate or 2-3 pinnate.

Flowers 2 sexual: carpel 1:—

Armed shrubs. Flrs. yellow, solitary, fascicled or racemed:—

Leaves simple.

Leaves pinnate.

Unarmed shrub. Flrs. white, in panicles:—

Leaves 2-3 pinnate.

.. 1. *Stauntonia*.

.. 2. *Holboellia*.

.. 3. *Berberis*.

.. 4. *Mahonia*.

.. 5. *Nandina*.

1, STAUNTONIA. DC.

Glabrous, climbing shrubs. *Leaves* alternate, digitate or pinnate; leaflets 3-7, petiolulate, entire, generally glaucous or pale beneath. *Racemes* axillary, solitary, or fascicled. *Flowers* 1-sexual. **MALE:** *Sepals* 6 in 2 series, linear. *Petals* 0. *Stamens* monadelphous. **FEM.:** *Carpels* 3. *Seeds* large, imbedded in a yellowish pulp; testa horny, black.

Leaves pinnately 3-foliolate:—

Racemes solitary or few.

Racemes numerous, fascicled.

Leaves digitately 3-7-foliolate.

1. *S. Brunoniana*.

2. *S. elliptica*.

3. *S. filamentosa*.

1. *Stauntonia Brunoniæ*, Wall.

A large climber; old stem softly grey-corky; branches often tubercled. *Leaves* pinnately 3-foliolate: leaflets 2.5-5 by 1-1.5 in. narrow elliptic or lanceolate, caudate-acuminate, entire, glabrous and shining above, somewhat glaucous beneath; nerves 6-8 on either side of the midrib, the first pair being basal, prominent beneath, midrib depressed above; petiole 2-5 in. up to the lowest pair of leaflets; petiolules of the latter .5-.7 in. long. *Racemes* solitary, or a few from scaly tubercles; rachis slender somewhat zigzag. *Flowers* greenish-yellow, .3-.6 in. across on very slender pedicels. .2-.3 in. long. *Ripe carpels* about 2 by 1 in., ovoid or oblong, many-seeded; seeds black, 3-gonous, immersed in a yellow pulp.

Sadiya, N. E. F. DISTRICT; Balijan, SIBSAGAR DISTRICT: KHASI HILLS. *Griffith! Hooker! etc.*

Fls. 8-10. Fr. 2-6.

2. *Stauntonia elliptica*, Hemsl. Syn. *Paravatia Brunoniana*, Decaisne. Vern. *Krang-sin-douha*, Kach.; *Jong-mot*, Kuki.

A large climber; branchlets striate. *Leaves* pinnately 3-foliolate; common petiole 2.5-5 in. long to insertion of leaflets, swollen and callous at the base; leaflets 2.5-4.5 by 1.4-2.7 in. elliptic or ovate, acute or rounded at the tip, subcoriaceous, glabrous, shining above, glaucous beneath; margins slightly recurved, lateral nerves 6-8 on either half, slender, the first pair or two subbasal with lax reticulations between; base as a rule rounded; petiolules lateral .4-1 in., terminal 1-2 in. long, swollen and callous at both extremities. *Racemes* 3-4.5 in. long in fascicles of 5-12 from imbricately bracteate axillary tubercles. *Flowers* greenish-yellow about .3 in. across, on filiform pedicels .2-.4 in. long. *Sepals* 6, ovate or elliptic, longitudinally ribbed. *Petals* 6, smaller than the sepals. *Stamens* 6, monadelphous. *Young fruit* of 3 distinct carpels; *mature* generally solitary 3-4 by 2 in.; seeds dark-brown or almost black, shining, irregularly faceted, with a thin grey papery arillus (or exocarp?), imbedded in yellow pulp.

Garampani, Diphling, and Balijan, SIBSAGAR; Gauhati, KAMRUP; Sadiya and Dismor, N. E. FRONTIER; Haflong, N. CACHAR HILLS; Cherrapunji, KHASI HILLS.

Fls. 8-11. Fr. takes 12 months to mature.

3. *Stauntonia filamentosa*, Griff.

A large climber with thick striated branchlets. *Leaves* digitately 5-foliolate; common petiole 3-6 in. long, swollen at the base; leaflets 5-7 by 2.2-3.4 in., oblong obovate, suddenly acuminate with a short tail, subcoriaceous, glabrous and green above, minutely densely glandular puberulous beneath; main lateral nerves about 10 on either side of the midrib, the first pair subbasal and continuous with the intermarginal loops of the other nerves; reticulations lax; petiolules .8-1.7 in. long, the terminal being the longest. *Flowers* and *fruit* not seen.

Upper Dehing Reserve, also Tingrai, LAKHIMPUR.

2. HOLBELLIA, Wall.

Holbellia latifolia, Wall. Vern. *Soh-lygn-kart*, *Mi-rang-k'sa*, Kh.; *Soh-tymbra*, Synt.; *Kram-sim-doukha*, Kach.

A fairly large climbing shrub; stem corky when old. *Leaves* alternate, digitate, 3-9-foliate. *Leaflets* very variable in size and shape, 3-5 by 1.5-2 in., broadly ovate, oblong or ovate-lanceolate, acuminate, coriaceous, glabrous, somewhat shining above, pale beneath, usually 3-nerved at the base; common petiole 3-7 in., petiolules 3-1 in. long. *Flowers* monœcious, green or purplish-green, sweet-scented, in axillary fascicles or racemes 1.5-4.5 in. long; pedicels 5 in. long, slender. *Sepals* 6 in 2 series. *Petals* 6, minute, orbicular. *Stamens* 6, free; anthers 2 in. long, apiculate extrorse, opening by slits. *Carpels* 3; stigmas oblong; placentation parietal. *Ripe carpels* berry-like, 2-3 in. long, of the shape and size of a small plantain; seeds black, generally compressed, imbedded in a yellow edible pulp.

KHASI and JAINTIA HILLS between 4, and 6,000 ft., e. g., Jarain, Laitsoham, Khimawrah, Um Risa, etc. Also NORTH CACHAR HILLS. e. g., Haflong, Gunjong, etc.

Fls. 2-5. Fr. 9-11.

There are two varieties of this plant.—Var. 1.—*latifolia* and Var. 2.—*angustifolia*, but only the former occurs in our area and the above description refers to it alone.

3. BERBERIS, Linn.

Berberis Wallichiana, DC. Vern. *Dieng-niang-mat-shynrang*, Kh.

An erect spinous shrub 6-10 ft. high; branches sharply angled. *Leaves* simple, generally in fascicles of 3-4 from tubercles in the axils of alternate 3-partite spines, 2-3 by .5-.75 in., oblong or oblong-lanceolate, acute at both ends, chartaceous or subcoriaceous, glabrous and shining on both surfaces usually serrulate with very sharp spines, sometimes entire; lateral nerves very faint; petiole 1 in. long, flattened and channelled. *Spines* 1-1.5 in. long. *Flowers* yellow, bisexual on 1-fld. axillary peduncles; peduncles in fascicles of 10-15, 3-5 in. long, red, slender, filiform, jointed at the top glabrous and shining. *Sepals* 6, petaloid, imbricate, in two series. *Petals* 6, in two series glandular at the base. *Stamens* 6, free, sensitive, anthers opening by two 1-curved valves. *Ovary* simple, stigma subsessile, broad; ovules basal, erect. *Berries* 3 by .15 in., oblong-ellipsoid, deep purple when ripe.

This plant has four varieties only one of which Var. *microcarpa* occurs in the KHASI HILLS above 5000 ft. e. g. Mowphlang and the above description refers to it only.

The wood of this and the next species are yellow.

Fls. 8-9. Fr. 9-10.

4. MAHONIA, Nutt.

Mahonia nepalensis, DC. Syn. *Berberis nepalensis*, Spreng. Vern. *Dieng-phuh-rnong*, *Dieng-niang-mat*, *Dieng-soh-riang-mat-kynthei*, Kh.; *Dieng-la-ranong*, *Dieng-larnong*, Synt.; *Lek-chutra*, Nep.

An erect shrub or sparingly branched small tree with soft corky bark, leafy only towards the extremities of the thick branchlets. *Leaves* 6-18 in. long, sheathed at the base with a pair of subulate stipules. *Leaflets* 2-12 pairs besides the terminal one, 2-4 by 1-1.8 in. ovate-oblong or lanceolate, sessile, firmly coriaceous, glabrous, shining above, pale beneath, with 3-8 large spinous teeth on either side, strongly 3-5 nerved from the base areoles very large. *Flowers* yellow, about 2 in. long, fascicled in erect dense flowered racemes. *Racemes* 4-10 in. long, erect, each from the axil of a bract. *Bracts* 1-2 in. long, hyaline persistent, covering the ends of the branchlets; bracteoles small broadly ovate or oblong, concave, deciduous; pedicels 3-5 in. long. *Sepals* 6, petaloid, imbricate in two series, elliptic. *Petals* 6, in two series, glandular at the base. *Stamens* 6, sensitive; anthers dehiscing by ascending valves. *Ovary* 1-celled; style short, stigma capitate, large. *Berries* 3-5 in. long, elliptic or globose, purple with glaucous bloom.

KHASI HILLS 4-5000 ft. on sunny spurs and open hill slopes.

Firs. 10-11. Fr. 11-1.

Takeda (Notes from the Royal Botanic Gardens Edinburgh, Volume VI. P. 215-224) maintains that the plants grouped under this name consists of a number of species. According to him *M. nepalensis* has not been hitherto collected outside Nepal. The plant described under this name should be called according to this view *M. pycnophylla*, Takeda, *M. nepalensis* var. *pycnophylla*, Fedde.

M. nepalensis is said to differ from our plant by its less coriaceous and somewhat narrower leaflets with more spines, larger bracts which are oblong to ovate oblong, obtuse and about 1.5-2.4 in. long and more ovules (4-5 instead of 2).

Mahonia acanthifolia, Takeda. Notes from the Royal Botanic Gardens. Edinburgh. Vol. VI. p. 219.

Differs from the plant described as *M. nepalensis*, DC. by its more numerous leaflets (up to 11 pairs) with few large teeth, and flowers with very small outer sepals. Punduah, (Khasi Hills) Wallich 1820, No. 1450C. There is no duplicate sheet at Calcutta herbarium.

M. manipurensis, Takeda. Notes from the Royal Botanic Garden Edinburgh P. 222.

Leaflets 5-9 pairs, 1.2-2.4 by 1.2-1.2 in. ovate to broad ovate, margins with few strong teeth, base truncate to subtruncate, or more or less cordate, 5-8 nerved, coriaceous. *Racemes* in fascicles of 5-8 up to 4 in. long, stout, dense flowered. *Bracts* ovate up to 2 in. long, outer sepals ovate, larger inward, 1.5-3 in. long, 3-5 nerved. *Petals* oblong, ovate, bifid at the apex up to about 27 in. long. *Ovary* with short style, 1-3 ovuled, *Fruit* unknown.

MANIPUR, Watt.

Flowers cold season.

M. Simonsii, Takeda. Loc. cit p. 222.

Leaflets 6-9 pairs, 2.75-4.25 by 1.2-1.2 in. lowest pair much smaller close to the stipules, distant from the next upper pair: lanceolate, long acuminate, lower half of base rounded upper half subuncate, margins serrate dentate, slightly glossy, coriaceous, nervules conspicuous. *Racemes* in fascicles of about 8, up to about 6.25 in. long, sometimes branched towards the base, somewhat lax flowered; pedicels 2-2.5 in. long, slender much exceeding the minute triangular acute bracts. *Outer sepals* very small inner gradually longer about 2-2.7 in. long, elliptic oblong obovate. *Ptals* oblong, about 2 in. long, bifid at apex, nectaries minute. *Stamens* slightly shorter than the petals; filaments a little longer than than the anthers. *Ovary* short styled, 3 ovuled. *Fruit* unknown.

Myrung, Simmons!

It is easy to distinguish from its, lanceolate acuminate leaflets with prominent nervules which are as strong as the main nerves and the minute bracts much smaller than the slender pedicels.

Flowers 11.

The description has been based on a single sheet in Calcutta herbarium which is also the type sheet for the species.

5. NANDINA. Thunb.

Nandina domestica. Thunb., the *Sacred Bamboo* of the Chinese, is an unarmed ornamental shrub, 3-6 ft. in height, with 2-3 pinnate evergreen leaves and small white flowers in large terminal panicles. It is a native of China and Japan, but is often grown at Shillong.

Fls. 5-7.

FAM. 7. NYMPHÆACE.

Aquatic herbs with perennial rootstock. *Leaves* usually floating, often peltate, with involute margins in bud. *Flowers* solitary, borne on a naked scape. *Sepals* 3-5, free. *Petals* 3-5 or, numerous, free, coloured. *Stamens* many. *Carpels* 3 or more, free or connate or sunk in pits of the disk; ovules few or many. *Fruit* various; seeds naked or arillate; albumen floury or 0, embryo enclosed in a sac.

- | | |
|---|---------------------------|
| Sepals and petals 3 each. Carpels free; ovules few. Seeds albuminous | ... 1. <i>Brasenia</i> . |
| Sepals 4-5. Petals and stamens indefinite :—
Ovary interior; carpel connate; ovules many.
Seeds albuminous :—
Sepals deciduous. Seeds minute, very numerous. | ... 2. <i>Nymphaea</i> . |
| Sepals persistent. Seeds large, 8-20. | ... 3. <i>Euryale</i> . |
| Sepals 4-5, Petals and stamens indefinite ;
carpels sunk in pits of the superior turbinate spongy disk. Seeds exalbuminous, | ... 4. <i>Nelumbium</i> . |

1. BRASENIA, Schreber.

Brasenia peltata, Pursh.

A slender plant with branching stem. *Leaves* alternate, 2-4 in. long, elliptic-oblong, floating; petiole covered with mucus. *Flowers* red, 1 in. diam.; peduncles axillary, pubescent, covered with mucus. *Sepals* 3, pubescent. *Petals* 3, red, linear. *Stamens* 12-18; anthers opening by lateral slits. *Carpels* 6-18, cylindrical; ovules 2-3, pendulous; carpels indehiscent. *Seeds* albuminous.

KHASI HILL in the neighbourhood of Nongkrem, 4,500 ft.

2. NYMPHÆA, Linn.

Large herbs with creeping rootstock. *Leaves* usually peltate or subpeltate. *Flowers* showy, white, red or blue, floating, supported by long cylindrical radical scapes. *Sepals* 4, adnate to the base of the disk. *Petals* 10-30, in many series, the inner gradually narrower and ultimately passing into stamens. *Stamens* indefinite; filaments flattened at the base; anthers introrse, opening by lateral slits. *Carpels* many, confluent with the disk. *Fruit* a spongy berry. *Seeds* minute, buried in pulp, with a fleshy aril.

Leaves large, 6 in. and over in length:—

Leaves sharply sinuate-toothed. Flowers white or red. Sepals obtuse, ribbed; anthers without appendages.

.. 1. *N. Lotus*.

Leaves entire or obtusely-toothed. Flowers blue or white. Sepals veined, not ribbed; anthers with long appendages.

.. 2. *N. stellata*.

Leaves up to 2 in. in length, entire. Sepals obtuse; anthers without appendages.

.. 3. *N. pygmaea*.

1. *Nymphæa Lotus*, Linn. Vern. *Mokuwa*, Nal, Ass.; *Nial*, Shaluk, Beng. *Kumuda*, Sans. For Var. *rubra*—*Rakta-kamal*, Beng.; *Raktotpala*, Sans.

Corms nodular, 3-4 in. diam. *Leaves* 6-12 in. broad, oval or orbicular, sagittate when young, usually pubescent beneath, strongly veined. *Flowers* usually 3-5 in. diam., white or red. *Sepals* oblong, greenish outside with 5-10 white ribs. *Petals* oblong to linear. *Filaments* broadly subulate. *Carpels* 10-20. *Seeds* ellipsoid, rough.

Throughout the plains of ASSAM in still water of hills and tanks. Var. *rubra* is, however, somewhat rare, specially in the BRAHMAPUTRA VALLEY. The tubers are eaten raw or roasted and the dried seeds after parching.

Fls. 8-10. Fr. 9-11.

2. *Nymphæa stellata*, Willd. Vern. *Sundi*, *Nil-padma* Beng. *Nilotpala*, Sans. The fruit *Dhemp*, Ass.

Corm 2-3 in. long, ovoid, not nodular. *Leaves* orbicular or elliptic, usually blotched with purple beneath, entire or slightly sinuate, glabrous; veins not so strong but more closely reticulate than in *N. Lotus*. *Flowers* 2-3 in. diam., usually light-blue, sometimes white or pink. *Sepals* not ribbed, often streaked with fine purple lines. *Petals* 10-30. *Stamens* 10-50; appendage of anthers often foliaceous. *Fruit* 13-30-celled; seeds striate.

Occurs in the same localities as the preceding species but generally in shallower water.

The tubers and seeds are used in the same ways as those of *N. Lotus*.

Fls. 8-10. Fr. 9-11.

3. *Nymphæa pygmaea*, Aiton.

A very small herb; rootstalk with soft, black hairs. *Leaves* 1-2 in. long, oblong-orbicular, with two diverging acute lobes from the base. *Flowers* white, 1.5-2 in. diam. *Sepals* 4, obtuse. *Petals* 8-10, obtuse. *Stamens* in 3-4 series, without appendages. *Stigmatic rays* 4-8, spoon-shaped.

In swamps in the KHASI HILLS. 4-6000 ft.; e.g., Nongkreim.

3. EURYALE, Salisb.

Euryale ferox, Salisb. *Shriew-u-pubon*, Khasi ; *Pukhal*, Sylh.

A very prickly aquatic herb ; rootstalk fibrous. *Leaves* 12-18 in. diam., orbicular, floating, green and glabrous but bullate and corrugated above, pink or deep-purple beneath, supported by stout but very porous interlacing ribs ; stout, recurved prickles on both surfaces along the ribs ; petiole prickly, pink or deep-green. *Flowers* about 2 in. diam., violet-blue or red. *Torus* prickly. *Sepals* 4, inserted above the ovary. *Petals* in many series passing into the stamens which are in bundles of 8. *Carpels* 8. *Fruit* spongy, prickly outside. *Seeds* about 20, arillate ; albumen farinaceous.

In tanks and iheels in SYLHET, CACHAR and the KHASI HILLS.

The seeds are considered good food for invalids and are eaten raw or roasted.

Fls. 5-7. Fr. 6-8.

4. NELUMBIUM, Tuss.

Nelumbium speciosum, Willd. Vern. *Podum* Ass ; *Padma* Beng. & Sans. ; *Soh-lapudong*, Khasi.

A large aquatic plant with milky opaque juice ; root-stock stout, creeping. *Leaves* peltate, 1·5-3 ft. diam., young generally raised above the water, old floating, often with scattered weak prickles ; petiole as long as the water is deep. *Sepals*, *petals* and *stamens* numerous, passing gradually into one another ; anthers clavate. *Carpels* many, 1-celled, sunk in the flat top of the large obconic extremity of the torus ; ovules 1-2. *Ripe-carpels* 3·5 in. long, ovoid, loose in the cavities of the enlarged spongy torus ; albumen 0 ; cotyledons fleshy ; plumule folded and enclosed by the cotyledons.

Throughout the PROVINCE up to 2000 ft. elevation.

The ripe carpels are eaten, raw or cooked. The flower is considered very sacred by the Hindus and Jains and is in much demand for worshipping or for decorating their temples.

Fls. 6-9 Fr. 11-12.

FAM. 8. PAPAVERACEÆ.

A small family of herbaceous plants with milky or yellowish juice. *Leaves* radical or alternate, exstipulate, lobed or cut. *Flowers* regular, 2-sexual. *Sepals* 2, rarely 3, concave ; perianth and stamens caducous, the later very numerous ; anthers erect, with lateral dehiscence. *Ovary* 1-celled or spuriously 2-4-celled by lamelliform placentas ; style very short or 0 ; stigmas radiating ; ovules in many series, parietal, anatropous. *Capsules* dehiscing by pores or valves ; seeds very small, with only albumen.

This Family of showy flowers is very poorly represented in Assam. The famous drug opium is obtained from scratches made on the capsules of

Papaver somniferum, Linn. Although the drug is much consumed the plant is not cultivated in Assam. Some beautiful strains of this plant are grown in gardens, specially in the HILLS.

The following is the only plant which was originally introduced from Mexico, and has now been naturalized in most parts of India.

ARGEMONE, Linn.

Argemone mexicana, Linn. Vern. *Kuhumkanta*, Ass. ; *Siyal-knata*, Beng. ; *Samshu*, Kach.

An erect thistle-like annual, 2-4ft. high, with bluish leaves and yellowish juice, *Cauline leaves* alternate 3-6 in. long, sessile or half-amplexicaul, pinnatifid, the lobes being further divided into large sections or teeth with sharp prickles at their apex. *Flowers* golden-yellow, 1.5-2 in. diam. *Sepals* 2 or 3 cuspidate. *Petals* 4 or 6. *Style* thick, very short ; stigma 4-7-lobed ; ovules on 4-7 parietal placentas. *Capsules* 8-1.5 in. long, oblong, usually prickly, dehiscing by short valves opposite each stigmatic lobe.

On dry waste lands throughout the PROVINCE. An oil can be expressed from the seeds which is used for lighting and possesses laxative properties. An infusion of the leaves and the yellow juice are also used medicinally.

Fls. 1-6 (chiefly). Fr. 3-6.

FAM. 9. FUMARIACEÆ.

Herbs with watery juice. *Leaves* divided or dissected, sometimes decompoundly. *Flowers* irregular, 2-sexual, in racemes. *Sepals* 2, small, scale-like, deciduous. *Petals* 4, in 2 very dissimilar pairs, one or both of the outer pair spurred gibbous, the inner pair often cohering by their tips. *Stamens* usually 6 and 2-adelphous ; anthers 2-called on the middle stamen of each bundle, 1-called on the other 4. *Ovary* 1-celled ; ovules 3 or more, amphitropous, parietal. *Fruit* a many seeded capsule or a 1-seeded nut. *Seeds* albuminous ; embryo minute.

A family of practically no forest importance.

Fruit a many-seeded capsule :—

Both outer petals spurred. ...

Only one outer petal spurred. ...

Fruit a 1-seeded nut :—

Only one outer petal spurred. ...

1. *Dicentra*.

2. *Corydalis*.

3. *Fumaria*.

1. DICENTRA, Borkh.

Slender climbing glabrous herbs. *Leaves* decompoundly divided the rachis ending in much-divided slender tendrils. *Flowers* yellow often tinged with purple, in leaf-opposed racemes. *Sepals* small, scale-like, deciduous. *Petals* 4, connivent, the 2 outer saccate at the base, the inner clawed, keeled, cohering by

the tips. *Capsule* dehiscent by valves; seeds beaked, generally arillate.

Capsule upto 3 in. in length, slender torulose, dry.

Seeds in one row, arillate and granulate.

Capsule within 2 in. in length, continuous, tapering.

dry, Seeds in 2 rows, arillate.

Capsule less than 1 in. in length, ovate cordate

fleshy. Seeds in many rows, granulate.

... 1. *D. torulosa*.

... 2. *D. Roylei*.

... 3. *D. thalictrifolia*.

1. *Dicentra torulosa*, Hk. f. & Th.

A trailing plant with white sulcate stem. *Leaves* 2-4 in. long; leaflets 2-1.2 in. long, ovate obovate or elliptic, membranous. *Racemes* 6-8 flowered, sub-umbellate; peduncle 4-1 in. long. *Flowers* golden-yellow, 5-7 in. long, cylindrical; pedicels 4-7 in. long; bracts as long as the pedicels or sometimes shorter, fimbriate. *Capsule* 1-3 in. by 12-15 in., pod-like, torulose, 4-12-seeded. *Seeds* in one row, brownish, with a 2-lobed aril.

KHASI HILLS. 4-6,000 ft.

Fls. 7-8. Fr. 9-11.

2. *Dicentra Roylei*, Hk. f. & Th.

Closely resembling the preceding species in foliage and general appearance, but is smaller and more slender. *Flowers* somewhat larger, yellow, often tinged with purple. *Capsule* 1-2 by 15-2 in., tapering to a fine point, continuous; seeds close, in 2 rows, orbicular, compressed, with a small aril at the back.

KHASI HILLS. Griffith.

Fls. & Fr. 6-9.

3. *Dicentra thalictrifolia* Hk. f. & Th.

A more diffuse plant than the other 2 species, with the same general appearance, but the leaflets sometimes attain 1.5 in. in length and 1 in. in breadth. *Flowers* generally shorter and more stout, yellow or purple; pedicels filiform up to 1 in. in length, ovate or elliptic in outline. *Capsule* 5-7 by 3-4 in., more or less fleshy, tardily dehiscent, surmounted with the persistent style and stigma. *Seeds* in 4 rows, black when fully mature, shining, coarsely granulate on the back, often with a very small, white aril.

KHASI HILLS, Kalapani, 5,000 ft. Hk. f. & Th. Nongkrem, Collett.

Fls. 5-6. Fr. 10-12.

2. CORYDALIS, DC.

Corydalis sibirica, Pers.

A much branched perennial leafy prostrate plant of pasture lands: *Leaves* pinnately lobed, the uppermost usually with 3 obovate or oblanceolate segments, membranous. *Racemes* few-flowered, terminal; bracts small, lobed. *Sepals* 2, small. *Petals* yellow, tinged with purple; spur broad, obtuse; back petal hooded, acute. *Stamens* 6, 2-adelphous, the posterior bundle spurred. *Ovary* 1-celled; style short, filiform; stigmas 2. *Capsule* 3-6

in. long, narrowed to the pedicel and surmounted by the persistent style and stigmas. *Seeds* few, small, shining.

KHASI HILLS 5,000 ft. *Mann*.

Fls. 5-8. Fr. 8-10.

3. FUMARIA, Linn.

Fumaria parviflora, Lamk. Vern. *Bansula*, Beng.

A much-branched fodder plant 12-18 in. high with sharply angled whitish stem. *Leaves* 1-2 in. long, much divided; ultimate segments very narrow, glaucous. *Racemes* leaf-opposed, lax-flowered. 8-2 in. long. *Flowers* about .25 in. long, white or purple. *Sepals* 2, small. Only 1 outer petal spurred. *Fruit* a 1-seeded globose nut about .07 in. diam.

Rice fields in LOWER ASSAM; also SYLHET and CACHAR. Goes up to 4,000 ft. in the KHASI HILLS.

Fl. & Fr. 10-2.

FAM. 10 CRUCIFERÆ.

Herbs with watery juice which is often pungent. *Leaves* alternate, exstipulate, simple or pinnate, entire or variously lobed or ent. *Flowers* regular, usually racemed. *Sepals* 4, free imbricate, often saccate at the base. *Petals* 4, free, hypogynous, often opposite the sepals, placed crosswise, (whence the name of the family), imbricate. *Stamens* usually 6, tetradynamous; 2 outer opposite the lateral sepals; 4 inner longer, in pairs opposite the median sepals. *Disk* usually with 4 glands opposite the sepals. *Ovary* usually divided into 2 cells by a membranous partition (replum) or less often 1 celled or more rarely with transverse partitions; style short or 0; ovules few or many on two parietal placentas, rarely solitary erect. *Fruit* either elongated and pod-like siliqua, valves opening from the base and deciduous; or short and dehiscent or indehiscent. *Seeds* exalbuminous. *Cotyledons* large, foliaceous in germination.

This family contains several plants of considerable economic value but is of little importance for the Forester. The following is a brief account of the commoner plants found in Assam.

Fruit dehiscent:—

Flowers yellow. Sepals gibbous at the base. Siliqua terete, beaked:—

Siliqua long; seeds in one series.

Siliqua short, turgid; seeds in 2 series.

.. 1. *Brassica*.

.. 2. *Eruca*.

Flowers yellow or white. Sepals not gibbous at the base

Sepals spreading. Siliquas turgid.

Sepals erect. Siliquas flat, linear.

Flowers white. Siliquas compressed, oblong.

.. 3. *Nasturtium*.

.. 4. *Cardamine*.

.. 5. *Lepidium*.

Fruit indehiscent, terete, beaked, transversely septate:

Flowers white-tinged with light purple, large for the family. Lateral-sepals saccate at the base.

.. 6. *Raphanus*.

1. BRASSICA, Linn.

Fleshy herbs. *Leaves* large, pinnatifid or lyrate, rarely entire. *Flowers* yellow, rarely white, in long racemes. *Seplas* erect or spreading; lateral saccate or gibbous at the base. *Petals* with a long claw. *Siliquas* with a seedless indehiscent beak; replum membranous; seeds globose.

This genus includes a number of useful plants such as:—

The cabbage *Brassica oleracea*, L. Vern. *Band-kobi* and its varieties cauliflower, vern. phul-kobi and *Knolkhol* or vern. *Gantri-Kobi*, etc.

Cauline leaves amplexicaul, usually auricled at the base:—

Leaves more or less hairy and glaucous.	..	1. <i>B. campestris</i> .
Leaves quite glabrous, faintly glaucous beneath.	..	2. <i>B. napus</i> .
Cauline leaves not amplexicaul, narrowed to the naked petiole.	..	3. <i>B. juncea</i> .

1. *Brassica campestris*, Linn.

A stout erect herb often with a swollen tap-root; lower leaves lyrate, hairy or harsh; upper oblong or lanceolate, covered with bloom. *Siliquas* with a flat seedless beak.

Var. *Sarson*. Prain, the *Swet-sarisha* or *Swet-rai* of Bengal.

Fls. & Fr. in the plains cold season. In the hills about 5 months later.

2. *Brassica napus*, Linn. Var. *dichotoma*, Prain. The Indian mustard. Vern. *Sula-rai*, Beng.

A slender glabrous plant. *Radical* and lower *cauline* leaves pinnatifid, rather small. *Flowers* 4-5 in. diam., pale golden yellow. *Siliquas* 1.5-2 in. long including the beak which is 5-7 in. long, on pedicels 6-7.5 in. long, each containing 8-15 pale yellow or purplish-black globose seeds.

Much cultivated for the seed. The flowers and leaves are also eaten cooked.

Fls. 11-12, Fr. 1-8.

3. *Brassica juncea*, Hk. f. & Th. Vern. *Rai*. Beng.: *La* or *Lahi*. Ass.; *Mustard*, Eng.

Stout or slender according to the extent of cultivation given. *Leaves* long-petioled, not amplexicaul, often with small lateral leaflets or auricles along the petiole, glabrous or with scattered soft white hairs, or scabrous. *Flowers* bright yellow; pedicels and calyx spreading. *Siliquas* vertically compressed; beak short, acuminate. *Seeds* dark-brown, reticulate.

Cultivated both as a pot-herb and for its seeds throughout Assam.

Fls. 9-11. Fr. 11-1.

2. ERUCA, Tourn.

Eruca Sativa, Lamk. Syn. *Brassica eruroides*, Roxb. Vern. *Swet-sarisha*, *Taramani*, Beng.; *Horio* or *Horiho*, *Behuri*, Ass.

A slender herb resembling the mustard with more or less glabrescent stem. *Leaves* 1.5-7 in. long, irregularly pinnatifid;

segments linear-oblong. *Flowers* white or lilac ; '7-9 in. long, pedicels short, slender. *Sepals* erect slender, '4-5 in. long, veined. *Siliquas* erect and appressed to the stem, about '7-9 in. long with a flattened seedless beak. *Seeds* globose, in 2 series.

Cultivated in the BRAHMAPUTRA VALLEY for the seed.

Fls. & Fr. 1-3.

3. NASTURTIUM. Br.

Terrestrial or aquatic herbs. *Leaves* entire, lobed or pinnatifid, glabrous or hairy. *Flowers* yellow or white, racemose. *Sepals* short, spreading, not sacate at the base. *Petals* short, scarcely clawed, sometimes wanting. *Stamens* 1-3 pairs. *Siliquas* long or short, cylindrical ; septum transparent. *Seeds* small, generally in 2 series.

An erect terrestrial herb, often with unbranched stems.

Leaves pinnatifid. Flowers yellow.

.. 1. *N. indicum*.

A prostrate aquatic herb with much-branched stems.

Leaves pinnate. Flowers white.

.. 2. *N. officinale*

1. *Nasturtium indicum*, D C.

An annual weed about a foot long, usually hairy ; stem simple or branching from near the base. *Leaves* 2-5 in. long, variously lobed or divided, coarsely toothed, rarely simple. *Racemes* 1-4 in. long. *Flowers* small ; *sepals* and *petals* equal. *Siliquas* '5-1 in. long, linear or narrowly oblong, spreading, or ascending ; pedicels '1-25 in. long. *Seeds* numerous in 2 series, very small.

Var. *benghalense*, DC. which differs by having bracteate flowers and usually taller stems appears to be more common than the type in SURMA VALLEY and LOWER ASSAM.

Fls. and Fr. 3-5.

2. *Nasturtium officinale*, Br. *The Watercress*, Eng. Vern. *Ayrsch-um*, Kh.

A much-branched perennial aquatic plant growing on wet mud or sluggish water. *Leaves* pinnate or 2-pinnate ; leaflets and pinnules opposite with a terminal one which is usually by far the largest. *Racemes* 1-4 in. long, rather lax-flowered. *Flowers* white, very small. *Petals* 2 or 3 times longer than the sepals, veined. *Siliquas* '3-1 in. long, on slender pedicels '3-7 in. long. *Seeds* small, in 2 series.

The plant is much used as a vegetable, being eaten raw or cooked, and is often cultivated in gardens for that purpose.

Fls. and Fr. 4-11.

4. CARDAMINE, Linn.

Cardamine hirsuta, Linn. Var. *sylvatica*. Linn. Syn. *C. debilis*, Don.

A small suberect glabrous plant 3-9 in. long. *Leaves* 2-3 in. long, pinnate, sometimes pinnatisect ; *Leaflets* or *segments* '2-8 in. long, varying in shape from orbicular to ovate or elliptic, quite

glabrous, often dentate or lobulate. *Flowers* small, white in terminal racemes. *Sepals* very small, erect. *Petals* about twice as long as the sepals, erect, clawed. *Siliques* 5-1 in. long, ascending, linear, compressed, not beaked. *Seeds* 1-seriate.

Fls. 2-4. Fr. 6-7.

5. LEPIDIUM, Linn.

Lepidium sativum, Linn. The *Common cress*, Eng. Vern. *Halim*, Hind. & Beng.

A glabrous annual plant 1-3 ft. high. *Radical leaves* long-petioled, 1-2 pinnate or pinnatisect, upper pinnatifid or lobed with the petiole gradually diminishing in length and the blades in width. *Flowers* white, ebracteate, in terminal elongating racemes; sepals short, equal at the base. *Siliques* 16-25 in. long orbicular, compressed, notched at the apex; pedicels erect, slender. *Seeds* solitary in each cell.

Cultivated in gardens at Shillong. The leaves and tender shoots are said to be good for liver complaints, being eaten raw or as a pot-herb.

Fls. and Fr. 11-1.

6. RAPHANUS, Linn.

Raphanus sativus, Linn. The *Radish*, Eng. Vern. *Mula* or *Muli*, Hind., Beng., etc.

An annual or biennial plant with generally a spindle-shaped white or red, fleshy taproot which is pungent in taste. *Basal leaves* 9-18 in. long, lyrate pinnate or pinnatisect, hispid: leaflets or segments coarsely toothed; *cauline leaves* simple linear. *Flowers* usually white or lilac with purple veins, in long terminal ebracteate racemes. *Sepals* erect, lateral ones saccate at the base. *Siliques* indehiscent, elongate, terete, usually 1-2 in. long, with a long tapering beak, filled inside with white pith between the seeds. *Seeds* 2-8, globose pendulous.

The root as well as the young leaves and tender siliques are eaten, raw or cooked, for which the plant is cultivated as a field-crop throughout India.

Fls. & Fr. 12-2.

FAM. 11. CAPPARIDACEÆ.

Trees, erect or climbing shrubs or herbs. *Leaves* simple or palmately 3-9 foliolate; stipules often spinescent or wanting. *Flowers* 4-merous, solitary or in racemes, corymbs or umbels. *Sepals* 4, free or connate. *Petals* usually 4, sometimes 2 or 0. *Stamens* 4 or numerous, exserted, generally inserted at the base of a gynophore; filaments filiform. *Ovary* 1-celled, (stalked in all woody genera); style short or 0, generally solitary. *Fruit* berried (woody genera), or capsular; seeds exalbuminous.

- I. ERECT HERBS with linear or oblong capsular fruit :—
 - Gonophore 0. Petals open in bud. Stamens 4 to 8 inserted on the disk. ... 1. **Cleome**.
 - Gonophore present. Petals imbricate in bud. Stamens 6 on long filaments. ... 2. **Gynandropsis**.
- II. TREES OR SHRUBS, the latter sometimes scandent.
 - Fruit a berry, sometimes drupe like :—
 - A. Fruit many-seeded :—
 - Sepals 4, open in bud, adnate to the disk. Stamens 4-6, inserted high on the gynophore. Leaves 3-foliate. ... 3. **Cratæva**.
 - Sepals 4, closed in bud, free. Stamens 8-indefinite, inserted at the base of the gynophore. Leaves simple. ... 4 **Capparis**
 - Fruit 1-seeded. Calyx of six 2-seriate segments. Stamens indefinite, inserted above the base of the short gynophore. Leaves simple. ... 5. **Roydsia**.

1. CLEOME, Linn.

• **Cleome viscosa**, Linn. Vern. *Hurhuria*, Beng.

An erect annual weed, 1-3 ft. high, stem striated and tomentose with mixed simple and glandular hairs. *Leaves* 3-5-foliate, very variable in size; leaflets 3-1·5 by 2·8 in., obovate, membranous, sessile, sometimes confluent, more or less hairy; petioles 0-2 in., striated and hairy like the stem. *Flowers* yellow 5-6 in. long. in leaf-bearing terminal racemes; sepals 4, spreading; petals 4, veined, imbricate in bud. *Stamens* 4-8, inserted on the disk. *Ovary* sessile. *Capsule* 2-3 in. long, narrowed at both ends, striated, the straitions frequently anastomosing. *Seeds* about 0·4-8 in. diam., reniform, rugose, dark brown, oily.

Common in abandoned fields, and on old ruins in the plains of ASSAM and BENGAL; goes up to 2,000 ft. in the hills.

The seeds are used medicinally as carminative, anthelmintic and stimulant.

Fls. & fr. throughout the year, but chiefly during the rains.

2. GYNANDROPSIS, DC.

Gynandropsis 'pentaphylla, DC. Vern. *Sada-hurhuria*, Beng. ; *Hulhulia*, Hind.

Very similar to the above but is generally taller and more showy when in flower ; strongly smelling. *Petiole* 2-3·5 in. long. *Leaflets* sessile, usually 5, 5-1·5 by 3-1 in., the middle one being the largest. *Flowers* white or purple, in corymbiform terminal racemes ; pedicels filiform in flowers but stout in fruit ; bracts 3-foliate. *Stamens* 6, inserted on a gonophore ; anthers purple. *Ovary* stalked. *Capsule* 2-4 in. long by 2 in. diam. on a stalk longer than the pedicel. *Seeds* reniform, rugose brown or black.

As common as *C. viscosa*.

Fls. & Fr. Chiefly 7-9.

3. CRATÆVA, Linn.

Deciduous trees. *Leaves* palmately 3-foliate glabrous, bitter. *Flowers* large, white or pale-yellow. *Sepals* 4, adherent at the base to the fleshy lobed disk. *Petals* 4, long-clawed, open in bud. *Stamens* numerous on a short column at the base of the gynophore. *Ovary* 1-celled, on slender gynophore ; ovules many on two parietal placentas. Berry fleshy, many-seeded.

A large tree. Leaves small membranous, pale beneath ; fruit globose, 1-celled ; seeds reniform, smooth.

1. *C. Roxburghii*.

Middle sized trees :—

Leaves of medium size, membranous, glaucous beneath ;

fruit ovoid, 2-celled ; seeds flat and angular.

2. *C. Nurvala*.

Leaves large, subcoriaceous glaucous beneath ; fruit

ellipsoid globose ; seeds spinose-tubercled on the back. 3. *C. lophosperma*

1. **Cratæva Roxburghii** R. Br., Syn. ('. religiosa, Forst. var. Roxburghii, F. B. I. i. 172. Vern. *Barun*, Ass. ; *Sabe-dotke*, Miri and Abor. ; *Jong-sia*, Garo.

(Often a large tree up to about a hundred feet in height and 9 ft. in girth ; branchlets with tips pointed upward, and generally irregularly angled, and dotted with elongated lenticels. Bark grey or greenish grey outside, plain but covered with lenticular warts, green underneath the thin corky layer ; inside white mottled with brown strands. *Leaflets* 2-3 by 1-1·5 in. ovate, elliptic or lanceolate, the lateral oblique at base, abruptly acuminate, membranous, generally shining above, pale beneath ; lateral nerves 7-9 on either side of the midrib ; tertiaries laxly, and quaternaries very minutely and finely reticulate ; common petiole 1·7-4 in., petiolules about 2 in. long. *Flowers* white fading to pale yellow, appearing with, or immediately after the leaves, 1·5-2 in. across, open in buds in terminal corymbs 2-4 in. long ; pedicels slender 1·5 in. long. *Sepals* 2-3 in. long, linear or narrow-lanceolate, strongly keeled and finely acuminate. *Petals* 6-8 in. long, boardly ovate or rhomboid, with a distinct midrib

and side-nerves, narrowed to a claw 2-3 in. long. *Filaments* filiform, 1.5 in. long, purple; anthers oblong. *Gynophore* 1-2 in. long, slender; ovary oblong or ellipsoid; stigma sessile. *Fruit* 1.5-2 in. across globose, speckled with round white lenticels stalked by the much thickened gynophore; seeds about .5 by .3-.4 in., reniform, with a smooth, hard, dark-brown testa.

Common near Bomjur, Nizam-ghat, and along the Buri-suti, Janai and Dhikari streams, etc. in the N. E. FRONTIER DISTRICT, North Lakhimpur Sub-Division: also KAMRUP and GARO HILLS.

The wood is pale-white fine and even grained and is suitable for packing cases, toys, models, writing-boards, turnery, etc. The leaves are good for fodder.

Fls. 3-4. Fr. 11-1.

2. *Cratæva Nurvala*, Ham. Vern. *Barun* or *Borun* Ass.; *Mibonju*, Kach.; *Ngasentur*, Kuki.

A middle-sized tree up to 50 ft. in height and 4 ft. in girth. *Bark* ashy-grey with close horizontal wrinkles, otherwise smooth, .7 in. thick, inside granular, light reddish-brown (on very old trees). *Leaflets* not very bitter, 5-7 by 1.5-2.3 in., lanceolate, very gradually tapering from below the middle to a long acumen, also downward to a cuneate, and in the case of the lateral leaflets, an oblique base, chartaceous when fully mature; lateral nerves 8-15 on either side of the midrib, arched, the intervening spaces very finely reticulate; petiolules .1-.2 in., common petiole 3-5 in. long. *Flowers* practically as in the preceding species, but the sepals are not keeled and less persistent and the corymbs are more laxly flowered. *Fruit* oblong (mature not seen), 2-celled; seeds flat, closely packed.

Somewhat rare occurring sporadically on low hilly grounds, e.g., round Lumding, NOWGONG DISTRICT; at Boduti, North Lakhimpur, also Langting reserve and Daotuhaja, N. C. HILLS.

Fls. 4.5. 10-12 (?).

3. *Cratæva lophosperma*, Kurz. Vern. *Barun* or *Borun*, Ass. and Beng.; *Bonhukha*, Kach.; *Loi-emba-lei*, Manip.; *Senatur*, Lush.

A small or middle-sized tree generally found along edges of sluggish streams. *Bark* plain, dark ashy-grey marked with numerous lenticels on branchlets, pale-white and granular inside, .5 in. thick. *Leaflets* very bitter 5-8 by 1.5-3 in., lanceolate, tapering to a fine acumen from after a quarter of the length, lateral very oblique at base, subcoriaceous when mature, green and shining above, glaucous beneath; midrib strong, reddish; lateral nerves more numerous (often up to 30 on either half) and stronger than in the other two species, reddish, often nearly horizontal near the midrib, reticulations also stronger; petiolules .1-.2 in., common petiole 1.5-4 in. long. *Flowers* as in the

foregoing species, but the corymbs are often larger and more congested, the pedicels longer, up to 2·5 in., and the lanceolate sepals only faintly keeled. *Petals* white, turning yellow, obovate or rhomboid. *Filaments* about 2 in. long, purple. *Gynophore* 2-2·5 in. long. *Fruit* obovoid, elliptic, or globose, speckled, otherwise fairly smooth, 2-celled by the intrusion of the placentas. *Seeds* about 5 in. long, crescent-shaped, spinous tubercled on the back.

The commonest species of the genus occurs in all DISTRICTS of UPPER ASSAM, Burisuti, Dikhumukh, the Majuli, Gotonga, etc.

Fls. 3-4. Fr. 7-9.

4. CAPPARIS, Linn.

Erect or climbing shrubs or small trees. *Leaves* simple, usually with stipulary thorns. *Flowers* usually showy. *Sepals* 4 in 2 series, imbricate. *Petals* 4, imbricate, not clawed. *Stamens* indefinite; filaments long. *Ovary* on a long gynophore, generally 2-celled; ovules many on perietal placentas. *Fruit* berried; seeds many, cotyledons convolute.

I. Flowers in paniced umbels or corymbs :—

- | | | |
|---|----|-------------------------|
| Young shoots puberulous. Leaves glabrous, nerves inconspicuous. | .. | 1. <i>C. pumila</i> . |
| Young shoots glabrous. Leaves glabrous, nerves prominent beneath. | .. | 2. <i>C. assamica</i> . |

II. Flowers in vertical series :—

A. Series of flowers many, 2-4-stichous, usually independent of leaves, many flowered :—

- | | | |
|--|----|---------------------------|
| Young shoots glabrous, Fls. 2 in. across; fr. 3 in. across, | .. | 3. <i>C. multiflora</i> , |
| Young shoots scurfy. Flrs. 1-2 in. across; fr. 1-1·5 in. across. | .. | 4. <i>C. florrida</i> . |

B. Series of flowers axillary 1-few-flowered :—

1. Usually climbers, always armed, Leaves bluntly acuminate :—

- | | | |
|---|----|--------------------------|
| Branchlets brown-pubescent, Leaves subcoriaceous, Flowers large, Fruit beaked. Pedicels fairly stout. | .. | 5. <i>C. oiaefolia</i> . |
| Branchlets glabrous, Leaves membranous, Flowers small, Fruit not beaked. pedicels filiform. | .. | 6. <i>C. tenera</i> . |

2. Erect shrubs, usually not armed. Leaves taper pointed :—

- | | | |
|--|----|----------------------------|
| Leaves ovate or oblong lanceolate 2-4 in. long. Flowers usually not more than 2 in each series, Fruit the size of a pea. 2-seeded. | .. | 7. <i>C. sabiaefolia</i> . |
| Leaves elliptic, 3-6 in. long, Flowers often up to 4 in each series. Fruit 5 in. diam., many-seeded. | .. | 8. <i>C. viminea</i> . |

1. *Capparis pumila*, Champion.

A shrub with straggling branches, branchlets softly greenish-grey puberulous; prickles small, recurved. Leaves 2.3-5 by 1.2 in., elliptic or oblong-lanceolate, acuminate, subcoriaceous, glabrous; lateral nerves 6-7 on either half, extremely fine, almost invisible in green leaves; base subacute; petiole 1.5-2 in. long, channelled, puberulous. Flowers white, 5 in. diam., in corymbs or umbels arranged in terminal panicles; buds globose; pedicels 1.5-2.5 in. long. Petals oblong. Stamens about 20. Fruit 5-7 in. diam., 1-seeded, globose, glabrous; embryo curved.

Mikir Hills near Barapather. SIBSAGAR DISTRICT. Appears to be rare

2. *Capparis assamica*, Hk. f. & Th. (?) Vern. *Diengsu-sohsaw*. Khasi; *Thanim-nium-kra*, Duff.

A scandent (?) shrub with glabrous branches, innovations pubescent. Leaves 5-8 by 1.2-3 in., oblong-lanceolate acuminate, base acute, attenuate or cuneate, subcoriaceous, glabrous, lateral nerves prominent beneath, 9-13 on either half, arched and looping at the extremities; petiole 2-3 in. long, channelled, stipular prickles minute, straight. Inflorescence terminal or subterminal raceme-like, 6-11 in. long, bearing numerous small white flowers; rachis glabrescent; bracts subulate up to 1.5 in. pubescent when young, those at the base of the inflorescence empty; pedicels in several rows, very slender 4-7.5 in. long, 1 or 2 superposed and slightly supra-axillary on the bracts. Sepals imbricate in pairs 1.5-2 in. long, subequal, concave elliptic to oblong-elliptic. Petals white 2-2.5 in. long, white obovate oblong. Filaments filiform; gynophore 4-6 in. long. Fruit not seen.

Nongrang-koh, KHASI HILLS (My sheet 7248)

Firs. 4-5.

Our plant differs in many respects from *C. assamica* as described in F. B. I. by Hooker & Thomson.

It should be studied further with more complete materials

3. *Capparis multiflora*, Hk. f. & Th. Vern. *Thanim-nium-kre*, Aka; *Thanim-nium-kra*, Daff.

A very variable erect bush 8-15 ft. high, generally sparingly branched, branchlets glabrous, terete or angled, with a large pith; thorns short, thick, straight or up-curved. Leaves membranous, glabrous, acuminate, of two different sizes and shapes; those below the flowers 6-10 by 2.5-6 by 1.2-2 in., elliptic, oblanceolate, or lanceolate, somewhat more membranous; lateral nerves 6-8 on either half, depressed above, much curved, looped to form an intermarginal vein. Flowers white, 2 in. across, very sweet-scented, in many flowered vertical series which are close or somewhat distinct and 2-4-stichous; buds about 1 in. across, globose; pedicels filiform 5-7 in. long. Sepals 4, imbricate, ovate, glabrous or sparsely adpressed pubescent outside. Petals 4, broadly elliptic

or suborbicular, glabrous. *Stamens* about 12, filaments filiform. *Gynophore* of barren flowers 2-3 in. long, filiform straight; of fertile flowers about 1 in. long, much thicker, spirally twisted. *Fruit* globose, about 3-in. diam., glabrous.

Kalioni, Daigurung and Garampani, DISTRICT SIBSAGAR; Bhoroli Reserve and Dulongmukh, NORTH LAKHIMPUR; Bhalukpong, DARRANG.

Fls. 3-4. Fr. 12-2.

4. *Capparis horrida*, Linn. f. *Hunkara*, Sans; *Asaria*, *bagnai*, Beng.

A scandent or scrambling bush with greyish or pale brown somewhat rough bark; branchlets green, young parts covered with scurfy rusty, deciduous, tomentum. *Leaves* 2-4 in. by 1-2 in., lanceolate or elliptic ovate, acute or shortly acuminate, mucronate, base more or less rounded; lateral nerves 6-8 on either half, ascending, somewhat distant, forming loops at the extremity; petiole 25-4 in., more or less tomentose at least when young; stipular spines stout hooked with a yellowish-brown tip and broad base. *Flowers* usually superposed in extra-axillary, rows 1-4 together, white, turning pink 1-2 in. across; pedicels 5-1 in. long. *Sepals* concave scurfy. *Petals* oblong obovate, exceeding the sepals, villous inside. *Stamens* numerous, purple, slender, up to 15 in. long; gynophore up to 17 in. enlarging and becoming woody in fruit. *Berry* 1-15 in. across, broadly ellipsoid or ovoid, orange red when ripe.

GARO HILLS—12th mile—Dalu road.

Flrs. 3-4. Fr. 8-9.

5. *Capparis olacifolia*, Hk. f. & Th. Vern. *kota-har*, Ass; *Ingau-rikang*, *Ingau-waikom*, Mik.; *Borun-khosai*, *Borun-phita-phang* Kach.; *Ling-uom*, Kuki *Deing-sia*, Khasi; *Ganga-thaisip*, Mech.

An erect shrub up to 15 ft. in height and 6-9 in. girth with blackish-grey, corky or warty bark and spreading branches; young shoots dark-brown, pubescent, terete, thorns usually straight and pointing upward. *Leaves* 2-6 by 8-25 in., ovate-lanceolate, taper-pointed, chartaceous or thinly coriaceous, glabrous except that the midrib is sometimes pubescent in very young leaves, shining above; lateral nerves 7-8 on either side of the midrib, arched, rather prominent underneath; base rounded or subacute; petiole 2-3 in. long, puberulous in young leaves. *Flowers* solitary or two from the same leaf-axil, white, inodorous, 15 in. diam.; buds ovoid, glabrous; pedicels 3-5 in. long. *Sepals* lanceolate, ciliate with dense tomentum. *Petals* obovate-oblong or oblanceolate, pubescent, white, the lowest with pale-yellow or purple blotch. *Stamens* about 35; filaments 1-13 in. long, anthers white at first with purple veins, turning blue in fading. *Ovary* pubescent. *Gynophore* 1-15

in. long, gradually thickened towards the apex in fruit. *Berries* '3-6 in. across, globose or ellipsoid and with a stiff conical beak, red when ripe, insipid, glabrous but rugose shifting; seeds 1-3 about '2 in. across, globose, reddish-brown; cotyledons convolute.

Nizamghat. N. E. FRONTIER: from Barpathar westward in SIBSAGAR and NOWGONG DISTRICTS: Bhounraguri near Tezpur: DARRANG; Kuls plantation, Andheri-juli, Luri, KAMRUP; Langting, Mupa, N. CACHAR; Shella, KHASI HILLS. Frequent in Sal and other deciduous forests.

Fls. 3-4. Fr. 12-2.

6. *Capparis tenera*, Dalz. Vern. *Premjila-khosa*, Kach.

A straggling glabrous climber; thorns recurved, whitish, very sharp-pointed, in pairs at the base of each leaf. *Leaves* 1-5-3 by '8-1-7 in., ovate, elliptic or lanceolate, finely acuminate, generally rounded at base, membranous, glabrous; lateral nerves 4-5 on either side of the midrib, much arched, very faint; petiole '2-3 in. long, slender. *Flowers* white, 2-5 from each axillary series, '3-4 in. across; buds globose, glabrous; pedicels '7-1-3 in. long, very slender. *Sepals* '12-15 in. long broadly elliptic or ovate, densely tomentose along the edges. *Petals* '2-3 in. long, oblong, woolly on both surfaces. *Stamens* 6-15; filaments very slender '6-9 in. long; anthers minute with a crooked tip. *Ovary* red, glabrous. *Gynophore* about as long as pedicel. *Fruit* pisiform, few seeded.

Diphu, Rengma and Nambor Reserves, SIBSAGAR: Dimapur, NOWGONG District; MANIPUR, Watt.

Fls. 3-4. Fr. 7-9.

7. *Capparis sabiaefolia*, Hk. f. & Th.

An erect shrub with thin glabrous branches; thorns 0, or minute increasing in size with age, conical, ascending. *Leaves* 2-4 by '7-1-5 in., elliptic to oblong-lanceolate, long-acuminate, subacute, rarely rounded at the base, thinly chartaceous, glabrous; main lateral nerves about 8 on either half, slender, arched; petiole '2-3 in. long, channelled. *Flowers* white, '2-6 in. across, usually 2 in each series, often solitary, slender, pedicels '5-6 in. in flower, lengthening (including the slender gynophore) to 2-2-2 in. in fruit. *Sepals* about '2 in. long, broadly abovate, glabrous except along the margins which are furfurous. *Fruit* about '2 in. in diam., globose.

Appears to be common in the NAGA HILLS *King ! Prain ! Watts !* and between 4-6,000 ft. in the KHASI HILLS, Shillong. *Hk. f. & Th.*

Fls. 4-6. Fr. 8-10.

8. *Capparis viminea*, Hk. f. & Th.

A glabrous bushy shrub 6-8 ft. high; stem and branches whitish. *Leaves* 2-5-6 by 1-2 in., ovate or elliptic, abruptly

long-acuminate, more or less acute at the base, membranous, glabrous: main lateral nerves 3-5, often with a few intermediate ones, much arched; petiole 2-3 in. long, rather stout, finely channelled. *Flowers* about 5 in. across, 2-4 in each series, very channelled. *Flowers* about 5 in. across, 2-4 in each series, very rarely solitary. *Sepals* as in the last species or narrower. *Fruit* 5-6 in. across, globose, many seeded.

In scrubs in the KHASI and N. CACHAR HILLS between 1-5,000 ft.

Fls 4-5. Fr. 7-9.

5. ROYDSIA, Roxb.

Roydsia suaveolens. Roxb. *Madhmalati*, *Madhabimalati*, Ass. ; Maonl. Tipp ; *Tille-saphlit*. Synt.

A large unarmed woody climber with speckled branches. *Leaves* simple 5-12 by 2-5 in., oblong or oblong-lanceolate generally thickly coriaceous, glabrous, glossy, deep-green above, pale underneath, generally minutely punctulate, with raised white dots on both surfaces, quite entire; main lateral nerves about 10-12 on either side of the midrib with 1-2 intermediate ones, the former looping to form an intermarginal nerve close to the edge, the intervening spaces strongly reticulate; base rounded or subacute; petiole 8-17 in. long, terete, rugulose. *Racemes* axillary, or slightly supra-axillary, generally simple and solitary, but sometimes forming a terminal panicle 3-7 in. long; rachis and pedicels velvety-pubescent especially when young. *Flowers* 4-6 in. long, and about as broad, dull-white, very sweet-scented (resembling *Mignonette*); pedicels 1-2 in. long; bracts subulate, tomentose about as long as the pedicels; buds obovoid-globose. *Calyx* 6-partite, segments in two rows, velvety, slightly imbricate in bud. *Petals* 0. *Stamens* numerous; filaments white fading to pale-yellow, 3-5 in. long, somewhat expanded in the middle. *Ovary* 3-celled; *styles* 3, about 68 in. long, subulate often slightly connate at base. *Gynophore* very short in flower enlarging to about 25 by 2 in. in fruit. *Fruit* a 1-seeded drupe, 1-1 in. long, ellipsoid or obovoid, scurfy, pale-orange when ripe; pulp yellow, aromatic, sweetish.

Fairly common throughout UPPER ASSAM. Quite worth cultivating for the delightfully-scented flowers.

The ripe fruit is eaten.

Fls 2-3. Fr. 10-1.

FAM. 12. VIOLACEÆ.

Herbs, shrubs or (rarely) small trees. *Leaves* alternate, rarely opposite, stipulate. *Flowers* regular or irregular, 2-bractenolate. *Sepals* 5, persistent, equal or unequal, imbricate in bud. *Petals* 5, hypogynous, the lower dissimilar, often saccate or spurred. *Stamens* 5, hypogynous or slightly perigynous; filaments short; anthers free or connate, with a broad overtopping connective, opening by longitudinal slits or terminal pores; staminodes 0. *Ovary* sessile, 1-celled; style 1, stigma entire or lobed; ovules many on parietal placentas. *Fruit* usually a 3-valved loculicidal capsule. *Seeds* small; cotyledons flat imbedded in a fleshy albumen.

Annual or perennial herbs. Sepals produced at the base

Corolla irregular; lowermost petal spurred
or saccate at the base. ...

1. *Viola*.

Shrubs or trees. Sepals rigid. Corolla regular; petals
subequal ...

2. *Alsodola*.

1. VIOLA, Linn.

Erect herbs, sometimes with a perennial woody root stock. *Flowers* sometimes cleistogamous and smaller than the ordinary ones, but producing more seeds. *Sepals* produced at the base. *Petals* erect or spreading, the lowest usually the largest, spurred or saccate. *Anthers* connate, the connectives of 2 lower often spurred at the base. *Stigma* obtuse, lobed or 4-lobular. *Capsule* 1-celled, 3-valved.

Stigma terminal, Capsule oblong or linear, many-seeded :—

Stemless and without stolon. Stipules adnate. Spur
saccate.

1. *V. Patrinii*.

Stemless but with stolon. Stipules free or nearly so.
Spur globose.

2. *V. diffusa*.

With long leafy stems and stolons. Stipules free. Spur
saccate.

3. *V. arcuata*.

Stigma lateral or oblique, Capsule globose, few-seeded :—

With long leafy stems and stolons. Stipules free. Spur
saccate.

4. *V. serpens*.

1. *Viola Patrinii*, DC.

Root stock perennial. *Leaves* glossy-green, very variable in shape and size, generally 1-3 in. by 3-1 in., more or less triangular in outline, crenate or serrate, cuneate or hastate at the base, generally glabrous, petiole about 3 times as long as the blade which is decurrent with it for some distance from above. *Flowers* lilac, scented, about 5 in. long, generally with smaller colourless flowers from the rootstock; peduncle of larger flowers 3-5 in., of the smaller flowers 6-8 in. long and more slender. *Spur* saccate, about 2 in. long.

KHASI HILLS; KAMRUP *Masters* ! ABOR HILLS, *Burkill* ! : MANIPUR, *Watt*.

Fls. 3-5.

2. *Viola diffusa*, Ging.

Stemless herb widely spreading by stolons. *Leaves* 5-2 by 3-8 in., globose obovate oblanceolate or spatulate, pubescent, crenate or crenulate, strongly ciliate along the margins; blade decurrent with the petiole throughout, which is 5-3 in. long. *Flowers* 3 in. across, dull-purple or nearly white, not scented; peduncle 5-2 in. long, slender, with a pair of linear bracts about the middle; petals recurved; style slender at the base, thickening upwards to the stigma. *Spur* globose.

KHASI HILLS - NORTH CACHAR HILLS, *Haflong*, *Craib* ! : NAGA HILLS, *Konoma*, *Watt* ! : ABOR HILLS, *Ponjijhams*, *Burkill* !

Fls. 2-3. Fr. 4-6.

3. *Viola arcuata*, Bl. (1825). Syn. *V. distans*, *Wall.*, (1828).

Stems slender, 2-9 in. long. *Stolons* slender often bearing leaves and flowers. *Leaves* 5-1.5 in. long, usually as broad as long sometimes broader than long, ovate deeply cordate or deltoid, more or less acute, crenate-serrate, glabrous or hirsute when mature; petiole 5-1.5 in. long, slender, glabrous. *Flowers* about 4 in. across, white or faintly blue; sepals acute; the lowermost petal sometimes smaller than the others; style straight, tapering to the stigma; peduncle 1.5-3 in. long, minutely bracteate usually above the middle. *Spur* saccate. *Capsule* about 4 in. long, many seeded.

KHASI HILLS above 4,000 ft., Shillong Mawphlong, Myrang, Cherrapunji, *et c.*

Fls. 4.5.

4. *Viola serpens*, Wall.

Very similar to the foregoing species and quite as variable. *Stem* and *stolon* sometimes absent. *Leaves* 5 by 4-2.5 in., ovate acute or acuminate, more or less deeply cordate with a narrow or broad sinus, crenate-serrate, glabrous or pubescent; *petiole* 2-4 in. long, slender; stipules toothed or fimbriate. *Flowers* 4-6 in. across, bluish or white, not scented; sepals about 1 in. long, acute, canescent; peduncles 2-5 in. long, bracteate about the middle or a little above it. *Spur* saccate, about 2 in. long. *Stigma* on an oblique or crooked, trumpet-shaped style. *Capsule* small, globose, few seeded.

KHASI HILLS; NAGA HILLS, *Prain* ! MANIPUR, *Watt* !

Fls. 2-4.

The following two garden species are frequently cultivated at Shillong and other hill stations—

5. *Viola tricolor*, Linn. *The Heartsease or garden pansy*. An annual herb. The flowers are up to 2 in. across and very showy.

6. *Viola odorata*, Linn. The 'Sweet violet'. A perennial herb. The flowers are of the shape of the indigenous violets and only slightly larger in size, but are very sweet-scented.

2. ALSODEIA, Thouars.

Shrubs or small trees. *Leaves* distichous, usually alternate stipules rigid. *Flowers* small, regular, axillary or terminal, solitary or in fascicles cymes or racemes. *Sepals* and *petals* 5 each, subequal; peduncles bracteate. *Stamens* 5, inserted inside or on an annular disk; connective produced into a broad membranous appendage. *Ovary* 1-celled with few or many ovules; style straight; stigma terminal. *Capsule* 3-valved, few-seeded; seeds glabrous.

Leaves small, scarcely exceeding 2 in. in length. Stamens exerted; anther cohering in a conc. Nerve-axils of leaves perforated.

Leaves middle-sized, at least 2.5 in. in length. Stamens included; anthers free:—

Nerve-axils of leaves bearded beneath. Flowers fascicled; peduncles 1-flowered. ... 1. *A. Roxburghii*.

Nerve-axils of leaves not bearded beneath. Flowers in axillary erect racemes. ... 2. *A. bengalensis*.

... 3. *A. racemosa*.

1. *Alsodeia Roxburghii*, Wall.

A small shrub with switchy, compressed and pubescent branchlets. *Leaves* 5-2 by 3-1 in. sessile, elliptic or lanceolate, cuneate at the base, acute or acuminate, entire or more or less crenulate, membranous or thinly chartaceous, glabrous above, usually pale and furfuraceous beneath; perforate at the axils of the lateral nerves which are about 4 on either half; tertiaries generally obsolete. *Flowers* white, axillary, subsessile, about 1 in. across; sepals unequal, obtuse; petals linear, tips revolute. *Disk* 10-toothed. *Stamens* exerted; filaments glabrous; anthers white, tomentose at the base; appendage oblong. *Ovary* glabrous; style slender, filiform. *Capsule* 2-3 in. long, pedicelled; tapering to the apex, 1-few-seeded.

Appears to have spread from Bengal into South Sylhet, Wallich's Distrib. BEHAR, BURMA and the ANDAMANS.

Fls. 9-10. Fr. 11-12.

2. *Alsodeia bengalensis*, Wall.

A large evergreen shrub or small tree often with channelled branchlets. *Leaves* 2.5-7 by 1.2-3 in., elliptic-lanceolate, serrate or serrulate, thinly chartaceous, wholly glabrous; bearded at the axils of the lateral nerves; main lateral nerves about a dozen on either half, slender, arched; tertiaries transverse to the lateral about .04 in. apart, subparallel; stipules .5 in. long, lanceolate. *Peduncle* in fascicles of 5-8, .3-.55 in. long, narrow-flowered, glabrous or pubescent. *Flowers* .15 in. across, glabrous. *Sepals* 5, about half the size of the flowers, broadly ovate, subacute, puberulous. *Petals* 5, ovate elliptic. *Disk* fleshy, 5-lobed. *Filaments* 5, very short, expanded at the base and cohering into a tube;

anthers oblong, glabrous, with a broad, hooded, sub-apical membranous appendage. *Style* short, simple. *Capsule* .25-.35 in. diam., globose, glabrous, 3-4 seeded. *Seeds* about .15 in. in diam., globose, brown-speckled.

SYLHET, Wallich and Griffith !

Fls. 2-4-10. Fr. 4-9-12.

3. *Alsodeia racemosa*, Hk. and Th.

A handsome glabrous shrub or small tree with rigid branches. *Leaves* 2-6 by 1-2.5 in., elliptic or obovate, acuminate, cuneate at the base, membranous, more or less repand serrulate, glabrous, shining above; main lateral nerves 7-11 on either half, slender, irregularly arched, with no perforations or beard at their axils; minor nerves reticulate; petiole .15-2 in. long, slender, puberulous; stipules as long as the petiole, subulate, scarious. *Racemes* 2-3 in. long, simple, erect or ascending, flower-bearing throughout their length, persistently bracteate; pedicels short, stiff, shortly 2-bracteolate at the base. *Flowers* .12 in. diam. *Sepals* ovate, about .08 in. long. *Petals* .1-1.2 in. long, oblong. *Filaments* subulate, glabrous, connate at the base and forming a cup with the disk; anthers ovate, hairy at the base, tip of connective broad, subacute. *Capsule* .5-6 in. long, glabrous; carpels boat shaped, strongly reticulate outside. *Seeds* .16 in. across, globose, white throughout.

ASSAM, Griffith ! But I have not found it anywhere in this Province

Fls. 3-4. Fr. 4-5.

13. BIXACEÆ.

(Warburg in Engler and Prantl's; *Pflanzenfamilien*; III. 6. 367).

Trees or shrubs with mucilaginous sap. *Leaves* simple, alternate, palminerved or palmately lobed; stipules minute, caducous. *Flowers* large, regular, 2-sexual. *Sepals* 4-5, free, imbricate. *Petals* 4-5, free, large. *Stamens* many; anthers 2 celled opening by slits or pores. *Ovary* 1-celled or spuriously 2-5 celled; ovules many, anatropous. *Fruit* a 1-5 celled dry capsule opening by valves. *Seeds* many, sometimes with long hairs; albumen copious; cotyledons foliaceous.

1. BIXA, Linn.

• *Bixa Orellana*, Linn. Vern. *Jarat*, *Jolandhar*, *hatronga*, Ass.; *Latkan*, Beng. The arnatto.

A small evergreen tree up to 15 ft., in height, generally with long branches from near the ground. *Bark* brown, fairly smooth.

Blaze yellowish brown turning reddish, fibrous; young parts and inflorescence with rust coloured scurfy tomentum. *Leaves* alternate 3-8 by 2-5 in., broadly ovate to cordate, tapering acuminate, entire or more or less sinuate on the margins, chartaceous or subcoriaceous, glabrous and somewhat shining above, undersurface usually with minute scurfy dots, nerves prominent beneath, main lateral nerves 4-5 on either side (excluding the basal) arcuate, prominent beneath, secondaries subparallel; base 5 nerved, truncate to shallow cordate, often more or less oblique; petiole 2-3 in. long, dilated at the apex; base more or less pulvinate; stipules very short, broad, early deciduous, stipular scar almost annulate with a circular gland close to and on either side of the petiole. *Flowers* white or pinkish, 1-2 in. across, in short terminal panicles about 2-5-3-5 in. across; pedicels .25-.35 in. long in flower, elongating to 5 in. in fruit, dilated upwards, apex with 5 persistent glands. *Bracts* and bracteoles very short broad, each often with a dorsal gland. *Sepals* 5, imbricate, deciduous. *Petals* 5, contorted in bud, oblong obovate about .6 in. long. *Stamens* numerous, inserted on a rather stout torus; filaments very slender about .4-.5 in. long; anthers opening by two terminal pores. *Ovary* 1-celled about .1 in. long, covered with soft bristles; style slender about .5 in. long, curved, dilated towards the top; stigma 2-cleft; ovules many on parietal placentas. *Capsule* 1.5-2 in. long, ovoid, densely but softly echinate, spines slender up to .3 in. long, subulate. *Seeds* many, in a farinaceous red pulp, obovoid, .2 in. long, albumen fleshy; cotyledons flat.

Introduced from Tropical America. e. g. near Nazira and many other places in SIBSAGAR DISTRICT, Lakhipur in CACHAR, SYLHET, Gomez! KHASI HILLS, 2500 ft., Clarke! MANIPUR, Watt! ASSAM, Jenkins! Masters!

The pulp surrounding the seeds is the well known arnatto or anatto dye, which is used, to colour butter, and other food and also silk to which it gives various shades of orange and red colours. It is also used for dyeing the hands. A strong fibre is obtained from the bark which is suitable for ropes. The seeds and root bark have also valuable medicinal properties.

Fls. 7-10. Fr. 10-12.

14. FLACOURTIACEÆ.

Trees or shrubs without mucilaginous sap. *Leaves* alternate, usually distichous, penninerved, rarely palminerved, often with translucent dots and dashes beneath; stipules small and caducous. *Flowers* bracteate, small, regular, 2-sexual or polygamous or dioecious, axillary or on lateral appendages of various shapes. *Sepals* 4-many, free, hypogynous or more or less perigynous, sometimes connate in bud. *Petals* 0, or 2-3 to several

times as many as the sepals. *Stamens* usually more numerous than the petals, in 1-many series, sometimes in bundles opposite the petals; anthers opening usually by lateral slits. *Ovary* superior, sometimes half-inferior, more rarely wholly so, 1-celled with 2-8 (usually 3-5) parietal placentas, which sometimes meet in the axis making the ovary spuriously as many celled; ovules usually many, anatropous; styles as many as the placentas, often connate. *Fruit* a capsule or a berry which is sometimes drupaceous. *Seeds* 1 or more, albuminous; cotyledons foliaceous (*partly after Haines' Botany of Behar and Orissa*).

Petals present :—

- | | |
|--|-----------------|
| Flowers in racemes, spikes or panicles. Fruit a dry capsule. | 1. Homaliūm. |
| Flowers in fascicles or cymes. Fruit a berry with a hard rind :— | |
| Stamens numerous (often up to 100 or more). | 2. Gynocardia. |
| Stamens not exceeding 20 (in the species here described). | 3. Hydnocarpus. |

Petals 0 :—

- | | |
|--|----------------|
| Fruit a succulent, sometimes drupaceous berry :— | |
| Ovary 2-8-celled with 2-6 styles. | 4. Flacourtia. |
| Ovary 1-celled with many connate styles. | 5. Xylosma. |
| Fruit a succulent capsule. Ovary 2-8 celled with 2-8 styles. | 6. Casearia. |

1. HOMALIUM, Jacq.

(Generally small tree. *Leaves* alternate, more or less crenate or serrate or entire, usually petioled, sometimes punctulate. *Flowers* small, hairy, in slender axillary or terminal, simple or paniced, racemes or spikes; bracts often prominent but caducous. *Calyx tube* adnate to the base of the ovary; segments 5-7, narrow, persistent. *Petals* 5-7, persistent. *Disk* tomentose. *Stamens* inserted at the base of the petals, solitary or in fascicles of 2-7, opposite the petals alternating with round hairy staminodal glands. *Ovary* half-superior, 1-celled; styles 2-6, filiform; stigmas capitate; ovules 2-many, pendulous on 2-6 parietal placentas at the top. *Capsule* half buried in the persistent calyx, coriaceous, 5 valved at the apex. *Seeds* usually few, albumen copious.

Racemes elongate. Stamens 1 opposite each petal. 1. *H. bhamoense* var. *Deb-barmani*.

Racemes paniced and divaricate. Stamens 3 opposite each petal. 2. *H. Schlicchii*

1. *Homaliūm bhamoense*, Cubit et Smith, var. *Debbarmani*. *Kanjilal*. f. Vern. *Shokshimaroug*, Garo.

A tall tree. Bark nearly smooth outside, blaze dun-brown; young parts, petiole and inflorescence, grey tomentose. *Leaves* 2-farious, 3-6 by 2-3.5 in. variable, elliptic-oblong or elliptic,

* I follow Warburg in Engler and Prantl's "Pflanzenfamilien" vol iii. 6A in uniting *Casearia* and *Homaliūm* with *Flacourtia*, *Xylosma*, *Gynocardia* and *Hydnocarpus* into one family and calling it FLACOURTIACEÆ.

somewhat bluntly acuminate, crenate serrate, sub-coriaceous, puberulous along the midrib and often along the nerves, otherwise glabrous above, softly hairy especially along the nerves beneath; main lateral nerves 7-10 on either side, tertiaries sub-parallel; base more or less cuneate, often decurrent into the channelled petiole which is .25-.5 in. long. *Flowers* small, in dense clusters on axillary racemes 3-8 in. long, which are sometimes branched; pedicels slender about .05 in. long. *Calyx* thinly pubescent outside, tube more or less ribbed, upto .07 in. long; lobes 5 or 4 about equalling the tube, linear, ciliate. *Petals* 5 or 4, .06-.1 in. long, spatulate or oblanceolate, ciliate. *Stamens* one opposite each petal and exceeding them in length. *Free* portion of ovary thinly pubescent; styles 4-3, sometimes 5. *Capsules* about .08 in. long.

GARO HILLS. Distribution BURMA: SIKKIM.

Fls. 3-4.

Typical *H. bhamoense*, Cubit and Smith, has, so far not been collected outside Burma. Our plant differs from it by its narrower, more softly pubescent leaves and somewhat larger flowers with less densely ciliate more elongate petals.

Forma glabra. Vern. *Sajira*, *Bolong*, Ass.; *Bolong-wah-vthri*; *Boldu-jag-teng*. Garo—differs from var. *Debbharmani*, by its glabrous or glabrescent and broader—usually elliptic to broadly elliptic leaves.

CACHAR—Lalchera: KAMRUP—KuIsi Range; GARO HILLS, Distribution CHITTAGONG.

It would appear that *H. bhamoense*, and the plants here described constitute a north eastern race of *H. zeylanicum*, Benth, and that they should all be combined with it under one species. Intermediate forms seem to occur and it is often difficult to differentiate between glabrous forms of *H. bhamoense* and *H. zeylanicum*.

2. *Homalium Schlichii*, Kurz. Vern. *Iheng-soh-mara*. Khasi.

A tall tree about 100 ft. in height and 7 ft. in girth buttressed at the base when old, deciduous in the hills but usually evergreen in shady localities in the plains. *Bark* dark-brown and somewhat rough outside, inside hard, granular, rich dun-brown mottled with specks of deeper colour, .5 in. thick. *Leaves* 3-7 by 1.5-2.4 in., elliptic, oblong or ovate, acute or cuneate at the base, shortly acuminate, distantly coarsely crenate or crenulate, subcoriaceous, glabrous, shining above, yellow before falling; lateral nerves 8-10 on either half, arched; petiole .3-.5 in. long, stout, red on young leaves as also are the midrib, nerves and margins. *Flowers* small, up to .2 in. across, on short divaricate terminal or subterminal grey pubescent panicles 2-4 in. long; pedicels short, but stout, thickly grey tomentose. *Sepals* linear-oblong, pubescent. *Petals* elliptic to oblanceolate, also pubescent but somewhat larger. *Stamens* 3 before each petal alternating with hairy gland like staminodes. *Free* portion of ovary tomentose.

KASHI HILLS, c. g., Nongkhla, Wah Rangphasaw, etc., also Badshaitila Reserve—SYLHET.

Fls. 3-5 Fr. not known.

2. GYNOCARDIA, R. Br.

Gynocardia odorata, R. Br. Vern. *Chaulmugra*, Beng. & Ass.; *Bon-sha*, Ass. (Darrang); *Bandarpelo*, Ass., *Lemtem*, Ass. (Sibsagar), *Dieng-soh-phailing*, *Soh-phoeing*, *Dierly-soh-lung*, Khasi; *Thebong-kok*, *Kampi-bumtal-arong*, Mik.; *Balibu*, *Masribu*, *Thithopha-bipha*, Garo; *Sibe-tulpi*, Abor; *Sibe-turpu*, Miri & Abor; *Tuki-sidik*, *Taki pomju-asing*, Miri; *Tak ik-changne*, or *Tuluk-changne*, Duff; *Umphu*, Aka; *Khungkha-biphang*, *Thailaokhiong*, *Thuila-phrong-buphang*, *athaiba*, (*athaiba* = fruit borne stem), Mech; *Thri-nong-pung*, Kuki; *Koutur*, Lushai & Kuki.

A small or middle sized glabrous tree with slender branches. Bark grey or greenish grey and generally warty outside, uniformly pale brown inside, 25-5 in. thick, green underneath the cuticle. Leaves bifarious, 6-10 by 1.5-3.5 in., oblong, abruptly acuminate, rounded or acute at base, entire, thinly coriaceous; lateral nerves 5-9 on either side of the midrib including the subbasal pair, very arcuate, tertiaries transverse to the midrib and often continuous from margin to margin. Quaternaries openly reticulate. Petiole 1-1.5 in. long, continuous, channelled. Flowers dioecious, pale-yellow, sweet scented, in few flowered axillary fascicles or in large bunches (of about 40 flowers) from the trunk, 1-1.5 in. across, female comparatively larger; buds globose, peduncles 1-2.5 in. long with minute bracts at the base. Calyx 5-lobed, saucer-shaped, leathery. Petals oblong or ovate, fleshy. MALE FLRS.—Stamens about 100; filaments wooly. FEMALE FLRS.—Stamnodes 10 or 15 villous, ovary 1-celled; styles 5. Fruit 3-5 in. across, always on the trunk, globose but usually broader than long, with a thick, hard rind minutely lenticelled outside. Seeds about 1 in. long, obovoid or oblong, circular in cross section; embryo somewhat eccentric, cotyledons about .05 in. thick, set in thick oily albumen.

Fairly common in evergreen forests throughout the province.

The seeds yield a somewhat thick brownish oil which is however less medicinal value than that of *Hydnocarpus Kurzii*.

Flrs 3-4 Fr. Cold season

Sir David Prain (Bengal Plants, p. 239) has revived Ruxburgh's name CHAULMOOGRAH for this Genus, but as this is not the real *Chaulmugra* tree, it is perhaps better to suppress that name.

3. HYDNOCARPUS, Gærtn.

Hydnocarpus Kurzii, Warb. Syn. *Taraktogenos Kurzii*, King; *Hydnocarpus heterophyllus*, Kurz. Vern. *Lamtem*, Ass.; *Chaulmugra*, *Dalmugri*, Beng.; *Dieng-soh-lap*, Khasi; *Thibongthar*, *Thehongthar*, Mik.; *Balibi*, Garo; *Kirta-Kirpang*, *Talo-asing*, Abor; *Siri-asing*, Miri; *Serbuli* or *Shauloukrongbupham*, Kach.; *Rowai-thing*, Naga; *Mata*, Kuki; *Matta*, Lusha. & Tipp; *Uthou*, Manip. *Bandie*, Nep.; *Dieng-soh-lap*, Khasi.

A tree up to 50 ft. in height with a tall trunk and narrow crown, with hanging branches. *Bark* fairly plain, grey, brown or almost black outside, often with white patches, uniformly yellow or yellowish brown and somewhat granular inside, .15-.25 in. thick; young parts tawny, pubescent. *Leaves* very much as in *Gynocardia odorata*, but the petiole is longer and swollen and slightly geniculate at the upper end, and the blade generally somewhat more thickly coriaceous and almost always cuneate at the base; lateral nerves more oblique and longer. *Flowers* .3-.5 in. across, pale yellow, inodorous, in few flowered axillary cymes, dioecious, though a few hermaphrodite flowers are sometimes found on male trees; pedicels up to .7 in. long. **MALE FLRS.**—*Sepals* 4, in pairs, round, concave. *Petals* 8, in two rows, smaller than the sepals, each with a cuneate, fleshy gland at the base. *Stamens* 20-30. **FEM. and 2-SEXUAL FLRS.**—much like the male, but *sepals* and *petals* often fewer, and stamens when present, not more than 16. *Ovary* villous, 1-celled; placentas 4, parietal. *Fruit* chocolate-brown, 3-2.5 in. across, globose, but generally rather longer than broad with a hard, plain but scurfy and rather velvety rind and a stout beak (the remains of the stigmas). *Seeds* about 1 in. long, faceted, tightly packed in the fruit; embryo central; cotyledons thin, broadly ovate, about .3 in. long and as broad, 2-nerved; albumen copious, oily.

Common in evergreen forests throughout UPPER ASSAM, often forming gregarious patches.

The seeds of this tree yield the proper Chaulmugra oil which is much used for all cutaneous complaints. Modern Systematists have dropped the generic name *Taraktogenos* and replaced this tree under *Hydnocarpus*.

Fr. 11.

4. FLACOURTIA, Commers.

Trees or shrubs, usually thorny; young shoots often reddish, *Leaves* toothed or crenate, penninerved with the lowest nerves basal or subbasal. *Flowers* small, usually dioecious. *Sepals* 4-5, small, imbricate. *Petals* 0. **MALE FLRS.**—*Stamens* numerous; anthers versatile, opening by slits. **FEM. FLRS.**—*Disk* annular or lobed, glandular. *Ovary* 2-8-celled with deeply intruded placentas; styles 2-10, short, free or connate; ovules 2, superposed. *Fruit* a drupe with several 1-seeded pyrenes.

- I. Leaves under 5 in. long not coriaceous, lateral nerves up to 5, slender:—

Leaves never long acuminate, spines usually under .4 in. across. Flowers solitary or in imperfect few flowered racemes; spines sometimes bearing leaves and flowers. Leaves .7-2 in. long.

1. *F. septara*.

Leaves usually long acuminate, chartaceous, spines much branched when present, (absent on old trees). Fruit .5-.7 in. across.

2. *F. Cataphracta*.

- II. Leaves up to 10 in. long, thickly coriaceous; lateral nerves 10-12, strong.

3. *F. sumatrana*.

1. *Flacourtia sepiara*, Roxb. Vern. *Thai-siao-gundi-khasiba*, Cach.

A shrub or small much branched tree attaining 25 ft. *Bark* grey, rough with exfoliating scales, spines usually axillary, stout, sometimes exceeding the leaves and bearing clusters of leaves or flowers, light yellow, somewhat granular, thin; young parts and petioles puberulous. *Leaves* 7-2 in., obovate, obovate-oblong or elliptic to suborbicular, apex rounded to shortly blunt acuminate, crenate-serrate; base cuneate to subcordate, glabrous, or slightly puberulous on the nerves at the base beneath, main lateral nerves 3-4 on either side, arched, the lowest more or less paired at or close to the base; petiole 1-2 in. long. *Flowers* small, usually 1-2 together at the ends of short shoots, rarely in imperfect racemes. **MALE FLRS.**—*Pedicels* slender, up to 3 in. long; sepals ovate, obtuse. **FEMALE FLRS.**—*With* shorter, and stouter pedicels and sepals broader than in male flowers. *Styles* usually 6-7. *Berry* with 6-7 pyrenes 25-3 in. across. *Pyrenes* rugose.

N. CACHAR HILLS, Gauhati (planted). Mann !

Flrs. 3-4. Fr. 4-5.

2. *Flacourtia Cataphracta*, Roxb. Vern. *Ponial* or *Poniol*, *Goch-poniol*, Ass. (Sibs); *Polian*, Ass. (Kam.); *Phinel*, Goalp.; *Tokroi*, Sylh., Cach. & Comilla; *Luk-Luk*, Sylh.; *Deng-soh-mukh*, Khasi; *Thengpi-kundu-arong*, Mik.; *Darichik*, Garo; *Phonial*, Mech.; *Duk-duki*, Tipp.

A small evergreen tree bearing compound spines on the trunk up to about middle edge, young shoots slightly pubescent; branchlets often with raised round lenticular dots. *Bark* cinnamon brown, fairly plain outside, uniformly light-brown inside, 1 in. thick. *Leaves* 2-5 by 1-2 in., ovate or ovate-lanceolate, long-acuminate, crenate, thinly chartaceous, quite glabrous; main lateral nerves 4-5 on either side of the midrib, the first 1-2 from near the base; tertiaries faint, transverse to the midrib, anastomosing; base rounded and then suddenly cuneate. *Flowers* small, in lax racemes which are axillary or spring from the extremities of short lateral shoots. **MALE FLRS.**—*Buds* globose, open .08 in. diam.; pedicels 4-6 in. long, very slender, glabrous; sepals orbicular, ciliate, hairy within; stamens about 50-80; filaments filiform, 1-12 in. long; anthers minute, globose. **FEM. FLRS.**—*Racemes* and pedicels somewhat shorter and the latter stouter; style conical, very short, stigmas 4-6, spreading. *Fruit* 5-7 in. across, globose, dark-purple when fully ripe, crowned by the persistent stigmas; stones 10-14.

Fairly common on both banks of the Brahmaputra below Sibsagar, e. g., Akhoyphutia, Dihoumukh, Garampani, Latabari, Lumding, Jamunamukh, Silghat, Tezpur, etc.; also KHASI HILLS. Not noticed in N.-E. FRONTIER and LAKHIMPUR DISTRICTS.

The wood is reddish, hard, compact and close grained and is used for agricultural implements. The acid ripe fruit is eaten.

Flrs. 3-4. Fr. 11-1.

3. *Flacourtia sumatrana*, Planch.

A small tree with a spreading crown; very young shoots slightly puberulous; branchlets with close round lenticel dots. *Leaves* 6-10 by 2.5-4.5 in., ovate-oblong or elliptic, suddenly acuminate, somewhat thickly and firmly coriaceous, rather coarsely and irregularly gland-serrate, rounded but sometimes abruptly cuneate at the base, glabrous and shining above; lateral nerves 10-12 on either half, depressed above, very prominent beneath, slightly arched, with midrib very sparsely pubescent or glabrate; tertiaries prominent, subparallel, transverse to the secondaries; quaternaries very slender, about .04 in. apart, transverse to the tertiaries, reticulate or subparallel; petiole .4-6 in. long, stout, shallowly channelled, puberulous or glabrate. *Flowers* very small, dioecious. *MALE* not seen. *FEM.* *FLRS.*—bracteolate, in axillary solitary or geminate panicles 1.5-3.5 in. long, rachis and its branches as well as the pedicels greenish grey pubescent. *Sepals* 5, broadly ovate-acuminate, concave, laciniose-ciliate, pubescent outside, minutely puberulous inside. *Dis* annular or slightly wavy, very fleshy. *Ovary* ovoid, glabrous; styles 4, tapering to a minute stigma, glabrous. *Drupe* berry-like, .2-2.5 in. long, ovoid or oblong; stones generally 6; albumen oily; embryo minute.

Only one found at Nagadhuli, near Mariani, DISTRICT SIBSAGAR, (Sheet No. 1781).

The above description applies to the form growing in our area.

Fr. 9.

Flacourtia inermis, Roxb.—Unarmed small tree: young parts puberulous. *Leaves* 4-8 by 2-3.5 in., ovate or oblong-lanceolate, acute or acuminate, coriaceous, glabrous and shining above, midrib pubescent beneath; petiole .35-.5 in. long; *Flowers* 2-sexual in short fascicled pubescent racemes. *Ovary* 5-celled, cells 2-ovuled. *Fruit* red, size of a cherry, acid with 8-10 pyrenes.

Said to occur in SYLHET and to be cultivated in other parts of India presumably for its fruit. I have never come across it nor are there any specimens at Calcutta herbarium from our area.

5. XYLOSMA, Froster.

Differs from *Flacourtia* as shown in the diagnosis given in the generic key. *Style* usually 1, placentas usually 2, rarely more parietal.

Leaves generally oblong-lanceolate, firmly coriaceous; lateral nerves 8-12, short and slightly arched; tertiaries scarcely parallel, conspicuously reticulate.

... 1. *X. longifolium*.

Leaves generally elliptic lanceolate, thinly coriaceous; lateral nerves 6-8, long and much arched; tertiaries parallel or subparallel and transverse to the midrib.

... 2. *X. controversum*.

1. *Xylosma longifolium*, Clos. Vern. *Mota-koli*, Ass. (Sibs. & Darr.); *Kata-hoh*, *Kotahar*, *Kata-ponial*, Ass.; (Kam.); *Mota-puli*, Ass. (Lakh.) & *Miri*; *Dieng-kani*, *Khasi*; *Ihengpiam-arong*, Mik.; *Phul-wal*, Garo; *Tang-en-ising*, (N. Lakh.), *uli-tang-asing*, Mimi; *Hagrani-sa*, Cach.; (wild tea).

A tree up to 60 ft., in height and 4 ft., in girth, thorny when young, often multiplying by root-suckers. *Bark* fairly smooth, but with large black warts, greenish below the cuticle, .2-.5 in. thick, inside yellowish-brown, turning deeper brown on exposure. *Leaves* 4-7 by 1-2.5 in., oblong, rarely elliptic-lanceolate, acuminate, obtusely glandular serrate with recurved margin, firmly coriaceous, glabrous, pinkish when very young, shining above when adult; lateral nerves 8-12, slender, irregular, moderately arched, short; tertiaries rather strongly though laxly reticulate; base acute; petiole .3-.5 in. long, narrowly margined. *Flowers* dioecious, yellow, .15 in. across, in short dense axillary racemes, which are fascicled or paniced, .3-1 in. long; pedicels .15-.25 in. long, articulate near the base, lengthening in fruit, puberulous or glabrous; bracts minute, oblong to ovate-acuminate; sepals 5 orbicular or ovate, arose at the margin. *MALE FLS.*—*Stamens* 15-20; filiform, surrounded by a disk with about 10 pink glandular lobes. *FEMALE FLS.*—*Ovary* glabrous, seated on a lobulate glandular disk; style 1, short; ovules few. *Fruit* globose, more or less dry, red when ripe with 2-8 sector-shaped seeds (or stones?).

Fairly common throughout UPPER ASSAM near swamps and streams. The wood is brownish moderately hard and even-grained, weighing 55 lbs per c. ft., not used as timber. The Mikirs prepare an extract from the tender young leaves which resembles opium and is used with it (whence the Mikirs name).

Fls mainly 11-1

2. *Xylosma controversum*, Clos.

A small tree up to 35 ft. in height and 2 ft. in girth; stem with simple spines. *Bark* greyish-brown, rough with close-set warts and with distant horizontal wrinkles, inside dun-brown with small streaks of amber brown, finely fibrous, rather soft and "cheesy." *Leaves* 2-6 by 1-2.5 in., elliptic-ovate or obovate-lanceolate, finely acuminate, shallowly gland-serrate, thinly coriaceous, glabrous, shining above, dull underneath; lateral nerves 6-8 on either half, very oblique, prominent underneath; tertiaries subparallel, transverse to the midrib, anastomosing by very slender nerves of the next degree; base very gradually cuneate; petiole .3-.4 in. long, sharply margined. *Flowers* almost as in the preceding species, but are always paniced and the panicles are larger being up to 1.5 in. long and somewhat more lax; pedicels shorter and the bracts usually narrower. *Sepals* suborbicular to ovate, unequal, arose-ciliate, adpressed silky inside. *Stamens* 25-40. *Fruit* as in the other species; seeds plano-convex, smooth, shining.

Kantib-behch and elsewhere in the Mikir Hills SIBSAGAR, 2-2500 ft. But the home of this tree is the KHASI HILLS, where it extends up to 5000 ft. Fls 11-2. Fr 7-10

6. CASEARIA, Jacq.

Shrubs or small trees. *Leaves* distichous, often with translucent dots or dashes, entire or serrate; stipules small, lateral caducous. *Flowers* small, yellowish-green, regular, usually 2-sexual,

clustered in axils of the leaves ; pedicels short, jointed, surrounded by small scales. *Calyx* inferior, deeply 4-5-lobed, persistent. *Petals* 0. *Stamens* 6-10, united into a tube, with staminodes alternating with the free portion of the filaments or nearly free, hypogynous or subperigynous ; anthers introrse. *Ovary* 1-celled, ovoid ; style simple ; ovules numerous on 3-4 parietal placentas. *Capsule* succulent, 3-nerved, globose or ovoid. *Seeds* many with a scarlet aril ; embryo straight ; cotyledons flat.

I. Adult leaves and branches glabrous :—

Leaves elliptic or lanceolate, regularly crenate or crenulate. *Calyx* pubescent outside. Fruit ellipsoid. ...

.. 1. *C. glomerata*.

Leaves elliptic or lanceolate, cuneate at the base, entire or obscurely crenulate. *Calyx* glabrous.

2. *C. esculenta*.

II. Adult Leaves and branchlets more or less pubescent :—

A shrub. Leaves oblong, closely serrate. Pedicels glabrous above, the articulation. Fruit small bright-red or orange globose.

.. 3. *C. Vareca*.

A middlesized tree. Leaves lanceolate, narrowed at both ends, crenate or nearly entire. Pedicels very long, pubescent. Fruit middlesized, ellipsoid.

.. 4. *C. Kurzii*.

1. *Casearia glomerata*, Roxb. Vern. *Tel-bhurki*, Ass. ; *Kachidohkka*, *Dreng-chi-dohkka*, *Sia-dokha* (Fish-bone), Kh. ; *Han-bo-akarang*, Mikir. ; *Bolong-maindok*, or—*maindop*—or *maindot*, *Boldreng Bol-dajagreng*, Garo ; *Dukhenda*, *Datphenda*, Mech. ; *Midoumaphang*, Kach. ; *Kharo-an*, Kuki ; *Khelret-thing*, Tipp. ; *Borkemla*, Nep.

Usually a small deciduous tree, (an individual tree 45 ft. in height and 6 ft. 3 in. in girth was met with in the Chima-Bangsi Reserve in the Garo Hills in March 1925) ; crown spreading. *Bark* 3 in. thick, rough, greyish-brown outside, sometimes covered with a mealy black powder, green below the epidermis ; inside whitish, turning yellowish-brown on exposure with vertical strands of amber-brown. *Leaves* 4-8 by 1.7-4 in., lanceolate or elliptic-lanceolate, acuminate (bluntly when the leaf is elliptic), denticulate or crenate, never quite entire, thinly coriaceous when fully mature ; base acute or cuneate, never rounded or cordate ; petiole 2 in. long. *Flowers* small, greenish-yellow or yellowish-brown ; pedicels in very dense fascicles, pubescent, up to 2 in. long or glabrous. *Calyx* small, funnel-shaped, more or less pubescent outside. *Stamens* 8-10, alternating with villous linear staminodes. *Fruit* (in March, apparently mature) 6.5-8 in. long, ovoid elliptic, pulpy. *Seeds* about 15 in. diam., white or ovoid-globose.

Common in the BRAHMAPUTRA VALLEY excepting in LAKHIMPUR and the N.-E. FRONTIER DISTRICT ; also in GARO, KASHI and MIKIR HILLS.

Wood white, not used. The young leaves and tender shoots are eaten, either as a vegetable or cooked with rice and fowl, specially by the Mikirs with whom it is indispensable for offerings to their Gods and in ceremonial feasts.

It coppices fairly well. The leaves urn copper-coloured before falling

Frs. 1-2. Fr. 3-5

Casearia graveolens, Roxb.—appears to be hardly more than a form of this species. It is supposed to differ mainly by its pedicels being glabrous above the articulation. This character is however by no means constant. Typical *C. graveolens* is rare in Assam but does occur in NOWGONG and KHASI HILLS.

2. *Casearia esculenta*, Roxb. Vern. *Dieng-soh-lormao*, Kh.; *Bolduiagreng*, Garo; *Kron-suri-arong*, Mik.

A small tree about 20 ft., in height and 18 in. in girth. *Bark* white, plain but warty outside, granular and yellowish with white vertical streaks inside. *Leaves* 3-5 by 1·2-2 in. elliptic-lanceolate, narrowed at both ends, entire or very obscurely crenate, subcoriaceous, glabrous and shining, reticulate beneath; petiole 3-5 in. long. *Flowers* axillary, yellowish. *Stamens* 8, united at the base with the disk. *Capsule* about 5 in. long; often attacked by gall insects; aril bright red.

Mawlong forest in the KHASI HILLS; Sugiri, GARO HILLS; Hailong, N. C. HILLS, ascending to 3500 ft.

The Mikirs eat the leaves and tender shoots cooked in curry.

Flrs. 9-10. Fr. 1-3.

3. *Casearia Vareca*, Roxb. Vern. *Bhagni* or *Roy-baghini*, *Chhaglawi* or *Chhagladuri*, *Sikrai* or *Sikraguti*, *Chhikramarg*, Ass.; *Bon-jhalukia*, Ass. (Sibs.) *Dieng-soh-rang*, *Dieng-sapet-khuntlung*, Synt.; *Tiho-okron-arong*, *Joumakron*, *Akron-arong*, Mik.; *Abbuk-asung*, Abor; *Saben-bukhen-asung*, Miri; *Asari-baphang*, Kach.; *Nelo-changne*, Duff.; *Thing-batiat*, Kuki; *Daino*, Jharua (Dalu); *Nak-pek*, Tipp.

A large shrub, rarely a small tree (25 ft. high and 4 in. diam. in the Deroi Reserve, SIBSAGAR). *Branches* often starting from the base; young shoots straight, rather angular, pubescent. *Bark* grey, warty with white blotches outside, green below the dead layers, light-brown, turning into red after exposure inside, about 25 in. thick. *Leaves* 3-6 by 1-2 in., generally oblong-lanceolate, obtuse and often abruptly apiculate to acuminate, closely serrate or serrulate, subcoriaceous, glabrous above, pubescent or puberulous at least along the nerves beneath; base cuneate; petiole 3-5 in. long. *Flowers* greenish-grey, in dense axillary clusters; pedicels very hairy below the joint, glabrous or nearly so above it. *Calyx* bowl-shaped, lobes broad ovate to suborbicular, about 1 in. long. *Staminal tube* elongated; filaments usually 8, rarely 10 a little shorter than the anthers, pubescent, alternating with the broad hair tipped staminodes. *Fruit* oval, 2-4 in. long, smooth, bright orange yellow. *Seeds* 4-6, oblong, attached to the middle of the valve, enveloped in a thin bright-red aril; embryo straight, cotyledons cordate.

Distributed all over the province and up to 3,000 ft., in the HILLS.

The fruit is rubbed into a paste and given to people suffering from worms, while the juice of the fruit is dropped into the ear when attacked by ticks.

Flrs. 6-9. Fr. 10-4. (chiefly mid-winter.)

4. **Casearia Kurzii*, C. B. Clarke. Vern. *Dieng-bai-synrang*, Kh. (Shella); *Dieng-soh-mara*, Kh. (Nongkla), *Shokshi-maring*, *Boldujagreng*, Garo.

Generally a middle-sized tree up to 50 ft. in height, but sometimes attaining 80 ft., in height 5 ft. in girth; shoots pubescent. Bark grey corky outside, plain green underneath the cork, generally with horizontal wrinkles below each living or fallen branch; inside light greenish-brown, 25 in. deep, with an unpleasant smell. Leaves 3-6 by 1·2-2 in. lanceolate or oblong, narrowed at the base, which is more or less oblique, acute or shortly acuminate, distantly crenate or nearly entire, subcoriaceous, glabrous above, with spreading yellow hairs beneath, specially when young; turning yellow before falling: petiole nearly 5 in. long, puberulous. Flowers in fascicles of 4-6 from axillary tubercles; often attacked by gall insects; pedicels slender, pubescent, 2-4 in. long. Ovary minutely pubescent. Stamens generally 10. Capsule nearly 6 in. long, black when ripe, eaten by birds.

Shella, Nangkha etc., on the southern slopes of the KHASI HILLS; Haflong, N. C. HILLS; Rongmachakgiri, Fulbari, GARO HILLS; Subhimalayan Sal-track, GOALPARA, c. g. Bomba Block; Burduar Reserve, KAMRUP.

The fresh-cut wood is yellowish-white, even-grained, believed to be durable by the Khasis who use it for rafters.

Flrs. 4-5. Fr 1-2 (of the following year!).

15. *PITTOSPORACEÆ*.

Trees or shrubs sometimes climbing. Leaves alternate or subverticillate, entire, very rarely toothed. Flowers hermaphrodite. Inflorescence various, terminal or axillary. Sepals 5, imbricate, free or connate. Petals 5, hypogynous, imbricate, free or connate. Torus small. Stamens 5, free; anthers versatile. Ovary 1-celled with 2-5 parietal placentas, or as many celled by the projection of placentas; style simple, stigma terminal 2-5 lobed; ovules many. Fruit capsular or indehiscent (in some foreign species). Seeds many, albumen copious, embryo minute.

PITTOSPORUM, Banks.

Erect trees, shrubs or undershrubs. Inflorescence usually corymbose, subumbellate or paniculate. Sepals 5, free or connate below. Petals erect, claws connivent or connate, often recurved in fully opened flowers at the top. Filaments subulate; anthers

2-celled, introrse, opening by slits. *Ovary* incompletely 2-3 celled by the intrusion of the placentas; ovules 2 or more on each placenta. *Capsule* 1-celled, 2-3 valved; valves placentiferous in the middle and often striate with horizontal lines inside; seeds covered by oily resinous pulp.

- I. Tall shrubs or small trees :—
 - Flowers in simple racemes or corymbs; capsule 3-valved, 7-1 in. long ellipsoid or obovoid oblong. ... 1. *P. glabratum*.
 - Flowers in panicles, corymbs or umbels; capsule 2-valved, 5 in. across, globose. ... 2. *P. floribundum*.
- II. Undershrubs, usually under 3 ft. in height. ... 3. *P. humile*.

1. **Pittosporum glabratum**, Lindl. Vern. *Dieng-thyllong*, *dieng-sanyar-un*, *dieng-lo-shiring-synrang*, *dieng-soh-tylluh*, Khasi.

An erect shrub 8-10 ft. high with light grey to blackish bark, blaze white, fibrous. *Branchlets* often whorled, young shoots and inflorescence covered with tufted, glandular hairs. *Leaves* opposite, or whorled, some alternate, very variable in size and shape, 1.5-7.5 by .5-1.2 in., oblong-lanceolate, oblanceolate, obovate or elliptic, acuminate or acute, entire, margins slightly revolute, coriaceous, glabrous, shining above, pale beneath; base attenuated, lateral nerves faint, impressed above, very oblique; petiole channelled up to .2 in. long. *Flowers* pale yellow in terminal and subterminal short racemes or corymbs, which are up to 2.2 in. long and covered at the base with small imbricating sharp-pointed triangular scales; racemes 3-10 flowered; bracts and bracteoles up to .1 in. long. *Pedicels* slender, lax .25-.5 in. long. *Calyx* .1 in. long, more or less glandular hairy; lobes triangular, ciliate. *Petals* .5-.6 in. long, claws connate in a cylindrical tube or sometimes free, limbs spreading, obovate-oblong, sub-acute, slightly hairy within or entirely glabrous; anthers apiculate, opening by slits. *Ovary* shaggy, shortly stalked; ovules many. *Capsule* up to 1 in. long, obovoid or ovoid oblong or ellipsoid, usually with a narrowed base, tipped by the persistent style, shortly stipitate, 3 valved, prominently striate inside with horizontal lines. *Seeds* remaining long attached by funicles after dehiscence of capsule, somewhat compressed and faceted ventrally, pulp red or orange-red, viscid.

KHASI & JAINTIA HILLS, also MANIPUR and NAGA HILLS 3000-6000 ft. Flowers 3-6. Fr. 9-1.

2. **Pittosporum floribundum**, W. & A. Vern. *Dieng-mulo-shi-ing*, *dieng-si-ing* (=ginger tree from the smell of the bark), *dieng-duma*, Kh.

A small tree attaining about 25 ft. in height, branches subverticillate, bark grey with large warty lenticels, white and fibrous inside. *Leaves* crowded towards the ends of branches, sometimes subverticillate, 3-6 by .7-1.5 in., oblong lanceolate oblanceolate or lanceolate, acuminate, margin undulate, subcoriaceous, nerves impressed above, secondaries rather obscure,

7-11 on either side of midrib, oblique, terminal portion parallel with the margin, tertiaries finely reticulate, base attenuated to the channelled petiole which is up to 5 in. long. *Flowers* pale yellow about .25 in. long, sweet scented. *Inflorescence* consisting of a terminal panicle of corymbs or umbels with the axis sometimes very reduced, much smaller than the leaves, usually up to 1.7 in. long by 3.5 in. across, glandular-pubescent, base often covered with early deciduous, broadly ovate, acute scales .25 in. long; bracteoles .15 in. long, ovate oblong; peduncles of the main panicle branches up to 1.5 in. long; pedicels up to .25 in. long. *Sepals* free .1 in. long, ovate or elliptic-oblong, obtuse, pubescent or glabrate outside. *Petals* .25 in. long, narrow oblong. *Ovary* adpressed hairy; style glabrous. *Capsule* orange-yellow, .3 in. across-2 valved, globose, crowned by the remains of the style; valves striate with horizontal lines; seeds covered with scarlet pulp.

KHASI HILLS, 3000-4000 ft., usually on broken ground.

The bark has an unpleasant smell when freshly cut. The branches of panicles sometimes arise from upper leaf axils.

Flowers 3-5. Fr. 10-1.

3. *Pittosporum humile*, Hk. f. & Thom.

A small bushy undershrub 2-3 ft. high with greyish stem; branchlets lenticellate; young parts glabrous. *Leaves* 1-2.5 by .2-4 in. narrow lanceolate, gradually acuminate or acute, margins slightly revolute, coriaceous, glabrous, dark green and shining above, paler beneath, base tapering into the short channelled petiole, secondary nerves faint, oblique, tertiaries impressed above and prettily reticulated. *Flowers* white .2-.25 in. long, in 2-5 flowered peduncled subumbellate, pubescent racemes, which are terminal or from upper leaf axils. *Peduncles* up to .6 in. long; bracteoles up to .2 in. long, often gland ciliate; pedicels up to .2 in. long. *Sepals* .1 in. long, free, oblong or ovate-lanceolate, acute or obtuse, often ciliate. *Petals* free, .2-.25 in. long, strap-shaped, recurved at the tip in open flowers; filaments glabrous. *Ovary* glabrous; placentas 2; ovules several. *Capsule* subglobose, .25 in. across, tipped by the persistent style, rugose outside, red and horizontally striate inside. *Seeds* compressed, laterally covered with deep red aril.

KHASI HILLS, 3000-5000 ft.

Flowers 4-6. Fr. 9-11.

Leaves towards the ends of shoots sometimes very small. The shoots smell somewhat like garlic when bruised.

FAM. 16. POLYGALACEÆ.

Erect or climbing trees or shrubs. *Leaves* alternate, simple, exstipulate, quite entire. *Flowers* hermaphrodite, irregular, 2-sexual, 2-bracteate. *Sepals* and *petals* 5 each, imbricate, unequal, inner 2 sepals often petaloid and larger. *Stamens* 8, rarely fewer; filaments generally united into a hypogynous sheath. *Ovary* free, 1-3 celled, with 1 or more ovules in each. *Fruit* generally a capsule or indehiscent and 1 seeded and sometimes samaroid, or of indehiscent carpels.

Herbs or less often shrubs, fruit capsular. . . .

1. *Polygala*.

Climbing shrubs; fruit samaroid. . . .

2. *Securidaca*.

Trees (in our area): fruit indehiscent, not winged. . . .

3. *Xanthophyllum*.

1. POLYGALA, Linn.

1. *Polygala arillata*, Hamilt. Vern. *Dieng-soh-tyuka*, *Dieng-jatya*, Kh.

A shrub 1-8 ft., sometimes more in height, young parts pubescent or puberulous. *Leaves* 3-6 by 2.5 in, lanceolate, elliptic-oblong, or obovate-lanceolate, acuminate, entire subcoriaceous, glabrous; base rounded or cuneate, nerves prominent, secondaries 6-8 on either half, arcuate and forming loops near the margin, tertiaries reticulate; petiole 2-4 in. long. *Flowers* .5-.75 in. long, many, in pubescent drooping racemes 2.5-10 in. long, which are sometimes panicle when terminal; bracts minute, linear or lanceolate early deciduous; pedicels .15 in. long. *Sepals* glabrous, unequal, upper concave, .3 in. long, two lower much smaller ovate, inner two petaloid, .5-.75 in. long, purple, obovate. *Petals* 3, yellow, united at the base with the staminal sheath, the lowermost keel-shaped, crested with a tuft of linear segments and united to the lateral petals for about three-fourth their lengths. *Stamens* 8, united for their lower half into a hypogynous split sheath; anthers opening by pores. *Ovary* 2 celled; ovule 1 in each cell, pendulous. *Capsule* 2-celled, loculicidal, .5-.6 in. across, broader than long, subreniform, usually notched at the apex, margined, more or less fleshy rugose with prominent veins when dry; seeds 2, globose, strophiole.

CACHAR, KHASI and JAINTIA HILLS up to 4000 ft.

Flrs. 5-8 ? Fr. 11-2.

The following herbs with woody rootstocks may be mentioned :—

1. *P. crotalarioides*, Ham.—An undershrub or a perennial herb attaining about 12 in., covered with spreading hairs. *Leaves* 1-2.5 in. long obovate or oblanceolate, apex rounded, often apiculate. *Racemes* usually shorter than the leaves, densely flowered; bracts and bracteoles minute, persistent. *Flowers* .25-.3 in. long, purple or purplish white; pedicels minute. *Capsule* .15-.25 in. across, orbicular margined ciliate. *Seeds* hairy; strophiole deeply 3-fld.

KHASI HILLS.

Flrs. & Fr. 5-9.

2. *P. leptalea*, DC.—A slender erect herb attaining about 20 in. with glabrous striate often angled branches. *Leaves* 7.5-1.25 in. linear narrowed at both ends; petiole scarcely any. *Flowers* pink, 1.5-2 in. long, in dense terminal and axillary racemes. *Capsule* broad obovoid, margined about .15 in. long. *Seeds* hairy.

*CACHAR (Prazer). KHASI & JAINTIA HILLS up to 4000 ft.

Fls. & Fr. 5-1.

3. *P. glomerata*, Lour.—A much branched undershrub or perennial herb attaining 24 in. *Stems* pubescent, ascending, switchy. *Leaves* variable 1-2.5 in. long, linear-lanceolate or oblong to broad ovate and elliptic mucronate, rounded or obtuse at the apex, glabrous or slightly pubescent; petiole very short, hairy. *Flowers* drooping, greenish 2.5-3 in. long in few flowered, very short pubescent, extra-axillary racemes. *Outer sepals* ciliate, acuminate; wings awned. *Capsule* 1.5-2 in. broad, as broad as or broader than long, narrowly margined, notched at the apex, ciliate. *Seeds* silky, strophiole with 3 appendages.

KHASI & JAINTIA HILLS up to 5000 ft. CACHAR—Prain! and probably also in other Districts.

Fls. & Fr. 4-11.

4. *P. sibirica*, Linn.—A very variable perennial herb, attaining up to 18 in. in length, stems many, slender. *Leaves* 4-1 in. elliptic-lanceolate, upper surface usually shining glabrate or with few minute hairs, veinlets prominently reticulate, margins slightly recurved; petioles very short. *Flowers* purple 2-2.5 in. long, in extra axillary racemes, which are usually 3-1.5 in. long, minutely pubescent and lax. *Outer sepals* subequal. *Capsules* .25 in. across, glabrous, suborbicular obcordate, notched at the apex, broadly margined. *Seeds* pilose, strophiole with 3 short appendages.

KHASI HILLS up to 5500 ft.

Fls. & Fr. 3-10 ?

2. SECURIDACA, Linn.

Securidaca tavoyana, Wall. Vern. *Phakehena-lata*, Ass.

A woody climber with dark brown stem; fibre strong, fine silky, young shoots puberulous. *Leaves* 3-5 by 1-2 in. elliptic, obovate-oblong or oblanceolate, abruptly acuminate, generally cuneate at the base, quite entire, thinly coriaceous, minutely and sparsely pubescent or glabrate and deep green above, more densely and permanently pubescent and pale beneath; main lateral nerves 8-12 on either half, generally very oblique, the first pair sub-basal, tertiaries very openly reticulate; petiole 2-3 in. long. *Flowers* pink, 2-3 in. across, in axillary and terminal panicles 4-9 in. long; pedicels filiform, 2-5 in. long, gradually shorter towards the apex of each branch of panicle. *Sepals* ovate or elliptic. The two innermost petals from a keel to which the lateral petals are adnate at the base, the latter truncate and generally tipped with yellow. *Ovary* 1-celled, 1 ovuled; style lateral and sharply curved near the extremity, developing into a wing in fruit. *Samaras* 1-celled, 2.5-4 by .6-1 in. with the wing; wing oblique broadest towards the apex, tip rounded or obtuse, thickened at the inner edge, closely veined; veins arcuate, furcate at the outer edge; nucleus irregularly tubercled. *Seed* generally solitary, .3-.35 in. long, suborbicular, compressed, exalbuminous; cotyledons oily.

Fairly common in all Districts of UPPAR ASSAM excepting NOWGONG.

Fls 9-10, Fr. 12-2.

3. XANTHOPHYLLUM, Roxb.

Xanthophyllum flavescens, Roxb. Incl. *X. virens*, Roxb.

A medium sized to large tree. *Bark* grey, warty and corky outside. *Leaves* 3-7 by 1·1-3 in., oblong-lanceolate to elliptic lanceolate, acuminate, coriaceous, glabrous, yellowish when dry; main lateral nerves 5-7, often with a few perforated glands at the axils or at the angles of nervules, nervules prominent beneath; petiole 25 in. long. *Flowers* pale yellow, zygomorphic, 3-5 in. long in terminal and axillary pubescent panicles; pedicels up to 2 in. long. *Sepals* 5, unequal, suborbicular, pubescent. *Petals* 4-5, subequal, much exceeding the sepals, lowermost keel-shaped. *Stamens* 8, 2 inserted on the disk, 6 attached to the base of the petals; disk hypogynous, annular, lobed. *Ovary* stipitate, densely strigose, 1-celled; ovules 1-12. *Fruit* indehiscent, globose, 6 in. across with thick walls, 1-seeded. *Seeds* exalbuminous.

CACHAR—Haflong, GARO HILLS—Rongrengiri, KHASI HILLS, Kurz !

Flrs. 3-4.

FAM. 17. TAMARICACEÆ.

Ultimate branchlets slender and green, somewhat resembling the needles of pines. *Leaves* alternate, minute, usually scale-like and adpressed on the branchlet, sometimes amplexicaul or sheathing exstipulate. *Flowers* regular, 2-sexual or 1-sexual, in simple or paniced spikes or racemes. *Sepals* and *Petals* usually 5, each imbricate, free or connate below. *Stamens* usually as many or twice as many as the petals, on a hypogynous or subperigynous glandular or lobed disk, free or connate; anthers versatile. *Ovary* free, 1-locular or imperfectly septate; styles 2-5, free or connate or stigmas sessile and 3-5; ovules 2- numerous on basal placentas. *Fruit* a capsule dehiscing into 3-5 valves. *Seeds* hairy or winged, albuminous.

TAMARIX, Linn. Tamarisk.

Tamarix dioica, Roxb. Vern. *Jhau* or *Lul-jahu*, Beng. & Ass.; *Rupun-asing*, Miri.

A handsome gregarious shrub up to 15 ft. in height with spreading branches; leaf scars concentric. *Bark* reticulately cracked. *Leaves* minute, about 0·5 in. long, tubular and clasping the stem, acuminate, green but with white margins. *Flowers* pink, 5-merous about 12 in. across, very numerous in compact peduncled usually paniced spikes, generally dioecious; bracts

up to nearly as long as the flowers, triangular, acuminate. keeled. *Sepals* about half as long as the petals, elliptic, ovate or elliptic, margins membranous. **MALE FL.:** *Petals* oblong. *Stamens* 5, longer than the petals, inserted between the notches of a 5-lobed disk; filaments ligulate; anthers purple. **FEMALE FL.:** *Petals* broader than in the males. *Staminodes* shorter than the petals usually with sagittate pale anthers, which are sometimes absent. *Ovary* 1-celled, 3-lobed; styles 3, longer than the petals. *Capsule* conical, 1-celled, 3-valved; seeds minute, plumose, numerous, compressed.

Very common along the banks of the Brahmaputra and its tributaries and generally under water during the rains.

Flrs. 7-9 l'r. 10-12.

FAM. 18. HYPERICACEÆ.

Herbs or shrubs rarely trees. *Leaves* opposite, extipulate, often punctate with pellucid glands or dark glandular dots, entire or gland toothed; stipules (). *Flowers* solitary or terminal, rarely axillary. *Sepals* and petals 5-4. *Petals* contorted in bud. *Stamens* indefinite, rarely definite, 3-5-adelphous, rarely free or all connate; anthers versatile. *Ovary* 3-5 or 1-celled, with 3-5 filiform free or united styles; ovules many or few on axile or parietal placentas. *Fruit* usually capsular. *Seeds* exalbuminous, embryo straight or curved.

HYPERICUM, Linn.

Herbs or shrubs, rarely trees. *Leaves* usually sessile or subsessile. *Flowers* yellow, terminal or axillary; inflorescence cymose. *Sepals* and petals 5, the former persistent, the latter usually oblique. *Capsule* septicidal or dehiscent along the placentas when one celled; usually tipped by the persistent styles.

- I. Stamens 5-adelphous, ovary 5-celled; styles 5:—

Leaves broad, 1' 2-2 by '5-1'2 in.					
Shrub 6-8 ft. high.	1.	<i>H. Hookerianum.</i>		
Leaves narrow '5-1 by '15-'5 in.				
Shrub up to 4 ft. high.	2.	<i>H. patulum.</i>		
- II. Stamens 3-adelphous, ovary 3 celled; styles 3:—

Sepals with 4land tipped teeth.					
	3.	<i>H. elodeoides.</i>		

1. *Hypericum Hookerianum*, W. & A., Syn. *H. oblongifolium*, *Flk. /.* Vern. *Lasyn-heh*, or *Mat-iar-stem*, Khasi.

An evergreen shrub about 6-8 in. in height with reddish brown bark. *Branchlets* usually opposite, terete. *Leaves* usually 1.2-2 by .5-1.2 in. ovate to ovate-oblong, subacute or obtuse, apiculate, margins revolute, thinly coriaceous, glabrous; lateral nerves distant, 4-5 on either side of the midrib ascending and convergent towards the apex, pellucid punctate, undersurface glaucous; petiole minute or nil. *Flowers* up to 2 in. across, yellow, in few flowered terminal corymbose cymes; bracts leafy; pedicels .25 in. long, 2 bracteolate. *Sepals* up to .25 in. long, unequal, broadly obovate, or elliptic, glabrous. *Petals* upto 1 in. long, suborbicular or broad ovate, often obliquely cuneate. *Stamens* 5-adelphous at the base; filaments yellow. *Ovary* equaling the styles; styles 5, exceeding the stamens, free nearly to the base. tips recurved. *Capsule* up to .7 in. long, oblong-ovoid, seated in the persistent calyx.

KHASI AND JAINTIA HILLS 3000-6000 ft., NAGA HILLS.

Flowers 4-6. Fr. 10-11.

In some forms the leaves attain 3.5 in. in length.

2. *Hypericum patulum*, Thunb. Vern. *La-syn-rit*, *Diengsyntia-samun*, Kh.; *Dieng-soh-sarlain*, Synt.

A small shrub upto 4 ft. in height, with reddish brown sometimes nearly black bark. *Branchlets* close set, often opposite, stiff, more or less margined along the internodes below the insertions of leaves. *Leaves* usually .5-1 by .15-.4 in., usually distichous, narrow lanceolate, or oblong or ovate-lanceolate, subacute or obtuse, minutely apiculate, margin slightly recurved, glabrous, pellucid punctate, undersurface glaucous or rusty brown black dotted; lateral nerves rather indistinct up to 6 on either side of midrib, ascending and convergent towards the apex, base narrowed to the minute petiole. *Flowers* yellow .7-1.5 in. across, in few flowered terminal cymes. *Pedicels* with 2 foliaceous bracts near the top; pedicels up to .25 in. long; bracteoles minute. *Sepals* 5, free, .25-.3 in. long, elliptic, obtuse, glabrate, dotted with pellucid glands. *Petals* 5, .4-.5 in. long, suborbicular, broadly obovate, often oblique, early deciduous. *Stamens* much shorter than the petals collected into 5 bundles at the base. *Ovary* exceeding or equalling the styles; styles 5, lower portions connate. *Capsule* ovoid, .4 in. long; valves persisting for a long time

KHASI & JAINTIA HILLS 3000-6000 ft., MANIPUR, NAGA HILLS.

Flowers 5-7. Fr. 9-10.

Leaves are usually small in the form commonly found in our area.

3. *Hypericum elodeoides*, Choisy.

A perennial herb or undershrub up to 2 ft. high. *Leaves* variable, usually .5-1.2 by .2-.4 in. sessile; subamplexicaul, upper with a fringe of bristly glands at the base, lanceolate, oblong or ovate, acute or obtuse, subcoriaceous, pellucid-punctate, margins usually black glandular, secondary nerves convergent towards the apex.

lower 1-2 pairs basal. *Cymes* compound, terminal and sub-terminal. *Flowers* up to .6 in. across, yellow; bracts linear or oblong with setose gland-tipped teeth. *Sepals* connate at the base, .3 in. long, lanceolate with long, glandular teeth. *Petals* exceeding the calyx, .3 in. long, obovate, black dotted. *Stamens* 3-adelphous at the base. *Styles* 3, divided to the base, exceeding the ovary. *Capsule* .3 in. long.

KHASI HILLS, 4-6000 ft.

Flowers 6-7. Fr. Autumn.

Leaves in some forms only .1 in. broad.

H. monanthemum, *Hk.f. & T.* A slender perennial herb similar to some forms of the above. *Leaves* .5-.75 in. long, oblong, elliptic or ovate; obtuse, pellucid punctate, and marginally glandular. *Cymes* few flowered; bracts glandular fringed. *Sepals* gland toothed. *Petals* with few black dots. *Style* shorter than the ovary. *Capsule* about .25 in. across. Hardly more than a herbaceous form of *H. elodeoides*.

KHASI HILLS, 6000 ft.

Flowers 4.

H. Sampsonii, *Hance*. — A perennial herb about 1 ft. high. *Leaves* sessile .9-2 by .4-.6 in. oblong, rounded at the apex, connate at the base, dotted on both surfaces; lateral nerves 3-4 pairs, convergent towards the apex, undersurface glaucous. *Flowers* comparatively small in lax terminal and axillary peduncled cymes; peduncles up to .2 in. long. *Sepals* 5, .25-.35 in. long, oblong, subacute, black dotted, connate at the base. *Petals* 5, about equalling sepals, oblong. *Stamens* 3-adelphous at the base. *Styles* 3, much shorter than the ovary. *Capsule* .25 in. long, enclosed by the persistent calyx and covered with resinous vesicles.

KHASI HILLS, NOWGONG, *Simmons*.

H. breviflorum, *Wall.* — An undershrub up to 18 in. long. *Leaves* 1-1.5 by .2-.3 in. oblong, or oblong-oblancoate, obtuse or subacute at the apex; lateral nerves 3-4 pairs, ascending, undersurface gland dotted; base narrowed to the minute petiole. *Cymes* axillary and terminal, few flowered, short peduncled. *Sepals* 5, entire, oblong-ovate, obtuse about .15 in. long. *Petals* not seen. "*Stamens* 9 in 3 bundles cohering for $\frac{1}{2}$ their lengths and separated by hypogynous scales." — *Hooker*. *Ovary* exceeding the sepals; styles 3, shorter than the ovary. *Capsule* .3 in. long, ovoid.

KHASI HILLS, 5000 ft. *Hooker* ! *Kurz* !

H. japonicum, *Thunb.* — A slender much branched annual 3-12 in. long. *Leaves* .15-.3 in. long ovate, or elliptic, pellucid dotted, covered with black glands beneath. *Flowers* .25 in. long in lax terminal dichasia or solitary in the upper axils. *Sepals* entire, narrow-lanceolate. *Petals* little shorter than the calyx, marcescent. *Stamens* connate at the base; styles usually 3, shorter than the ovary. *Capsule* equalling the persistent sepals.

KHASI HILLS, Plains of ASSAM in scrubs and grass lands, KAMRUP, SYLHET, DARRANG, LAKHIMPUR, SADIYA, SIBSAGAR, LOWER ASSAM (*Kurz*) — probably all over the province.

Flowers 2-6 according to elevation. Fr. 8-11.

H. Lalandii, *Choisy*. — A slender unbranched tufted annual attaining 18 in.; stems with fetid smell. *Leaves* .2-.4 in. linear oblong, rather thick. *Cymes* few flowered, lax. *Sepals* entire, oblong, .25 in. long. *Petals* marcescent; styles shorter than the ovary. *Capsule* equalling the persistent sepals.

KHASI HILLS, 5-6000 ft.

Flowers spring and summer. Fr. 7 (?) - 10.

FAM. 19. GUTTIFERÆ.

Trees,* rarely shrubs, almost wholly glabrous, generally evergreen and exuding gum-resin of various colours. *Leaves* opposite, entire, usually exstipulate, evergreen, often with close fine parallel nervation. *Flowers* regular, 2-sexual or polygamous, often showy. *Sepals* and *petals* 2-6, imbricate or in decussate pairs, generally concave. *Petals* 2-6, rarely more or 0, usually 4-5, imbricate, or contorted. Male fls.-*stamens* many; filaments free or variously united. Female fls.-*staminodes* many, free or connate. *Ovary* 1-5-12 celled; style usually 1; stigmas as many as cells in the ovary. *Fruit* usually indehiscent, often baccate. *Seeds* large, exalbuminous, cotyledons small and radicle large or cotyledons thick, with a very short radicle.

- I. Style short or 0; stigma large. Ripe fruit pulpy :—
 Ovary 2 or more celled, cells 1-ovuled :—
 Calyx of 4 or 5 sepals. 1. *Garcinia*.
 Ovary usually 2-celled, cells usually 2-ovuled :—
 Calyx enclosed before flowering,
 at length bursting into 2 or
 3 valves or sepals. 2. *Ochrocarpus*.
- II. Style long, slender; stigma small. Ripe
 fruit dr. or pulp fleshy :—
 A. Flowers solitary. Ovary 2-celled,
 cells 2-ovuled. Fruit a capsule. 3. *Mesua*.
 B. Flowers panicled or racemed. Fruit
 drupaceous :—
 Ovary 1-celled with 4 ovules ;
 stigma 4-fid. 4. *Kayea*.
 Ovary 1-celled with 1 ovule .
 stigma peltate. 5. *Calophyllum*.

1. GARCINIA, Linn.

Trees or shrubs exuding yellow or greenish gum-resin ; branches usually opposite, horizontal or pendulous. *Leaves* coriaceous, evergreen. *Flowers* polygamous, solitary or in cymes. *Sepals* and *petals* 4 or 5 each, imbricate. MALE FL. : *Stamens* numerous, free or more generally collected into a 4-5 lobed mass round a pistillode ; anthers 2-celled, rarely 4-celled. FEMALE and 2-SEXUAL FLs. : *Staminodes* or *stamens* 8 or many ; ovary 2-12-celled ; stigma sessile or nearly so, often large and spreading ; ovule 1 in each cell, attached to the inner angle of the cell. *Fruit* pulpy when ripe ; seeds often arillate ; embryo a homogeneous oily mass.

I. Flowers 5 merous :—

Leaves large, oblong-lanceolate with an
 intramarginal nerve.

1. *G. xanthoxygmus*.

I. Flowers 4 merous :—

A. Stigma deeply lobed :—

1. Flowers terminal or axillary, solitary,
 umbelled or fascicled, anthers 2 or
 more celled :—

- a. Middle sized to large trees, flrs. white or yellowish:-
- i. Petioles without fleshy ligules ; stamens in male flrs. collected in a 4 angled mass, fruit over 1'5 in. across :-
 Pedicels moderately stout, fruit obliquely obtuse at the top. .. 2. *G. Coiba*.
 Pedicels stout, fruit with a prominent mamillate protuberance at the top. .. *G. Ksdia*.
 - ii. Petioles with fleshy stem clasping ligules ; stamens in male flrs. in 4 bundles. Fruit under 1'5 in. across. 3. *G. affinis*
- b. A shrub ; flrs. red :-
 Stamens in male flrs. in 4 bundles of 4-5 fruit about 1 in. across. 4. *G. lanceolata*.
2. Flowers from axils of fallen leaves, anthers 1-celled opening transversely, fruit about '7 in. long. 5. *G. Morella*.
3. Male flrs. in short terminal panicles ; stamens in male flrs. in a 4-angled mass, anthers 2-celled ; female flrs. on stout 4-angled peduncles '5-1'6 in. long. Leaves large .. 6. *G. pedunculata*.
- B. Stigma entire:-
1. Bracts not leafy :-
 Male flrs. paniced ; female flrs. in spike-like stout racemes ripe fruit about 1 in. across. 7. *G. paniculata*.
 Male flrs. usually 2 or 3 together on a peduncle, peduncles rarely paniced, female flrs. usually solitary ripe fruit 3 in. across. 8. *G. atrovirens*.
 2. Bracts leafy:
 Flowers in axillary cymes, fruit 1-1'5 in. long. *G. anomala*.

1. *Garcinia xanthochymus*, Hk. f. Vern. *Tepor*, *Tepol-tenga*-Ass. ; *Dephal*, Sylh. ; *Demphal*, *Torloy*, *Tipp.*, *Arnuh*, *Garo* ; *Thesampreng*, *Mikir*, *Dieng-soh-ryu-san*, *Dieng-soh-khyllung*, *Khasi*.

A small or middle sized tree with sombre-green foliage and a deep narrow crown ; branchlets square, and usually sulcate, rather thick, green. *Bark* dark-brown exfoliating in small flakes, white or slightly pinkish inside, exuding pale-green gum. *Leaves* 8-16 by 2-3'5 in., narrowly oblong or oblong-lanceolate, coriaceous, shining on both surfaces ; lateral nerves irregular, almost invisible on green leaves, main about 30 on either half looping into an intramarginal nerve and alternating with as thick but shorter intermediate ones ; midrib stout, rather sharp on the back ; base cuneate ; margins thickened, slightly recurved ; petiole '6-1 in., thick, angled, rugose, with a fleshy ligule at base. *Flowers* pentamerous, dull-white in 4-8 flowered fascicles from axils of fallen leaves on fleshy pedicels. **MALE FLs.**-*Sepals* 5, orbicular, about '16 in. diam. fleshy ; *petals* 5, about twice the size of the sepals, orbicular, thin, veined ; *stamens* in 5 fleshy bundles of 3-5, alternating with 5 fleshy glands ;

anthers 2-celled. **BISEXUAL FLS.**—*sepals* as in the males; *petals* ciliate; *stamens* as in the males. *Ovary* usually 5-celled with a neck supporting a 5-6 lobed spreading stigma. *Fruit* 1.5-2.5 in. diam., pointed, crowned by the persistent stigmatic lobes, green, golden yellow when ripe; seeds oblong.

Fairly common in high evergreen forests where the soil is clayey.

Wood dark-greyish-brown, hard and close-grained, with numerous concentric white bands between the fine but irregular medullary rays; weight about 55 lbs. per c. ft. The fruit is very acid and is eaten raw and cooked.

Fls. 3-5.

Fr. 10-2.

2. *Garcinia Cowa*, Roxb. Vern. *Kau-theke*, *Kungach*, Ass. (also *Kuji-theke*, Ass. being often confused with (*t.* *Kydia*); *Blachung-changne*, Daff.; *Kau*, Sylh.; *Cach*, Manip and Naga; *Khatoksi*, Meeh, *Tekra*, *Rengran*, Garo.

A small or middle-sized tree up to 40 ft. in height with an oval crown and dark green foliage; branchlets terete or slightly 4-gonous. *Bark* brown greyish outside, nearly smooth, or on old trees rough with exfoliating scales, often with large white blotches, inside red, soon turning reddish-brown, exuding a yellow gum. *Leaves* 2-7 by 1-3 in., rather broadly elliptical lanceolate, gradually or abruptly acuminate, cuneate at base, somewhat fleshy when green, drying chartaceous, red to reddish-brown when young; main lateral nerves about 12 on either side, arcuate, meeting near the margin; petiole .25-.6 in. long. *Flowers* dioecious, 4-merous, yellow. **MALE FL.**—2-3 in. across in dense terminal or axillary clusters; pedicels up to .35 in. long, rather stout; sepals .15-.25 in. broad ovate or suborbicular, thick, pale yellow, unequal. *Petals* twice as long, oblong brownish; anthers 4-gonous and 4-celled sub-sessile and close-set on a 4-cornered fleshy mass; pistillode minute. **FEMALE FL.**—larger than male flowers, terminal, solitary or more generally 3-5 together, shortly pedicelled; *staminodes* forming an interrupted ring consisting of 5-10 connate filaments round the ovary; stigma spreading into 6-8 crenate lobes. *Fruit* about 2 in. diam., globose but slightly tapering and somewhat oblique towards the apex, dull-red outside and orange inside when ripe, 4-8 seeded, crowned by the persistent stigma.

In all Districts; up to 3000 ft., in the KHASI HILLS.

The acid fruit is eaten and preserved in sun-dried slices in Assamese households for use in dysentery, but is considered to be somewhat inferior in quality to that of *G. Kydia*.

Fls. 3-4.

Fr. 6-8.

Garcinia Kydia, Roxb. Vern. *Kuji-theke*, Ass.; *Hau*, Cach.; *Tarak-asing*, Miri and Abor; *Dieng-sofi-longksan*, Khasi; *Tekra*, *Denga-doti*, Garo; *Chop-chopa*, Ass. (Kamrup).

A glabrous evergreen tree 50-70 ft. in height with a narrow crown and drooping branches. *Bark* dark-brown and smooth outside with a thin cuticle, which peels off easily exposing a red-veined brown surface, blaze pale yellow, .12-.3 in. thick, exuding a yellow gum. *Leaves* 2.5-5 by .8-1.7 in., ovate-oblong to elliptic or oblong-lanceolate, acuminate, very gradually cuneate at the base, coriaceous, glabrous, shining above; lateral nerves very

slender, rather irregular, about 12 on either half, with a few intermediate ones, all arched to form an intramarginal nerve about .08 in. from the edge; petiole 3-4 in. long, slightly dilated at the base. *Flowers* dioecious, yellow, larger and on much thicker pedicels than in the preceding species. *Sepals* 4, 2-2.5 in. long, equal, ovate, fleshy; *petals* thick, about twice the sepals, concave at the base. *MALE FLS.*—in small terminal umbellules; *stamens* numerous, on a fleshy 4-lobed elevated mass; filaments very short; anthers 4-gonous, 4-celled. *FEM. FLS.*: *staminodes* 4, 2-3 cleft with glands at the extremities; *ovary* 6-8 celled; stigma sessile, spreading, irregularly 6-8 lobed, fleshy glandular. *Fruit* about 2 in. diam. globose, depressed at the apex with a mamillate protuberance; seeds straight along the inner face but rounded along the back, covered with a juicy, fleshy, acid aril.

Hardly separable as a species from the last in the herbarium. As it is usually comparatively easily differentiated in the field, it has been tentatively separated.

Fairly common in UPPER ASSAM up to about 2000 ft. except perhaps the N. E. FRONTIER DISTRICT, often cultivated in homesteads for its acid fruit, which is considered as a specific for dysentery also for external application in obstinate cases of headache.

Flrs. 2-4. Fr. 6-8.

3. *Garcinia affinis*, Wall. Vern. *Thekakhaksi*, Garo; *Dieng-soh-kwang-rüt*, Khasi.

A fairly large tree with horizontal branches and grey bark exfoliating in large roundish flakes, blaze pink turning brown, exuding white gum. *Leaves* 4-6.5 by 1.5-3 in., elliptic oblong to oblong lanceolate, shortly blunt acuminate, or subacute, thinly coriaceous (when dry), glabrous, lateral nerves about 18-21 on either half, fine with many intermediate ones, ending in an intramarginal nerve; base subacute or acute; petiole 1-1.6 in. long channelled with a stem clasping fleshy ligule at the base. *MALE FLS.*—75 in. across, yellowish in terminal fascicles of 3-9; buds globose; pedicels 1-3 in. long. *Sepals* and *petals* 4 each, the latter much larger. *Stamens* in 4 short bundles. *FEMALE FLS.*—solitary terminal; ovary 4-celled; stigma divided. *Fruit* nearly globose, mamillate, 1.25 in. across, dark purple, dry crowned by the stigma.

Rongrengiri reserve—GARO HILLS, Rangbynee—KHASI HILLS; SYLHET, Wallich's sheet No. 4254 referred to by Hooker, but of which there is no duplicate at Calcutta. Identification based on incomplete material.

4. *Garcinia lanceifolia*, Roxb. Vern. *Rupohi-theke*, Ass. *Prangsu*, *Prangso-arong*, Mik.; *Shushru-thai*, Kach; *Pelti*, Lushai; *Thisuru*, Garo; *Kengrapel*, *Toiteng*, Kuki; *Dieng-soh-jadu*, Khasi; *Dieng-soh-srit*, Synt.

A handsome glabrous shrub up to 12 ft. in height growing under dense shade of other trees; stem dark-brown, decussately branched. *Leaves* dark glossy-green, 2.5-5 by 1.1-2 in. lanceolate, long-acuminate, rather fleshy when green but drying almost membranous; lateral nerves 8-10 on either side of the midrib, very slender, irregular, meeting close to the margin; base tapering; petiole 1-1.6 in. long, margined. *Flowers* red, terminal, solitary or 2-3 together, bracteate, male about .3 in. across, female on short thick pedicels. *Sepals* 4, 1.5-2 in. long, broadly elliptic; *petals* 4, somewhat shorter and slightly oblique.

Stamens in 4 bundles of 4-5 each; anthers 1-celled. *Ovary* obovoid; stigma 6-8 lobed, glandular-tubercled. *Fruit* obovoid, about 1 in. diam., bright orange-red, 6-8 seeded.

Fairly common in evergreen forests in LAKHIMPUR, SIBSAGAR, CACHAR, NOWGONG, KHASI HILLS up to 3000 ft., GARO HILLS, NAGA HILLS; often cultivated in villages for the fruit.

The leaves are subacid and are eaten cooked by Mikirs. The ripe fruit which is acid is eaten with relish.

Flrs. 2-3.

Fr. 6-7.

5. *Garcinia Morella*, Desr., including *G. elliptica*, Wall. Vern. *Kuji-thekera*, Ass.; *Korbomba*, Kuki; *Sundur-kun*, Sylhet.

A small tree up to about 40 ft. in height. *Bark* dark greyish-brown about 3 in. thick; inside cream-coloured in older trees mottled with dark-brown dots, exuding a yellow gum. *Leaves* 4-6 by 2-3 in.; elliptic to ovate-lanceolate, obtusely acuminate, coriaceous; lateral nerves oblique, irregular, 2-5 in. apart; base cuneate; petiole 3-5 in. long, thickened and shortly ligulate at the base. **MALE FLS.**: generally 3 together, in axils of fallen leaves, very shortly pedicelled, about 3 in. across. *Sepals* and *petals* orbicular, the latter somewhat larger. *Stamens* on a 4-angled fleshy mass; anthers orbicular, shortly stalked, flattened, circumsciss. **FEMALE FL.** larger than male, solitary, subsessile; staminodes about 12, the filaments forming a ring round the ovary. *Ovary* globose; *stigma* sessile, round or 4-lobed, tubercled. *Fruit* about 7 in. diam. globose or slightly elongate, seated on the persistent sepals and crowned by the imperfectly 4-lobed stigma, yellow when ripe. *Seeds* 1, slightly compressed; testa dark-brown, slightly muricate.

Jaipur forests, LAKHIMPUR: Bhalukpong, DARRANG: Bhutan Hills, Barak Line Reserve, CACHAR; SYLHET: KHASI & JAINTHIA HILLS—Hooker, probably also the vicinity of MIKIR HILLS.

Wood yellow, fairly hard, mottled, with numerous wavy concentric bands; medullary rays moderately broad; weight about 56 lbs. per c. ft. The gum resin is the true gamboge which is useful as a dye and medicine, but its use is not known in Assam. The seed yields a fatty oil which can be used for illuminating purposes also as a substitute for ghi.

There seem to be two varieties of this tree, the leaves of the one having closer and more transverse lateral nerves than of the other. There are no doubt other differences also, but materials at hand are not sufficient to enable me to define them.

Flrs. 12-2.

Fr. 5-6.

6. *Garcinia pedunculata*, Roxb. Vern. *Bor-thekera*, Ass; *Tabing-asing*, Miri & Abor; *ampri-arong*, Mik.; *Thaipomlien*, Lushai; *Soh-lyntraw*, *Dieng-soh-danei*, Khasi.

A fairly large tree up to 60 ft. in height with a fluted trunk and rather short spreading branches. *Bark* thick, spongy; nearly smooth and dark-brown or dark grey outside, pale-brown inside with a network of very fine red lines; gum scanty and slow to exude. *Leaves* 6-12 by 3-5.5 in., obovate or oblanceolate, rigid, subcoriaceous, midrib stout; lateral nerves 3-5 in. apart,

arched so as to be tangential* to the margins, tertiaries very fine, about .08 in. apart, transverse to the secondary nerves; base cuneate; petiole 1-1.5 in. long. MALE FLS.—pale green in few-flowered terminal panicles and on stiff pedicels 2-3 in. long, each with a pair of bracts a little above the base; sepals .3 in. across, orbicular, fleshy; petals slightly longer than the sepals but narrower; stamens numerous in a 4-cornered mass; anthers 2-celled but 4-angled. FEMALE FLS. solitary, larger than male, terminal on a thick 4-angled peduncle, which is .5-1.6 in. long; staminodes 20-30 in 4 bundles, which are connate below; stigma peltate, spreading, about 10-lobed. Fruit globose 3-4.5 in. diam., fleshy; seeds 8-10, reniform, enclosed in a fleshy aril.

Occurs sporadically throughout UPPER ASSAM up to 3000 ft

The acid fruit is eaten raw or cooked.

Fls. 9-4. Fr. 12-2.

7. *Garcinia paniculata*, Roxb. Vern. *Sochopa-tenga*, Ass.; *Thisru*; *Garo*; *Bombs*, Tipp.; *Bombhathei*, Lushai; *Bombathing*, Kuki; *Dieng-soh-jadu*, *Dieng-soh-longkor*, *Dieng-soh-longkydu*, Khasi.

A handsome dioecious evergreen tree up to 60 ft. in height and 4 ft. in girth, with oval crown and decussate branches. Bark dark-brown or brownish grey and nearly smooth outside, about .3 in. thick; inside pink with fine veins of deep red, soon turning deep reddish brown, exuding a yellow gum. Leaves 4-7.5 by 2-3.5 in. obovate, elliptic or oblanceolate, suddenly bluntly acuminate, cuneate at the base, subcoriaceous, smooth and shining on both surfaces; lateral nerves 8-12 on either half, arched and vanishing near the margin without forming a continuous intramarginal nerve; tertiaries very fine, transverse, subparallel, .1-1.2 in. apart; petiole .6-.9 in. long, stout, slightly dilated at the base. MALE FLS.—dull-white, very sweet-scented, about .5 in. diam. in decussately branched conical terminal panicles 3-5 in. long, with angled branches; sepals and petals 1 each, decussate, imbricate; stamens numerous on an elevated glandular receptacle. FEMALE FLS.—larger, sessile or on very short pedicels in few flowered peduncled terminal spike-like racemes, which are sometimes shortly branched at the base; ovary oval; stigma sessile, convex, entire, tubercled with minute glands. Fruit about 1 in. long, globose or slightly elongate, crowned by the hemispherical granular stigma; seeds generally 4, enclosed in a pulpy aril.

Holongapar, Naga janka, Garampani, etc. in SIBSAGAR; CACHAR, KHASI and JANTIA HILLS up to 3000 ft., LUSHAI HILLS, GARO HILLS, NAGA HILLS.

Wood moderately hard, greyish-brown with closely packed wavy concentric bands; pores scanty, fairly large; medullary rays of three grades, of the last grade very fine and close. It is liable to split. Weight about 40 lbs. per cu. ft. The ripe fruit is eaten with much relish.

Fls. 12-2.

Fr. 5-7.

8. *Garcinia atroviridis*, Griff.

A graceful tree up to 50 ft. in height; branchlets terete smooth, thick; bark blackish. *Leaves* 6-9 by 2-3 in. oblong-lanceolate, abruptly acute at the apex, contracted at the base, thickly coriaceous, glabrous, shining both above and beneath; lateral nerves about 50 on either half (about 12-16 in. apart), anastomosing along the margin, inconspicuous when green, prominent when dry; petiole 5-1 in. long, reddish. **MALE FLs.** about 6 in. across, 2, less often 3 together; peduncles up to 7 in. long, sometimes panicled; *sepals* 4, the two outer smaller, orbicular, concave, streaked with red inside; petals similar to inner petals, deep-red, concave; stamens united into a ring. **FEMALE FLs.**—terminal, usually solitary, about 1.5 in. across; peduncle 1 in. long; *staminodes* in a discontinuous wavy ring round the ovary; *ovary* vertically ribbed, 10-16 celled; stigma umbrella-shaped, entire, broader than the ovary, fleshy, blood-red, entire but wavy at the margin. *Ripe fruit* 3 in. across, globose, yellowish-green, slightly lobed at the base, crowned by the sessile stigma, which then becomes concave.

This tree occurs in the N I FRONTIER DISTRICT Not yet met with in the other DISTRICTS.

The fruit is edible

9. *Garcinia anomala*, Planch. Vern. *Itubung*, Manipur; *Thechu*, Garo; *Dung-soh-kuang*, *Soh-lain-lhlaw*, Kh.; *Dung-sa-slung*, *Dung-soh-lang-sam*, Synt.

A small tree, with brown or grey rough bark about 12 in. thick; blaze yellowish or very light pinkish white, very finely fibrous, exuding yellowish gum. *Leaves* 3.5-8 by 1.5-1 in. elliptic to oblong lanceolate, shortly blunt acuminate, coriaceous; lateral nerves fine about 16-27 on either side, with many intermediate ones, anastomosing near the margin, joined by fine tertiaries, often nearly at right angles; base cuneate, subacute or rounded; petiole 5-7.5 in. long, channelled; base with a fleshy sheathing ligule. *Flowers* in 3-flowered axillary cymes supported by opposite leafy bracts 3-5 in. long, peduncles up to 1 in. long, bracteoles opposite, caducous, up to 1 in. long, more or less concave. **MALE FLs.** *sepals* 1, 3 in. long, suborbicular, concave. *Petals* 1, yellowish-white, obovate-oblong, slightly oblique, 5 in. long. *Stamens* numerous, surrounding and concealing the pistillode; anthers forming a globose mass dehiscing longitudinally. **FEMALE FLs.**—6 in. across, *sepals* and petals smaller than in the male flrs., otherwise similar. *Staminodes* connate at the base, shorter than the ovary. *Ovary* oblong; stigma expanded, edges revolute. *Fruit* 1-celled, supported by the more or less persistent recurved sepals, 1-1.5 in. long, subglobose or ovoid, with a short thickened style.

Damra Reserve, GARO HILLS, NAGA HILLS, KHASI & JAINTHIA HILLS, 3000-5000 ft.

Flrs. 11. Fr. 11-2 (?)

* *Garcinia spicata*, Hk. f. Vern. *Dingso Kwang*, Khasi.

A middle sized tree (70' 159"). *Bark* brown, about '5 in. thick, pale inside. *Branches* angular. *Leaves* 5-8 by 2.5-3 in., broadly elliptic or elliptic oblong, acute, coriaceous, glabrous; lateral nerves numerous, slender, transverse nervules oblique; base acute or obtuse; petiole '4-6 in. long, transversely rugose. *Flowers* 5-merous, in fascicles, frequently lengthening out to spiciform racemes; males sometimes mixed with females in the same fascicles. *Ovary* 3-4-celled, ovoid. *Fruit* green, subglobose, beaked.

Sheet No. 3036 (U. N. Kanjilal) is identified at Sibpur Herbarium (Royal Botanic Garden) as *G. ovalifolia*, Hk. f. — *Garcinia spicata*, Hk. f. I have followed Brandis in accepting the older name. This is a new record in Assam.

Fruit is eaten.

Fls. Hot season.

Fr. Cold season.

Imperfectly known species:—

1. *Garcinia* sp., Vern. *Tempor*, Ass. A tree generally resembling *G. xanthochymus*, but taller. *Bark* dark brown, exfoliating in large flakes, thin, red inside, changing to dark brown, resin at first white, then yellow. *Branchlets* sulcate, swollen at the nodes. *Leaves* 6-8 by 2.5-3 in. ovate lanceolate, elliptic, or oblong, short acuminate or obtuse; base subacute or broadly cuneate, coriaceous, shining, main lateral nerves about 15-22 on either half, meeting near the margin, with many intermediate ones between; petiole '5-1'2 in. stout, laterally angled, rugose with fine horizontal wrinkles, and with a fleshy stem-clasping ligule at the base. *Flowers* white, 4-merous, monœcious. MALE FLRS.—about 1'2 in. across; sepals coriaceous orbicular or broader than long '5-6 in. across, two outer a little larger. *Petals* 4, subequal a little larger than the sepals. *Staminal* mass 4 lobed; filaments many, very short, anthers 2-lobed, dehiscing vertically. FEMALE FLOWERS—a little smaller than the male flowers about '9 in. across; stigma indistinctly and rather irregularly lobed, smooth, edges recurved. *Fruit* not seen.

Sheet No. 3632 Rajgarali—LAKHIMPUR.

Flrs. 5.

2. *Garcinia* sp.—A small tree upto 35 ft. in height with a narrow crown and slender branchlets, young shoots red. *Bark* dark brown or black about '1 in. thick exuding yellow gum. *Leaves* 3-4 by 1-1'7 in. lanceolate or oblong to elliptic-lanceolate, acuminate, thick and fleshy when green, drying thin glabrous, shining above, glaucous beneath; lateral nerves fine, rather indistinct, upto about 18 in each half with many intermediate ones, usually joining close to the margin to form an intermarginal nerve, *tertiaries* very fine, oblique more or less wavy or subparallel; base acute, narrowed to the short, ('2-3 in. long) channelled petiole. *Flowers* 4-merous, axillary or terminal, solitary or 2-3 together. MALE FLRS.: small on stout pedicels about '25 in. long; bracts opposite, small. *Sepals* '05 in. long, ovate. *Petals* imbricate in bud, orbicular, about '1 in. long. *Stamens* in 4 erect bundles joined at the base, round a pistillode with an expanded rugose stigma; staminal bundles adnate and opposite to the petals; anthers many, almost sessile, 4-celled. FEMALE FLRS. not seen.

Longai Reserve, SYLHET, evergreen forest in SYLHET and possibly in other Districts. Sheets Nos. 4942 and 6897.

Wood coarse fibred, perishable.

Flrs. 4.

2. OCHROCARPUS, Thouars.

Trees. *Leaves* opposite or ternately whorled, coriaceous. *Flowers* polygamous in short cymes or lateral or axillary fascicles. *Calyx* entirely closed at first, at length splitting into 2, sometimes 3 valves or sepals. *Petals* 4 or more. *Stamens* indefinite; filaments filiform, free or shortly connate at the base; anthers erect oblong or linear, dehiscing longitudinally. *Ovary* usually 2-celled; ovules usually 2 in each cell; style short, stout, or () ; stigma 3-lobed. *Berry* 1-4-seeded. *Seeds*

large, enclosed in pulp; embryo of a large fleshy tigellus with the cotyledons reduced to a small mamilla or O.

Flowers in dense fascicles:—

Pedicels thickened upwards .5-.75 in. long:—

Fruit 1 in. long, obliquely ovoid. 1. *O. longifolius*.

Flowers solitary or in few fld. lax fascicles:—

Pedicels slender 1-2 in. long:—

Fruit 1.25 in. long, ovoid. 2. *O. siamensis*.

1. **Ochrocarpus longifolius**, Benth. & Hook. f. ex T. Anders. Vern. *Suklong*, Lushai,

A small or large tree with dense deep green foliage; young shoots obscurely angled. *Bark* greyish brown, inside reddish, turning brown, exuding milky sap. *Leaves* 5-7 by 1-2 in., oblong lanceolate, usually acute or bluntly pointed, firmly coriaceous, quite glabrous, midrib prominent, veins elegantly reticulated; base obtuse; petiole stout, about .3 in. long. *Flowers* .6 in. across, in dense short fascicles, in axils of fallen leaves or on old wood. *Buds* globose, orange red; pedicels .5-.75 in. long, thickened upwards; bracts numerous, subulate. *Calyx* reflexed during flowering. *Petals* white streaked with red, ovate oblong, acute deciduous. *Stamens* sterile in female flowers; style short, stout; stigma broad, peltate. *Fruit* 1 in. long, obliquely ovoid, tipped by the hard pointed style.

LUSHAI HILLS (A fragmentary specimen was collected here and identified as above in the Calcutta Herbarium).

The flower buds have commercial importances and are used for dyeing silk.

Fls. Hot season. Frt. Rainy season.

2. **Ochrocarpus siamensis**, T. Anders.

A middle-sized evergreen tree, glabrous. *Leaves* 8-10 by 1.5-2.3 in., oblong or oblong lanceolate, entire, obtuse, coriaceous, glabrous, midrib prominent, reticulated; base narrowed into a thick petiole .3-.5 in. long. *Flowers* fragrant, white, solitary or laxly fascicled; pedicels slender 1-2 in. long; sepals 2, herbaceous. *Petals* broadly oblong lanceolate, blunt or rounded at the tip. *Fruit* ovoid, mucronate, 1.25 in. long, glabrous.

LUSHAI HILLS (B. C. Sen Gupta).

Fls. Hot season. Frt. Rainy season.

3. MESUA, Linn.

Mesua ferrea, Linn. Vern. *Nahor*, Ass. & Miri; *Inji* or *Inji-asing*, Abor; *Micharne* or *Phikcharne-arong*, Mik.; *Khung-khari-luphang*, Kach.; *Ngai-ching*, Naga; *Nageswar*, Sans.; Sylh & Cach.; *Karai*, Khindi, Garo; *Khersei*, Tipp.; *Nasser-bippang*, Mech; *Khersei*, Kuki; *Herse*, Lushai; *Uthan*, Manip.; *Dieng-ngai*, Khasi.

A pre-eminently evergreen middle-sized handsome tree with a dense conical crown in pole stage. *Bark* grey and smooth but generally warty in young trees, afterwards dark-brown or cinnamon, exfoliating in large white flakes, which expose a warty reddish

brown inner surface, coarsely fibrous and red inside, exuding an aromatic oleo-resin. *Leaves* opposite, decussate, very variable, 2.5-7 by .5-2 in., lanceolate or narrowly elliptic-oblong, bluntly long-acuminate, rounded at base on young plants, gradually more acute with age, thinly but rigidly coriaceous, glabrous, shining above, generally covered with a wax-like white powder underneath, red when young and tender, persisting for at least two years; lateral nerves very fine, almost invisible, straight, nearly parallel, sub-transverse; petiole, 2.5 in long, slightly channelled. *Flowers* solitary, generally terminal, sometimes axillary, 1.5-3 in. across, very fragrant; peduncles rusty-tomentose, 3-6 in. long. *Sepals* 5-6 in. long, 4 in 2 pairs, imbricate, thick but with sharp margins, concave, velvety-puberulous outside, persistent. *Petals* 1, pure-white, much exceeding the sepals, cuneate, obovate or obovate, curled and erose at the margins, very finely brown or purple-veined, caducous. *Stamens* very many, forming a globose yellow mass in the centre of the flower; filaments very slender; anthers golden-yellow, linear, 1-12 in. long. *Ovary* ovoid, 2-celled, with 2 ovules in each cell; style long; stigma peltate. *Fruit* 1' 2-1.6 in. across, ovoid, pointed, 1-celled 1-1 seeded, supported by the persistent sepals. *Seeds* variously faceted according to their number in each capsule, with a dark-brown shining horny testa; cotyledons fleshy, oily pale-yellow; radicle inferior.

Common and generally gregarious in almost all evergreen forests in UPPER ASSAM, where the ground is more or less hilly. Does best on well-drained shingly soil with an admixture of red clay. Goes up to 3000 ft in the MIKIR HILLS. Thrives best in a locality with heavy rainfall and humid atmosphere. Much cultivated in gardens and avenues.

Seedlings and saplings and even small poles stand shade very well. Gregarious flowering takes place every third or fourth year and flowering trees do not put forth new leaves, at any rate not till September following.

Sapwood white. Heartwood dark-red, very hard and very heavy (about 75 lbs. per c. ft.). Pores of moderate size, not numerous, generally in radial and oblique strings of 2-5. Medullary rays extremely fine and numerous, uniform and equidistant with numerous wavy concentric lines of lighter tissue. Annual rings indistinct. The timber, though hard and strong, is not very durable being subject to dry rot. It is, however, much used as house posts and piles, also railway sleepers. The flowers are used medicinally and an essence is often extracted from them. The oleo-resin which can be tapped from the trees may be used for varnish. The seeds contain fatty oil which has been found excellent for soap-making. Strung with thin stripes of bamboo they are often used as candles which burn steadily with a reddish light but give a heavy smoke. About 150-200 seeds weigh 1 lb.

New leaves 2-5, and occasionally 9-10.

Firs. 4-5. Fr. 8-10.

4. KAYEA, Wall.

Trees. *Leaves* opposite. *Flowers* hermaphrodite, solitary or paniced. *Sepals* and *Petals* 4 each, imbricate; stamens numerous; filaments slender, free or connate at the base; anthers small, subglobose, 2-celled with vertical dehiscence. *Ovary* 1-celled; style slender, terminated by a 1-cleft stigma; ovules 4, erect. *Fruit* subdrupaceous, indehiscent, 1-1 seeded. *Seeds* with crustaceous testa.

Leaves narrow-oblong or narrowly lanceolate

5-10 in. long ; -

Flowers 1 in. across, panicle branches lax.

... 1. *K. floribunda*.

Leaves ovate-to elliptic-lanceolate, 3-5.5 in.

long ; -

Flowers .3 in. across ; panicle branches short.

... 2. *K. assamica*.

1. *Kaya floribunda*, Wall. Vern. *Kasukorol*, Karol, Cachar ; *Darchong-khab*, *Serpai*, Kuki ; *Phai-hershei*, Tipp. ; *Bolung*, Garo.

A large tall evergreen tree with greenish-grey or brown bark with faint horizontal wrinkles exfoliating in round scales, 15-25 in. in. thick, blaze light pink, or pinkish brown, finely fibrous, sometimes exuding yellowish gum ; all parts glabrous. *Leaves* 5-10 by 1.8-2.5 in., narrowly oblong to lanceolate, acuminate, coriaceous, glabrous, green on both surfaces, pellucid dotted at least when dry ; main lateral nerves about 20-30 on either half, arched and meeting near the margins almost regularly alternating with intermediate nerves, which in their turn alternate with finer ones running about half way up, prominent on the undersurface ; base acute cuneate or rounded ; petiole .5-.7 in. long. *Flowers* white about an inch across on terminal panicles ; bracts and bracteoles small, opposite, deciduous, the former at the base of panicle branches, the latter at the base of pedicels ; pedicels .25-.3 in. long. *Sepals* .3 in long or broad suborbicular, broader than long, accrescent in fruit. *Petals* about .4 in. long, white, with pink edges oblong-obovate or obovate. *Anthers* golden yellow. *Fruits* indehiscent dry, almost encased within the hardened, rugose sepals -- and at this stage -- connate sepals, and tipped by the style ; depressed globose or transversely ellipsoid, 1.5-1.75 in. across, 1-2 seeded. *Sepals* with reddish brown smooth testa.

CACHAR, Bhutan Hill, Sonai reserve ; Lallacherra ; Katakhil reserve ; SYLIET, GARO HILLS, KILASI HILLS ; ascending to 3000 ft.

Wood heavy, pores distant, but rather large, medullary rays fine with concentric bands of soft tissue across the rays giving them a superficial resemblance to annual rings. The timber is used for dugouts and construction

Flrs. 3.

Fr. 5.

2. *Kaya assamica*, King & Prain. Ind. For. xvii, 61.- Vern. *Sia-nahor*, Ass. (Lakh).

A slow growing tall handsome evergreen tree much resembling Nahor in general habit ; branches terete yellowish. *Bark* light brownish-grey, often exfoliating in large square plates ; inside fibrous, reddish with fine and close whitish veins, soon turning brown. *Leaves* 3-5.5 by 1-1.8 in., ovate or elliptic-lanceolate, shortly acuminate and often very finely mucronate, cuneate at the base, firmly coriaceous, somewhat shining above, dull underneath ; lateral nerves arched, almost regularly of three grades, the main ones .25-.6 in. apart and looping to form an uneven intermarginal vein, those of the last grade disappearing about halfway between the midrib and the margin ; petiole slender, .4-.9 in. long. *Flowers* white, about .3 in. across in

terminal or axillary fascicled panicles 3-6 in. long with short, decussate, slender glabrous, bracteate branches; pedicels in flower very slender, 1-2 in. long, much enlarged and thickened in fruit, bracteolate; bracts and bracteoles small, opposite, caducous, buds globose about .08 in. diam. *Sepals* 4, in 2 pairs, imbricate, the outer about .15 in. diam., orbicular, inner spatulate, both much enlarged in fruit so as to completely envelope it. *Petals* 4, white, about 1 in. long, sub-orbicular, thin. *Stamens* numerous, longer than the sepals; filaments free, capillary; anthers small, globose. *Ovary* 1-celled; style slender; stigma 4-fid; ovules 4, erect. *Fruit* depressed globose, scarcely 1 in. long but about 1.8 in. in diam., entirely or almost entirely enveloped by the accrescent hard sepals. *Seeds* solitary, globose but very depressed, 1-1.3 in. diam.; testa reddish-brown, crustaceous, smooth; cotyledons fleshy.

The above description has been based on actual specimens and differs in some points from that given by the authors in the Indian Forester, notably as regards the fruit.

This tree occurs only along the foot of the Himalayas in the NORTH LAKHIMPUR SUB-DIVISION.

Heartwood red at first, turning to dark-chestnut, hard, even-grained, weighing about 60 lbs. per c. ft. Annual rings generally narrow, sharply separated by a thin band of softer tissue. Pores of moderate size, irregularly but uniformly scattered, often filled with resin. Medullary rays very fine but not so close as in Nahr, the distance between them being about equal to the transverse diameter of the pores, uniform, fairly equidistant. Sapwood of a lighter brown. The timber is much valued for construction in the North Lakhimpur Sub-Division. The fruit is used for poisoning fish.

Flrs. 4-5.

5. CALOPHYLLUM, Linn.

Calophyllum polyanthum, Wall. Vern. Telo. Cach. *Scutebel*, Kuki; *Dieng-la-Karu*, Khasi.

A medium-sized to large evergreen glabrous tree. Bark grey or brown, sometimes almost black when covered with lichens, about .3 in. thick, somewhat rough, exfoliating in oblong flakes, blaze red or reddish brown with whitish bands exuding an amber coloured aromatic gum. *Branchlets* 4-angled, compressed. *Leaves* 2.5-4.5 in., oblong elliptic or ovate-lanceolate, bluntish acuminate, margins undulate, slightly recurved, coriaceous; lateral nerves sub-transverse, very close, parallel; base acute or cuneate, narrowed into the margined petiole, which is .25-.5 in. long. *Flowers* about .2-.3 in. across, polygamous, 4-merous in many flowered, long, simple or branched racemes from the upper leaf axils, usually exceeding the leaves and on terminal panicles; pedicels slender, .15-.2 in. long. *Sepals* unequal, outer suborbicular, small, inner petaloid, longer. *Petals* rather longer than inner sepals, obovate, reflexed. *Stamens* very many; filaments filiform, short; anthers 2-celled.

Ovary 1-celled; style slender; stigma peltate; ovule solitary, erect. *Fruit* a subglobose or ovoid drupe about 1 in. long, crowned by the short style; *seed* egg-shaped, brown.

CACHAR, GARO HILLS—Tura, KHASI & JAINTIA HILLS up to about 2500 ft.. ABOR COUNTRY.

Young leaves are red.

FAM. 20. TERNSTRÆMIACEÆ.

Erect or rarely climbing shrubs, or trees. *Leaves* alternate simple, extipulate, usually coriaceous. *Flowers* regular, generally showy and bisexual, usually subtended by a pair of sepal-like bracts. *Sepals* and *Petals* usually 5 each, rarely fewer or more, imbricate the latter often connate at the base. *Stamens* numerous, free or connate at the base, often adnate to the petals. *Ovary* 3-5 celled (many celled in *Actinidia*); styles as many as ovary cells, or if simple, usually with as many divisions; ovules 2-6 or many in each cell, on axile placentas. *Fruit* capsular or baccate; *seeds* few and large, or numerous and small; albumen scanty or 0.

I Peduncles 1-flowered. Erect shrubs or trees:—

A. Flowers 2-sexual, often 1-sexual in (*Ternstroemia japonica*), normally at least 15 in. diam. Seeds few, large:—

1. Fruit indehiscent:—

a. Style simple; anthers basifixed:—

i. Anthers glabrous, ovules 2 in each cell of ovary. ..

ii. Anthers pilose; ovules many in each cell of ovary:—

Ovary 2-3 celled; seeds few.

Ovary usually 5 celled; seeds numerous. ..

b. Styles 5; anthers versatile, glabrous. ...

2. Fruit dehiscent. Styles 3-5; anthers versatile:—

a. Large or medium-sized trees;

seeds winged:—

Capsule globose; seeds reniform winged all round except along the straight ventral edge. ..

Capsule oblong; seeds prolonged upwards into an oblong wing.

b. Shrubs or small trees; seeds not winged. ...

B. Flowers dioecious; scarcely more than 2 in. diam. Anthers basifixed; styles usually 3. Fruit a berry; seeds numerous. ...

1. Ternstroemia.

2. Cleystera.

4. Pyrenaria.

5. Schima.

6. Gordonia.

7. Camellia.

8. Eurya.

- II. Flowers in cymes umbels or panicles, usually not less than '5 in. diam. Anthers versatile :—

1. Fruit pulpy, many seeded :—

Trees or erect shrubs.

Styles 3-5.

2. Climbing shrubs. Styles numerous.

... 9. Saurauja

... 10. Actinidia.

1. TERNSTRÖMIA, Linn.

Ternstroemia Japonica, Thunb. Vern. *Pani-jikiri*, Ass. (Darrang), *Pani-bokul*, Ass (Sibs); *Dieng-la-saw*, Khasi.

A glabrous tree, medium-sized under favourable conditions, but very often stunted to the size of a shrub. Bark grey, warty, blaze light reddish white, soon turning dirty brown, finely fibrous, about '5 in. thick. *Leaves* collected towards the extremities of shoots 2-3 by '7-1'2 in. oblong-obovate, oblong-lanceolate or elliptic, bluntly apiculate or rounded at the apex, gradually narrowed to the '3-5 in. long petiole, entire or minutely crenulate near the apex, coriaceous, dark green above, paler beneath; lateral nerves about 8 on either half, very indistinct. *Flowers* yellowish white, solitary, more or less nodding from axils of fallen or existing leaves, usually dioecious, but sometimes hermaphrodite, '4-6 in. across when fully open, males very sweet scented; peduncles '4-7 in. long with a pair of small broadly ovate bracts below the flower. *Sepals* and *petals* 5 each, subequal, '2-3 in. long, imbricate, connate at the base, orbicular to broadly elliptic oblong, crosso-ciliolate. *Stamens* numerous; filaments short; anthers linear, basifixed, apiculate, glabrous. *Ovary* 2-3 celled; style simple; stigma with 2-3 broad lobes; ovules 2 in each cell, pendulous from the apex. *Fruit* '5-7 in. diam., obovoid-globose, shortly beaked by the remains of the style and supported by the persistent sepals and bracteoles; seed 3-4, red.

A native of the hills, but often found in marshy localities in the plains. e. g., Borjan in LAKHIMPUR; the Diroi Reserve in SIBSAGAR; Chengelmaia and Charduar in DARRANG, NAGA HILLS, etc

Flowers 4-6. Fr. 9-11.

Two varieties of this tree seem to occur in our area :—

1. With larger and flowers crowded on short thick angled subpatent peduncles.
2. With smaller, more distant flowers on slender terete nodding peduncles. The former is the one commonly found in the Khasi Hills and latter is the variety that generally represents the tree in the plains.

2. CLEYERA, DC.

Trees or shrubs. *Flowers* small solitary on axillary peduncles which are often fascicled; bracts minute or 0. *Sepals* 5. *Petals* 5, more or less connate at the base, much exceeding the petals. *Stamens* many; anthers pilose. *Ovary* 2-3-celled; styles simple elongate with a 2-3 fid apex; stigmas slender; ovules many. *Fruit* baccate. *Seeds* usually few.

Peduncles usually fascicled in leaf axils ; bracts
obsolete.

Peduncles usually solitary or in twos in leaf
axils, bracts minute ... 1. *C. ochracea*.*

... 2. *Ç. grandiflora*.

1. *Cleyera ochracea*. DC. Vern. *Pani-bokul*, Ass. (Sibs).

A small tree having a superficial resemblance to *Ternstroemia japonica*. Leaves 2.5-4.5 by 1.7 in. oblong-obovate to oblanceolate, quite entire and with recurved margins, apex subacuminate with a broad blunt tip, cuneate at the base, midrib very stout ; main lateral nerves about 12 on either half, slender, tertiaries also slender, laxly reticulating ; petiole 3-4.5 in. long, flattened, broadly margined. Flowers yellow, .5-.7 in. across, peduncles in axillary fascicles, rarely solitary, .6-.8 in. long, glabrous, thickened upward ; bracts () or obscure. Sepals 5, about .1 in. long, orbicular or broadly ovate, minutely but stiffly ciliate. Petals 5, yellow, .3-.4 in. long, elliptic. Stamens numerous ; filaments longer than the anthers ; anthers with white bristles. Style filiform, persistent. Fruit a berry.

Diroi Reserve in SIBSAGAR ; probably also in the MIKIR HILLS ; lower range of KHASI HILLS.
Fls. 7-8. Fr. 9-11.

2. *Cleyera grandiflora*, H. Kf. & Th. Vern. *Dieng-tic-la-muh*, Khasi.

A small glabrous tree similar to the last but larger in all its parts. Bark dark brown outside, reddish with patches of brown inside. Leaves 3-4 in. (.5 in. according to F. B. I.) elliptic, shortly and often somewhat abruptly blunt acuminate ; base cuneate or acute at the base, coriaceous, midrib stout, lateral nerves indistinct, but apparently over 15 on either side ; petiole 3-5 in. long. Flowers 1 in. across, white, scented. Peduncles rather stout, .6-1 in. long, with 2 minute alternate deciduous bracts towards the top. Sepals 1-1.5 in. long, orbicular or nearly so, ciliate. Petals 4-5 in. long, fleshy, elliptic. Anthers with scattered bristles. Fruit not seen.

KHASI HILLS Rangbyneng, 4,000 ft. (sheet No. 7199). Probably not specifically distinct from *C. ochracea*.

Wood heavy, very fine-grained, reddish-brown, hard.

Flowers 7.

3. ADINANDRA. Jack.

Adinandra Griffithii, Dyer.

A small tree ; bark dark grey and warted outside, brown with streaks of lighter colour inside ; all parts glabrous. Leaves 3-6.5 by 1.25-2 in., oblong elliptic or oblong-lanceolate, somewhat bluntly and often abruptly acuminate ; base narrowed, rounded, acute or cuneate, entire with stiff translucent margin, dark green above, paler beneath, coriaceous ; lateral nerves slender, rather obscure, upto 15 on either side ; petioles 4-6 in. long, stout.

channelled. *Flowers* solitary, white glabrous; peduncles 1-1.5 in. long, thicker upwards, recurved with 2 small bracts at the top. *Sepals* persistent, 3-4 in. long, inner larger, suborbicular to orbicular-obovate. *Petals* 5, about equalling the sepals, connate at the base. *Stamens* many, adnate to the petals, sparingly hairy. *Ovary* 5-celled, glabrous; style joined at the foot, deeply 5-fid, segments linear; ovules many in each cell, pendulous. *Fruit* a many seeded ovoid berry usually crowned by the thickened base of the style, about .8 in. long; *seeds* numerous, exalbuminous.

KHASI HILLS, Mamloo.

Flrs. 4-5.

Fr. 10.

4. PYRENARIA, Bl.

Shrubs or small trees. *Leaves* fairly large, serrate. *Flowers* large, axillary, subsessile. *Sepals* 5, unequal, imbricating, the outermost generally resembling the bracts, the innermost the petals. *Stamens* numerous; filaments adnate to the base of the petals. *Ovary* 5-celled with 2 ovules in each cell; styles 5, free or more or less united. *Fruit* indehiscent, drupe-like; *seeds* without a wing, with a woody testa, exalbuminous.

Leaves and branchlets glabrous;
bracts smaller than and resembling
the sepals.

Leaves beneath and branchlets
pubescent; bracts foliaceous
larger than and very unlike the
sepals.

... 1. *P. barringtoniaefolia*.

... 2. *P. diospyracea*.

1. *Pyrenaria barringtoniaefolia*, Seem. Vern. *Bon-madhuri* (Wild Guava), Ass. (Sibs and Lakh); *Janghali-tajar*, *Janghali-cha*, Ass. (Darrang); *Pala-popul-changue*, Daf.

A shrub up to 20 ft. in height. *Bark* dark grey, with fine vertical fissures, blaze brown or reddish-brown. 1-1.2 in. thick. *Leaves* 7-12 by 2-2.4 in. spatulate or oblanceolate, abruptly cuspidate-acuminate, tapering to a channelled stout petiole .5-.6 in. long, cuspidate-serrate; thinly coriaceous, glabrous, main lateral nerves 10-12 on either half, tertiary ones very openly reticulate; midrib depressed above, very prominent beneath. *Flowers* pale-white, 1.2-1.6 in. diam., axillary, solitary on short, thick, glabrous peduncles about .2 in. long. *Bracts* .1-1.5 in. long; *sepals* .3-.4 in. long; *petals* .5-.7 in. long, all more or less orbicular, grey silky outside, more or less eroso-ciliate. *Stamens* very many forming a yellow mass at the centre of the flower; filaments short, glabrous, connate at the base. *Ovary* silky; styles distinct. *Fruit* 1.5 by 1 in. ovoid, minutely lepidote, 5-celled; stones thin-walled, each with 1-2-seeds; seeds about .5 in. long, ellipsoid, laterally also often partially ventrally, compressed with a hard smooth brown testa.

Early common in the outskirts of evergreen forests in all the DISTRICTS of UPPER ASSAM except perhaps the dryer portions of NOWGONG.
Fls. 4-5. Fr. 12-3.

2. *Pyrenaria diospyricarpa*, Kurz.

A small tree upto 25 ft. in height; young parts densely grey-pubescent. *Bark* dark-brown outside, but red inside. *Leaves* 4.8-5 by 1.5-2.8 in., obovate or oblanceolate, abruptly bluntly-acuminate, cuspidate-serrulate, almost membranous, glabrescent above, finely pubescent especially along the midrib and nerves beneath; main lateral nerves 10-11 on either side of the midrib anastomosing .25-.5 in. away from the margin; tertiaries distant, faint; petiole .25-.3 in. long, pubescent. *Flowers* 1-1.3 in. across, dull white, solitary, axillary, subsessile. *Bracts* green, very unequal, 4-7 in. long, ovate to oblong, pubescent outside. *Sepals* about .4 in. diam., orbicular or obovate coriaceous, very densely silky-pubescent outside. *Petals* about .7 by .4-.5 in., elliptic, thick in the centre with membranous margins, glabrous except on the centre of the back. *Stamens* as in the other species. *Ovary* villous; styles 3, free at the apex. *Drupe* 2-3 by 1.5-2.3 in. cylindrical or slightly obovoid, waxy-yellow, supported by the persistent bracts and sepals.

Nambor and Doyang Reserves, SIBSAGAR, not common. Sheet No. 8951, 1709.

Fls. 11-12. Fr. 1-2.

The above description differs in some respects from Kurz's, flowering and fruiting time is also different. It is a good variety and may turn out on further examination to be a new species.

5. SCHIMA, Reinw.

Evergreen trees. *Leaves* thinly coriaceous. *Flowers* handsome, 2 bracteate; peduncles—1 flowered and axillary or the uppermost in short racemes. *Sepals* 5, subequal. *Petals* 5, much larger, connate at the base, unequal, the outermost concave and more or less hooded, *Stamens* many, adnate to the base of the petals; anthers versatile. *Ovary* 5 rarely 4-6 celled; style simple or slightly lobed at the apex with broad spreading stigma; ovules 2-6 in each cell, attached laterally, subpendulous. *Capsule* woody, depressed, globose, usually tipped by the persistent style, loculicidal with a persistent axis. *Seeds* flat, more or less reniform, winged all round except on the hilum, albumen scanty.

Sepals glabrate outside, outer concave.

petals glabrous except at the base.

Sepals densely woolly outside, outer concave, petals densely silky.

... 1. *S. Wallichii*.

... 2. *S. khasiana*

1. *Schima Wallichii*, Choisy, Vern. Noga-bhe, Ass.; Cheknan-arong, Chingan-arong, Mik., Ingkhia-ching, Naga; Kamsuri or Kamsuri-phang, Kach.; Rangi-Rata, Sylh.; Bonak, Cach.; Guga, Mech; Man-khing, Man-thiang, Kuki, Man-khing-thing, Tipp., Dieng-shyr-ngan. Synt.; Dieng-ngan. Khasi.

II. Flowers erect, sepals deciduous:--

Flowers large : 1-1'25 in. across, stamens 70-80.

... 3. *C. drupifera*.Flowers moderate sized up to '75 in. across,
stamens about 30.... 4. *C. caduca*.

1. *Camellia theifera*. (triff. Syn. *Thea chinensis*, Linn. Vern. *Cha*, *Chah*, Hind & Ass. The tea plant.

A large evergreen shrub with glabrous grey branchlets. *Leaves* 3-6 by 1-2'5 in., obovate, elliptic-oblong or oblanceolate, acute or acuminate, closely serrate or serrulate, usually coriaceous, glabrous above, often slightly pilose along and near the midrib beneath ; main lateral nerves very slender, somewhat transverse, 8-12 on either side of the midrib, arched and forming an intermarginal nerve away from the margin ; petiole '15-'2 in. long, flattened above and slightly margined. *Flowers* white, 1-1'5 in. diam., solitary or a few together ; peduncles very short with 2-3 sepal-like bracte. *Sepals* 5, '1-'12 in. long, orbicular, concave, leathery, ciliate, glabrate, pubescent or silky outside, persistent. *Petals* 5, '5-'7 in., long, broadly obovate, slightly connate at the base, glabrous or puberulous outside. *Stamens* numerous ; filaments glabrous connate at the base also adherent to the base of the petals. *Ovary* 3-5 celled, villous ; styles 3, glabrous, connate beyond the middle. *Capsule* '7-'9 in. diam., 3-cornered, leathery ; seeds generally 1 in each cell, rarely more, globose or faceted, smooth, pale brown.

Extensively cultivated in all the Districts of UPPER ASSAM, also found wild in parts of LAKHIMPUR and SIBSAGAR.

Wood greyish-white or light cinnamon colour, very fine-grained with uniformly distributed numerous pores and very fine close medullary rays. Straight branches of unpruned shrubs make very good walking sticks and tool handles.

Flowers 12-3. Fr. 9-12.

2. *Camellia caudata*, Wall. Vern. *Phulkat*, Ass. (Sibs) ; *Dieng-chi*, *Dieng-fyrnem-synrang*, Khasi ; *Dieng-la-phyrno*, Synt.

A small evergreen tree with a spreading crown ; branchlets grey pubescent. *Bark* very thin, smooth, greyish or reddish-brown, brownish green underneath the membranous outer layer, blaze reddish brown inside. *Leaves* 1'7-3'5 by '6-1'3 in. elliptic-oblong to narrowly oblong-lanceolate, caudate-acuminate, serrulate, membranous glabrous above, except the depressed puberulous midrib, more or less pubescent or pilose beneath, especially along the prominent midrib ; lateral nerves very slender oblique and irregular, 8-12 on either half, anastomosing ; petiole '1-'2 in. long, slender, pubescent. *Flowers* white, faintly scented, about 1 in. diam., solitary or 2-5 together, nodding ; peduncles covered with imbricating bracts throughout. *Bracts* and sepals ovate, silky outside. *Petals* 5, spirally arranged, '3-4 in. long, gradually larger inward, obovate, puberulous or silky towards the apex outside. *Filaments* clothed with spreading silky hairs, outer coherent into a glabrate tube '2-'3 in. long. *Ovary* and style densely white, villous ; the latter slightly

exserted, trifid at the apex, segments linear, glabrous. *Capsule* 1 by .7 in., globose or more or less pointed at both ends 1-seeded, opening stellately.

Frequent in evergreen forests in LAKHIMPUR and SIBSAGAR very common round Garampani and behind Numaligarh ascending KHASI and JAINTIA HILLS up to 5,200 ft.

The wood is yellowish-white, fine and close-grained but somewhat soft and light.

Flrs. 10-11.

3. *Camellia drupifera*, Lour. Syn. C. Kissi, Wall. C. Mastersi, Griff. Vern. *Dieng-tyrnem-bhoi*, Khasi.

A shrub or a small tree. *Bark* grey outside, light red and paler towards the cambium inside; branchlets pubescent, buds silky. *Leaves* 2.5-4.5 by 1-1.6 in., elliptic-oblong, oblong-lanceolate or oblanceolate, acuminate or shortly caudate, tapering at the base to petiole, margins slightly recurved, slightly serrulate or almost entire, coriaceous, glabrous above, pilose or glabrescent beneath; lateral nerves rather indistinct, 8-10 on either side of midrib, forming loops close to the margin; petiole .1-2 in. long when young, glabrate with age. *Flowers* white, 1-1.25 in. across, erect; peduncles terminal and axillary 1-3 together, very short, at first closely invested by the imbricating bracts, ultimately marked with prominent annulate scars; bracts early deciduous, upto .4 in. long, upper larger, suborbicular or broadly ovate, silky tomentose, grading into the sepals. *Sepals* deciduous, up to .3 in. long, suborbicular, silky outside. *Petals* about .7 in. long, obovate, more or less pubescent outside. *Stamens* about 70-80, glabrous, outer connate at the base, inner free. *Ovary* woolly; style with 2-3 fid. hairy towards the base. *Capsule* about 1 in., at first pyriform and pubescent, ultimately globose; seed usually 1 in each cell.

KHASI HILLS 3000-5000 ft., CACHAR HILLS (Prazer), NAGA HILLS, MANIPUR.

Flowers 7-11. Fr. 1-(?)

4. *Camellia caduca*, C. B. Clarke, Mss. Vern. *Dieng-tyrnem*, *Dieng-jih-halich*, Khasi.

A large shrub, somewhat resembling the last species but with smaller leaves of flowers. *Leaves* 1.7-3 by .8-1.2 in. oblong or elliptic lanceolate, acuminate; base cuneate, acute or tapering, usually sharply serrulate or nearly entire, coriaceous, often minutely wrinkled, midrib pubescent, otherwise glabrous above, under surface pilose, specially towards the base and along the midrib or glabrate; lateral nerves obscure, 6-9 on either half, meeting near the margin in loops; petiole .25-.3 in. long. *Flowers* white, scented, erect on short stout peduncles; .6-.75 in. across; peduncles axillary or terminal, 1-4 together; bracts caducous, silky or thinly pubescent, larger upwards, more or less keeled, up to .25 in. long, passing upwards into the sepals and leaving prominent scars on the

peduncles after falling. *Petals* unequal, inner larger up to .5 in. long, obovate, nearly glabrous or slightly pubescent outside. *Stamens* 20-38, glabrous. *Ovary* tomentose; style usually 2-3 fid, hairy towards the base. *Capsule* up to .75 in long, pyriform, pointed at the apex.

KHASI HILLS, 4,500-6,000 ft. ; common.

Fls & Fr. 10-12.

8. EURYA, Thunb.

Shrubs or small trees. *Leaves* 2-stichous, usually serrate, generally shining above. *Flowers* small, generally dull-white, dioecious, in axillary fascicles, rarely solitary with persistent bracteoles. *Sepals* and *Petals* 5 each, imbricate, the latter united at the base. *Stamens* 12-22, from the base of the corolla; anthers basifixed. *Ovary* usually 3-celled with 3 styles which are free or united. *Fruit* a berry containing numerous angular seeds; albumen copious, oily.

Leaves usually serrate :-

Generally shrubby; branchlets angular, usually glabrous. *Sepals* glabrous or glabrate.

Often a middle-sized tree; branchlets terete, pubescent. *Sepals* pubescent

Leaves nearly entire.

.. .. 1. *E. japonica*.

.. .. 2. *E. acuminata*.

.. .. *E. symplocina*.

1. *Eurya japonica*, Thunb. Vern. *Sasen*, Ass., *Marmara*, Ass. (Lakh); *Yabi-changne*, Daff; *Pun-heng-heng*, Jharua; *Chhamist*, Garo; *Dieng-pyrsit*, Khasi.

A very variable shrub of the look of tea-bushes, occasionally a small tree up to 25 ft. in height; branchlets angular, with prominent decurrent lines from both sides of the base of the petioles, usually glabrous. *Bark* thin, dark-brown with lines of lenticels, blaze reddish greenish-white. *Leaves* dark-green, 1-3.5 by .6-1.1 in., elliptic obovate or oblanceolate, tip rounded or subacute, closely serrate, thinly coriaceous, glabrous except the midrib, which is hairy underneath; main lateral nerves somewhat transverse, about 10 on either half; tertiaries reticulate; midrib impressed above, prominent beneath. *Flowers* about .1 in. long, white in fascicles of 2-5 rarely solitary, each with two minute bracteoles, with an unpleasant pungent smell, generally glabrous. *Sepals* unequal, the two outer smaller, suborbicular or broad ovate, obtuse. *Petals* white, about double the sepals, obovate. MALE FLS.—with no sign of pistil; *stamens* 12-15, slightly exserted. FEMALE FLS.—*styles* generally 3, very slender, slightly united in flower, but often nearly to the top in fruit. *Berries* about .15 in. diam., mucronate with the remains of the styles, black and with a pinkish juice when ripe.

MIKIR HILLS and adjoining forests of SIBSAGAR and NOWGONG; Joka and Jaipur Reserves in LAKHIMPUR, not very common in UPPER ASSAM, NAGA HILLS, KHASI HILLS up to 6000 ft.

Fls. & Fr. 6-1; probably throughout the year.

Var. *nilida*, *Korths-Leaves* 1-2.2 by .5-.8 in. narrow elliptic or lanceolate, acute or shortly acuminate; petioles very short; styles united above the middle.

KHASI HILLS.

Var. *pyllanthoides*, *Blum*:—branchlets silky pubescent at the tips. *Leaves* longer than in the type, narrow elliptic, or oblong lanceolate, acuminate styles united.

KHASI HILLS (Griffith).

Eurya japonica, Thunb. Var. *nilida*, *korth-forma* Kanjilali, *Debbarman*, N. f.

A small tree, about 10-15 ft. tall. *Leaves* alternate. 1.5-3.7 by .3-.7 in., very narrow oblong or elliptic linear lanceolate, acute, some acuminate, narrowed towards the base ending in short about .1 in. long petiole, margins distantly somewhat glandular serrate. *Flowers* dioecious, axillary, about .1 in. in diameter.

♂ Flower with 5 sepals, 5 petals, both subequal, glabrous outside, obscurely pubescent inside, caducous. *Stamens* 15; pistillode frequently present. *Ovary* 5-locular; styles -2.

Habitat:—ASSAM, KHASI & JAINTIA HILLS, near Kynshi, 5th October, 1915. U. N. KANJILAL No. 6914; N. CACHAR HILLS, Dchinai Bak, 1500-1600 ft, 25th June 1915, U. N. KANJILAL No. 6780.

2. *Eurya acuminata*, DC. Vern. *Murmura*, Ass. (Sibs); *Theng-hau-jang*, Mik.; *Bon-dousa*, *Bon-sobai*, Mech; *Dieng-lu-pyrshit*, Synt.; *Dieng-shut*, *Dieng-pyrshit-hoh*, Khasi.

A small evergreen tree, sometimes up to 40 ft. in height; branchlets terete, the decurrent ridges, if at all present, not prominent; young parts generally grey-hairy. *Bark* dark-brown and fairly smooth outside, reddish inside, thin. *Leaves* 2-4 by .5-1.4 in. oblong to linear-lanceolate, generally caudate-acuminate, closely crenate serrate, subcoriaceous, glabrous and often shining above, midrib impressed above, prominent and hairy beneath; main lateral nerves about 12 on either half alternating with shorter intermediate ones; base subacute; petiole very short, puberulous. *Flowers* .15-.25 in. long, white with a very heavy unpleasant smell, 2 bracteolate, nodding, up to 8 from the lower leaf axils and 2 or even 1 from the upper. *Sepals* concave, pubescent outside, outer 2 smallest. *Petals* white, alternating with the sepals, .1-2 in. long, much exceeding the sepals. *Stamens* 15-24, shorter than the petals. *Ovary* pubescent; styles 3-5, united beyond the middle in the type, free in var. *euprista*, recurved in fruit. *Capsule* globose, .2 in. across, crowned with the remains of the style. *Seeds* bluntly trigonous.

Fairly common in all the DISTRICTS of UPPER ASSAM, KHASI and JAINTIA HILLS up to 5500 ft., NAGA HILLS.

Arrested shoots with imbricating lanceolate aristate greenish scales or less often reduced leaves, are sometimes formed in the leaf axils.

Fls. 9-11. Fr. 1-6.

Var. *euprista*, *Korths*, Vern. *Gaurchikrai*, Ass.—differs by having broader and more membranous leaves which are more or less pilose beneath and more glossy above, the flowers being usually solitary and the styles 4-5, free both in flower and fruit. Also the *sepals* and *ovary* are glabrous. *Bark* deeper red inside and in thin layers. Grows up to 35 ft. in height. Found at Difulu and the foot of the Tiru Hills, SIBSAGAR also in KHASI HILLS.

Wood reddish brown, soft, even grained with evenly distributed minute pores and very fine medullary rays, weighing about 40 lbs per c. ft. It is very good for fuel.

Var. *Wallichina*, Stend - styles united.

KHASI HILLS, CACHAR.

Eurya trachyacarpa, Korth. - A shrub. *Leaves* resembling those of *E. acuminata*, but narrower, longer tailed, more closely serrate, and more membranous; petiole slender 1 in. long. *Peduncles* slender, glabrous .15 in. long, solitary or 2-3 in a fascicle, each with 2 small bracts. *Sepals* pubescent and styles united to $\frac{2}{3}$ rd their lengths. Hooker records it from Khasi Hills on Griffith's authority. There is no specimen at Calcutta Herbarium.

Eurya symplocina, Bl. - An evergreen tree, with dark grey bark. *Branches* lenticelled; leaf buds silky, narrow lanceolate. *Leaves* 2-4 by 1-1.4 in. elliptic lanceolate, bluntly acuminate, thinly coriaceous, glabrous, or midrib beneath with adpressed pubescence, entire or serrulate above the middle; base cuneate; petiole .15-.2 in. *Flowers* 2 in. diameter, flatter than in *E. acuminata* but with similar unpleasant smell, mostly below the leaves, in 3-4 flowered fascicles from axils of fallen leaves; pedicels .15-.25 in. long, 3 bracteate. *Sepals* unequal, silky outside, more free than in *E. acuminata*. *Petals* .15 by .1 in. elliptic. *Anthems* long; styles united more than half way up. *Fruit* .15 in. diam., with remains of the style at the apex.

No. 6223 from Sehramim, KHASI HILLS. The specimens are rather incomplete for satisfactory determination.

Flowers 11.

9. SAURAUJA, Willd.

Shrubs or small trees generally with strigose or scaly branches. *Leaves* approximate at the ends of branches, generally glabrous above, usually serrate, with prominent parallel lateral nerves. *Flowers* usually 2-sexual, bracteate, in axillary cymes or panicles; bracts remote from the calyx. *Sepals* and *petals* 5, each, much imbricate, the former persistent, the latter more or less united at the base. *Stamens* many; filaments adhering to the base of the corolla; anthers versatile, opening by pores. *Ovary* 3-5 celled; styles as many as cells, free or more or less united; ovules many in each cell, anatropous. *Fruit* a 3-5 locular pulpy berry, rarely dry or subdehiscent; seeds many, small, albuminous.

- I. Flowers under 1 in. diameter; sepals not covered with scales :-

- A. Flowers in long peduncled panicles

6-13 in. long :-

Sepals totally or nearly smooth, young parts covered with ferruginous tomentum and pointed scales mixed. ... 1. *S. napaulensis*.

Sepals densely wooly outside, young parts covered with floccose rusty tomentum. ... 2. *S. Griffithii*

- B. Flowers in solitary or fascicled cymes from axils or axils of fallen leaves :-

Sepals smooth outside :-

Leaves glabrous and satiny underneath, lateral nerves 10-20 on either half, oblique and arched, petiole up to 1 in. Flowers .25 in. across, white, fading to pink. ... 3. *S. Roxburghii*.

Leaves densely mealy rusty puberulous beneath, lateral nerves up to 40 on either half nearly straight; petiole 1-2 in. long. Flowers .7 in. across light pink. ... 4. *S. punduana*.

Leaves rusty tomentose beneath, lateral nerves up to 25 on

either half, oblique and *arched,
minor nerves conspicuous,
underneath; petioles 1-2 in.
long. Flowers 3 in.

across, white turning pink.
All parts clothed with stiff
long rusty or black hairs,
leaves distant, stiff hairs
on the principal and minor
nerves above, more densely
hairy beneath; lateral nerves
15-25 pairs, arched, petioles
5-1 in. long. Flowers 25 in. across ...

.. 5. *S. fasciculata*.

- II. Flowers 1 in. across, sepals densely
covered with sharp pointed scales: -
Peduncles solitary or fascicled from
axils of existing leaves:—

Leaves thinly puberulous or
glabrescent beneath, lateral
nerves up to 30, slightly arched.
Flowers white with a bright
red centre. ...

.. 7. *S. cerea*.

1. *Saurauja napaulensis*, DC.

A small tree with reddish brown bark; young parts covered with broad based acuminate scales and brown scurfy tomentum. *Branchlets* and petioles ultimately tuberculate with the persistent bases of scales. *Leaves* 7-12 by 2.2-6.5 in., elliptic, oblanceolate or oblong lanceolate, acute or short acuminate, serrate, upper surface glabrate, undersurface ferruginous tomentose, sometimes glabrate with age; lateral nerves 25-35 on either half, prominent subparallel, connivent near the margin with the upper, tertiaries fine, base narrowed; petioles 1-2.5 in. long, ultimately tuberculate and glabrate. *Flowers* pink, 5 in. across, in long peduncled lax axillary panicles up to 16 in. long, usually from the ends of the branches; branches up to 3.5 in. long; bracts deciduous, elliptic acute, 1.5 in. long. *Sepals* 1.5-2.5 in. long, broad ovate or suborbicular, obtuse glabrous or slightly pubescent towards the base, edges membranous, persistent. *Petals* broad, exceeding the sepals, marcescent tips recurved, margins fimbriate to about the middle, tube widened below; *stamens* many, free. *Ovary* glabrous; styles 5, radiating, united towards base. *Berries* 3.5 in. across, green, sweetish, subglobose or broad ovoid, 5 lobed, green, mealy inside. *Seeds* reddish brown small.

KHASI HILLS, NAGA HILLS, GARO HILLS, MANIPUR, 2500-3000ft.

The ripe fruit is edible.

Fls. 12-6, Fr. 11-1.

2. *Saurauja Griffithii*, Dyer.

A middle-sized or small tree, bark brown rough vertically fissured, blaze 2.5-3 in. very soft, whitish. *Young* twigs, under-surface of leaves, petioles and inflorescence covered with dense rusty or reddish brown floccose tomentum, specially when young. *Leaves* 10-13.5 by 5-7.5 in. broadly elliptic or obovate, shortly

apiculate or abruptly short acuminate, from the rounded apex. subentire or with distant spinulose teeth, base rounded; lateral nerves 30-35 on either half, tertiaries subparallel near the margin, coriaceous, upper surface glabrous; petioles 1.5-2.5 in. long. *Flowers* 2-3 in. across, in peduncled-much branched axillary panicles up to 13 in. long; peduncles up to 7 in. long, main branches 2-3 in. long; pedicels up to .7 in. long; bracts early deciduous, up to .6 in., ovate or elliptic, lower leafy, bracteoles small, oblong. *Sepals* up to .25 in. suborbicular broad ovate or elliptic, tomentose outside. *Petals* not seen in our specimens. *Styles* 5, combined at the base. Berry 5 grooved, about .3 in. across, tipped by the style and seated in the persistent calyx.

GOALPARA, but usually found in SIKKIM in the hills between 3700 & 5000ft. The old leaves are sometimes glabrate on the undersurface.

Flowers 2-6.

3. **Saurauja Roxburghii**, Wall. *Bon-posola*, Ass. (Lakh & Sibs.), *Pariposola*, *Porbotia-sengunia*, Ass. (Darr.); *Hengunia*, Ass. (N. Lakh); *Chepu-changne*, *Chipung-changne*, Duff, *Nonthler-arong*, Mik., *Tong-bahu*, *Dia-ching*, Naga; *Bon-loisu-phang*, Kach; *Gogon*, Nep; *Sing-khrai*, Manip.; *Terpu*, Lushai; *Deibru*, Mech. *Geng-sning*, *Bor-jir-sinung*, Garo. *Arbung-thing* Tipp.; *Dheng-soh-la* pied, Khasi.

A small tree up to 30 ft. in height and 30 in. in girth, generally with a narrow crown; young parts covered with scurfy tomentum and subulate scales. *Bark* grey or greenish-grey and on old stems, corky outside and closely vertically fissured, on branches, green below the cuticle, greenish or pale pinkish-white inside, .3-.5 in. thick, finely fibrous, exuding copious watery sap during spring. *Leaves* 5-12 by 2-4.5 in., elliptic or elliptic oblong, acute or shortly acuminate, subacute or more or less rounded at the base, shallowly serrulate, subcoriaceous, wholly glabrous when mature, pale and with a satiny gloss underneath when green; lateral nerves 10-20 on either half, somewhat distant oblique, arched often rather corky, tertiaries transverse and parallel, quaternaries very minutely reticulate; midrib stout; petioles 1-2 in. long, terete, glabrescent. *Flowers* .25 in. across, urceolate, on shortly peduncled slender fascicled cymes from the axils of fallen leaves; buds globose, about .1 in. in diam.; bracteoles minute. *Petals* ovate, white, fading pink, united at the base, tips recurved. *Stamens* about 50. *Ovary* glabrous; styles usually 5, sometimes 4, united below, but abruptly stellately spreading above. *Berries* whitish, about .2 in. diam., globose.

Common throughout the whole province up to 400 ft.

Wood yellowish when green turning reddish brown, soft, with a large pith pores and medullary rays very fine, very numerous. The leaves are good cattle and buffalo fodder and the ripe fruit is eaten.

Flrs. 3-5. Fr. 5-8.

4. *Saurauja panduana*, Wall. Vern. *Bata-gogon*, Gaban, Nep; *Dieng-ja-la-ngap*, Khasi; *Dieng-soh-la-pat*, Khasi (Nongstoin); *Dieng-sbh-khijut*, Khasi (Nongkhaw); *Dieng-soh-la-pird*, *Dieng-la-kampid*, Synt.

A pretty, small, evergreen tree about 20 ft. in height somewhat of a squat habit and with thin lepidote branchlets. *Bark* brown or brownish grey with large corky lenticels, vertically split on old stems, green underneath the cuticle on branches; inside greenish white changing to brown on exposure, finely fibrous, soft and slightly mucilaginous. *Leaves* 6-12 by 2.5-4.2 in., elliptic obovate or oblanceolate, finely acuminate, cuspidate serrate, coriaceous, glabrous above, finely buff or tan mealy tomentose beneath; lateral nerves 25-40 on either half, reticulating near the margin, on the undersurface, each with 4-6 minute subulate scales at regular intervals, tertiaries transverse or slightly oblique, subparallel, very fine; base cuneate, subacute or abruptly rounded; petioles 1-2 in. long; rather stout, covered with adpressed lanceolate scales. *Cymes* 2-3 in. long, fascicled or solitary from axils of present and fallen leaves; peduncles sometimes flattened, ramifications densely covered with acute scales; bracteoles broadly ovate, pointed. *Flowers* 7 in. across, white, changing to pink; *sepals* 5, thin, glabrous; *ovary* ovoid or globose, glabrous; *styles* 5, united up to varying heights, tips spreading. *Berry* globose, white.

Along the foot of the NAGA HILLS in the LAKHIMPUR and SIRSAGAR DISTRICTS; e.g., the Jaipur and Desai Valley Reserves, also the MIKIR HILLS, GARO HILLS and KHASI HILLS up to 5,000 ft.

Wood light brown, soft, not of any particular use. The ripe fruits are eaten.

Frs. 4-6.

Fr. 9-11.

5. *Saurauja fasciculata*, Wall. Vern. *Sare-gogon*, Nep.

A small tree affecting rocky streams and the vicinity of waterfalls: branchlets covered with densely rusty-tomentose and scattered adpressed scales mixed, bark brown. *Leaves* 6-12 by 1.3-3.2 in., narrow elliptic-oblong, finely acuminate, acute or rounded at the base, setose serrulate, coriaceous, glabrous above, softly and rusty tomentose underneath; lateral nerves 16-30 on either half, arched, looping at the extremities; midrib stout, covered with deciduous adpressed scales; petioles 6-1.4 in. long, terete, covered with scattered scales, ultimately glabrate. *Cymes* up to 3 in. long, peduncled, branches glabrous, 1-3 flowered; bracteoles minute, linear-deltoid. *Flowers* 3 in. across, white, fading to pink; *sepals* ovate, obtuse.

Only once found near Borjan, Makum Forest, LAKHIMPUR
The leaves are eaten by cattle and buffaloes.

Flowering and fruiting time unknown.

6. *Saurauja macrotricha*, Kurz. Vern. *Dieng-soh-jalbi*, *Dieng-soh-lympied*, Khasi.

A small tree clothed with long stiff rusty brown, sometimes almost black hairs. *Leaves* 7-11 by 2-3.4 in. lanceolate or

elliptic-lanceolate, shortly acuminate, bristle serrate, chartaceous, covered with scattered spreading hairs along the midrib and the nerves above, more densely beneath, main lateral nerves 15-25 on either side of midrib, slightly arched and looped near the margin; tertiaries fine; base narrowed; petioles hirsute, usually 5-1 in. long. *Flowers* 25 in. across, fasciculate on slender hirsute cymes from axils of present or fallen leaves, 5-75 in. long; bracts minute, glabrous, lanceolate; pedicels hirsute, 3-6 in. long. *Sepals* 15 in. long, glabrous, elliptic or broad ovate, acute. *Petals* shortly exceeding the sepals, connate at the base, lobes rounded with reflexed tips. *Ovary* glabrous; styles 5, united at the base. *Berries* globose, 2 in. across exceeding the sepals.

Rare, LAKHIMPUR—Namchang, Clarke! Margarita, Prain! KHASI HILLS up to 5000 ft. (Kurz, Clarke)

Firs. 4-6. Fr. 6-8 ?

Saurauja cerea, Griff. Vern. *Porbotu-hengunia*, Ass. (Darr); *Hero-changne*, Daff.

A small tree up to 20 ft. in height; young shoots thick, covered with sharp pointed scales and having a large pith. *Bark* greyish with large lenticels outside, on branches smooth and shining, inside dark brown. *Leaves* 8-18 by 5-7.5 in., broadly cuneate-obovate, abruptly shortly acuminate, acute or rounded at the base, chartaceous, glabrous above, glabrescent and pale beneath; midrib stout, generally sprinkled with adpressed pointed scales; lateral nerves somewhat distant, 18-22 on either half, slender, slightly arched with distant adpressed scales; tertiaries transverse, more or less wavy; petioles 5-1.5 in. long, stout, densely covered with pointed scales. *Flowers* 1 in. across, solitary on short densely scaly peduncles, which are usually fascicled in the axils of fallen leaves. *Sepals* orbicular, densely scaly and tomentose outside. *Petals* united at the base, orbicular obovate, white but with blood red base, waxy. *Ovary* densely villous; styles 5, united and hairy at the base.

Bhalukpung, DARRANG, and possibly in other similar localities along the foot of the HIMALAYAS.

The ripe fruit is eaten.

Firs. 4-5.

10. ACTINIDIA, Lindl.

Actinidia callosa, Lindl. Vern. *Mei-soh-khan*, *Mei-jaior*, Khasi.

A climbing or straggling shrub; branchlets glabrous, lenticelled; bark corky on old stems. *Leaves* 2-6 by 1.2-3 in. ovate-oblong or obovate, finely acuminate, generally cuneate at the base, setosely serrulate, membranous, glabrous, but often with scattered transverse stiff sharp bristles on the midrib above; lateral nerves 8-12 on either half, very oblique and arched, prominent underneath, tertiaries transverse, parallel; petioles 7-2 in. long, slender. *Flowers* whitish, polygamous or dioecious, 5 in. across

in few flowered axillary umbellate cymes; peduncles .3-.7 in. long, generally solitary; pedicels about 1 in. long, slender. *Sepals* and *Petals* 5 each, imbricate, the former .15 in. long, broad ovate, tomentose; petals .2 in. long, obovate. *Stamens* many; anthers versatile, opening by slits. *Ovary* oblong, villous, many-celled; styles clavate, as many as cells in the ovary, elongating and spreading in fruit. *Fruit* up to 1.5 by .7 in. long, ovoid, slightly rugose, buried in soft pulp.

MIKIR HILLS (behind Naharian tea garden), SIBSAGAR District and is likely to occur further inside those hills, also CACHAR (Prazer), LAKHIMPUR-Margarita (Prain), KHASI HILLS up to 5000 ft., MANIPUR and ABOR COUNTRY.

The ripe fruit is acid and is eaten.

Flrs. 4-5. Fr.

FAM. 21. DIPTEROCARPACEÆ.

Resinous tree (in Assam.) *Leaves* alternate, simple, entire, penninerved; stipules small or large, generally fugacious, leaving a transverse scar. *Flowers* regular, 2-sexual, generally sweet scented, in terminal or axillary panicles. *Calyx* gamosepalous, campanulate, free or adnate to the ovary, 5-lobed, 2 or more of the lobes usually accrescent in fruit forming wings. *Petals* 5, twisted, sometimes connate at the base. *Stamens* 5-10-15 or indefinite, hypo- or perigynous, free or connate or adnate to the petals; filaments short, often dilated at the base; anthers 2-celled, connective produced into an appendage above or obtuse. *Ovary* slightly immersed in the torus, usually 3-celled, rarely 2-1 celled; styles fused. *Fruit* nut-like or capsular, usually winged with the variously enlarged calyx-lobes. *Seed* exalbuminous; cotyledons fleshy.

Stipules large, amplexicaul :—

Calyx tube turbinate or urceolate enclosing the ovary but not adnate to it. Fruit with 2 large erect wings.

Stipules small, not amplexicaul :—

Calyx tube short, adnate to the ovary :—

Fruit with 3 large and 2 small erect imbricate wings.

Fruit supported by accrescent subvalvate calyx lobes.

1. Dipterocarpus.

2. Shorea.

3. Vatica.

1. DIPTEROCARPUS, Gaertn.

Tall trees with long cylindrical bole; young parts often stellately hairy. *Leaves* coriaceous, entire or crenate; lateral nerves almost straight and parallel, tertiaries transverse; petiole somewhat swollen at both ends; stipules large, clasping the stem and enclosing the terminal bud, caducous. *Flowers* large, white or

reddish, in few-flowered racemes or panicles. *Calyx* accrescent in fruit, free, 5-lobed, tube turbinate or urceolate. *Petals* spreading, somewhat cohering at base, usually pubescent outside. *Stamens* indefinite; filaments much dilated at the base; anthers linear, connective acuminate or cuspidate. *Ovary* 3-celled with 2 ovules in each cell; style filiform. *Fruit* a woody nut, generally 1-seeded, enclosed in the calyx-tube, with two of the calyx-lobes forming two erect strap-shaped or oblong wings, the other lobes remaining short and forming a crown round the apex of the nut. *Seed* fleshy, cotyledons unequal.

Leaves ciliate on the margins :—

Young parts covered with fasciated bristles :

calyx-lobes erect in flower, pointed.

Young parts velvety tomentose ; calyx lobes reflexed in flower, pointed.

Young parts canescent ; calyx lobes obtuse.

Leaves glabrous :—

Young shoots glabrous.

1. *D. macrocarpus*.

2. *D. Mannii*.

Dipterocarpus sp.

3. *D. turbinatus*.

1. **Dipterocarpus macrocarpus**, Vesque. Syn. *D. pilosus*, *Rarb.* Vern. *Hollong* or *Holong*, Ass.

A very large gregarious tree attaining 150 ft. in height and 12-20 ft. in girth with a long cylindrical bole and a small spherical crown when mature; young shoots and petioles covered with dun-brown fasciated hairs; scars of fallen stipules oblique broad but not very prominent, young twigs compressed. *Bark* pale bluish-grey outside, plain or very nearly so with many large raised warts, reddish-brown inside but yellowish towards the cambium, .7-.9 in. thick. *Leaves* 10-18 by 5.5-9.5 in., elliptic-oblong, shortly acuminate, slightly repand and densely brown-ciliate, with fasciated hairs, membranous, sparsely pilose above when young, glabrous when mature, stellate pubescent beneath, especially along the nerves; lateral nerves oblique, straight, 18-25 on either half, tertiary transverse, subparallel with reticulations between; base rounded; petiole 1.2-2 in.; stipules 3-5 in. long, obliquely set, membranous, densely pilose outside with long fasciated hairs, glabrous but punctate inside with the bases of the outside hairs. *Flowers* usually solitary, axillary, 2.5-3 in. long, pinkish; pedicels .12 in. long, stout, densely grey-puberulous. *Calyx-tube* turbinate, .6 in. long, .5 in. wide at mouth, velvety-puberulous outside, silky-pubescent inside, ordinary lobes 3, deltoid triangular, erect, enlarged lobes strap-shaped, .8-1 by .15-.2 in., coriaceous, velvety plain. *Petals* 5, 2.5-by-6-.8 in., subfalcately oblanceolate, membranous, especially towards the tip and margins, faintly longitudinally nerved, imbricate, twisted generally to the left in bud, glabrate inside, stellately puberulous in close horizontal bands outside except on overlapped parts. *Stamens* about 30; filaments dilated at base, about .12 in. long; anthers oblong, .2-.3 in. long, with a pair of tubercles at the base; arista of connective weakly subulate up to .25 in. long. *Ovary* .25 × .16 in., ovoid, silky pubescent, obscurely longitudinally ribbed; style .6 in. long,

tapering from the top of the ovary, longitudinally ribbed, silky, hairy. *Fruit* 2 by 1.4 in., ovoid, pointed towards both ends, itself densely dun-silky outside, but the encasing calyx-tube is glabrate and minutely punctate with the stellate bases of the fallen hairs. *Unenlarged calyx-lobes* about .8 by .8 in., orbicular-ovate, enlarged lobes 6-9 by 1.5-2 in., puberulous, leathery with three strong main nerves and 1-2 short more or less wavy marginal ones; nervules transverse; radicle apical, erect.

SIBSAGAR, LAKHIMPUR and NAGA HILLS generally on hilly ground, easily recognised from a distance by its towering over the heads of nearly all its associates.

Wood reddish brown, moderately hard; weighing 40-45 lbs. per c. ft., medullary rays conspicuous, straight, fairly equidistant; pores large, unevenly distributed generally in groups of 2 to 3. The timber is much used for house building especially for planking. On account of the resin it contains it is not used for tea boxes although otherwise very suitable.

Flrs. 6-7. Fr. end of cold season.

2. *Dipterocarpus Mannii*, King in herb. Cal. Nov. sp. Vern. *Hollong* or *Holong*, Ass.

A tree as large as the foregoing and growing in the same localities, young shoots stout, nearly terete, softly grey-velvety with slightly oblique prominent scars of fallen stipules. *Bark* pale bluish-grey outside, closely vertically fissured, of a uniform cream colour outside. *Leaves* 7-12 by 4-7 in., elliptic ovate or oblong, shortly but rather finely acuminate, subcoriaceous, plaited parallel to the lateral nerves in bud, repand or shallowly crenate and thinly ciliate along the margins, glabrate above although the midrib is scarcely wholly without hairs, softly stellate pubescent along nerves and nervules beneath; lateral nerves 16-22 on either half, straight and parallel, strong underneath, tertiaries transverse sub-parallel, very fine, close; base rounded, sometimes slightly cordate; petiole 1.3-2 in. long, rather stout, velvety stellate pubescent; stipules 4.5-5 by .7-.85 in., lanceolate, stellately silky-pubescent outside, glabrous and with 13-15 very fine longitudinal nerves inside. *Flowers* pinkish(?), 3 in. long, nearly subsessile in 2-5 flowered axillary panicles. *Calyx-tube* .5 in. long and almost as broad at mouth, velvety-pubescent outside, silky inside; ordinary lobes broadly triangular with a thin and generally recurved margin; wing lobes .7 by .18 in., densely brown-felted. *Petals* 2.2-2 by .45-.52 in., oblanceolate or strap-shaped, membranous, faintly closely nerved, tufted pubescent in transverse wavy bands on exposed parts outside, sparsely puberulous inside, twisted generally to the right in bud. *Stamens* about 25, shorter than in preceding species; filaments scarcely .1 in. long, dilated, weak; anthers about .25 in. long with two basal tubercles, appendage of the connective up to .15 in. long, bristle-like. *Ovary* globose, .15 in. diam., brown-silky, tapering to the style which is .5 in. long or a little longer, longitudinally ribbed, silky. *Fruit* about 1.5 in. long, densely dun-silky outside; the encasing calyx-tube globose with a some-

what constricted neck, ordinary calyx-lobes about .8 in. long, globose, erect but with recurved margins : wings 7-9" by 1.1-1.7 in., with only 3 longitudinal nerves and very completely reticulate nervules.

SIBSAGAR and LAKHIMPUR on hilly grounds or table lands.

The following is an extract from a letter written by Sir D. Prain to Mr. G. Mann probably in 1884, which has been attached to a sheet of flowering specimen of this species collected by the late Babu Kripanath De from the Makum Forest, LAKHIMPUR.

"This is the species sent by you long ago (in F. B. I. page 296 sub *D. pilose notalum videres*). Mr. Clarke has marked on it ? Mekai x x x x x x x. As you now show us it is not Mekai (*Shorea assamica*), x x x x x x x x x x. x x x x x. I was inclined to think this is a very distinct variety of *D. Pilosus*, but Dr. King who has also gone over them with me apropos of your other plants says he would rather look on it as specially distinct and proposes to name it *Dipterocarpus Manni*, King Mss." I have followed Sir J. King in separating this from *D. pilosus*.

Flrs. 6-7. Fr. cold season.

3. *Dipterocarpus turbinatus*, Gaertn. Vern. *Kuroilsal*, (Ach.; *Korjong*, Kuki, *Kherjony*, Tipp. *Kuroil*, Syl. The Gurjun oil tree.

Lofty tree attaining a diameter of about 36 in. with a long cylindrical bole and spreading crown. *Bark* grey or brown rough, vertically fissured, hard, deep brown inside, 1.5 in. thick ; young twigs glabrous or glabrate, stipular scars at first canescent, ultimately glabrate. *Leaves* 5-12 in. long by 2.5-5 in., ovate or ovate-lanceolate, shortly blunt acuminate, sinuate crenate or entire, coriaceous, glabrous on both surfaces ; lateral nerves straight, 12-20 on either half ; base rounded or subcordate ; petiole 1-1.7 in. long, glabrous ; stipules up to about 2 in. long, buff-tomentose, hairs spreading towards the top. *Flowers* 1.2-1.4 in. long, white or pinkish, in few flowered short glabrous racemes from leaf axils of fallen leaves ; pedicels very short. *Calyx-tube* obconic, .3 in. long, glabrous or pruinose, ordinary lobes broadly triangular, acute, very short, wing lobes .3-.5 in. by .1 in. *Petals* softly tomentose on exposed surface, 1-1.2 in. long. *Filaments* very short ; anthers .2-.25 in. long excluding the subulate awn, tubercled at the base. *Ovary* densely pilose, tufted canno-tomentose, tapering to the apex. *Encasing Calyx tube* pruinose, unenlarged lobes .3-.4 by .2-.25 in., obtuse oblong, wings 4-5 by .8-1.4 in., linear oblong, oblanceolate-oblong ; with one prominent nerve and two basal smaller nerves.

SYLHET, CACHAR & GARO HILLS

Kurz calls the form above described *D. lævis*, Hamil.

"Yields a superior quality of wood oil in large quantities and exudes a dirty brown resin"-Kurz. Wood about 49 lbs per. c. ft., tough, moderately hard, heartwood reddish brown, pores large, medullary rays of two class-broad and fine, several of the latter between a pair of the former. Wood is not durable and is subject to attack by shot hole borers and white ants, suitable for packing cases but not suitable for tea chests on account of its resinous contents ; temporary buildings etc. for which its size should recommend its use.

Flrs. 3-4. Fr. 5-6. ?

Imperfectly known species.—

Dipterocarpus sp. near *D. vestitus*, Wall. Cat.—A large tree, "8-10 ft. in girth"—Mann.; young shoots, petiole and inflorescence stellate canescent. *Leaves* 5 by 2.5-3 in. (from a solitary specimen) elliptic or elliptic-oblong, sub-acute, or very shortly obtuse acuminate, margins sinuate crenate, ciliate, coriaceous, midrib above and nerves on the undersurface stellate hairy; lateral nerves 13-17 on either half; base narrowed, obtuse; petiole about 1.2 in. long, stipules brown stellate or fasciculate, tomentose. *Flowers* about 1.7 in. long in short few flowered axillary racemes; pedicel short, stout, up to .2 in. long; calyx-tube about .6 in. long, campanulate or obtusely obconic stellate pubescent outside, glabrous except about the throat within, ordinary lobes obtuse .1-1.5 in. long, wing lobes canno-tomentose, up to .7 in. long, linear oblong. *Petals* twisted to the right in bud, falcate oblong, exposed, surface stellately canno-tomentose about 1.2 in. long. *Stamens* about 35; filaments with dilated base, very short; anthers about .2 in. long, tapering to the subulate appendage of the connective which is about .15 in. long, base shortly two lobed. *Ovary* pilose, ribbed. *Fruit* not seen.

Pathari Hills-SYLHET-Mann. (!)

Firs. 3.

2. SHOREA, Roxb.

Resinous trees, generally of large size. *Leaves* alternate, entire or repand, coriaceous; stipules usually small, caducous. *Flowers* in axillary and terminal lax cyme-bearing panicles; bracts and bracteoles caducous. *Calyx-tube* short, adnate to the torus, segments imbricate, hairy outside, accrescent in fruit. *Petals* imbricate, hairy outside on the exposed portions. *Stamens* 15-50 or more; anther-cells equal, connective usually prolonged into an appendage. *Ovary* 3-celled, cells 2-ovuled; style subulate. *Fruit* fleshy, usually 1-seeded, tightly embraced by the bases of the enlarged sepals which develop into erect wings of unequal lengths, generally 3 long and 2 short; cotyledons fleshy, unequal, one embracing the other; radicle superior.

Leaves ordinarily more than 2 in. in breadth;

flowers small; calyx-segments ovate, .08 in.

long, fruit and wings not glabrous.

... 1. *S. robusta*.

Leaves scarcely more than 2 in. in breadth;

flowers fairly large, calyx-segments

lanceolate .2-3 in. long, fruit and wings

glabrous.

... 2. *S. assamica*.

1. *Shorea robusta*, Gaertn. Vern. *Sal* or *Hul* Ass.; *Hul-crong*, Mik., *Dieng-blei*, Khasi; *Borsal*, *Borsal*, *Borsar*, Garo. The sal tree.

A large tree, deciduous but seldom wholly leafless, with narrow conical crown when young, but with broad spreading crown when mature; young shoots buff-tomentose. *Bark* of young trees blackish-brown, smooth or with a few longitudinal cracks and marked with minute grey specks, of old trees dark-grey, very thick, strongly fibrous, rough with deep irregular furrows, of overmature trees again more or less smooth, dark-brown. *Leaves* at first red or pinkish, afterwards pale-green, mature dark-green, old pale-yellow, drying brown, 4-12 by 2-7 in., ovate-oblong, shortly acuminate, ending in an obtuse point, thinly coriaceous but tough, wholly glabrous and shining when fully mature or the

nerves beneath more or less puberulous ; lateral nerves 12-15 on either half, strong underneath, secondaries slender, transverse, subparallel ; base rounded or slightly cordate ; petiole terete, .5-.8 in. long ; stipules .3-.5 in. long, oblong, slightly falcate, tomentose, caducous. *Flowers* .3-.5 in. long, subsessile, unilateral on racemes 5-10 in. long, arranged in large terminal and axillary panicles, every part of the inflorescence covered with buff tomentum ; bracts caducous, bracteoles minute or wanting. *Calyx-tube* short, adnate to the torus, segments about .1 in. long, ovate, imbricate, shaggy, all accrescent in fruit. *Petals* cream coloured, or yellowish, buff-silky outside, almost glabrous inside, about .5 in. long, tapering upwards, longitudinally 10-12 nerved. *Stamens* up to 50, much shorter than the petals ; filaments swollen at the base ; connective subulate, bearded, minutely trifid at the apex. *Ovary* globose, pubescent ; style subulate. *Fruit* .5 in. long, ovoid, acute, indehiscent, densely canescent ; wings 5, 3 large and 2 small, the largest 3 by .6 in. and the smallest 1.5 by .25 in., spatulate, 10-12 nerved, always more or less pubescent.

The principal timber tree of at least four Districts of this Province, but does not extend east of Nowgong and north of Balipara in Darrang. Two patches evidently artificial, occur in SIBSAGAR, one near Sapokhati and another not far from Khumtai.

The timber is too well known to require a description. A brown dye is sometimes extracted from the bark. The opaline resin is used for caulking boats and is burned for incense. About 350-425 fruits weigh a lb.

New L. and fl. 3-4 Fr. 5-6.

2. *Shorea assamica*, Dyer. Vern. Makai, Mekai or Mekahi, Ass. (Lakhimpur).

A large gregarious tree, 100 ft. or more in height and 8 to 10 ft. in girth, with a cylindrical bole and large crown ; branchlets pendulous, young parts pubescent or puberulous. *Bark* reddish-brown, exfoliating in large overlapping plates, more or less in whorls, inside light-brown in thin layers, exposing darker-brown concentric bands, .7 in. thick. *Leaves* generally 2-4 by 1.2-2 in., ovate and shortly acuminate but on young shoots up to 6 by 2.2 in., oblong lanceolate, tapering and long acuminate, quite entire, thinly coriaceous, glabrous and shining above, at first softly pubescent along the midrib and nerves but afterwards glabrate beneath, midrib prominent beneath, depressed above ; lateral nerves 16-19 on either side, arched, tertiaries faint, transverse, very close ; base rounded ; petiole .3-.4 in. long, pubescent ; stipules 3-6.5 by about .15 in. ovate to lanceolate, finely pointed, strongly 6-8 nerved outside, more or less pubescent, deciduous but not caducous. *Flowers* .5-.6 in. long on short pedicels in axillary or subterminal panicles 3-5 in. long ; bracts caducous ; bracteoles about .08 in. long, shaggy, caducous. *Calyx-tube* very small, segments 5, .2 in. long, lanceolate, canescent outside, pubescent within. *Petals* 5, somewhat unequal, about .5 by .2 in., velvety-pubescent outside where not overlapped, glabrous within. *Stamens* 15, very small, glabrous, adnate to the base of petals ;

filaments .02-.03 in. long, dilated at the base; anthers about .05 in. long, appendage of connective bristle-like, .06-.1 in. long. *Ovary* about .05 in. across, ovoid, somewhat compressed, glabrous or with a few scattered minute hairs, the ridges being almost ciliate; style filiform, about .2 in. long, with a few minute hairs near the base. *Fruit* about .8 by .5 in, glabrous, clasped by the bases of the enlarged calyx-segments; wings linear to spatulate, 2.5-4.5 by .3-.8 in., glabrous, shining, with 6-13 longitudinal nerves and strong and close transverse nervules.

Confined to the Makum Range, LAKHIMPUR & NAGA HILLS. There was a patch of very fine forest of this most handsome tree on the ground now occupied by the town of Margherita. Another patch of good forest occurs in the Jeypur Reserve between Tippam and Namchang. I have never met with it in SIBSAGAR.

Wood light-brown, fine-grained, soft, seasoning well; pores large, single or groups; medullary rays fine and close. Weight 36 lbs. per c ft. It is very suitable for doors, windows, planking and tea boxes.

Flrs. 8-9. Fr. 10-12.

3. VATICA, Linn.

Vatica lanceifolia, Bl. Vern. *Morhat*, Ass. *Mir-kom-phor*, Mik.; *Koyo-asmy*, Abor; *Kalang-asing*, Miri; *Dieng-Lang-Knom*, Khasi; *Dieng-soh-kania*, Khasi (Nongpoh); *Morukur*, Lushai; *Mohal*, Cach; *Moat*, Sylh.; *Mekruk*, Manip.; *Khirkha-champa*, Mech; *Lamukur*, Tipp.; *Kham-khor*, Garo.

A small or middle-sized evergreen tree; young shoots mealy puberulous. *Bark* greenish-grey outside with close horizontal wrinkles, otherwise nearly smooth, inside light greenish-brown, mottled with faint blotches and streaks of lighter colour, compact and hard, .15-.3 in. thick. *Leaves* 4-9 by 1.2-3.5 in., elliptic or oblong-lanceolate, finely acuminate, quite entire, chartaceous, glabrous above, minutely velvety-puberulous or glaucous beneath; lateral nerves 11-15 on either half, slender, arched, tertiaries reticulate; base rounded or sub-acute; petiole .3-.55 in. long, slightly swollen below the insertion of the blade; stipules fugacious up to about .2 in. long, lanceolate or ovate pubescent. *Flowers* white, fragrant, .4-7 in. long, on axillary, solitary or fasciated, pubescent, panicles 2-5 in. long. *Calyx* small, about .1 in. long, velvety-puberulous outside; tube short, adnate to the base of the ovary; segments 5, deltoid-acute, uniformly accrescent in fruit. *Petals* 5, much imbricate, oblanceolate or strap-shaped, puberulous outside where not overlapped, twisted to the right in the cylindrical buds. *Stamens* 15, anther cells somewhat unequal, not contiguous, with a blunt beak at the base, connective flat, tapering to a pointed appendage which is about as long as the anthers. *Ovary* turbinate, puberulous about .08 in. long; style as long as the ovary, somewhat stout, clavate at the apex; stigma 3 toothed. *Fruit* ovoid-globose, .7-1 in. long, brown velvety, supported by thin ovate wings .6 by .4 in.; cotyledons fleshy.

Common in scrubby evergreen forests in all the Districts, excepting the NORTH EAST FRONTIER where it is some-what rare, ascending up to about 3000 ft. Generally very common with a gregarious tendency round swamps.

Wood light brown, compact, with scanty pores and fine medullary rays, but is seldom used except as firewood. It gives excellent charcoal. The clear white resin is used as an incense.

Fls. 4-5. Fr. 7-9.

Vatica Shingkeng, Dunn. Vern. *Shing-keng*, Abor.

A tall tree, glabrous, often gregarious. *Bark* thick, brownish; branches lenticellate. *Leaves* 3.5-7 in. long, alternate, lanceolate, long acuminate or caudate, chartaceous; lateral nerves 6 pairs, ascending; nerve prominent beneath; base rotundate; petiole .24-.4 in. long. *Flowers* not known. *Calyx* outer segments ovate, obtuse, striate, 1-2 in. long; inner .4-.6 in. long. *Fruit* dehiscent very late or not at all dehiscent, 8 in. long, globose, shortly acuminate, seated on the accrescent persistent patent calyx. *Seeds* angular, few.

N. E. F. TRACT (Rengging to Janakmukh).

(Burkill's No. 36254, 36615, 37311 & 37453).

FAM. 22. *ANCISTROCLADACEÆ*.

only Genus.

ANCISTROCLADUS, Wall.

Glabrous scandent shrubs without resin-ducts, branchlets often ending in hooked tendrils. *Leaves* alternate, simple, entire; stipules small, caducous. *Flowers* regular, bisexual, small, in axillary or pseudo-terminal panicles. Calyx-tube ultimately adnate to the ovary, lobes imbricate, unequal, enlarged into wings in fruit. *Petals* 5, contorted, slightly connate at the base. *Stamens* 5-10; filaments short, broad and connate at the base; anthers opening lengthwise, 2-celled. *Ovary* 1-celled; ascending; style thick with three stigmas; ovule solitary. *Fruit* a nut adnate to the tube of the fruiting calyx and surrounded by the wings. *Seeds* globose, with copious albumen, testa often intruding between folds of the embryo; cotyledons folded and enclosing the radicle.

Ancistrocladus Wallichii, Planchon.

A large woody climber, branches thick, angular. *Leaves* crowded at the ends of branches, sessile, 4-16 by 1-3.5 in. oblanceolate, tapering to the sub-auricled base; subcoriaceous, punctate with minute scales on both surfaces, midrib stout, depressed above; lateral nerves rather obscured by reticulations of tertiary nerves a short distance from the midrib. *Flowers* purplish in dichotomously branched, pseudo-terminal panicles shorter than the leaves. *Fruit* pentagonous, turbinate, .4-.3 in. with 5 unequal, veined, glabrous wings 1-2.5 by .15-.8 in. linear oblong to oblanceolate.

SYLHET *De-Silva*, Brandis; Cachar, Brandis, not collected since and there are no specimens at Calcutta from our area.

Fls. 3-4 (7) cold season (Brandis); Fr. 7-9 (7).

Ancistrocladus extensus, Wall? — A strong climber with black stems. *Leaves* up to 17 in by 4 in, oblanceolate, shortly acuminate, tapering to the subauricled base, thinly coriaceous lateral nerves joined by intramarginal veins, obscured by many intermediate tertiary veins prominently reticulated, upper surface punctate with minute scales. *Panicle* repeatedly dichotomous, branches recurved, divaricate. *Wings* unequal, larger, 1.5-1.75 in.

KHASI & JAINTHIA HILLS — elevation about 300 ft

Record based on a leaf specimen which matches with the species in the Calcutta Herbarium

FAM. 23. MALVACEÆ.

Herbs, shrubs or soft wooded trees, young parts mostly covered with stellate hairs; bark with mucilaginous juice and tenacious fibre. *Leaves* alternate, stipulate simple-lobed or digitately compound, usually palminnerved. *Bracteoles* 3 or more, rarely absent, often forming an epicalyx. *Flowers* regular, generally 2-sexual, axillary or terminal, solitary fascicled or cymosely panicle. *Sepals* 5 more or less connate, valvate in bud. *Petals* 5, hypogynous, twistedly imbricate, often adnate to the base of the staminal column. *Stamens* generally indefinite, monadelphous or pentadelphous, anthers 1-celled bursting longitudinally. *Ovary* syncarpous, carpels generally numerous, styles as many as carpels, more or less connate, ovules 1 or more from the inner angle of each cell. *Fruit* capsular or of dry cocci, seeds sometimes with silky tubular hairs (*cotton*) albumen scanty or 0, embryo curved

- I Usually herbs or small shrubs, staminal tube entire or slightly divided at the apex, angled or lobed —
 - A Fruit schizocarpic i.e. ripe carpels separate from the axis —
 - 1 Bracteoles 0 Styles as many as the carpels. Seeds without cotton. Fls usually yellow.
 - Carpels 7-10 1 ovuled .. 1 **Sida**
 - Carpels 5-20 2 or more ovuled .. 2 **Abutilon**
 - 2 Bracteoles usually 5 narrow stigmas spreading, carpels 5 spiny styles 10 flowers red .. 3 **Urena**
 - B Fruit capsular —
 - 1 Stigmas spreading —
 - Ovary 5 celled .. 4 **Hibiscus**
 - 2 Stigmas connate —
 - Bracteoles 3 large leafy persistent seeds cottony .. 5 **Gossypium**
 - Bracteoles 5 small subulate deciduous seeds not cottony .. 6 **Thespesia**
- II Trees, Staminal tube deeply divided into bundles of stamens —
 - 1 Leaves simple lobed Fls less than 1 in diam panicle Bracteoles 4-6 Seeds without cotton .. 7 **Kydia**
 - Leaves digitate Fls 1 in or more in diam, solitary Bracteoles 0 Seeds with cotton. .. 8. **Bombax**.

1. SIDA, Linn.

Herbs or undershrubs. *Leaves* simple, sometimes lobed. *Flowers* yellow, opening at noon; peduncles generally jointed. *Bractëoles* 0. *Calyx* tubular below; segments 5, valvate persistent. *Corolla* of 5 petals, connate below. *Staminal tube* divided above into numerous filaments. *Carpels* 5 or more, separating from the axis in fruit, generally 2-awned at the summit, each with a solitary pendulous ovule dehiscing irregularly and between the awns. *Seeds* solitary.

Leaves linear-lanceolate, acuminate, nearly glabrous, subsessile.

Leaves usually more or less rhomboid, stellately hoary underneath on petioles, .3-7 in. long.

Leaves cordate-oblong, downy on petioles, 1-2 in. long.

1. *S. carpinifolia*

2. *S. rhombifolia*.

3. *S. cordifolia*.

1. *Sida carpinifolia*, Linn. Vern. *Borialu*, Ass. (Darr); *Berela* or *Sret-berela*, Beng.; *Ting-khilou*, Lushai; *Balu-phomijivika*, Sans.

Small undershrub in grass lands. *Leaves* 2-3 in. long, linear lanceolate, acuminate. *Peduncles* short, jointed in the middle. *Carpels* 5-9, rugose, awned.

2. *Sida rhombifolia*, Linn. Incl. *S. rhomboidea*, Roeb. (sp). Vern. *Borialu*, Ass.; *Berela* or *Sret-berela* Beng.; *Soh-byrt-it-rit*, Khasi; *Mahabala*, *Atibala*, *Pitapushpa*, Sans.

A shrub up to 5 ft. in height, very variable in shape and size of leaf and length of peduncle. *Leaves* 5-3 in. long, generally rhomboid, more or less pubescent above, stellately grey-tomentose beneath; base 3-nerved, usually cuneate; sometimes obtusely; petiole about $\frac{1}{3}$ th the length of the blade. *Peduncle* .5-1 in. long, jointed above or below the middle. *Carpels* 10, awns generally inflected, sometimes (Var. *rhomboidea*) almost absent.

3. *Sida cordifolia*, Linn. Vern. *Berela*, *Bala*, Beng.; *Batyalaha*, *Bala*, Sans.

A small undershrub generally found near moist places. *Leaves* 1-2 by .6-1.2 in. oblong, cordate, obtuse, crenate downy on both surfaces; petiole as long as the blade. *Peduncles* jointed near the flower, lower longer than the petioles, upper very short. *Carpels* 10; awns exceeding the calyx and covered with stiff reflexed hairs.

The above three plants are common throughout the province up to about 3000 ft. They flower during the rains or shortly after. Their roots have valuable medicinal properties, and their stems yield a fine white silky fibre much superior to jute and therefore of considerable potential commercial value.

2. ABUTILON, Gaertn.

Abutilon indicum, G. Don. Sans. *Atibala*, *Kankatika*; Vern. *Jhapa*, Ass.; *Tepari* or *Petari*, Beng.; *Sani-kunthon*, Cach.

A perennial herb sometimes up to 8 ft. in height, stem covered with soft velvety tomentum. *Leaves* .5-6 in., nearly as

broad as long, ovate or orbicular-cordate, acute or acuminate, entire or distantly irregularly toothed, stellate pubescent above, finely grey-felted and also with scattered hairs underneath, palmately 5-9 nerved at the base; petiole .3-4 in., felted; stipules small, deflexed. *Flowers* golden-yellow, 1 in. in diam., opening in the evening; calyx-segments ovate-acute, valvate; peduncles 1-3 in. long, 1-flrd., jointed about .25-1 in. below the flower. *Stamens* as in *Sida*. *Fruit* broadly bell-shaped and flat topped; carpels 15-20, separating from the axis, coarsely felted but glabrescent, apiculate at the apex; seeds 1-3 in each carpel.

Occasionally met with in grass lands in NOWGONG, DARRANG & NAGA HILLS.

The leaves give a mucilaginous extract which is used as a demulcent. An infusion is prepared from the roots which is considered good as a cooling remedy in fevers. The seeds are used as a laxative and also as a demulcent. The stem gives a good fibre suitable for ropes.

Several exotic species of *Abutilon* are grown in gardens for their handsome flowers.

Fls. & Fr. 10-2

Malvastrum coromandelianum, Græke, Syn. **M. tricuspidatum**, A. Gray. An erect undershrub or perennial herb upto 3 ft. high covered with stellate hairs the arms of which are adpressed on the undersurface of leaves, petiole and calyx. *Leaves* 7-3 in. long, ovate or ovate-lanceolate, irregularly serrate, 5 nerved at the base, strigose with simple hairs above; petioles upto 1.2 in. long; stipules linear. *Flowers* yellow, solitary, 5-7 in across; bracteoles 3 half the length of the calyx. *Calyx*-lobes triangular cleft nearly half way down. *Petals* exceeding the calyx. *Carpels* 8-12, reniform, separating from a short central torus, indehiscent, strigose, and 3-cuspidate when mature.

An introduced plant now run wild in several districts in LOWER ASSAM in waste lands. A good fibre can be obtained from the stems. Closely resembles a *Sida* from which it can be distinguished by the presence of bracteoles.

3. URENA, Linn.

Urena lobata, Linn. Vern. *Hon-borokua*, Ass. (Sib-); *Sokamara*, Ass. (Darr); *Agra*, Ass. (Kamrup); *Tangom*, Miri; *Nonth-arony*, Mik.; *Sam-thai*, Mech; *Sompok-pi*, Manipuri; *Samthai*, *Samkhonthai*, Cach.; *Dalle-kurro*, Nep.; *Samthe*, *Samthakhar*, Garo; *Bagh-ehhaka*, Jharua and Mech; *Soh-byrthit*, *Soh-byrthit*, Kh.

An undershrub up to 5 ft. in height; more or less covered all over with spreading stellate pubescence. *Leaves* very variable in shape and size, .5-3 by .3-1 in., ovate to broadly cordate-orbicular, generally broader than long, persistent, 5-7 lobed, 5-9 nerved at the base, coarsely toothed or serrate, somewhat hispidly pubescent above but softly and more densely beneath; midrib and sometimes two adjacent nerves with a glandular pore; petiole 2-2.2 in. long; stipules short, linear, both densely brown stellate pubescent. *Flowers* pink, with a darker centre, .6-1.2 in. across; one or more on axillary peduncles; pedicels short, clustered; bracteoles 5, connate below; lobes equalling the calyx. *Calyx* deciduous, tube short, lobes up to .2 in. long, ovate to oblong-lanceolate, ciliate, pubescent on the midrib outside, glabrous within. *Petals* 5, tomentose outside, connate below and adnate to the staminal tube. *Staminal-tube* cylindric. *Ovary* 5-celled, each

with one ovule; style with 10 capitate stigmatic branches; ripe carpels about .2 in. long, indehiscent, breaking off from the axis, densely tomentose as well as armed with stellately barbed bristles.

A common weed throughout this part of the province.

The root and bark have medicinal properties and the stem gives a strong white fibre suitable for twine and sacking.

Flrs. & Fr. 6-12.

4. HIBISCUS, Medik.

Herbs or shrubs or trees generally with large showy flowers. *Leaves* rounded or palmately lobed. *Inflorescence* generally axillary. *Bracteoles* 5 or more, free, connate, or spathaceous. *Calyx* 5 toothed or 5 fid, sometimes spathaceous. *Petals* 5, adnate at the base with the staminal tube. *Staminal-tube* giving off anther-bearing filaments along its entire length; anthers reniform, 1-celled. *Ovary* usually 5-celled; styles 5, connate below, spreading above. *Fruit* capsular; seeds glabrous or hairy.

- | | |
|--|-----------------------------|
| I. A small tree. Bracteoles many, deciduous; seeds bearded with long silky hairs. | 1. <i>H. macrophyllus</i> . |
| II. A large climbing shrub. Bracteoles 5, persistent; seeds covered with long white hairs. | 2. <i>H. fragrans</i> . |
| III. Annuals or undershrubs:— | |
| A. Bracteoles not provided with leafy appendages nor forked:— | |
| Bracteoles numerous, deciduous. | <i>H. Trionum</i> . |

1. *Hibiscus macrophyllus*, Roxl. Vern. *Pohu-udat*, Ass. (Sibs.); *Pharna*, Mik.; *Misi-mugrong-buphang*, Kach.; *Baiza*, Lushai; *Jabo*, Tipp., *Chamia*, Sylh. and Cachar; *Mao-marli*, Ass. (Garo); *Kong-Krouai*, Kuki; *Tylen-dkhar*, Khasi.

A small deciduous tree; young shoots, petioles, stipules and inflorescence shaggy with long tufted yellowish brown bristles, up to .4 in. long and stellate tomentum. *Bark* greyish white, somewhat rough on old stems, blaze at first yellowish-brown with streaks of brown tissue, turning darker brown after exposure. *Leaves* 7-12 in. across, orbicular, deeply cordate, abruptly short acuminate, entire or minutely crenulate on luxuriant shoots, thinly coriaceous, intricately stellate, tomentose on both surfaces especially the lower, palmately 7-9 nerved, turning yellow before falling; petiole 9-14 in. long; stipules 3-4 by .8-1 in., oblong, convolute. *Flowers* about 2.5-4 in. long, and across, in axillary and terminal cymes, each supported by a pair of large—up to 2.3 in. long—spathaceous caducous bracts; pedicels 1.5-2 in. long, jointed. *Bracteoles* 10-12, linear, 1-1.2 in. long, connate at the base. *Sepals* 5, connate below into a 10-ribbed cup. *Petals* 5,

imbricate, pale yellow* fading* to pinkish brown, with a deep purple blotch at the base inside. *Staminal* column yellow. *Styles* deep purple. *Capsule* about 1.5 by 1 in., oblong, pointed; seeds bearded with shining tawny hairs.

In open scrubs in the Mikir Hills, SIBSAGAR and NOWGONG, CACHAR, GAROHILLS, and foot of KHASI & JAINTHIA HILLS, NAGA HILLS and SYLHET.

The heartwood is light purplish-brown, even-grained, soft but durable, weighing about 35 lbs. per c. ft. It is much used for rafters, posts and sill plates, especially in the Garo Hills. The inner layers of bark give fibre suitable for cordage.

Fls. 3-4. Fr. 5-6

2. *Hibiscus fragrans*, Roxb. Vern. *Pichhola-lata*, Ass. (Lakh.); *Susang-rube*, Miri; *Nrok-pen*, Naga.

A large scandent shrub spreading on tall trees especially near streams. *Bark* on old stems with short vertical furrows; young parts and petioles minutely but closely stellate tomentose. *Leaves* 2.5 by 3.5-1.5 in., those near flowers much smaller, ovate, cordate, acute, distantly dentate or repand, at first stellately hispidulous above, buff-tomentose beneath, ultimately glabrescent, chartaceous, palmately 5-7 nerved; petiole usually rather more than half the length of the blade, slender, terete; stipules linear-lanceolate, about .7 in. long, caducous. *Flowers* white or light rosy-pink with a pale yellow centre, fragrant, 1.5-2.5 in. across; pedicels axillary generally 1-3 together, rarely panicle, 1.5-2.5 in. long, slightly thinner than the petioles, tomentose, jointed, .3-.8 in. below the flower. *Bracteoles* 5, .4-.6 in. long, ovate, connate below forming a broad shallow cup, persistent. *Calyx* lobes similar to bracteoles but a little larger. *Petals* finely longitudinally veined, .6-1 in. long, stellate pubescent outside. *Filaments* very slender, purplish. *Capsules* 1.4 by .8 in. ovoid, tan-hairy outside; seeds reniform, about 1 in. long, rugose, covered with radiating fine straight white or brown hairs, .6-.8 in. long.

Common throughout UPPER ASSAM including the E. FRONTIER DISTRICT ascending up to about 1000 ft.

Fls. 12-1. Fr. 1-3.

***Hibiscus Trionum*, Linn.**—A pubescent herb 4-5 ft. high growing annually from carrot like roots. *Lower leaves* orbicular, upper 3-5 lobed. It has large yellow flowers membranous ventricose deciduous calyx and numerous linear deciduous bracteoles. *Capsule* 1-1.5 in. long, hirsute; seeds glabrous.

Found in grass lands in NOWGONG.

Fls. 9-10. Fr. 11-12.

Not previously reported from this province,

***Hibiscus Abelmoschus*, Linn.** Eng. Musk-mallow. Sans. *Latakasturika*; Ar. *Habbel-mishk*, *Gorukhia-korai* (Sibs) Ass.; *Twmq-la-rit*, Khasi. A very variable hispid annual 3-5 ft. high. *Leaves* polymorphic palmate, 5-7 lobed or upper sagittate, 3.7 in. long, petiole with long deflexed hairs, shorter in upper leaves. *Flowers* about 4 in. across, yellow with purple centre on stout peduncles; bracteoles linear, 6-13, up to 1 in. long, much shorter than the capsule not accrescent; calyx spathaceous. *Capsule*, 1.7-3 in. long, beaked, sparsely setose; seeds reniform, striate.

Cultivated in many parts of India. Recorded from grass lands in SIBSAGAR; KHASI HILLS up to 3000 ft-probably also in many other localities in UPPER ASSAM.

The seeds when rubbed or ground have the smell of musk and are used in perfumery on account of this odorous principle. They are also used largely in Indian medicine. Coarse fibre suitable for cordage can be obtained out of the stem.

Flrs. 9-10. Fr. 10-11.

Hibiscus pungens Roxb. Vern. *Usipak*, *Usipag*. Miri : *Sidum-sipiag*, Abor : *Nam-afian-arong*, Mik. ; *Kakura*, Sylh. ; *Musa-megon*, Mech. ; *Tiew-malloi*, Khasi.—A bristly herb up to 12 ft. in height. *Leaves* 6-12 in. across, palmately 5-lobed ; lobes crenate ; petiole 5-10 in. long. *Flowers* 4-5 in. across, yellow with a purple centre on peduncles 2-3 in. long ; bracteoles 5, lanceolate up to 1·2 in. long, accrescent ; calyx spathaceous, membranous. *Capsule* 2 in. long, tapering to a point.

Fairly common in grass lands especially in the N. E. FRONTIER DISTRICT, ascending up to 3000 ft.

The paste of the roots is used by Miris as a poultice for sprains and inflammations.

Flowers 9-10 Fr. 10-11

Hibiscus surattensis, Linn. Vern. *Hansrong*, Mik. ; —A sorrel-like trailing acid plant covered with sharp recurved prickles. *Leaves* 1·5-3 in. across, palmately 3-5 lobed or suborbicular, crenate-serrate, prickly along the nerves beneath ; petiole 1·5-4 in. long, prickly ; stipules broad, ear-shaped, ciliate. *Flowers* light yellow with a dark centre on peduncles up to 3 in. long. *Bracteoles* about 10, persistent, 5-6 in. long, consisting of a bristly stalk supporting a peltately leafy, spatulate, ciliate blade with a linear caudate basal appendage 2·5-4 in. long. *Calyx* 5 cleft, accrescent in fruit, chartaceous generally pink, lobes ovate acuminate with bristle-topped prickles along the margins and midrib, upper prickles hooked. *Capsul* covered with bristle-like, shining, white or yellow hairs, seeds downy.

Diphu reserve, SIBSAGAR and similar localities round the Mikir Hills, GARO HILLS.

The Mikirs use the leaves and twigs as greens.

Flrs. & Fr. 10-11.

Hibiscus radiatus, Willd. —An undershrub armed with short scattered prickles. *Leaves* 1·5-3 by 1·5-2 in., usually palmately 3-5 lobed, lobes lanceolate or oblanceolate, serrate with few scattered bristles along the nerves beneath ; petiole up to 3 in. slightly prickly, more or less pubescent ; stipules linear up to 2·5 in. long. *Flowers* yellow with purple centre about 2·5 in. across, solitary on short stout axillary peduncles. *Bracteoles* 4-6 in., about 10, often unequally forked, bristly along the margins. *Calyx* membranous accrescent in fruit, lobes ovate acuminate, 5-7 in. long, armed with bristle pointed prickles on the margins, upper prickles hooked. *Corolla* 2·5 in. long, bell-shaped. *Capsules* ovoid, densely setose ; seeds smooth.

KHASI HILLS, Hooker & Thomson ; ASSAM without any locality—Fisher (!).

The following species are commonly cultivated :—

1. **H. esculentus**, Linn. Ochra, The edible Hibiscus, Lady's finger, Vern. *Dheros*, *Bhind*, Beng., *Bhindi*, Hind., *Bhendi*, Ass., *Tindisa*, Sans.—A tall annual with coarsely toothed 3-5 lobed leaves, deciduous linear bracteoles, yellow flowers with a crimson centre and pyramidal oblong pubescent fruits 5-10 in. long.

Largely grown for the unripe fruits which are in season during the later part of summer and the rains.

2. **Hibiscus mutabilis**, L. Vern. *Shfalpatma*, Beng.—A large shrub or a small tree with fairly large deeply cordate 3-5 lobed leaves, white or light rose, single or double flowers, 3-5 in. across which change to deep rose or red, and globose capsules.

3. *H. Rosa-sinensis*, Linn. Common garden Hibiscus, Chinese Shoe-flower. Vern. *Joba* (Ass. & Beng.), *Japa*, *Java*, *Jans*.—An ornamental shrub. *Leaves* up to 4 in. long, ovate acuminate, coarsely serrate, glabrous or nearly so, base 3 nerved. *Flowers* single and double ranging from orange yellow to salmon and crimson from the upper axils with linear lanceolate bracteoles. *Fruits* not formed in our area.

Flowers almost throughout the year in warmer districts but mainly from April to October.

4. *H. syriacus*, Linn.—A taller shrub than the last often with erect slender branches. *Leaves* ovate or sub-rhomboid, upper more or less 3-lobed, toothed, nearly glabrous, up to 2 in. long. *Flowers* white or light pink to lilac blue with a purplish centre.

Common, frost hardy and grown more commonly in hills than the last species.

5. *H. schizopetalus*, Hk. f. *Leaves* narrow, ovate, coarsely toothed, usually 1.5-3 in. long. *Flowers* red or orange. *Calyx* spathaceous. *Petals* deeply lacinate and reflexed, staminal column long, slender, pendulous. Cultivated in gardens in the plains; flowers in hot and rainy season. A native of Africa.

5. GOSSYPIUM, Linn.

This genus differs from *Hibiscus* by having 3 large leafy cordate bracteoles which with the calyx are sprinkled with black glandular dots and by the seeds being covered with intricate woolly hairs which is the cotton of commerce.

Gossypium herbaceum, Linn. Vern. *Kopafi* Ass., is cultivated by the hill-tribes of Assam e.g. the Mikirs, Nagas, Kukis, Daflas and Garos. *Leaves* 3-5 lobed, nearly glabrous; stipules ovate or lanceolate. *Bracteoles* as long as the capsule and much exceeding the truncate calyx. *Flowers* yellow, generally with a purple centre. *Capsule* ovoid, 3-5 celled with 5-7 seeds in each cell, pendulous when open, presenting a striking appearance with the hanging balls of white cotton.

Fls. 8-9. Fr. 10-11.

6. THESPESIA, Soland ex Corr.

Thespesia macrophylla, Blume. Syn. *T. Lampas*, Dalx. et Gibs. An undershrub up to 5 ft. high; young parts rusty pubescent. *Leaves* 3.5-8 by 3-6 in., palmately 3-6 lobed, lobes usually acuminate, middle largest, upper smaller, rough pubescent or glabrate above, softly stellate tomentose beneath, both surfaces with raised dots, midrib with a glandular pore near the base on the under-surface; base usually 7-nerved; petiole up to 4 in. long; stipules subulate, caducous. *Flowers* 3-4 in. across, yellow with crimson centre, 1-3 on axillary peduncles up to 5 in. long; pedicels .3-.5 in. *Bracteoles* 5-8, setaceous, caducous. *Calyx* persistent, small, cupular, with 5 subulate teeth up to .3 in. long, from a truncate margin. *Corolla* lobes convolute, staminal tube 5 toothed at the apex. *Ovary* usually 5 celled; style club-shaped, 5 furrowed; ovules few in each cell of ovary. *Capsule* 1 in. long, ovoid, pointed, 5 celled, loculicidal; seeds smooth.

GOALPARA, NAGA HILLS, probably also in other areas.

Perennial or flowering shoots die down to the root?

Fls. 8-10. Fr. 10-12.

7. KYDIA, Roxb.

Trees with stellate pubescence and mucilaginous bark. *Leaves* palmately nerved, lobed or angled; 1-3 of the innermost nerves with a large oblong gland near the base. *Flowers* small, numerous, polygamous, in terminal panicles; bracteoles 4-6, connate at the base, accrescent and spreading in fruit. *Sepals* 5, valvate, connate at the base. *Petals* 5, obcordate, adnate to the staminal tube. *Staminal-tube* split half-way down into 5 segments each bearing at the apex 3-5 sessile anthers, which are imperfect in the female flowers. *Ovary* 2-3 celled; style 3-cleft; stigmas 3, imperfect in the male flowers; ovules 2 in each cell, ascending. *Capsule* depressed-globose, 3-valved; seeds reniform, furrowed.

Leaves downy beneath; bracteoles oblong or obovate, downy or hispid.

.. 1. *K. calycina*.

Leaves glabrate; bracteoles oblanceolate, glabrous, shining.

.. 2. *K. glabrescens*.

1. *Kydia calycina*, Roxb. Vern. *Pichhola*, Ass. (Sibs); *Bon-kopah*, *Bon-kopahi*, *Kukuha*, Ass. (Nowg.); *Kukuha*, Ass. (Darr.); *Arlak-arong*, *Arlakso-arong*, *Pakrak*, *Star-misiri-arong*, Mik., *Modon-phang*, Kach.; *Jabri-changne* Daff.; *Heppaching*, Naga; *Kubinde*, Nep. *Musamugon-buphang*, Mech; *Boldubak*, Garo; *Chakle*, Jharua; *Wok-thing-thel*, Kuki; *Kotru*, Ass. (Kamrup); *Dieng-misiri*, *Dieng-lainnep*, Khasi.

A moderate-sized fast-growing deciduous tree with a gregarious tendency; young parts covered with grey stellate hairs. *Bark* grey, exfoliating in long strips, reddish inside, green underneath the corky layer, innermost layers fibrous and lace-like; branches rough with large white specks. *Leaves* 3-6·5 in. long, suborbicular or orbicular, often broader than long, palmately 5-7 nerved and generally with as many lobes; base slightly cordate or truncate, glabrate above, downy and pale beneath; petiole 1-4·2 in. long. *Flowers* generally white, 5-7 in. across, numerous, polygamous, generally dioecious, in much branched axillary and terminal panicles; pedicels slender, 5-7 in. long, generally tufted, stellate-downy; bracteoles 4-6, oblong or obovate, accrescent, persistent, downy at first, afterwards hispid with the bases of fallen hairs, prominently veined and spreading. *Sepals* ovate, acute, accrescent and incurved over the fruit. *Petals* clawed. *Capsule* depressed-globose, about 2 in. across, buff or yellow-villous.

Mostly in patches of deciduous forests in SIBSAGAR, DARRANG and almost throughout NOWGONG, e. g. Nichuguard, Kalioni, Kaziranga, Bhalukpong, Charduar, Silghat, Lanka, Dimapur etc.; LAKHIMPUR, GARO HILLS, N. E. FRONTIER, KHASI HILLS, KAMRUP, GOALPARA, North Cachar Hills, NAGA HILLS.

The wood may be found suitable for matches. The fibrous inner bark is used for tying purposes. The mucilaginous substance of the bark is used in Northern India for the clarification of sugar. About 900 seeds weigh 1 oz.

2. *Kydia glabrescens*, Mast. Vern. *Subi-asing*, Miri. *Kukuha*, Ass. (Darr.). This tree looks so very much like the foregoing

species that where they occur together the same vernacular names are applied indiscriminately to both.

A tall tree up to about 100 ft. in height and 7 ft. in girth; branchlets nearly glabrous. *Bark* grey outside, scurfy on old stems, cream-coloured inside with reticulating strands of firmer tissue which is reddish on old trees, green underneath the corky layers, 5-8 in. thick. *Leaves* 3-4.5 in. diam., orbicular, rather broader than long, those below the inflorescence much smaller and generally elliptical, 5-7 nerved at the base, not or very slightly lobed at the extremities of the three innermost nerves, chartaceous, glabrous at least when mature, tertiary and ultimate nervules visible but extremely fine and elegantly reticulated. Old leaves turn yellow before falling. *Panicles* terminal and axillary; pedicels fascicled, 5-7 in. long, filiform, obscurely stellate-hirsute; bracteoles 4-6, but generally 4 only, 4-6 by 1-1.5 in., oblanceolate, glabrous, shining, spreading in fruit. *Sepals* glabrous, nerved. *Petals* not seen. *Capsule* as in the last species.

Sadiya, Khairempani, Dorkang Chapuri, Songkong, etc., N. E. FRONTIER DISTRICT; Margherita, Borjan, Jeypur, Gagaldubi, etc., LAKHIMPUR, Dilli, Baruasali, Holongapar, etc., SIBSAGAR and in the Charduar Reserve in DARRANG. Probably never wholly leafless.

Squirrels and bears seem to be fond of the bark.

Figs. 8-9. Fr. 11-12.

8. BOMBAX, Linn.

Deciduous tree. *Leaves* digitate. *Flowers* solitary or clustered, congregated at the ends of branchlets appearing before the leaves; bracteoles 0. *Calyx* leathery, cupshaped, irregularly 2-5 lobed or truncate. *Petals* obovate or oblong. *Stamens* indefinite, adnate to the petals; filaments often combined; anthers reniform. *Ovary* 5-celled; ovules many in each cell; style clavate. *Capsule* loculicidally 5-valved, cells woolly within. *Seeds* imbedded in dense wool; albumen scanty.

Filaments flattened at the base, stamens less than 100.

Filaments thread-like, stamens more than 400.

.. 1. *B. malabaricum*.

.. 2. *B. insignis*.

1. *Bombax malabaricum*, DC. The silk cotton tree. Sans. *Shalmali*. Vern. *Simal*, *Simul*, Hind. & Beng., *Simolu*, *Himolu*, *Himila*, Ass.; *Singi-asing*, *Miri*; *Pharkong-arong*, Mik.; *Bonju-phang*, *Ponju-phang*, Kach.; *Hebui-bang*, *Naga*; *Dieng-Kymphad*, *Dieng-syr-ah*, *Khasi*, *Dieng-kya-Synt.*; *Phunchong*, *An-pung*, *Kuki*, *Simla*, *Mech.*, *Bolehhu*, *Garó*.

A lofty deciduous tree; stem continuous and straight, more or less buttressed at the base when old, covered with large conical prickles when young; branches whorled, horizontally spreading. *Bark* dark-brown or grey smooth on young trees but vertically fissured and rough on old trees, blaze light pinkish white, soft and fleshy with coarse strands of bast, green underneath the corky layer. *Leaves* digitate; common petiole 6-12 in. long. *Leaflets* 5-7; 6-9 by 3-5 in., lanceolate oblanceolate or obovate, acuminate, entire, chartaceous or coriaceous, glabrous; petioles 1 in. long;

stipules small, caducous. *Flowers* 4-5 in. across, fleshy, near the ends of the branches on short fleshy pedicels. *Calyx* very fleshy, cup-shaped, white-silky inside, slightly lobed at the margin, deciduous. *Petals* crimson or orange, rarely white, 3-6 by 1-2 in., recurved, white-stellate canescent outside. *Stamens* shorter than the petals, arranged in 5 bundles and an inner bundle of 15, of which the 5 innermost are longest and forked; filaments 70-90, deep pink, sparingly covered with spreading hairs, flattened at the base; anthers twisted after dehiscence. *Style* 5, lobed at the apex, exceeding the stamens. *Capsule* 5-7 in. long, oblong-ovoid, woody, 5-angled. *Seeds* obovate, glabrous and smooth, embedded in silky wool.

Gregarious on river-flats but occurs sporadically in all sorts of forests throughout the province, more generally along open streams.

The wood is porous, soft and perishable, but durable under water or when seasoned in water; weight 17-30 lbs. per c. ft. It is pre-eminently the favourite tree for tea boxes, and is very suitable for well curbs, water-shoots etc. The cotton is used in upholstery and to stuff pillows and cushions. The seed is a nourishing food for cattle which also eat the flowers greedily. The roots of saplings are believed to possess valuable medicinal properties, as also the gum which sells in the bazars of N. India under the name of *mochras*. About 750-900 seeds weigh 1 oz.

Leafless 12-3. Fls. 1-3. Fr. 4-5.

2. Bombax insigne, Wall. Vern. *Dhumbhoil*, Cachar; *Tera*, Manipur; *pang*, Lush.; *Anphang-thing*, Kuki.

A Moderate sized to large tree with blunt prickles or unarmed. *Bark* fibrous exfoliating in numerous thin papery flakes, brownish grey outside on young stems but blackish brown on old trees, flesh coloured underneath the corky layers, light brown inside. *Petioles* 7-8 in. long; leaflets 7-9; 4.5-6.5 in. by 1.3-2 in., oblanceolate, or obovate shortly acuminate, glabrous, lateral nerves 15-18 pairs on either half, nervules finely reticulate, base narrowed to the short margined petiolule .2-.5 in. long. *Flowers* usually brick-red, solitary, scattered on the leafless branches, pedicels stout, short, jointed at the top. *Calyx* up to 2 in. by 1.5 in. across, silky inside, often warty outside, 2-lobed or finally deeply 2 cleft. *Petals* 5-6 in. by 1.5 in., reflexed when fully opened, stellate pubescent outside. *Stamens* in 5 phlanges, staminal tube short, filaments 400-600, filiform, shorter than the corolla. *Stigma* with 5 radiating lobes. *Capsule* 5-7 in. by 1.5 in., oblong, glabrous.

Not common. CACHAR, LUSHAI HILLS, SYLHET.

Wood similar to that of *B. malabaricum* but more durable and the pores are smaller. About 330-570 seeds weigh 1 oz.

Fls. 12-1. Fr. hot season.

Eriodendron anfractuosum, DC. The white silk cotton tree. A tall deciduous tree with prickly stem when young. *Leaves* digitate, petioles 4-6 in. long, stipules caducous; leaflets 5-8, 2-3 in. long, lanceolate, entire, glabrous, glaucous beneath, petiolules very short. *Flowers* 1.5-2 in. across, white or yellowish at the ends of the branches; bracteoles 0. *Petals* woolly outside; ovary glabrous. *Capsule* 4-5 in. long, fusiform; seeds imbedded in silky wool.

Planted occasionally in the plains e.g. SIBSAGAR, native of S. AMERICA, WEST INDIES, CEYLON

The floss from the capsules commercially known as *kapok* is of better quality than that of *Bombax malabaricum* and is used for the same purposes.

FAM. 24. STERCULIACEÆ.

Trees or shrubs, rarely climbing; young parts usually covered with stellate pubescence, often inter-mixed with simple hairs. *Bark* mucilaginous and with strong-fibre. *Leaves* alternate, simple and lobed or digitate, stipulate. *Flowers* generally regular, 1 or 2-sexual or polygamous, in axillary or terminal cymes or panicles, rarely solitary or fascicled. *Calyx* usually gamosepalous; segments 5. *Petals* 5 or 0. *Stamens* usually monadelphous with 5 to 25 2-celled anthers. *Ovary* stipitate or sessile, free, 2-5 celled; carpels free or combined; styles as many as cells in the ovary, distinct or more or less connate; ovules usually 2-many in each carpel. *Fruit* capsular, indehiscent or follicular. *Seeds* not wooly.

1. Flowers unisexual or polygamous. Carpels distinct. Petals none. Trees :—
 - Fruit carpels whorled, dehiscent. ... 1. *Sterculia*.
 - Fruit carpels solitary, indehiscent. ... 2. *Heritiera*.
- II. Flowers bisexual. Carpels combined. Petals present :—
 - A. Erect shrubs or trees; capsule not echinate.
 1. Seeds not winged. Shrubs; leaves palmately lobed or angled :—
 - Capsule cylindric, coriaceous. ... *Helicteres*.
 - Capsule turbinate, membranous. ... 3. *Abroma*.
 2. Seeds winged. Trees; leaves entire, lobed or coarsely toothed :—
 - Flowers solitary or in few-flowered cymes, usually large; staminal column with 5 staminodes. ... 4. *Pterospermum*.
 - Flowers in many flowered corymbose panicles; rather small. Staminodes 0. ... 5. *Reevesia*.
 - B. A climber :—
 - Seeds not winged. Flowers minute; capsule more or less echinate. ... 6. *Buettneria*.

1. STERCULIA, Linn.

Trees with simple, often lobed, or digitate leaves. *Flowers* polygamous in terminal or axillary panicles. *Calyx* tubular, generally coloured. *Petals* 0. Staminal column bearing at the apex a ring of sessile anthers. *Ovary* of 5 carpels; styles connate at the base; stigmas radiating. *Fruit* of radiating follicles.

woody or membranous, generally opening before ripening. *Seeds* one or more in each carpel, albuminous, sometimes winged or arillate.

- I. Leaves digitate. Flowers small. Follicles coriaceous. .. 1. *S. versicolor*.
- II. Leaves simple, palmately lobed. Calyx-segments shorter than the tube :—
 - Flowers small in long panicles. Follicles coriaceous. .. 2. *S. villosa*.
 - Flowers fairly large in short stiff panicles. Follicles papery. .. 3. *S. colorata*.
- III. Leaves simple, usually not lobed. Calyx segments many times longer than the tube :—
 - A. Seeds 4-8 in each follicle, not winged :—
 1. Leaves tomentose beneath. Pedicels up to 3 in. long. .. 4. *S. guttata*.
 2. Leaves wholly glabrous. Pedicels up to 1 in. long, capillary :—
 - Leaves rounded at base. Racemes short, erect. Calyx-segments never cohering at the tips. Follicles pink, downy. .. 5. *S. Roxburghii*.
 - Leaves tapering at base. Panicles long, drooping. Calyx segments often cohering at the tips. Follicles crimson, velvety. .. 6. *S. coccinea*.
 - B. Seeds numerous, prominently winged :—
 Calyx-segments scarcely exceeding the tube. Leaves cordate, wholly glabrous. .. 7. *S. alata*.

1. *Sterculia versicolor*, Wall. Vern. *Durong-phang*, Kach. ; *Khai-pang-thing*, Kuki ; *Star-um*, Khasi.

A lofty tree with a long straight bole and spreading crown ; branchlets thick with a large pith and marked with prominent scars of fallen leaves and stipules. *Bark* grey or cinnamon-brown and with many horizontal wrinkles outside, exfoliating in papery flakes, inside white with reticulating thin strands of white fibrous tissue, the outer edge of blaze mottled brown, the rest with concentric layers of bast, .6-.75 in. thick. *Leaves* digitate ; petiole 10-18 in. long ; leaflets 7-9, 6-11 by 2-4 in., elliptic, lanceolate or oblanceolate, very shortly petioluled, quite entire, subcoriaceous, glabrous above, puberulous or glabrescent beneath, lateral nerves 28-32 on either half, oblique, straight or slightly arched ; tertiaries subparallel, transverse to the secondaries, about .06 in. apart ; ultimate nervules very closely though obscurely reticulated. *Panicles* 10-14 in. long, 8-12 crowded at extremities of branches above the current year's leaves ; flower-buds globose, .05-.08 in. diam., buff tomentose. *Flowers* pale yellow, 2-2.5 in. long, very shortly pedicelled. *Calyx* campanulate ; segments oblong, inflexed, shorter than the tube. *Staminal column* curved. *Ovary* 5-lobed, buff-villous. *Follicles* 5-6, 3-3.5 by 1.5 in., slightly compressed, coriaceous, obscurely ribbed, covered with dark brown urticating brittle hairs. *Seeds* up to 10 in each follicle, .6 by .3 in., oblong, with a jet-black shining aril and a knob at the hilum.

At the foot of the NAGA HILLS near Nichuguard, Naojan, SIBSAGAR, N. CACHAR HILLS, KHASI HILLS up to about 2500 ft.
The seeds are eaten roasted.

2. *Sterculia villosa*, Roxb. Vern. Udal, Odal, Odla, Ass. ; *Sergok-asing*, Miri & Abor. ; *Chekong* or *Chikong-arong*, Jinje-kong, *Theng-chi-kong-long*, *Kongkulu*, Mik., *Dukhundu-phang*, *Tekundu-phang*, Cach. *Heppuk-bang*, Naga ; *Udal*, Sylh., Cach. and Daff. ; *Ubak*, *Upak*, *Umak*, Garo ; *Dieng-star*, *Tluh*, Khasi ; *Odal*, Mech ; *Ruija*, Kuki ; *Japui-kung*, Tipp.

A moderate-sized deciduous tree with a spreading crown and a gregarious tendency ; branchlets thick, with large heart-shaped scars of fallen leaves, more or less whorled on young trees. *Bark* grey, more or less smooth, 1 in. thick ; inside light red, fibrous. *Young* shoots, petiole, and inflorescence brown tomentose with stellate and spreading hairs inter-mixed. *Leaves* crowded at the ends of branchlets, simple, but deeply 5-7 lobed, deeply cordate, 10-18 in. across, light red when very young ; lobes oblong or ovate, acuminate, with entire distantly toothed or lobed margins, glabrescent or covered with scattered stellate hairs above, tomentose beneath ; petiole 10-16 in. long, minutely tomentose ; stipules lanceolate, acuminate, caducous. *Flowers* dun-yellow, '25 in. across, in crowded drooping panicles 9-12 in. long from the ends of shoots, males more numerous than females ; pedicels slender. *Ovary* campanulate, membranous, stellate-pubescent outside, lobes short, acute, erect. *Male fls.*-Staminal column with 10 anthers. *Female fls.*-*Gynophore* about '2 in. long. *Ovary* globose, stellately hairy, staminodes in a ring beneath the ovary. *Follicles* 2-5, sessile, 2-3.5 by 1-1.2 in., reddish-brown and tomentose outside, scarlet and shining inside. *Seeds* '3 by .25 in. oblong, oily, with a shining black aril.

Common in deciduous forests throughout ASSAM, especially on gravel beds of hill-streams ascending to about 2500 ft. ; often tending to become gregarious.

Wood soft, light and open-grained, weighing about 20 lbs. per c. ft. It can be used for tea-boxes. The inner bark yields a coarse strong fibre which is made into ropes or breast-bands for elephants for dragging timber. The seeds are eaten baked or roasted. The tree exudes a clear white gum which in other parts of India is used medicinally especially in veterinary practice. About 110-120 seeds weigh 1 oz.

Leafless 12-4. New leaves 4-5. Fls. 3-4. Fr. 4-6.

3. *Sterculia colorata*, Roxb. Vern. *Jhari-udal*, *Jari-udal*, *Kath-udal*, Ass. ; *Sangkru-arong*, Mik. ; *Bohog-odla*, Mech ; *Bol-ujun*, *Chengsu*, *Walgem*, Garo ; *Dieng-symphlor*, *Dieng-Sangkhlor*, Kh.

A spreading deciduous tree up to about 40 ft. in height and 5 ft. in girth, usually precocious ; branchlets stiff but not very thick, glabrous. *Bark* about 2 in. thick on mature trees, dark-grey outside, white with bands of soft granular tissue alternating with strands of fibrous porous tissue inside. *Leaves* 4-10 in. long and as broad or slightly broader, very variable, usually deeply 3-5 lobed with caudate-acuminate lobes on saplings, slightly lobed or not lobed at all on mature trees, palmately 5-7 nerved, chartaceous, glabrescent on both surfaces ; ultimate nervules very closely reticulate ; base generally deeply cordate, especially on saplings ; petiole about as long as the blade or

slightly shorter; stipules caducous, lanceolate. *Flowers* about .7 in. long, solitary or in fascicles of 2-3 in short erect panicles from axils of fallen leaves, both densely covered with orange red stellate tomentum. *Calyx* funnel-shaped, lobes short, acute or obtuse, tube long, persistent in fruit, ultimately purplish outside, yellowish stellate tomentose within, with a ring of tufted hairs towards the base. HERMAPHRODITE FLRS.—*AntHERS* 20-30, sessile on a long gonophore, which is ultimately exerted by .25-.3 in. beyond the calyx, surrounding the 5 very small flask shaped carpels; styles recurved. MALE FLRS.—*Staminal* column about .2 in. long, carpels of pistillode smaller than those of hermaphrodite flrs. *Follicles* 2-3 in. long, stipitate, membranous, glabrous, pink outside, green inside, venose, opening long before maturity. *Seeds* 2-3 in each follicle, about .3 in. by .25 in., ovoid smooth, light green.

KHASI AND JAINTHIA HILLS, GARO HILLS, NORTH CACHAR HILLS, GOALPARA, NAGA HILLS.

Leafless 12-4. Flrs. 2-3. Fr. 3-5.

4. *Sterculia guttata*, Roxb. Vern. *Hirikh*, Ass.

A large evergreen tree with a simple stem and oval crown; young parts and inflorescence rusty stellate tomentose. *Bark* dark-brown, rough with warts outside, much cracked on old trees, fibrous, white mottled with brown, quickly turning uniformly brown inside. *Leaves* simple, not lobed, ovate elliptic or obovate acute or abruptly short acuminate, 6-10 by 3.5-6 in., entire, subcoriaceous, glabrescent and rugulose above, rusty tomentose beneath, often somewhat inequilateral, turning yellow before falling; lateral nerves 10-14 on either half, with midrib very prominent beneath, tertiaries subparallel, transverse to the secondary nerves, quaternaries reticulate; base rounded or slightly cordate; petiole 1.5-2.5 in. long, stout, slightly swollen and geniculate, caducous. *Flowers* pale; chiefly male, .5-.6 in. long, in narrow racemiform panicles; buds lanceolate or spindle-shaped; pedicels .2-.3 in. long, rusty hairy; bracts lanceolate, .3-.5 in. long. *Calyx* deeply 5-partite; segments .3-.5 in. long, narrow-lanceolate, rusty tomentose outside, glandular and with scattered long hairs inside, sometimes cohering at the tips; tube very short. MALE FLRS.—*Staminal* column .3 in. long, slender, curved; anthers 10-15, very small, sessile. HERMAPHRODITE FLRS. (functionally female?). *Gonophore* stout. *Ovary* surmounting the ring of anthers, globose, woolly, 3-5 lobed; styles curved. *Follicles* red, 1-5; 3-5 by 1.3-1.7 in., coriaceous, compressed, tomentose outside, smooth and pink inside. *Seeds* 3-4 in each follicle, ellipsoid, .8 by .6 in., black, smooth; albumen oily; cotyledons elliptic.

Digboi, Borjan, Dulong Reserve and similar other places in the LAKHIMPUR DISTRICT.

The seeds are eaten roasted. In the Malabar coast a kind of coarse rug is made by beating and washing the inner bark which is opened and taken off whole in lengths of 6 ft. or so

Fls. 4-5. Fr. 8-9.

5. *Sterculia Roxburghii*, Wall. Vern. Nag-phona, Nag-phena, Ass. ; *Mimong-omak*, *Misi-chik-udari*, Garo.

A small or middle-sized tree. *Bark* dark-brown, somewhat rough outside, light brown inside, turning deep brown after exposure. *Leaves* 3-8 by 1-3.5 in., variable in size and shape, simple, ovate, obovate, elliptic-oblong or lanceolate, shortly cordate-acuminate, entire, chartaceous or subcoriaceous, glabrous ; main lateral nerves 6-8 on either half, oblique and much arched, the lowest sub-basal ; base rounded ; petiole .5-1.3 in., terete, swollen and geniculate near the insertion of the blade. *Racemes* 2-4 in. long, narrow, erect from axils of fallen leaves and also axillary ; pedicels .3-1 in. long, bracteate, slender, stellately hirsute. *Flowers* about .5 in. across, brick-red ; buds ovoid ; male fls. more numerous. *Calyx* campanulate, 5 partite ; tube short. *Follicles* pink, 1-5, spreading, 2-3 by .7-.9 in., compressed, thickly coriaceous, beaked, downy. *Seeds* 4-8, black, ovoid.

Sporadic in evergreen mixed forests in LAKHIMPUR, SIBSAGAR and GARO HILLS.

The roasted seeds are eaten.

Flrs. 2-3. Fr. 6-7.

6. *Sterculia coccinea*, Roxb. Vern. *Nak-che-peta*, Ass. ; *Saglepapio*, Miri ; *Konkelu*, Mik., *Tatom-pelom-changne*, Duff.

A shrub or a small tree. *Bark* grey, warty, green below the cuticle, thin, whitish inside. *Leaves* 4-12 by 2-3.5 in., oblanceolate, abruptly short acuminate, often bluntly, and tapering to the narrow base, quite entire, chartaceous or sub-coriaceous, glabrous above, generally with stellate or simple minute adpressed hairs beneath ; lateral nerves about 12 on either side of the strong midrib, arched and anastomosing near the margin ; petiole 1-2 in. long ; terete, thickened and slightly geniculate below the insertion of blade ; stipules subulate, .2-.25 in. long, caducous, rusty pubescent. *Panicles* 4-7 in. long, axillary, rarely supra-axillary, generally long-peduncled ; branches of panicles and pedicels capillary, the latter .2-.3 in. long. *Flowers* pale, over 1 in. in diam., when fully expanded. *Calyx-tube* very short, lobes .5-.6 in. long, very narrow, patently white-hairy, free or cohering at the tips. *Follicles* 2-5, scarlet, 3-5 by .6-.8 in., thinly coriaceous, velvety outside, glabrous and bright-red inside. *Seeds* 4-8, ovoid, smooth.

Fairly common in LAKHIMPUR, SIBSAGAR and DARRANG also in the MIKIR, NAGA, GARO and KHASI HILLS (ascending to about 3000 ft.)

The tender fruit is eaten cooked like beans and mature seeds are eaten fried or roasted.

Flrs. 8-9. Fr. 4-5.

7. *Sterculia alata*, Roxb. vern. *Pahayi*, Ass. (Sibs) ; *Bong-long-thing* or *Pong-long-thing*, Mik. ; *Thailokhrong*, *Bandar-pela*, Cach. ; *Khamari*, Nep. ; *Phunber-pui*, Lusbai ; *Bantai*, Kuki ; *Mi-bol*, Garo ; *Dieng-klong*, *Dieng-soh-lakor*, Khasi.

A tall tree up to 150 ft. in height and 9 ft. in girth with a high narrow conical crown and horizontal branches ; young parts golden-pubescent. *Bark* greyish-brown, more or less smooth, but

with horizontal wrinkles and shallow vertical-fissures about .25 in. apart; green underneath the corky layers, and dun-yellow, fibrous, with distant strands of light green tissue inside. *Leaves* simple, 4-10 by 3-8 in., ovate, cordate, subacute, chartaceous, glabrous; basal nerves 7, lateral 4 on either half, tertiary transverse to the main nerves; petiole 1.5-4 in. long; stipules tubulate, caducous. *Panicles* from axils of fallen leaves, few-flowered. *Flowers* brownish-yellow, .6-1 in. across. *Calyx* campanulate, divided half way into 5-6 thick linear-lanceolate segments, densely rusty stellate-tomentose outside and with red veins inside. **MALE FLS.**—*Staminal column* .5-.6 in. long, bearing at the top 5-6 sterile carpels round which the subsessile stamens are arranged. *Hermaphrodite* (or functionally female?) flowers:—*Carpels* sessile; style recurved, stamens (staminodes?) arranged round the base of the carpels. *Follicles* 1-5; 3-5 in. across, shortly beaked, on stout stalks 2-3 in. long, woody, minutely brown-felted outside, corky within. *Seeds* numerous, tightly packed, elliptic, compressed, 1 in. long with a white spongy terminal wing, 2-2.7 by 1.3-1.5 in.

Somewhat gregarious in evergreen forests along foot of the hills in all districts except perhaps the N. E. FRONTIER. Common near Garampani and Tikhang in SIBSAGAR and round the Dhansiri Station in NOWGONG.

A very handsome avenue tree. Wood white, soft, apparently elastic. Drums are made of the stem in Nepal. The Mikirs and Kacharis eat the seeds roasted. The fibre of the bark is sometimes used for rough cordage.

Fls. 2-4. Fr. 11-3.

Sterculia ? sp.—A tree; young parts and petiole tawny stellate pubescent. *Leaves* 5-8.5 by 1.5 in., oblong lanceolate, acuminate, entire, chartaceous, thinly millate hairy on the nerves on both surfaces, more densely pubescent on the nedrib, lateral nerves oblique about 6 on either half (excluding the basal pair); *rvules* finely reticulate; petiole 1-2 in. long, geniculate at the top; stipules small, densely pubescent, early deciduous.

lrs. & Fr. not seen.

Umlowa-KHASI HILLS.

Sterculia khasiana (King Mss) Debbarman. Nov. sp.

A medium sized tree, shoots and inflorescence ferruginous tomentose. *Leaves* 3.6-7 by 1.6-3 in., entire, subcoriaceous, elliptic or obovate lanceolate, apices shortly acuminate, somewhat narrowed towards the base, smooth; stipules .2 in. long, coriaceous, needle-shaped or lanceolate, caducous. *Racemes* apical, single at the axis, lax, rather spreading; peduncle erect, delicate. *Flowers* bracteate; bracts minute, ovate lanceolate, caducous; pedicels 3-5 in. long, erectopatent. *Calyx* lobes 5, puberulous inside; lobes 4-6 in. long, linear lanceolate, trinerved. *Petals* absent. *Staminal-column* 1 in. long, thick, reflex, smooth; anthers 10, white on sessile column of the flowers. *Fruits* not seen.

Habitat:—ASSAM, KHASI HILLS, Griffith (Date of collection and No. not known); KHASI HILLS, 1873, Rutton, (comm. C. B. Clarke, Oct. 1877, No. 21884 A & D.) (Type in Calcutta Herbarium).

2. HERITIERA, Aiton.

Evergreen trees. *Leaves* simple, entire, coriaceous, peltate, scaly beneath. *Flowers* small, 1-sexual in axillary panicles. *Calyx* segments 5, sometimes 6-7. *Petals* 0. **MALE FLS.**: *Staminal column* slender bearing a ring of 4-5 2-celled anthers at the top. **FEMALE FLS.**: *Ovary* of 5 nearly free carpels; styles short; ovules 1-2 in each carpel. *Ripe carpels* woody, indehiscent, keeled or winged. *Seeds* exalbuminous.

Leaves large; petiole over 1 in. long.

.. 1. *H. macrophylla*.

Leaves medium-sized to small, petiole under .5 in. long .. 2. *H. acuminata*.

1. *Heritiera macrophylla*, Wall. Vern. *Tepop-pomik*, Abor; *Thing-ansil*, Kuki.

A large evergreen tree, generally widely buttressed at the base when old. *Bark* dark-brown or nearly black, almost smooth, exfoliating in small square flakes, light red or nearly white inside, fibrous. *Leaves* simple, 6-18 by 2-7 in., elliptic-oblong or lanceolate, acuminate, narrowed to a sub-cordate or sub-peltate base, entire, thinly coriaceous, glabrous and dark green above, silvery beneath with stellate scales; midrib very stout, main lateral nerves 8-11 on either half, very oblique, lowest sub-basal, tertiaries slender, transverse or reticulate; petiole 1-3 in. long, geniculate at the apex, scaly. *Flowers* small, 1-sexual, pink, in axillary puberulous panicles. *Calyx* cleft to the base; segments acute. *Staminal column* slender with a crown of 4-5, 2-celled anthers at the top. *Ovary* of 5 distinct carpels of which generally only one develops into fruit. *Ripe carpel* indehiscent, globose, about 1.5 in. across, rough outside, with an obliquely set, narrow winged beak about 1.5 in. long and .3 in. broad.

A very handsome tree, found in the neighbourhood of Pasighat, N. E. FRONTIER DISTRICT.; also according to Brandis in CACHAR.

Timber hard; annual rings distinct, medullary rays uniform, joined by fine transverse lines, takes a fine polish, used for posts.

Flrs. 4-5. Fr. 9-10.

2. *Heritiera acuminata*, Wall. Vern. *Arkhar*, Lushai, Kuki; *Thing-phalem*, Kuki, *Thing-saiph*, Tipp.; *Rashwet*, Synt. *Chingren*, Naga *Bondonthuphang*, Kach.

A medium sized tree often buttressed at the base; young shoots, petioles and undersurface of leaves covered with star-like peltate brown scales which turn silvery with age. *Bark* grey and rough out-side, red inside with streaks of deeper red, inner layers lace-like. *Leaves* 2.5-7 by .8-2 in., lanceolate, oblanceolate or oblong to elliptic, acuminate, subcoriaceous or coriaceous, glabrous above, main lateral nerves 5-6 on either side, distant, upper arcuate, lowest pair basal; base acute, obtuse or rounded; petiole .25-.5 in., geniculate at the apex; stipules very small, subulate, caducous. *Panicles* axillary, much branched, densely covered with stellate tomentose scales, 1.2-4 in. long; bracts very small, caducous; pedicels up to .25 in. long, slender. *Calyx* campanulate, 4-5 lobed, lobes acute, recurved. MALE FLRS.: *Calyx* .1 in. long, staminal column slender, girt at base with a fleshy disk. FEMALE FLRS.: *Calyx* .15-.2 in. long; ovary of 4-5 distinct ridged carpels covered with scales and stellate hairs and with 2 minute staminodes between each carpel, styles red, recurved. *Ripe carpels* 2-4 together, 2-3 in. long, globose with an oblique parallel veined wing at the top, as broad as the diameter of the carpel.

CACHAR, SYLHET, KHASI and JAINTIA HILLS, North Cachar Hills ascending to about 2000 ft.

Sap wood greyish brown; heartwood red, annual rings clear; medullary rays evenly distributed, joined by fine wavy transverse lines; takes a good polish. Timber hard, used for posts and ridge plates.

Flrs. 4-5. Fr. 10-12.

Heritiera dubia, Wall.—Leaves 3-7 by 1-2.5 in., oblong lanceolate or ovate, finely acuminate, chartaceous, glabrous above, silvery lepidote beneath; base acute or abruptly rounded, 3-nerved; petiole .6-1 in. long. Flowers rusty villous in axillary panicles, 2-2.5 in. long. Staminal column fleshy. Ovary tomentose, style short, oblique, stigma 4 lobed. Fr. not seen.

KHASI AND JAINTIA HILLS—G. Gallataly (!)

Helicteres elongata, Wall.—A diffuse straggling shrub. Leaves about 3 by 1.5 in., obliquely ovate or oblong-lanceolate, thinly stellate pubescent. Flowers bisexual in axillary or terminal, many-flowered erect racemose cymes as long as or longer than the leaves; bracteoles setaceous. Calyx 5-cleft; campanulate. Petals 5, clawed. Staminal column adnate to the gynophore. Ovary 5-lobed, 5-celled; ovules several in each cell. Fruit 1-1.5 in. long, cylindric, beaked, stellate hairy in some forms, shaggy outside, of united carpels opening along their inner edge.

ASSAM. Brandis Ind. Trees.

I have seen no specimens at Calcutta.

3. ABROMA, Jacq.

Abroma augusta, Linn. Vern. *Gorukhia-korai*, Ass. (Sibs); *Vi-sipak*, Miri; *Ulat-kambal*, Beng.; *Bon-kopahi*, Ass.; (Kamrup); *Jhinuk*, *Thanthani*, Sylh.; *Theng-tyrkhum*, Khasi.

A shrub 8-12 ft. high with horizontal branches and velvety branchlets. Leaves 4-11 by 2.5-7 in., ovate or lanceolate, more or less cordate, finely acuminate, membranous, entire or repand denticulate, sometimes lobed, glabrescent above, softly pubescent or glabrescent beneath, 5-7 nerved at the base and with 4-6 main lateral nerves on either side of the midrib; petiole .5-5 in. long; stipules .2-5 in. long, linear-lanceolate, deciduous. Flowers bisexual, purple, about 2 in. diam., in leaf opposed pedunculate few-flowered cymes. Sepals 1 in. long, lanceolate, persistent. Petals imbricate, caducous with a concave claw. Staminal tube short, staminodes 5, alternating with shorter fertile stamens opposite the petals. Ovary sessile, 5 lobed, pyramidal; ovules many in each cell; styles 5. Capsule 1.5-2 in. long, obpyramidal, finely pubescent or ultimately glabrescent, truncate at the apex, membranous, 5 angled, dehiscing septicidally and at the top, valves villous at the edges forming a triangular wing behind each carpel. Seeds numerous.

In scrub forest throughout ASSAM, ascending up to 4000 ft.

The bark of the twigs yields a strong silky fibre which may be used for a variety of purposes and for which the plant is well worth cultivating in plantations. The bark of the root is a valuable emmenagogue and has also demulcent properties.

Flrs. 6-9. Fr. 8-12.

4. PTEROSPERMUM, Schreb.

Trees, scaly or with stellate hairs. Leaves simple, lobed or not, bifarious, generally nerved from the base and oblique. Flowers axillary, 2-sexual, bracteate; bracteoles often lancinate.

Calyx deeply 5-cleft. *Petals* 5, deciduous. *Staminal column* short, adnate to the gynophore, divided above into 5 groups with 20 filaments, 5 of which are staminodes, alternate with groups of three anthers. *Ovary* 5-celled, inserted within the top of the staminal column; style solitary; stigma furrowed; ovules many. *Capsule* generally woody, terete or more or less angled. *Seeds* winged at the upper extremity; cotyledons wrinkled or corrugated; albumen thin or 0.

Branchlets thick; leaves large and broad;

calyx-lobes 4-5 in. long, very fleshy;

capsule angled.

.. 1. *P. acerifolium*.

Branchlets thin; leaves small and narrow;

calyx-lobes 1.5-2 in. long, thin; capsule

terete.

.. 2. *p. lanceæfolium*.

1. *Pterospermum acerifolium*, Willd. Saus. *Karnikara*; Vern. *Tepopasing*, Miri; *Tepop-paptok*, *Sipop-using*, Abor; *Morra*, *Morugos*, Ass.; (Lakh.); *Hatipeala*, Ass. (Nowgong); *Motamarulia*, Ass. (Jeypur); *Bon-marla*, Ass. (Darr.); *Larubanda*, Ass. (Kamrup); *Modubura*, *Lai-dorhuphang*, *Lau-gongrai-baphang*, *Rangirata*, Cach.; *Kongla-arang*, *Lokong-krong-arong*, *Lopoklok-arong*, Mik. *Tuyuru-changne*, Duff.; *Kualia*, Manipur; *Hatipaul*, Nepal; *Waisil-thing*, Lushai; *Modubura*, Sylh.; *Avor*, *Ching-pha*, Tipp.; *Nakhar-theng*, Kuki; *Bhot-odla*, *Laider*, *Mech*; *Rikhabok*, *Mat-bul-japha*, Garo; *Dieng-tharo-masi*, Khasi; *Dieng-la-um-pai*, Khasi; (Nongpoh); *Dieng-myrhau*, Khasi (Tharia); *Dieng-khoh*, *Khashi* (Shella); *Dieng-khong-suet*, Khasi; (Hatmawdon). *Dieng-dit-la-khoh*, Kh.; (Nongkla.)

An evergreen tree up to 80 ft. in height and 8 ft. in girth, with a heavy broad crown; young parts and inflorescence floccose, rusty stellate tomentose. *Bark* dark-brown and rather rough outside, inside deep purplish red, variegated with streaks of white in marble-like pattern. *Leaves* 8-15 by 6-12 in.; very variable in size and shape even in the same twig, somewhat obliquely obovate or orbicular, often lobed, entire or remotely toothed, deeply cordate or peltate, coriaceous, glabrous and deep green above, grey or brownish tomentose beneath, palmately 8-10-nerved from the extremity of the petiole and with 3-6 lateral nerves on either side of the midrib; tertiary and quaternary nerves sub-parallel; petiole 4-12 in. long, striate; stipules multifid, caducous. *Flowers* solitary or in 2-3 flowered cymes, 5-6 in. across, fragrant; peduncles .5 in. long; bracteoles multifid, deciduous. *Calyx-segments* 4-5 by .3-5 in., linear, very fleshy, floccosely-brown tomentose outside, tufted villous along the middle, stellate downy on the edges within. *Petals* twistedly imbricate, a little shorter than the sepals, cuneately linear, pure white, thin. *Filaments* 1.1-1.5 in. long, filiform, glabrous, in threes against each calyx-segment, with a staminode 2-3 in. long between, all forming a tube about 1 in. long below the ovary and adnate to the gynophore; anthers .5 in. long. *Ovary* oblong, obscurely 5-angled, brown-shaggy; style simple, tapering to the club-shaped stigma,

stellate tomentose towards the base. *Capsule* 4-6 by 1.8-3.4 in., 5-celled, 5-angled, woody, floccosely brown-tomentose. *Seeds* in two rows of 8-10 in each cell, .3-.4 in. diam., rhomboid, compressed with a straight, oblong, thin, horny, shining, amber-coloured wing, 1.2-1.8 by .3-.5 in., having a thickened dorsal margin; albumen scanty, waxy; cotyledons corrugated.

Throughout the Province in mixed evergreen forests, often gregarious ascending to 2500 ft.

The heartwood being red is often smuggled as *Poma*; Weight about 48 lbs. per c. ft. The leaves are good cattle-fodder and are laid on roofs under thatch or slates in some parts of N. W. India. A plaster made of the calyx is considered infallible in glandular swellings about the neck and ears.

Figs. 4-6. Fr. 12-3.

2. *Pterospermum lanceifolium*, Roxb. Vern. *Motanahor*, *Bon-baguri*, Ass.; (Lakh. and Sibs.); *Bon-nahor*, Ass. (Darr.); *Bon-tituli*, Ass., (Kamrup); *Nahorahn*, Miri; *Theng-pituli* or *Theng-pitula-arong*, *Phong-arong*, Mik., *Pung-i-tabri*, Daff.; *Ching-nai*, Naga; *Singani*, Nep.; *Lai-kulai-phang*, Cach.; *Arkhar*, Kuki; *Sakhipelham*, Lushai; *Ban-barai*, Narcha, Sylh.; *Phaibomarta*, Tipp.; *Bol-nabat*, *Bokta*, Garo; *Dieng-nor-sha*, *Dieng-pen-siwang*, Khasi.

Usually a small or middle sized tree but occasionally up to 70 ft. in height and 7 ft. in girth, when the stem is buttressed at the base; sometimes epiphytic; branchlets thin; young parts, undersurface of leaves, petioles and inflorescence felted, with fine stellate at first rusty, ultimately buff-tomentum. *Bark* greyish green and rough outside, inside reddish with white vertical streaks which soon turn reddish-brown. *Leaves* 2.5-6 by 7-1.5 in., lanceolate oblong or obovate-oblong, finely acuminate, entire or obscurely repand in the upper half, glabrous and shining above, midrib stout; main lateral nerves 5-7 on either half, slender, oblique, tertiaries parallel, transverse to the midrib, ultimate nervules (visible only when the leaf is held against the light, and fully mature) finely reticulate; base more or less oblique, rounded or sub-cordate, sometimes very narrowly peltate; petiole .1-2 in. long; stipules .2-3 in. long, subulate with 2-4 filiform branches, .1-.25 in. long, caducous. *Flowers* 2-3 in. across, pale-white, fragrant; buds oblong-lanceolate, 5-ridged; peduncles 1.7-2 in. long, 1-flowered with 1 or 2, 2-5 fid bracteoles. *Calyx-segments* 1.3-1.6 by .15-.2 in., brown tomentose, outside white or grey with adpressed, stellately tufted hairs and fine tomentum within. *Petals* white, membranous, slightly longer and wider than the calyx-segments, tapering towards the base. *Stamens* about 1 in. long, including the linear anthers; gynandrophore about .15 in. long. *Ovary* gradually narrowed to the ribbed simple style, buff-tomentose. *Capsule* 2.5-3 by 1-1.7 in., lanceolate, terete, woody buff-felted outside, 5-celled, each cell with about 4 seeds. *Seeds* about .3 in. diam., orbicular, compressed with a terminal wing-like that of the preceding species but shorter and somewhat tapering.

Common specially in mixed scrub forests, ascending to about 2000 ft. Wood moderately hard with numerous and close undulating medullary rays, but is not much used. The Daflias chew the leaves to redden their lips. Squirrels seem to be fond of the bark.

Flrs. 4-6, Fr. 10-6.

Dterospermum Blumeanaum, Korth.—A tree 40-50 ft. in height; branchlets covered when young with scurfy deciduous rusty stellate hairs. *Leaves* 3-5.5 in. by 1.35-2 in., very unequal sided, oblong to ovate or lanceolate oblong, entire or with a few coarse teeth towards the apex, acuminate, one side of base often subauriculate, densely brown tomentose when young, glabrous and dark green above, minutely tawny or brown tomentose beneath, with many brown stellate hairs specially on the nerves beneath, lateral nerves 5-7 on either half, prominent beneath; petiole short; stipules subulate, lanceolate. *Flowers* 2-3 in. long, axillary, solitary or in few flowered cymes. *Buds* cylindric, acute, about 2 in. long; sepals narrowly linear, acute, scurfy, stellate pubescent outside, silky within. *Petals* membranous, oblong-lanceolate or subspathulate, shorter than the petals. *Fertile stamens* about 10; staminodes 5. *Ovary* villous, 5-celled; style shorter than the staminal tube, glabrous. *Capsule* 3-4 in. long, woody, oblong, 5 angled, subacute, slightly narrowed towards the base.

According to Brandis (Ind. Trees) occurs in Assam. There are no specimens at Calcutta from our area.

Firs. 4. Fr. 6.

5. REEVESIA, Lindl.

Reevesia Wallichii, Brown.

A medium-sized tree attaining about 50 ft. with grey and somewhat smooth bark exfoliating in round flakes, inner substance soft, cream-coloured. *Leaves* simple, 2.7-6.5 by 1.5-3 in., ovate, ovate-oblong, acuminate, coriaceous, entire, glabrous above, sparsely stellate pubescent beneath, main lateral nerves 6-8 on either half, lowest pair basal, base obtuse or rounded; petiole .5-1.5 in. long, geniculate at the apex; stipules early deciduous. *Flowers* white, fragrant, bisexual, in corymbiform panicle of cymes, usually shorter than the leaves; panicles terminal or from axils of fallen leaves; pedicels jointed, 2 bracteolate. *Calyx* ultimately 5-fid, .15 in. long, persistent. *Petals* spathulate, clawed, exceeding the calyx. *Staminal column* exceeding the petals, adnate to the gynophore and bearing a globose head of anthers in 5 bundles of 3 each. *Ovary* 5-lobed with 2 ovules, in each carpel; stigma subsessile, 5-lobed. *Carpels* pubescent. *Capsule* 1.5-2 in. long, obovoid oblong, brown velvety outside, 5-celled, grooved between the cells, valves woody, dorsally slightly keeled, dehiscing septicidally and ultimately along the backs of carpels. *Seeds* 1-2, .8-1.2 in. long in each cell, winged downwards; wing membranous with brown veins, oblong, .6-8 in. long, albuminous.

KHASI AND JAINTIA HILLS, 3500-4500 ft.

Flrs. 4. Fr. 12-2

6. BUETTNERIA, Linn.

Généally climbing shrubs with palmately nerved leaves. *Flowers* bisexual, 5-merous, small, in much branched umbellate cymes. *Sepals* connate at the base. *Petals* with a concave claw and with two lateral lobes. *Anthers* 5, extrorse, seated on a more or less

truncate staminal tube, opposite the petals and alternating with 5 staminodes which are opposite the sepals. *Ovary* sessile, 5-celled with 2 ovules in each cell. *Capsule* septicidal, globose, echinate, 5-celled, with one seed in each cell. *Seeds* exalbuminous; cotyledons spirally rolled.

Leaves chartaceous, entire, glabrate and shining above; capsule armed with stout conical prickles.

.. 1. *B. aspera*.

Leaves membranous, serrulate, more or less pilose above; capsule covered with wiry thin barbed bristles.

.. 2. *B. pilosa*.

1. **Buettneria aspera**, Colebr. Vern. *Tikom-borua*, Ass. (Sibs.); *Risul-rubi*, Miri & Abor; *Warpokhu*, Mik.; *Pira-doukha*, Kach.; *Jong-long-rhui*, Lushai; *Lata-kuti*, Dusi-phri, Garo; *Ther-un*, Tille-sa-phai, Mei-klong, Mei-slah, Khasi.

A large woody climber with sulcate branchlets; young shoots and inflorescence grey or buff stellate pubescent. *Bark* dark-brown closely longitudinally or spirally furrowed on old stems. *Leaves* 4-8 in. diam., orbicular, cordate, abruptly acuminate, entire or obscurely repand, chartaceous, glabrate and shining above, puberulous along the nerves beneath, bright pink when young; midrib with one or more large glands near the 5-7 nerved base and 5-6 regularly arched lateral nerves; tertiary sub-parallel and transverse to the secondary nerves; ultimate nervules very fine and closely reticulate; petiole 2-5 in. long, sulcate, puberulous; stipules 5 in. long, linear lanceolate, early deciduous. *Flowers* pale brown, 1.5-2 in. diam., buds ovoid or pyramidal; pedicels slender, 1.3-1.5 in. long, jointed in the middle, cymosely umbelled on the ultimate ramifications of peduncled cymes; inflorescence up to 5 in. long; peduncles fascicled, axillary, up to 2 in. long; bracts and bracteoles subulate. *Petals* shorter than the sepals, terminal lobe fleshy, acute, lanceolate. *Capsule* 1-1.5 in. across, globose, woody, armed with stout sharp rather distant conical prickles. *Seeds* ovate oblong, solitary in each cell, immersed in watery sap, unarmed.

Fairly common in mixed evergreen forests throughout UPPER ASSAM and also NAGA HILLS ascending up to 2500 ft.

Young parts and bark macerated are used by Mikirs and Khasi women to wash the hair.

Flrs. 5-6 Fr. 11-3.

2. **Buettneria pilosa**, Roxb. Vern. *Dim-soh-doukha*, *Dum-shoh-doukha*, Cach.; *Manlang-rang*, Kuki; *Jirmi*, Khasi.

A large woody climber; branchlets grooved, at first densely pubescent, afterwards more or less strigose. *Leaves* 4-7 by 2.5-6 in., orbicular or ovate, cordate, abruptly acuminate often more or less distinctly 3-5 lobed, closely serrulose-denticulate, membranous, somewhat harshly stellate-pubescent, 7-9 nerved at the base and with 3-5 lateral nerves on either side of the midrib, other nerves as in the preceding species; petiole 2-8 in. long, shaggy while young. *Flowers* yellowish, about 2 in. across; in much branched

pubescent compound cymes; bracteoles subulate, pedicels capillary several together on ultimate^b cymose umbels; petals shorter than the sepals, terminal lobe linear lanceolate; anthers yellow, spreading. *Capsule* spherical, .6-.8 in. diam., densely covered with barbed bristles.

In the lower hills or not far from the foot of the hills in SIBSAGAR (Barpathar, Naojan) and NOWGONG (Lumding, Amguri, Doboka).

Flrs. 10-11. Fr. 12-4.

Dombeya Mastersi, Hk. f. A large branchy shrub. *Leaves* 4-6.5 in. across, orbicular cordate, often obscurely 3 lobed, acuminate, thinly pubescent above, soft hairy beneath, palmately 7-9 nerved, crenate-dentate; petiole 1.5-3 in. long, villous like the pedicels and peduncles with long spreading hairs. *Flowers* white, 1-1.5 in. across in many flowered, axillary, peduncled umbels; peduncles up to 1.5 in. long, sometimes forked towards the top, each branch bearing an umbel with a solitary flower in the fork; pedicels slender, 1-1.5 in. long, surmounted by an epicalyx of 3 deciduous, linear lanceolate, acuminate bracteoles about .75 in. long. *Sepals* .5 in. long, lanceolate, valvate, reflexed in flower. *Petals* .7-1 in. by .45-.5 in. oblique, imbricate. *Staminal tube* short, nearly enclosing the ovary; stamens in bundles of 3 with an interposed petaloid staminode having pinkish base, and linear ligulate limb which is longer than the stamens. *Ovary* densely villous; style free at the apex. *Capsule* 5 celled with papery valves; seeds rugose.

A native of TROPICAL AFRICA. Cultivated in public gardens in Shillong.

Flrs. 1-2.

FAM. 25. TILIACEÆ.

Trees, shrubs or herbs; bark usually mucilaginous and with strong fibres. *Leaves* alternate, simple or lobed, generally mucilaginous; stipules free. *Flowers* regular, 2-sexual or rarely 1-sexual, usually cymose. *Sepals* 3-5, free or connate, valvate. *Petals* as many as the sepals, rarely absent. *Stamens* indefinite, rarely few, free or connate, frequently inserted on a gonophore; anthers introrse dehiscing by lateral slits. *Ovary* free, 2-10 celled; ovules 1-many on axile placentas; style simple, or parted into as many divisions as cells in the ovary, or 0; stigmas terminal. *Fruit* baccate or capsular, 2-10-celled or spuriously many-celled, rarely 1-celled by abortion. *Seeds* solitary or many; albumen generally copious; embryo straight, usually with leafy cotyledons.

Fruits not winged:—

Trees or shrubs; fruit drupaceous.

... 1. *Grewia*.

Herbs or undershrubs; fruit capsular:—

Petals glandular at base, capsules

prickly or bristly.

... 2. *Triumfetta*.
Corchorus.

Petals not glandular, capsules unarmed.

Fruits winged:—

A tree. *Leaves* alternate.

... 3. *Columbia*.

A climber. *Leaves* opposite.

... 4. *Plagiopteron*.

1. GREWIA, Linn.

Trees or erect or sometimes straggling or climbing shrubs, usually stellate-pubescent. *Leaves* alternate, usually distichous,

often inequilateral, more or less toothed, with 3-7 basal nerves. *Flowers* generally yellow, less often white, in axillary, extra-axillary or terminal fascicles, cymes or panicles, sometimes solitary. *Sepals* 5, distinct, coriaceous, more or less coloured within. *Petals* 5, usually with a glandular scale* at the base within, generally much shorter than the sepals, sometimes wanting. *Stamens* indefinite, free, all fertile, inserted on a stout gonophore when the petals are glandular. *Ovary* 2-4 celled; style subulate. *Fruit* a drupe, more or less fleshy, entire or lobed; seed albuminous; cotyledons flat.

I. *Tices.*

Flowers involucrate and paniced.

Flowers in axillary umbels which are generally fascicled:—

Leaves oblong or ovate, more or less cordate, densely tomentose beneath. Flowers yellow.

Leaves lanceolate, acute at the base, glabrescent. Flowers white.

II. *Erect or straggling shrubs or undershrubs:—*

A. Leaves softly tomentose, pubescent or glabrescent, never rough:—

1. Leaves broad, 5-nerved at the base:—
Flowers yellow, drupe scarcely lobed.
Undershrub with a thick underground root-stock and annual shoots.

2. Leaves narrow, 3-nerved at the base:—
Leaves nearly glabrous, green on both surfaces. Flrs. bisexual, white.
Leaves hoary beneath. Flrs. polygamous, yellowish.

B. Leaves rough on one or both surfaces:—

1. Erect shrubs or undershrubs; peduncles never exceeding the petioles:—

Leaf 3-nerved at the base, thin; more or less lobed, fleshy, rind not crustaceous. Shrub with persistent shoots

Leaf 3-5-nerved at the base, thick, rind crustaceous, undershrub or shrub, usually with annual shoots from a woody rootstock, drupe not lobed, rind crustaceous.

2. Straggling shrub; peduncle exceeding the petiole; drupe not lobed.

8. *G. sclerophylla.*

9. *G. denticulata.*

1. *Grewia Microcos*, Linn. Vern. *Pisoli*, Ass.; *Theng-pranke-arong*, Mik.; *Heitup*, Manip.; *Bolchibins*, Borsubret, Garo *Lakhul-guta*, Koi-pura, Pipi, Jharna; *Phisiula Pesondi*, Sylh. *Dieng-soh-dkhar*, *Dieng-soh-lieng-hadem*, Khasi.

A deciduous (?) tree up to 50 ft. in height and 5 ft. in girth; trunk often fluted; young shoots patently pubescent. *Bark* dark-brown or nearly black outside, exfoliating in thin flakes, finely fibrous, pink or red and in more or less distinct concentric layers near the cambium, fainter outward and variegated with brown or greenish-grey and leathery. *Leaves* bifarious, 3-7.5 by 1-3.5 in., ovate, oblong, obovate-oblong or lanceolate, serrulate or nearly

* The gland may sometimes be present or absent in one and the same species. Its presence appears to be correlated with the length of the gonophore.

entire, chartaceous, glabrescent but the petiole and main nerves are seldom wholly glabrous; main lateral nerves 6-7 on either side of the midrib, the lowest pair basal; base rounded, or sometimes cordate, more or less oblique; petiole '25-6 in. long, terete; stipules more or less falcate, linear-lanceolate, '25-5 in. long. *Flowers* pale-yellow in heads of 3, supported by involucreal bracts which are '25-3 in. long, lanceolate, coherent at the base and puberulous outside; heads pedunculate and arranged in terminal panicles 3-6 in. long. *Sepals* obovate-oblong, cream-coloured, about 3 by 1 in., hooded, pubescent. *Petals* about 1 in. long, cream coloured, somewhat reddish on the back, glands about half the petals, slightly ciliate. *Filaments* shorter than the sepals. *Gonophore* and *ovary* glabrous, the former with a wooly fringe at the top. *Drupe* globose about 3 in. across, smooth, glabrous; stone enveloped in a matted sac of strong fibres.

KAMRUP, NOWGONG, CACHAR, N. CACHAR HILLS, SYLHET, KHASI & JAINTIA HILLS, GOALPARA, GARO HILLS ascending up to 2000 ft., in deciduous forests.

Wood light-red, weighing about 50 lbs. per c. ft. seldom used except for firewood. In Burma leaves used for covering cigars for which it is considered to be the best leaf.

Flrs. 5-6. Fr. 11-1.

2. *Grewia elastica*, Royle. Syn. (*Grewia vestita*, Wall. Incl. (†. *asiatica*, Linn. Var. *vestita*, F. B. I., Vern. *Man-bijal*, Ass. (Now); *Byul-goch* Ass. (Kam.); *Phuhwa*, Ass. (Darr.); *Thusura*, Mech; *The-bong-dar-arong*, *Bong-der-so-arong*, Mik.; *Laiman-phang*, *Mikir-lata-phang*, *Thai-a-dou*, Cach.; *Sial-phosra*, Nep.; *Thai-girip-theng*, Kuki. *Bor-khentri*, *Khungshriwakhik*, Garo; *Dhamna*, Jharua-Garo Hills; *Dieng-sok-langhri-that*, Khasi; *Dieng-tha-ballieh*, Khasi (Nongpoh).

A deciduous tree up to 60 ft. in height and about 5 ft. in girth; young parts densely grey-felted. *Bark* greyish-white on old stems exfoliating in hard rectangular pieces; inside whitish mottled with thick irregular pink streaks but soon turning deep brown obliterating the streaks. *Leaves* 3-5 by 2-2.5 in., obliquely ovate, oblong-ovate or elliptic, sometimes obscurely 3-lobed, acuminate, closely crenata-serrate, thinly coriaceous, dark-green and hispid with stellate hairs above, pale and softly felted beneath, pink when very young, basal nerves 5-6, nearly straight; lateral nerves 3-4 on either side of the midrib, tertiaries transverse, parallel; petiole 2-4 in. long; stipules subulate, 3-4 in. long. *Flowers* yellow, in fascicled or rarely solitary axillary cymes; peduncle 3-5 in. long, downy, each bearing 2-3 bracteolate flowers; bud globose to ovoid, not or very obscurely ribbed; pedicels 3-4 in. long. *Sepals* 2-5 in., linear-oblong, yellow inside. *Petals* yellow, oblong, much shorter than the sepals. *Stamens* numerous; filaments yellow, slender, glabrous. *Ovary* villous; style equalling the stamens or slightly exceeding them. *Drupe* globose, 2-3 in. across, sometimes obscurely 2-4 lobed, slightly hairy, blackish when ripe.

In deciduous forests in DARRANG and NOWGONG, KAMRUP, N. C. HILLS, SOALPARA, KHASI & JAINTHIA HILLS ascending up to 3000 ft.

Wood, grey, close grained, tough and elastic, used in other parts of India for bows, spear-handles, banghy-poles, etc.; weight about 50 lbs. per c. ft. The branches are lopped for fodder and the ripe fruit is edible. The bark yields a strong fibre suitable for ropes.

Firs. 4-5. Fr. 9-11.

3. *Grewia disperma*, Rottl. Syn. *Grewia laevigata*, Vahl. Vern. *Sernam-longda*, *Theng-rom-pa*, *Rampak-arong*, Mik.; *Khau-khlem-maising-phang* or *Khau-khlem-marsi*, *Mithang-Samja*, Cach.; *Gangthi*, Sylh.; *Bol-mengu*, Garo; *Thing-nhap-khir*, *Wai-thel-te-thing*, Kuki; *Dieng-doh-thli*, Khasi; *Dieng-tier-ser*, Khasi (Shella); *Dieng-tiew-sat*, Khasi (Tharia).

A small tree but sometimes up to 45 ft. in height and 3 ft. in girth; young shoots glabrous or nearly so. Bark thin, dark-grey or brown outside, uniformly cream-coloured inside. Leaves 3-7 by 1-2.4 in., green on both surfaces, oblong-lanceolate, acuminate, acute and 3-nerved at the base, glandular-serrate, membranous, glabrous or glabrescent; lateral nerves about 6 on either side of the midrib, slightly arched, basal almost straight, tertiaries transverse, very slender; petiole .3-.5 in. long, glabrous; stipules subulate, shorter than the petals. Flowers 1-1.5 in. across, in 3-flowered axillary cymes; buds oblong, ribbed; peduncles .8-1.2 in. long, slender, 1-3 in each leaf axil; pedicels nearly as long as the peduncles. Sepals .6-1 in. long, linear-oblong, fleshy, 2-ribbed, green outside, white within. Petals .1-1.5 in. long, white, membranous, entire, tapering to the apex, claw dilated, gland exceeding half the petal. Ovary villous; style glabrous; stigma lacinate. Gonophore elongated, villous at the top. Drupe .25-.3 in. diam., 1-4 lobed, rugose when ripe.

In mixed scrub in all districts excepting LAKHIMPUR and the N E FRONTIER ascending to 3000 ft.

The leaves are used for fodder. The wood gives an offensive smell when burnt and is therefore carefully avoided as firewood for cooking purposes. The bark yields a good fibre which is suitable for cordage.

Fls. 9-10. Fr. 11-12.

4. *Grewia sapida*, Roxb. Vern. *Phuhura*, *Thaura-guti* (the fruit), Ass. (Darr.); *Bong-der-so-arong*, Mik.; *Pumi-aye*; Miri.

A prostrate undershrub with a perennial woody rootstock throwing out annually a number of switchy shoots, which after producing leaves, flowers and fruit, are burnt or browsed down to be similarly renewed next year; young shoots shaggy. Leaves 2-4 by 1.5-3 in., ovate, obovate, obovate-oblong or orbicular, usually doubly serrate, sometimes obscurely lobed, apex rounded or broadly acute, pilose or scabrid above, softly pubescent beneath; base usually 5-nerved, oblique; petiole .2-.3 in. long, grey-shaggy; stipules .3 in. long, subulate, subsistent. Flowers 4-6 in. across, yellow, 2-5 on each peduncle; peduncles 2-5 in each leaf-axil, .7-1.5 in. long, slender, hairy; pedicels .5-.8 in. long; bud obovoid, tomentose. Sepals reddish-brown inside,

oblong or oblanceolate. *Petals* yellow, elliptic, entire, often emarginate at the apex. *Drupe* 2-8 in. diam., obscurely lobed, hirsute.

In large open dry grass-lands in all the DISTRICTS ascending to 2500 ft. A favourite fodder plant. The ripe fruit is edible.

Flrs. and Fr. 5-5.

5. *Grewia multiflora*, Juss. Vern. Kukur-huta, Ass.; Barbi-ang, Miri; Singnam-longlak, Mik.; Papu-tadu-changne, Duff.; Mithaichora, Pura-koroi, Sylh.; Dieng-tyrbhong, Khasi; Dieng-tiewsier, Khasi (Hatmawdon).

A bushy shrub which often becomes procumbent with very small leaves due to excessive browsing; bark dark-brown outside, thin; white inside; branches thin; sparingly strigose. *Leaves* very variable in size and shape, irregularly distichous, 1.5-4 by .5-1.5 in. elliptic-lanceolate, acuminate, rounded or subacute at the base, glandular serrate, chartaceous, glabrescent, dark-green shining above; lateral nerves 5-6 on either half, the lowest sub-basal; petiole .15-.2 in. long, slender, strigose; stipules 1-2 in. long, subulate. *Peduncles* .5-.8 in. long, 3-flowered; pedicels nearly as long or longer. *Flowers* white, small; buds obovoid, ribbed. *Sepals* 3-5 in. long linear-oblong. *Petals* half the length of the sepals, entire. *Filaments* short. *Gonophore* glabrous with a fringe of hairs at the top. *Drupe* 1-4 lobed, about .2 in. across, globose, black or purplish, fleshy, glabrescent.

Throughout UPPER ASSAM. Very common in SIBSAGAR and the MIKIR HILLS.

The lac insect is reared on this plant and for this purpose it is often planted near homesteads in the Mikir Hills.

Flrs. 8-9. Fr. 9-11.

6. *Grewia hirsuta*, Vahl. Var. *helictrofolia*, Wall (Sp) Syn. G. *polygama*, Masters, not of Roxburgh.—Vide Journal of Botany Vol. XLIX P.356 et. seq. Vern. Hukta-pata, Ass.; Soh-synting, Khasi.

A spreading shrub attaining about 9 ft. with annual or periodic shoots; young parts and inflorescence pubescent. *Leaves* 2-5 by .4-.9 in., narrow lanceolate or oblong, acute or acuminate, closely toothed, stellate pubescent or glabrate above, grey or tawny tomentose beneath; lateral nerves (excluding the basal) 4-6 on either side of midrib; base rather oblique, usually 3-nerved; petiole up to .15 in. long; stipules subulate up to .2 in. long. *Flower* yellow, polygamous. *Peduncles* axillary, 1-5 together, 2-6 flowered, up to .5 in. long, but usually much smaller; pedicels up to .4 in. long; bracts subulate; buds obovoid, ribbed tomentose. *Sepals* linear-oblong, up to .4 in. long, usually with a tuft of hairs at the base inside. *Petals* obovate oblong, much shorter. *Stamens* many, usually exceeding 20; gonophore villous at the top, in male flowers, stamens much exceeding the hairs; in hermaphrodite flowers, stamens about as long as the hairs or slightly longer. *Ovary* villous. *Drupe* 2-4 in. across, reddish brown and shining when ripe, rind crustaceous, covered with a few scattered hairs or glabrous when ripe, usually with 1-4 lobes.

Grass lands KAMRUP and KHASI and JAINTIA HILLS in lower elevations ; probably also in other similar forests.

A very variable plant. Roxburgh's plant does not appear to be this species.

The fruit is edible and roots are considered to be tonic in Hindu medicine and the fruits are used in cases of diarrhoea and dysentery.

Frs. rainy season. Fr. 11-1.

7. *Grewia abutilifolia*, Juss. Syn. (*G. aspera*, Roxb. Vern. *Soh-cit-blang*, Kh. ; *Bipo-bum-the-arong*, Mik. ; *Bon-dusa-phang*, Cach.

A bushy shrub up to 10 ft. high with more or less smooth grey bark about .3 in. thick, blaze red with white streaks ; young parts and inflorescence rough stellate tomentose. *Leaves* 4.5-8.5 by 2.5-6 in., broadly elliptic, elliptic ovate or suborbicular, sometimes lobulate, short acuminate, irregularly serrate, chartaceous when mature, rough stellate hairy on both surfaces, more densely beneath ; lateral nerves 5-6 (above the basal) on either side of midrib, nervules finely reticulate ; base 3-nerved, rounded ; petiole .4-6 in. long, densely tomentose ; stipules subulate, adpressed hairy. .3-1 in. long. *Peduncles* very short, 1 or more from leaf axils, 3-4 flowered ; bracts caducous, lanceolate, .25-.3 in. long ; bracteoles linear, short ; pedicels up to .2 in. long, elongating and stout in fruit ; buds ellipsoid. *Sepals* .4-7 by .1-1.5 in., narrow oblong, glabrous, white, turning yellow and glabrous inside. *Petals* much shorter than the sepals, rounded at the apex, gland about half the length of the petal. *Filaments* white, very slender. *Ovary* villous ; style exceeding the stamens ; stigmas lobed. *Gonophore* glabrous with tufted hairs at the top. *Drupe* slightly 2-4 lobed. .4-.5 in. across, depressed, turbinate with scattered bristle-like deciduous hairs, fleshy.

NOWGONG-Sonakusi reserve ; N. CACHAR HILLS ; KHASI and JAINTIA HILLS—Barnihat, ascending to about 1000 ft.

Frs. 4-5. Fr. 10-1?

8. *Grewia sclerophylla*, Roxb. Syn. *G. scabrophylla*, Roxb.

A shrub or an undershrub ; young parts, petiole and inflorescence densely brown, rough stellate tomentose. *Leaves* 1.5-8 by 2.5-5 in., elliptic ovate or obovate to suborbicular, irregularly toothed, larger teeth often glandular at the tip, rather thick, rough above, stellate tomentose beneath ; lateral nerves (excluding the basal) 5-6 on either side of the midrib, slightly arcuate ; base 3-nerved, rounded or obtuse ; petiole .3-.6 in. long, often with one or more glands at the top ; stipules subulate, up to .4 in. long. *Peduncles* short, 1-few on leaf axils, each 2-3 flowered ; pedicels stout, about .5 in. long. *Buds* .4-.5 in. long, oblong, ribbed. *Sepals* .5 in. long, oblong, yellow inside ; petals half the length of sepals, obovate, notched at the apex, gland villous on the edges about a third of the petal. *Ovary* villous ; style peltate, slightly exceeding the stamens. *Gonophore* glabrous, villous at the top and with tufts of hair between the petals at the base. *Drupe* globose, depressed at the top, .5-.8 in. across, rough stellate hairy, with a crustaceous rind and sweet viscid pulp, stones usually 4.

KAMRUP, GOALPARA, NAGA HILLS, lower elevation in KHASI HILLS, probably also in other areas in grass lands. Often burnt every year and then becoming very stunted with a woody rootstock.

The fruit is edible and the stem yields good fibre.

Frs. 5-9. Fr. Autumn.

9. *Grewia denticulata*, Wall. Ann. Roy. Bot. Gard. Calc. IX. 10. t. 12. Syn. G. *nagensium*, Prain, Journ. As. Soc. Beng. Vol. LXIX. 2. 168.

A straggling shrub with terete branches, young shoots harsh with stellate hairs. *Leaves* bifarious, 4-7 by 2-3.2 in., ovate-or oblong-lanceolate, acuminate, subequally closely serrate, chartaceous, hispidly stellate-pubescent, sparsely above, densely beneath, especially along the nerves; lateral nerves 4-6 on either side of the midrib; base rounded, 3-nerved; petiole terete, .2-.3 in. long, densely rusty stellate pubescent. *Flowers* white (fading to yellow?) in peduncled umbellate scabrid cymes; peduncles .4-1 in. long, stout; pedicels .6-.8 in. long, dilated upwards, elongating in fruit; bracts triangular, lanceolate, .2 in. long, stellate hairy outside. *Sepals* .4-.5 in. long, lanceolate. *Petals* about .2 in. long, ovate, the large basal gland occupying nearly the whole of the lower half. *Gonophore* adpressed villous. *Ovary* pubescent. *Drupc* 2-1, sometimes 3-lobed, globose but somewhat compressed, about .3 in. across, rugose with the lenticular bases of fallen stellate hairs.

SIBSAGAR, Derol Reserve; Jaipur, Borian, etc., LAKHIMPUR.

Fls 8-9. Fr. 11-1.

2. TRIUMFETTA, Linn.

Herbs or undershrubs with stellate pubescence. *Leaves* usually serrate or dentate, sometimes lobed. *Flowers* yellow, in dense cymes which are axillary or leaf-opposed or imperceptibly pass into terminal spike-like inflorescence. *Sepals* 5 distinct. *Petals* 5, glandular and ciliate at the base. *Stamens* 5-many. *Ovary* 2-5 celled, cells 2-ovuled; style filiform. *Capsule* subglobose, with more or less hooked spines or bristles. *Seeds* pendulous, albuminous.

Upper leaves ovate or lanceolate; capsules .6-1 in. across (including the spines):-

Spines of capsules long, hispid.

... 1. *T. pilosa*.

Leaves rhomboid, more or less lobed; capsule .25-3 in. across (including the spines):-

Spines of capsules short, glabrous.

... 2. *T. rhomboidea*.

1. *Triumfetta pilosa*, Roth. Vern. *Soh-bythrid*, Kh.

A perennial herb or undershrub with a woody base and hispid stems; young parts rusty tomentose. *Leaves* 2.5-5 in. long, very variable, lower often lobed, upper ovate-lanceolate, acuminate, unequally serrate, membranous, pubescent above, tomentose beneath; base usually 5-nerved, rounded or subcordate; lower petioles up to 1.8 in. long, upper short; stipules obliquely lanceolate or linear, .25 in. long. *Flowers* .2-.3 in. long in

congested lateral cymes, much shorter than the leaves. *Stamens* 10. *Ovary* covered with short scales. *Capsule* .6-1 in. across, spines 2-.35 in. long, slender, hooked, patently hispid in the lower half.

Grass lands in SIBSAGAR, NAGA HILLS, KHASI HILLS ascending to 4500 ft., probably in similar localities in all dists.

Flrs. 7-9. Fr. 9-11.

T. cana, Bl.-*Leaves* ovate-oblong or lanceolate, 2-4.5 in. long, upper smaller. *Flowers* .15-2 in. long in tomentose extra-axillary cymes. *Capsule* about .6 in. across, globose, spines hispid. Scarcely more than a variety of the last.

KHASI and JAINTIA HILLS about 5000 ft.

Flrs. 7.

T. tomentosa, Boj. *Leaves* 2-5 in. long, ovate lanceolate, upper narrower. *Stamens* 5-7. *Capsule* not exceeding .6 in., appears to be a tomentose state of *T. pilosa*.

SYLHET (Wallich) and probably in most localities where the latter is found.

2. *Triumfetta rhomboidea*, Jacq. *Jhinjharita*, Sans. *Agra*, Ass.; *Sok-hyr-thit*, Kh.; *Bolnghas*, Nep.; *Northe-arong*, Mik.

Herbaceous or suffrutescent up to 6 ft. high. *Lower leaves* usually 3-lobed, 2-3 in. across, cordate, irregularly serrate, rounded or cuneate at the base, membranous, upper leaves smaller and narrower, not lobed; petiole 1-1.5 in. long, hairy, swollen at the junction with the blade. *Flowers* .3 in. long in dense leaf-opposed and terminal cymes. *Sepals* hooded at the apex. *Petals* shorter than the sepals. *Stamens* 10-15. *Capsules* .25 in. across, villous between the spines; spines about .1 in. long, glabrous, hooked, sharp pointed.

Very common along road sides, jhums and abandoned village sites in the plains of ASSAM, NAGA HILLS.

Flrs. 8-11. Fr. 9-12.

CORCHORUS, Linn.

Herbs or undershrubs. *Leaves* simple, serrate, the lower pair of teeth usually much prolonged into filiform appendages. *Flowers* small, yellow, bracteate. *Sepals* 4-5. *Petals* 4-5, not glandular at the base. *Stamens* generally numerous, on a short torus. *Ovary* 2-5 celled; ovules many in each cell; style short. *Capsule* elongated or subglobose, echinate or muricate, usually beaked. 2-5 valved, sometimes transversely septate between the seeds. *Seeds* numerous.

The following two species are cultivated in SIBSAGAR, LAKHIMPUR and DARRANG for jute fibre and their cultivation is gradually extending throughout ASSAM.

Capsule globose, muricate and ridged, not beaked; cells not transversely septate.

.. 1. *C. capsularis*.

Capsule elongate, glabrous, 10-ribbed, beaked; cells transversely septate.

.. 2. *C. olitorius*.

1. *Corchorus capsularis*, Linn. Vern. *Tita-mura-pat*, Ass.; *Nalita*, *Nalita-pat*, Beng.-The leaves of this species are bitter and are used as a bitter tonic, and dried leaves are kept in households in E. BENGAL for this purpose. This species is more generally cultivated in Assam than *C. olitorius*. Two varieties are ordinarily recognized, one being larger plant than the other.

2. *Corchorus olitorius*, Linn. Vern. *Mura-pat*. Ass. ; *Pat*, *Koshla*, Beng. The fruit characters given above in the analysis are sufficient to distinguish it from the foregoing species. The leaves are mucilaginous, sweetish, and are used as a spinach.

In Watt's Dictionary of Economic Products most of the remarks as to the use of the leaves of these two plants have been mixed up.

Much of the wealth of rural E. BENGAL is due to these two plants which yield the rûle of commerce and are very extensively cultivated for the fibre.

3. COLUMBIA, Pers.

Columbia floribunda, Wall. Vern. *Arlak-pi*, Mik. ; *Bra-rayang-phung*, Kach. ; *Khasre*, Nep. ; *Thaltre*, Lush. ; *Antha-thung*, Kuki ; *Larnbunda*, Ass. (Kamrup).

A deciduous tree up to 50 ft. in height and 3 ft. in girth ; stem fluted ; all young parts more or less scabrid with short stellate hairs. *Bark* grey and rough outside, reddish-brown or cream coloured inside, with broad streaks of lighter tissue, turning deeper brown on exposure, 3-5 in. thick, finely fibrous, in thin concentric layers, scarcely mucilaginous. *Leaves* 4-6 by 3-7 in., upper small, rotundate ovate or obovate-oblong or sub-orbicular, acute or subacute, often shortly lobed, irregularly gland-toothed, subcoriaceous, rugulose and scabrous on both surfaces, minutely punctate beneath ; lateral nerves 3-5 on either side of the middle nerve ; base rounded or slightly cordate, 5-7 nerved ; petiole .7-2.2 in. long, swollen at the apex, scabrid. *Flowers* small, in few fld. clusters ; clusters arranged in lax terminal panicles or shorter peduncles from upper leaf axils ; bracts leaf-like ; pedicels slender, pubescent. *Sepals* 5, distinct, red inside, .1 in. long. *Petals* 5, oblong-spathulate, as long or longer than sepals, yellow with scarlet dots, each with a small glandular cavity at the base. *Stamens* numerous, free on a raised torus. *Ovary* 3-5 celled, each cell 2-4 ovuled. *Capsules* .6-.9 in. across, of 3-5 indehiscent, 2-winged, pubescent, usually 1-seeded cocci ; wings venose. *Seeds* albuminous ; cotyledons flat.

A rather handsome tree with a gregarious tendency. Nichuguard and Dimapui, SIBSAGAR ; Lumding, Doboka, Amguri, etc., NOWGONG, USHAH HILLS ; NORTH CACHAR HILLS ; NAGA HILLS.

Frs. 6-8. Fr. 11-1.

4. PLAGIOPTERON, Griff.

Plagiopteron suaveolens, Griff.

A very large woody climber. *Bark* brownish grey with shallow fissures outside, dull white with oval brownish patches inside ; young parts stellate pubescent. *Leaves* opposite, 4-6 by 2.5-3.5 in., elliptic to obovate, abruptly acuminate, entire, glabrous or slightly puberulous along the midrib underneath, nerves raised underneath, main lateral nerves 5-6 on either side, lowest pair basal, upper arcuate, tertiaries transverse to the secondaries ; petiole more or less stellate pubescent, 3-5 in. long ; stipules short, linear,

caducous. *Flowers* small, greenish in peduncled panicles from upper leaf axils; peduncles 2-3 in. long. *Sepals* 5, minute. *Petals* 5, oblong, puberulous outside, much longer than the sepals, revolute. *Stamens* numerous; filaments filiform, exceeding the petals; anthers 2-celled, cells divergent at the base. *Ovary* pilose, 3-celled, with 2 ovules in each; style subulate. *Fruit* dry, turbinate, stellate pubescent, 3-winged at the top, 3-1 celled, wings oblong, elliptic or oblong, 1-1.7 in. long, unequal with subparallel veins, base of wings hollow and continuous with the cavity of the fruit.

KHASI & JAIINTIA HILLS in low elevations.

Fr. '12.

FAM. 26. ELÆOCARPACEÆ.

Trees or shrubs without mucilage sacs. *Leaves* alternate, simple, not lobed, stipulate. *Flowers* regular, 2-sexual, in axillary racemes. *Sepals* 4-6, valvate. *Petals* 4-6, valvate, generally lacinate at the apex, inserted outside the disk. *Stamens* indefinite, inserted on a fleshy disk; anthers linear, opening by terminal pores. *Ovary* sessile, 2-5 celled; style columnar. *Fruit* a drupe with a bony stone or a capsule. *Seeds* pendulous with fleshy albumen; cotyledons flat.

Peduncles racemed Torus raised. Fruit a smooth drupe.

... 1. Elæocarpus.

Peduncles 1-flowered. Torus depressed. Fruit an echinate or setose capsule.

... 2. Echlocarpus.

1. ELÆOCARPUS, Linn.

Trees. *Leaves* usually crenate or serrate and generally deep red when old. *Flowers* sometimes polygamous. *Sepals* 4-5, distinct, generally keeled within along the middle. *Petals* 4-5. *Disk* glandular. *Anthers* dehiscing by a transverse slit at the apex. *Ovules* 2 in each cell of ovary, pendulous. *Drupe* with a single horny tuberculate stone divided into 1-5 1-seeded cells. *Seeds* with hard testa.

- I. Petioles continuous, drupe globose.
Anthers bearded; ovary 5-celled, stone prominently tubercled.

.. 1. *E. Ganitrus*.

- II. Petioles geniculate and usually swollen at the apex; drupes elongate:—

A. Petals narrowed towards the base:—

1. Flowers under 4 in. —

a. Anthers bearded, but not awned at the apex:—

f. Petiole 1-2 in. long, thickened and with a pair of glands at the apex:—

Bracteoles minute, caducous; glands at the apex of petiole minute:—

* Leaves and petiole glabrous or glabrescent:—

Leaves and sepals prominently pustulate when dry, stone indistinctly rugose.

.. 2. *E. floribundus*.

Leaves and sepals not pustulate when dry, stone prominently rugose.

.. 3. *E. robustus*.

** Leaves and petiole tomentose.

.. 4. *E. Wallichii*.

*** Leaves glabrous; glands at the apex of petiole usually prominent, often of leafy processes; bracteoles fairly large, subsistent; stone tuberculate.

.. 5. *E. sikkimensis*.

1. Petiole under 1 in. long and without any glands at the apex:—

Nerve axils glandular, anthers shortly ciliate at apex, dry leaves often minutely pustulate, stone rugose.

.. 6. *E. lanceifolius*.

b. Anthers usually not bearded or awned at apex:—

i. Leaves glabrous, bracteoles minute, caducous:—

Leaves obovate, buds silky,

pyramidal, 5-cornered.

.. 7. *E. hygrophilus*.

Leaves narrow-lanceolate, buds glabrescent, ovoid oblong, sublerete.

.. 8. *E. acuminatus*

ii. Leaves ferruginous tomentose beneath, bracteoles lacinate or tinged, persistent:—

Petals lacinate to near the base.

.. 9. *E. Braccatus*.

2. Flower over .4 in. across; anthers awned:—

a. Large trees; lateral nerves of leaves usually 12 pairs or more, stone of fruit compressed, ridged, rugose:—

Leaves rather scattered, generally more or less acute at the base; petiole up to 2 in.; awn of anthers about as long as the anthers, stone ridged along the faces.

.. 10. *E. aristatus*.

Leaves usually closely crowded, generally obtuse at the base; petiole on young shoots very short and stout or 0, awn of anthers shorter than the anthers.

.. 11. *E. rugosus*.

b. Small tree; lateral nerves of leaves 7-8 pairs:—

Leaves oblanceolate, often with prominent glandular pits at nerve axils beneath.

.. 12. *E. obtusus*.

B. Petals dilated towards the base:—

1. Ovary villous, leaves more or less serrate:—

Lateral nerves of leaves over 12 pairs, usually glandular at the axils of bifurcations near the margin. Flowers (about .5 in.) long, anthers awned.

.. 13. *E. varunna*.

Lateral nerves of leaves under 12 pairs, not glandular at the axils of nerve bifurcations. Flowers small, about .15-.2 in. long; anthers shortly beaked.

.. 14. *E. prunitolius*.

2. Ovary glabrous, leaves entire, anthers awned, flowers about .3 in. long.

.. 15. *E. integer*,

N. B. Species 2-6 are closely allied. The characters on which their separation has been based are variable in this genus, further field observations are therefore necessary for their classification.

1. *Elæocarpus Ganitrus*, Roxb. Vern, *Rudraksha*, Sans. & Beng., Ass.; *Rudrai*, Ass.; *Ludurai-asing*, Miri & Abor; *Boragi-asing*, Miri; *Lekam-arong*, Mik.; *Ludrai*, Sylh. & Tipp., *Van-tha-mu-thing*, Kuki; *Undarmala-biphang*, Mech.; *Ludrok*, Udruk, Garo.; *Soh-langskai*, Khasi.

A tree up to 60 ft. in height and 4 ft. in girth, generally buttressed at the base; young parts silky puberulous. *Bark* fairly smooth and greyish-brown outside with light reticulate fissures and large white blotches; uniformly pale but turning brown after exposure and fibrous inside, .3-.5 in. thick. *Leaves* 3-6 by 1-2 in., oblong-lanceolate, oblanceolate or sometimes elliptic, acute or acuminate, minutely crenate serrate or subentire, thinly chartaceous, almost glabrous, turning yellow before falling; main lateral nerves 8-12 on either half, slender, arched; base generally narrowed or acute; petiole .4-.6 in. long, sharply margined. *Racemes* about 3 in. long, often drooping, mostly from axils of fallen leaves. *Flowers* white, nodding, .3-.5 in. across; buds ovoid, conical; pedicels .3-.4 in. long, silky. *Sepals* 2-2.5 in. long, linear-lanceolate, acuminate, silky canescent outside. *Petals* about .3 in. long, cuneate-oblong, pubescent along the margins near the base, lacinate one-third to half way down, into 10-15 processes. *Stamens* about 30; filaments very short; anthers .1-.15 in. long, one cell slightly longer than the other and bearing fine white bristles at the apex, torus pubescent, wrinkled. *Ovary* normally 5-celled, silky villous. *Drupe* .6-1 in. across, globose, deep blue and mealy outside, succulent when fully ripe; stone normally 5-celled, strongly tubercled and marked with as many longitudinal furrows as there are cells in the stone.

Unquestionably indigenous, occurs sporadically in all the DISTRICTS and ascending up to about 1000 ft., but nowhere so common as in the N. E. FRONTIER DISTRICT.

The wood is white, fine—and even-grained, tough and elastic. Weight 28 lbs. per c. ft.

The tree is much prized for its tubercled nuts which are strung up into rosaries worn by various sects of Hindus. Freaky nuts with fewer or more than 5 cells are believed to possess special merits attached to each number and therefore fetch much higher prices.

Flrs 5-6.

Fr. 11-12.

2. *Elæocarpus floribundus*, Bl. Vern. *Belphei*, Sylh., *Jalpai*, Beng.; *Ok-hi-simung-ti*, *Theng-koreng-arong*, Mik., *Charphal*, Manip.; *Badarphang*, Kach.; *Ron*, Kuki; *Koying*, Nep.

A tree up to 60 ft. in the height and 8 ft. in girth; branchlets glabrous, buds silky. *Bark* greyish-brown, vertically fissured, and often with horizontal wrinkles outside; reddish and fibrous inside. *Leaves* 3-6 by 1.5-2.5 in., ovate-elliptic, bluntly acuminate, acute or cuneate, less often rounded at the base, coarsely repand-serrate, subcoriaceous, glabrous, blistered on both surfaces when dry, turning bright red before falling; main lateral nerves 5-7 on either half, arcuate; tertiary nerves obscure; petiole .8-2 in. long, glabrous, thickened, geniculate and with a pair of small glands at the apex. *Racemes* 5-6 in. long, from axils of fallen leaves, 20-30 flowered; rachis minutely puberulous—glabrescent; pedicels .3-.6 in. long, glabrescent. *Flowers* white, .3 in. across. *Sepals* .2 in. long, lanceolate, blistered outside when dry scarcely keeled inside, thickened and tomentose at the margins. *Petals* as long as the sepals, triangular-cuneate, irregularly lacinate to varying depths into about 25-30 filiform processes, margins finely ciliate. *Stamens* 20-25; filaments very slender and weak, about .05 in. long, minutely puberulous; anthers slender, slightly longer than the filaments; cells nearly equal, terminated by a few minute bristles. *Disk*, *ovary* and base of style silky villous. *Drupe* light-green, about 1.8 by .8 in., externally resembling an olive, oblong, smooth; flesh pleasantly acid, edible; stone 3-celled or by suppression 2-celled, terete, tapering towards both ends, very shallowly rugose and with 3 fine furrows. *Seeds* .75 by .2 in., spindle-shaped; albumen oily.

In the Makum Range LAKHIMPUR and perhaps elsewhere throughout the upper parts of the ASSAM VALLEY, not common.

Often cultivated round homesteads in all the DISTRICTS, up to 5500 ft. in the KIIASI HILLS (Shillong) for the fruit.

The fruit is eaten cooked or pickled.

Fls. 5-8. Fr. 11-12

There seem to be two forms of this tree; 1. cultivated with narrower leaves, shorter pedicels and larger and more fleshy drupes and 2. wild with broader leaves, longer pedicels and smaller, harder and more astringent fruits.

3. *Elæocarpus robustus*, Roxb. Vern. *Poreng*, *Seleng*, Ass.; *Theng-phrang-ki-arong*, Mik., *Muya-phang*, *Bon-khong-krai-phang*, *Songrang-haphang*, Kach.; *Agong* or *Ragong*, *Bol-ragong*, *Gangmai*, Garo; *Tehei-chi-ching*, Naga; *Dieng-Lasaw*, Khasi (Tharia); *Dieng-ja-roi*, Khasi (Nongkla); *Dieng-soh-khyllam*, Khasi; *Huara*, Sylh.

A middle-sized tree up to 65 ft. in height and 6 ft. in girth; stem much fluted and with numerous aerial roots at the base in swampy localities; young shoots generally rusty pubescent. *Bark* light greenish-grey, nearly smooth and lenticelled on young trees, rough and warty on mature ones; fibrous inside, greenish yellow, on older stems mottled with deep brown dots. *Leaves* 4-9 by 2-4 in., ovate-oblong to ovate lanceolate, acuminate, rounded or cuneate at the base, cuspidately repand-serrate, thinly coriaceous, glabrous above, softly rusty tomentose, especially along the nerves

when young but afterwards glabrescent beneath, pinkish brown when very young; turning bright scarlet in the cold weather; main lateral nerves about 10-12 on either half, depressed above, prominent beneath, tertiary nerves laxly reticulate; petiole 1-2 in. long, swollen at both ends, geniculate and often with two processes near the apex. *Racemes* 2.5-5 in. long, generally from axils of fallen leaves; rachis grey, puberulous; bracteoles minute, caducous. *Flowers* white, fragrant, .25-.3 in. across; buds globose at first, gradually turning ovoid; pedicels .25-.5 in. long, grey puberulous, generally curved. *Sepals* .15 to .2 in. long, lanceolate, puberulous, rather strongly keeled inside, densely villous along the somewhat thickened margins. *Petals* irregularly laciniate into 30-40 very fine processes, basal portion densely ciliate along the margins. *Stamens* about 40; filaments very short; anthers about .06 in. long, minutely glandular puberulous, the longer valve ciliate. *Disk* of 5 distinct globose silky glands. *Drupe* about 1 in. long, ovoid, greenish-yellow, 2-3 celled, oblong or ovoid, with 3 shallow longitudinal grooves, rather prominently rugose, albumen oily.

Fairly common throughout the PROVINCE except perhaps in the N. E. FRONTIER DISTRICT, ascending up to about 2500 ft.

Wood greyish white, soft, even-grained but porous, med. rays fine. Weight about 35 lbs. per c. ft., takes a fine polish.

Fls. 4-5. Fr. 8-9.

Very closely allied if at all distinct is *E. lucidus*, Roxb. A tree up to 60 ft. in height and 4-5 ft. in girth. *Bark* plain, greyish white, with vertical lines of lenticels and faint horizontal wrinkles; red underneath the corky layer, dark brown inside, shading off to yellow near the cambium, turning blackish brown after exposure. *Leaves* 3-7 by 1.5-3 in., glabrous or more or less puberulous along the midrib above and the petiole; base often unequal; lateral nerves 8-11 on either side of midrib; petiole .6-1.8 in., generally with glandular spurs near the apex. *Flowers* somewhat smaller than *E. robustus*. *Stamens* 30 in 5 groups with reddish brown silky glands between the groups; filaments very short, longer anther cells with few or without apical bristles. Other characters as in *E. robustus*. *Drupe* not seen.

Dhansiri reserve, NOWGONG, Umling reserve KHASI & JAINTHIA HILLS, probably in all localities where *E. robustus* is found. There is no constant character by means of which the two can be separated.

4. *Elæocarpus Wallichii*, Kurz.

A small tree with brown smoothish bark; young shoots, under-surface of leaves along the nerves and petiole greyish or tawny tomentose. *Leaves* 6.5-12 by 3-5 in., oblong to elliptic, acuminate, distantly serrate or subentire, glabrate, except along the midrib and nerves above; lateral nerves 12-15 on either half, looping near the margin, prominent beneath; petiole 1-2 in. long, geniculate, often with two minute glands at the top. *Racemes* 4.5-8 in. long from the axils of fallen leaves, tomentose; pedicels .3-.4 in. long. *Flowers* small; sepals tomentose, lanceolate, about .2 in. long. *Petals* cuneate, deeply laciniate, .15-.2 in. long; anthers bearded. *Ovary* villous, 3-celled with 2 collateral ovules. Fr. not seen.

GOALPARA.

Stem sometimes stilted on aerial roots.

5. *Elæocarpus sikkimensis*, Mast. Vern. *Seleng*, Ass.

Generally the names given to the foregoing species are applied to this tree also.

A middle-sized tree up to 50 ft. in height; young shoots and inflorescence pubescent. *Bark* grey and rough with vertical fissures outside; green underneath the corky layers, pale, gradually more yellowish towards the cambium and sometimes mottled with reddish-brown dots inside. *Leaves* 4-7 in. by 2-3.5 in., elliptic or ovate-oblong, acuminate, somewhat distantly cuspidate-serrate, acute, subacute or obtuse at the base, rather thinly chartaceous, glabrous, orange red during the cold weather; lateral nerves 7-9 on either side of the midrib, much arched; tertiary nerves very slender, laxly parallel-reticulate underneath; petiole 1-2 in. long, thickened but not pronouncedly geniculate at the apex, generally with two leafy processes a little below the base of the blade which are sometimes up to .6 by .1 in., falcate and with a distinct midrib. *Racemes* 2.5-4 in. long, from axils of current year's leaves; thinly pilose; pedicels .3-.6 in. long, slender; buds silky, each supported by a large subpersistent boat-shaped hairy bractcole, .15-.25 in. long. *Flowers* about 12-20 in each raceme, .3-.4 in. across. *Sepals* narrow-lanceolate, sparsely pilose outside, thinly keeled and glabrous inside, tomentose at the thin margins. *Petals* white, cuneate, almost glabrous, divided above into 20-25 filiform processes. *Stamens* 25-30; tip of the longer anthers bearded with 2-4 very small white bristles. *Disk* small, silky, lobes obscure, contiguous. *Ovary* conical, silky; style persistent. *Drupe* 2 by 1 in.; stone tubercled.

Throughout Upper ASSAM in submontane tracts but more common in LAKHIMPUR than in the other DISTRICTS.

A more handsome tree than the preceding species.

Figs. 1-5:

6. *Elæocarpus lanceæfolius*, Roxb. Vern. *Dieng-soh-khyllum*, Kh.; *Dieng-soh-lyngka*, Synt.

A middle sized evergreen tree with spreading dense crown; young parts silky pubescent. *Bark* greyish brown and rugose with strings of lenticels outside, uniformly light red and fibrous inside. *Leaves* 2-6 by .75-2 in., lanceolate, elliptic-lanceolate or oblanceolate, acuminate, distantly crenate-serrate, glabrous or almost so, often minutely pustulate beneath, thinly coriaceous, turning bright red when old; lateral nerves 6-8 on either side of midrib often with glands at axils, arcuate, repeatedly bifurcate, and forming loops near the margin; base tapering or narrowed more or less to the margined petiole which is .3-.75 in. long and often rather obscurely geniculate at the apex. *Racemes* 2-3 in. long from the axils of leaves or of those of fallen leaves, puberulous; pedicels slender, .15-.2 in. long; bracts very small, linear lanceolate, caducous. *Flowers* white, small, buds lanceolate. *Sepals* .15-.2 in long, oblong-lanceolate, keeled, puberulous, often glabrate outside, depressed silky puberulous, often glabrate within, minutely woolly along the edge and the keel. *Petals* about as long as sepals, finely laciniate to about half the length, margins finely ciliate. *Stamens* up to 15, puberulous, anther cells

unequal, the larger or sometimes both, minutely bristly at the apex. *Disk* of 5 hairy, round, glands. *Ovary* villous, 3-celled. *Drupe* about 1-1.5 by .7-.9 in., ovoid, green with faint yellow specks, stone rugose with 3 longitudinal channels, 1-seeded.

KHASI HILLS, NAGA HILLS, GARO HILLS—Rongmachelgiri ascending up to 6000 ft.

The fruit is eaten. Wood brown with close annual rings and numerous extremely fine med. rays, pores few in short strings, soft, takes a good polish but is liable to crack in seasoning. Used for tea boxes, house building and charcoal.

Figs. 6-8. Fr. 11-12.

Var. *vestitus*—young parts and inflorescence brown tomentose. *Mature leaves* pubescent along midrib and nerves on the under surface, glabrate above except along the base of midrib; petiole upto .9 in., slightly or not margined, distinctly geniculate at apex, pubescent or puberulous. *Racemes* with stouter rachis than in the type; pedicels stout, 1 in. or less, buds ovoid lanceolate. *Sepals* 2 in. long, brown tomentose outside, thinly silky within, more broadly lanceolate than in the type.

—KASHI & JAINTIA HILLS, 4500-5000 ft.

Figs. 5.

7. *Elæocarpus hygrophilus*, Kurz.

A small tree upto about 50 ft. in height and 3 ft. in girth, young shoots terete, glabrous, shining. *Bark* greyish-brown and nearly smooth outside; light brown shading off to yellow near the cambium inside. *Leaves* 2.5-6 by 1.2-2.4 in., obovate, oblanceolate or cuneate-oblong, blunt-apiculate or rounded at the apex, cuneate at the base, crenately cuspidate-serrate, coriaceous, glabrous, shining above, pale or subglaucous beneath, turning yellow before falling; midrib stout; main lateral nerves about 7-9 on either side of the midrib, arched, slender, irregular, generally with large glandular pits in the axils; petiole .15-1 in. long, stout, flattened above, swollen at both ends, glabrous. *Racemes* 2-4 in. long, rachis rather slender, silvery-pubescent at first, afterwards glabrescent. *Flowers* small; pedicels 2-25 in. long, silvery-silky; buds pyramidal. *Sepals* .25 in. long, acute, silky-pubescent outside, velvety along the margins. *Petals* a little longer than the sepals, glabrous. *Filaments* short, minutely puberulous; anthers not bearded. *Ovary* silky, 3-celled. *Drupe* lanceolate, pointed at both ends.

Specimens collected only from Dirij, NORTH LAKHIMPUR, but this tree probably occurs throughout UPPER ASSAM round swamps and along edges of sluggish streams like *E. obtusus* which it very closely resembles in habit and foliage and for which it is liable to be mistaken when not in flower or fruit.

Figs. 4-5.

Elæocarpus sp. near *E. oblongus*, Gaertn. Vern. *Charai-guti-khowa*, Ass.; *Miri-Komker-asing*, Miri and Abor.

A small tree up to 40 ft. in height and 3 ft. in girth, generally growing near streams and throwing out numerous aerial roots. *Bark* dark-brown with many whitish lenticels outside; greenish brown inside. *Leaves* 3-5 by 1.5-2.5 in., obovate or oblong-elliptic, acuminate, cuspidately crenate-serrate, thinly subcoriaceous, quite glabrous, red during the greater part of the year; main lateral nerves 6-8 on either side of the midrib, slender, much arched, tertiaries very slender and finely reticulated; base narrowed; petiole .75-1.4 in. long, margined, more or less pubescent, often with two setose glands at the apex. *Racemes* about 3.5 in. long from the axils of existing or fallen leaves, pubescent; bracteoles .15 in., ovate lanceolate, adpressed silky pubescent; pedicels stout, about .3 in. long, disk glands about 10, villous. *Drupe* (rather immature) 1-1.5 in., oblong-ellipsoid, pointed at both ends, 2-1? celled.

Specimens incomplete not definitely determined.
Near Bomjui in N. E. FRONTIER DISTRICT also Makum Range in
LAKHIMPUR DIVISION.

Wood white, tough and stony.

Fr. 5-7.

8. *Elæocarpus acuminatus*, Wall.

A tree with lenticellate branches, bark greyish with shallow furrows. *Leaves* 2.5-5.2 by .6-1.2 in., narrow lanceolate, acuminate, coriaceous, glabrous, silky when very young; lateral nerves impressed and rather indistinct above, 8-10 on either half; base tapering to the short petiole; petiole up to .4 in. long, geniculate and slightly swollen at the top. *Racemes* stoutish from the axils of fallen leaves puberulous, 1.5-3.5 in. long, pedicels .2-.25 in.; buds oblong ovoid. *Sepals* .2 in. long, oblong lanceolate, nearly glabrous outside, adpressed pubescent, keeled within, minutely villous on the edges and the keel. *Petals* white, nearly as long as sepals or slightly shorter cuneate, apex laciniate to more than half the length into 16-18 segments, villous on the margins on the lower portion; stamens 35-40; filaments about half the anthers, both puberulous; anthers not bearded, shortly apiculate. *Disk glands* 5, broad, 2-lobed, pubescent. *Ovary* villous, 2-celled; ovules in 2 rows in each cell. *Drupe* not seen.

KHASI and JAINTIA HILLS, Mowmai, Chera. Thlongblei, up to 4500 ft.
Flrs. 9.

9. *Elæocarpus Braceanus*, Watt.

A small tree with warty brown bark; young shoots, undersurface of leaves along the nerves and petioles, ferruginous tomentose. *Leaves* 2.5-5.5 by .75-2 in., elliptic, elliptic-lanceolate or oblong lanceolate, acuminate, glabrous and impressed along the nerves above, strongly 9-10 nerved beneath; base narrowed; petiole .3-.6 in., slightly swollen and jointed at apex. *Racemes* from axils of fallen leaves 1.5-5.5 in. long, tomentose; pedicels stout, very short. *Buds* roundish or ovoid, supported usually by 3 long persisting, small, deeply lacinate bracteoles. *Flowers* small, brown tomentose. *Sepals* lanceolate, .15 in. *Petals* slightly smaller than the sepals deeply lacinate into numerous segments to near the base. *Stamens* 30 or more puberulous; anthers not bearded. *Ovary* 2-celled with 2-collateral ovules in each cell, villous; disk glands hairy. *Drupe* 1.25 by 1 in., abruptly pointed at the apex, stone ovoid, terete, very rugose with three rather indistinct grooves.

NAGA HILLS, KHASI and JAINTIA HILLS up to 5000 ft.

Flrs. 10. Fr. 6.

10. *Elæocarpus aristatus*, Roxb. Vern. *Gerela-sopa*, Ass. (Lakh.); *Nagint*, Ass. (Kam.); *Mirchobi*, Mik.; *Lechau*, Manip.; *Bou-champa*, Cach.; *Karnakhur*, Tipp.; *Chham-nangal*, *Gangma-jachhang*, Garo; *Dieng-thang-khapiah*, Khasi (Nongkila).

A large tree up to 100 ft. in height and 8 ft. in girth, stem of large trees buttressed at the base; branchlets thick, rough

with heart-shaped or oval scars of fallen leaves, coarsely rusty hairy towards the extremity. *Bark* dun-grey, nearly smooth, but with horizontal wrinkles and very fine vertical fissures outside; white with coarse brownish veins inside. *Leaves* somewhat crowded about the ends of the branchlets, erect and pinkish-green when young, 4-12 by 1.7-5.5 in., cuneate obovate or oblanceolate, rounded or subacute at the tip, usually cuneate at the base, distantly minutely serrulate or subentire, thinly but firmly coriaceous, glabrous, turning red before falling; midrib very stout; lateral nerves 12-22 on either half, slightly arched or almost straight, often glandular at the axils; petiole .6-2 in. long, swollen at both extremities, geniculate at the apex, flattened and rusty hairy above while young; stipules subulate, caducous. *Racemes* axillary, 4-6 in. long; rachis and pedicels rusty villous, but ultimately glabrescent; bracts leafy, cuspidate-toothed, often lacinate towards the base, up to .4 in. long, caducous; pedicels .5-.7 in. *Flowers* pale white, drooping, faintly scented, .8 in. diam.; buds lanceolate, 5-ribbed. *Sepals* .6-.7 by .1 in., narrow lanceolate, rusty-tomentose outside, glabrous within, margins rather thick, involute. *Petals* .5-.6 in. long, wedge-shaped, densely silky hairy outside, deeply lacinate. *Stamens* up to 55; filaments short; anthers about .2 in. long, linear, with an awn of about the same length. *Ovary* 2-celled, ovoid, very hairy; style subulate. *Drupes* about 1-1.3 in. long, oblong; stone sharply pointed at both ends, compressed, with a longitudinal ridge on each of the faces, rugose.

Fairly common throughout ASSAM except perhaps the N.E. FRONTIER DISTRICT, always in mixed high forests ascending to about 1600 ft.

Wood light dun-brown, moderately hard, weighing about 45 lbs. per c. ft. Medullary rays mostly very fine with occasional ones of moderate thickness; pores of moderate size, often subdivided, annual rings indistinct, used for tea-boxes.

Frs. 4-5. Fr. 8-9.

11. *Elaeocarpus rugosus*, Roxb. Vern. *Gatronga*, Ass. (Lakh); *Phul-champa*, *Bor-chopa*, Ass. (Darr.); *Turuk-pai-asing*, Miri and Abor; *Kadeng-srang-arong*, Mik.; *bon-lai-su-phung*, Kach.; *Sanku-nuru*, Daff.; *Ankhi-si-phak*, Garo.

A lofty deciduous tree up to 100 ft. or more in height and 14 ft. in girth, in foliage and habit closely resembling *Terminalia Catappa*; stem of mature trees buttressed at base; branches spreading; branchlets thick, more or less rufous-hairy. *Bark* greyish, rough and more or less wrinkled outside; green underneath the corky layer, pale-brown and mottled with brown dots or streaks inside. *Leaves* crowded at ends of branchlets, 6-16 by 3-6 in., obovate, oblanceolate or subpanduriform, subacute, bluntly apiculate or obtuse, narrowed and generally obtuse at base, distantly and often minutely cuspidate-serrate or subentire, coriaceous, glabrous when mature, turning red before falling; midrib stout, triangular in section; lateral nerves 12-16 on either half, spreading, usually with large glands at the axils; tertiaries strongly reticulate; petiole 0 or very short on young shoots,

1-2.2 in. on flowering shoots, twigs, thick, swollen at both ends. *Racemes* axillary or from nodes below the leaves, 4-7 in. long; rachis buff-tomentose; bracts up to 1.2 in. long, leafy, oblanceolate, serrate, caducous. *Flowers* of the size of the preceding species; pedicels .5-.9 in. long, buds cylindric, ovoid, pointed, 5-ribbed; .6-.75 in. long. *Sepals* linear lanceolate acuminate, buff-tomentose or pubescent outside. *Petals* about as long as the sepals, cuneate oblong, densely buff-silky outside, glabrous inside. *Stamens* up to 50; filaments shorter than the anthers, pubescent; anthers unequal, awns shorter than the anthers. *Ovary* 2 celled, shaggy, pointed; style much longer than the ovary, tapering to a fine point. *Drupe* about 1.3 in. long, obovoid, greenish yellow; stone generally 1-celled, compressed and with sharp edges, pointed, strongly rugose.

Fairly common throughout UPPER ASSAM, especially in the N. E. FRONTIER AND LAKHIMPUR DISTRICTS, ascending to lower foot hills.

Wood white of similar structure as of the last species but more porous and lighter, about 38 lbs. per c. ft. and annual rings marked by a thin line of softer tissue. Suitable for tea-boxes.

Fls. 3-4. Fr. 9-10.

12. *Elaeocarpus obtusus*, Bl. Syn. E. Monoceros, Cav. Vern. *puni-sopa*, Ass. (Lakh.); *phutkuli*, Ass. (Darr.)

A small tree up to 30 ft. in height and 2-2.5 ft. in girth, generally branched from near the ground and with aerial roots near the base; branchlets glabrous. *Bark* grey, nearly smooth, shining but with scattered lenticels, scarcely 1 in. thick, leathery; blaze pale. *Leaves* 3-5.5 by 1.5-2.5 in., obovate-oblanceolate, obtuse or subacute, cuneate at the base, distantly cuspidately crenate-serrate, thinly coriaceous, quite glabrous, shining above, dull beneath, turning yellow to deep orange before falling; lateral nerves 6-8 on either side of the midrib, slender, much arched, generally with large glandular pits at the axils; petiole .6-1 in. long, swollen at the ends, flattened above. *Racemes* 2-3 in. long, corymbose from the axils of existing or fallen leaves, 4-8 flowered; pedicels 1-1.5 in. long, slender, glabrate. *Flowers* .7-.9 in. long, dull white; buds lanceolate, 5-ribbed. *Sepals* .7 in. by about .12 in. near the base, oblong lanceolate, glabrous inside, with thickened tomentose margins. *Petals* cuneate, oblong, slightly larger than the sepals, canescent outside, thinly pilose inside. *Disk* 10 lobed, grey-silky as also is the ovoid ovary. *Stamens* 50-65, one of the anther valves terminating in an awn rather longer than the anther. *Drupe* 1.5 in. long, ovoid, obtuse; stone 1-celled, terete, strongly tubercled.

Along edges of swamps or sluggish streams in LAKHIMPUR, SIBSAGAR and DARRANG; not very common.

The stones of the fruit are slung up in roaries and given to children to wear.

Fls. 5.

E. *staffianus*, Gagnep. A middle-sized to small tree with light greyish bark. *Leaves* mostly towards the ends of branchlets, 4-6 by 1.5-2.5 in., oblong to obovate, apex somewhat obtusely acuminate, serrulate or nearly entire, thinly coriaceous, glabrous, axils of nerves glandular; petiole .3-1 in. long. *Racemes* axillary or

few from the nodes below the leaves, lax, shorter than the leaves, lax few (usually up to 4) flowered; pedicels 8-1.2 in. long, buds ovate acute, glabrescent, .5-.65 in. long. *Sepals* .6-.7 in. long, glabrescent or thinly pubescent outside. *Petals* about as long as the sepals, silky pilose, apex 2 lobed and laciniate into 25-30 segments. *Filaments* pubescent, shorter than the anthers, 1/2 as long as the anthers. *Drupe* ovate to oblong, stone 1 in. by .6 in., abruptly pointed at the apex and base, somewhat compressed, muricate, margins ridged, ridges denticulate.

Sadiya, Griffith 702 ! UPPER ASSAM.

Closely allied to the preceding if at all specifically distinct. Some of the sheets included under *E. obtusus* in Calcutta Herbarium are preferable to this species. These are apparently connected by good intermediates.

It differs mainly by fewer flowered, laxer racemes and more compressed ridged stone of the drupes.

13. *Elæocarpus Varunna*, Nam. Vern. Bhadrak or Bhadraksha, Poreng (?) Ass. (Sib.); Niganibual, Ass. (Lakh.); Pong-o-test, Naga; Gangma-chiring, Garo; Mir-chobe, Mik.; Dieng-ri-lam, Khasi; Dieng-sia-sah, Khasi (Uman); Dieng-soh-dkhap, Khasi (Nongkhlaw).

A fairly large tree up to 60 ft. in height and 6 ft. in girth with a large spreading crown; stem sometimes stilted on aerial roots; young parts grey silky pilose. *Bark* grey or brownish-grey, nearly smooth or lightly fissured, often with vertical lines of lenticels, blaze dirty or brownish yellow, fibrous and soft. *Leaves* 4-8 by 1.7-3 in., elliptic or oblong, finely acuminate, subacute or rounded at the base, regularly cuspidately crenate-serrate, firmly chartaceous or thinly coriaceous, grey silky when very young, afterwards bright green and shining, deep red before falling; lateral nerves 12-15 on either half, arched, repeatedly bifurcating near the margins, often with small glandular pits at the axils of the bifurcations; tertiary veins conspicuous though fine, rather close, subparallel; petiole 1.3-2.5 in. long, thickened and geniculate below insertions of blade. *Racemes* 2.5-5 in., axillary, ascending, at first grey-silky, glabrescent; pedicels .25-.5 in. long, rather stout and stiff, curved. *Flowers* .5-.6 in. across, white; buds lanceolate, about as long as the pedicels, obsolete 5-ribbed. *Sepals* densely bright silky, especially outside, lanceolate. *Petals* slightly shorter than the sepals, oblong, broadest at the base, pale silky except at the uniformly fringed apex. *Stamens* about 30; anthers shortly awned. *Disk* red, rather sharply 10 lobed. *Drupe* .7 by .5 in., oblong, rounded at the ends, shining, 1-celled, 2-seeded in all the fruits examined; stone subterete, pointed and with 3 minute apertures at the base, 3-furrowed, not prominently rugose, hirsute.

Common in mixed forests throughout Upper Assam, ascending to 3000 ft. in KHASI HILLS, GARO HILLS, NAGA HILLS.

Wood greyish-white, soft, weighing 30 lbs. per c. ft., fine and even grained, suitable for tea boxes.

Fls. 2-3. Fr. 7-9.

14. *Elæocarpus prunifolius*, Wall. Vern. Dieng-la-khmar, Dieng-ruin, Synt. Soh-khyllam-eit-blany, Soh-khyllam-ai-blany, Khasi.

A small evergreen tree. *Bark* grey and slightly rough outside, blaze pale brown, yellow near the cambium, green on the edges below the corky layer. *Branchlets* glabrous or nearly so; young leaves reddish brown. *Leaves* 2-5 by 1-2.2 in., oblong-lanceolate to elliptic lanceolate, acuminate, crenate-serrate or subentire, subcoriaceous, glabrous, shining above; lateral nerves 6-9 on either side, slender; petiole .8-1.5 in., swollen and geniculate at the apex. *Racemes* mostly axillary, 1.5-3.5 in. long, at first silky pubescent, ultimately puberulous, lower bracts leafy, upper small, broadly spatulate, caducous; pedicels slender, about .25-.33 in. long, often more or less bent near the apex, buds oblong lanceolate, adpressed silky. *Flowers* white; sepals .2-.25 in. long, pilose or glabrate outside, keeled and thinly adpressed pubescent within, margins villous; petals up to .2 in. oblong, laciniate into 6-8 short segments at the apex; base slightly broader, sacciform with two pits which cover the disk glands, adpressed silky on both sides. *Stamens* about 15-25, minutely puberulous; filaments short; anthers not bearded, larger lobe with a short blunt beak. *Disk* glands 10, roundish, silky. *Ovary* 2-3 celled, silky; ovules superposed. *Drupe* .6-.7 in. long, oblong-ovoid, stone .4-.15 in. long, ovoid, slightly rugose, obscurely 3 angled, 3 grooved, pointed at the apex with 3 apertures at the base.

SYLHET, KHASI AND JAINTIA HILLS ascending to 4500 ft.

The fruit is said to be edible. Wood yellowish brown, pores scanty, medullary rays numerous, very fine between slightly thicker ones, takes a good polish, but cracks on drying, not used.

Fls. 1-2. Fr. 10.

15. *Elæocarpus integer*, Wall. Syn. F. *petiolatus*, Wall. Vern. *Holthak*, Lushai, *Hun*, Tipp.; *Cheng-biehhal*, Sylh.

A medium sized tree. *Bark* greyish-brown, warty, more or less smooth, about .25 in. thick; blaze dun yellow, faintly mottled. shoots glabrate. *Leaves* usually 3-8 by 1.7-3.5 in., elliptic lanceolate or oblong elliptic, bluntly acuminate or acute, entire or distantly serrulate, glabrous, coriaceous; lateral nerves 7-8 on either half, nervules prominent, raised; base narrowed; petiole 1-3 in. long, geniculate at the top. *Racemes* axillary or from axils of fallen leaves, 3-5 in. long, glabrate; pedicels curved at apex, .25-.45 in., finely puberulous, buds ellipsoid, abruptly acuminate. *Flowers* .4-.5 in. across; sepals .25-.3 in. long, lanceolate, glabrate outside, puberulous and keeled within, margins finely villous. *Petals* nearly as long, oblong, finely laciniate and glabrous at the apex, silky on both surfaces, the hairs on the inner face reflexed, ridged in the centre, concave; base saccate with a sub two-celled pit and broader. *Stamens* 30; filaments less than half the length of anthers, finely adpressed pubescent, longer lobe of anthers awned, awns reflexed, disk of 2-10 rounded glabrescent glands. *Ovary* glabrous, 2-celled with 2 superposed rows of ovules. *Drupe* oblong ovoid, .6 in. long; stone slightly rugose, indistinctly 4-ridged.

CACHAR, SYLHET,

Fls. 1.

E. bracteatus, Kurz.—A large tree. Leaves perfectly glabrous, elliptic, obovate, serrate, narrowed into a petiole .5-1 in. long, which is thickened and geniculate at apex. Secondary nerves 8-10 pair. Racemes short, corymbose. Pedicels 3 times the length of sepals, in the axils of oblong-obovate, often serrate bracts. Sepals .7 in. long. Awn nearly as long as anther, ovary 2-celled, tomentose, stone wrinkled.

UPPER ASSAM (After Brandis).

2. ECHINOCARPUS, Bl.

(Included under *Sloanea* Linn. in Engler & Prantl iii 6.5)

Trees. Leaves penniveined; petiole swollen and geniculate at the apex. Peduncles axillary, 1-flowered, solitary or fascicled. Sepals 4-5, imbricate. Petals 4-5, variously cut. Stamens numerous, free, on a thick flat disk; anthers linear. Ovary 3-4 celled, cells many ovuled; style subulate. Fruit a 3-4 celled or by abortion 1-celled loculicidal—capsule covered with prickles or bristles.

Capsules covered with wiry persistent spines, .6-1 in. long:—

Leaves large, membranous.

.. 1. *E. assamicus*.

Capsules covered with deciduous bristles under .2 in. long:—

Leaves glabrous beneath, capsule about 1 in. across.

... 2. *E. dasycarpus*.

Leaves tomentose beneath, capsule 1.5 in. or more across.

... 3. *E. tomentosus*.

1. *Echinocarpus assamicus*, Benth. Vern. *Joba-hingori*, Ass.; *Phul-hingori*, Ass. (Sib.); *Bandor-lukoi* (monkey's comb), Ass. (lakh); *Sibe-taba*, Abor & Miri; *Tane-using*, Abor; *Sibe-dumpuk*, *Sibe-tatur*, Miri; *Tophen-changne*, Duff.; *Phong-rong-arong*, Mik.; *Sarang*, Meeh.; *Sita*, *Sinta*, Sylh. & Cach.; *Phaithing*, Kuki; *Thing-pat-lhui*, Tipp.

A deciduous tree up to 60 ft. in height and over 5 ft. in girth; old trees usually buttressed at the base. Bark fairly smooth, generally with horizontal wrinkles, grey or blackish outside, often with white blotches, thin; blaze rather granular, very light dun-brown. Leaves 4-16 by 2-6 in., elliptic or oblanceolate, abruptly acuminate, tapering down to a narrow but rounded often cordate base, obsoletely cuspidate-serrate, membranous, thinly pubescent and somewhat harsh beneath, ultimately glabrescent; lateral nerves 7-10 on either half, arched; petiole .4-2.8 in. long, thickened and geniculate at the apex. Flowers after leaf fall, pale creamy white, about .6 in. across; peduncles (in flower) 1-1.5 in. long, buff-tomentose, sub-fascicled or scattered between the leaves, shortly elongating and thickening in fruit. Sepals 1, about .4 by .2 in., densely buff-tomentose, especially outside. Petals 4, cuneately suborbicular, about as long as the sepals, densely pubescent. Stamens 60-150 on a flattened pitted torus; filaments about .2 in. long, densely pubescent; anthers about as long or slightly shorter, linear, sparsely puberulous, opening by an oblique terminal pore. Ovary 4-celled, ovoid, densely silky; style .3 in. long, conical, hairy. Capsule 4-celled, 2-3 in. across with the spines which are very dense, sharp-pointed and sparsely hispid. Seeds arillate.

A common tree in all the DISTRICTS and more or less gregarious on low banks of streams and reclaimed marshes.

Wood of a light cream-colour, light and soft, used for tea-boxes and planking.

Flrs. 10-11. Fr. 3-4. Leafless 9-10.

2. *Echinocarpus dasycarpus*, Benth.

A large tree up to 80 ft. in height and 7 ft. in girth, apparently evergreen. *Bark* greyish-brown, nearly smooth, with faint horizontal wrinkles; inside hard, light reddish-brown with streaks of pale tissue. *Leaves* 4-7 by 2-2.5 in., elliptic, oblong or oblanceolate, acuminate, more or less rounded or narrowed at the base, entire or distantly serrulate, coriaceous, glabrous; main lateral nerves 5-6 on either half, much arched, prominent beneath; petiole .8-1.1 in. long, much swollen at both ends. *Peduncles* usually axillary, solitary or sometimes two together, .5-1.5 in., elongating in fruit, puberulous. *Flowers* .5-.7 in. across, yellowish-white. *Sepals* slightly unequal ovate-lanceolate to broadly elliptic, buff-tomentose. *Petals* broadly obovate, variously cut at the apex and a little longer than the sepals, pubescent. *Stamens* 50-55, pubescent, awned anthers with the awn about as a long as, or slightly longer than filaments. *Ovary* ovoid, villous. *Capsule* about 1 in. diam., globose, generally with 4 woody valves, covered with very dense weak deciduous bristles about .1-.15 in. long, somewhat flattened and obsoletely feathered with golden hairs. *Seeds* black, with a red arillus.

Jaypur Reserve, LAKHIMPUR, NAGA HILLS, KHASI HILLS, 3500-5000 ft.

Wood greyish-brown, soft; pores regular; medullary rays fine and moderately broad, closely packed, straight. Used for planking and tea-boxes in Darjeeling.

Flrs. 7-8. Fr. 1-2.

3. *Echinocarpus tomentosus*, Benth.

A moderate-sized tree. *Bark* dark brown corky outside; dull-white brown, mottled and coarsely fibred inside; young shoots brown tomentose. *Leaves* 6.5-9.5 by 3-5.5 in. (but sometimes attaining 12 by 8 in.), elliptic or ovate, acuminate, coarsely toothed, coriaceous, glabrous above, tomentose beneath along the nerves; lateral nerves 11 on either half, arcuate, prominent; base often narrowed, subcordate or rounded; petiole 1-2 in. long, pubescent, ultimately glabrate, swollen at the apex. *Flowers* .5 in. across, sepals 5, ovate, pointed. *Petals* oblong, concave, 1-5 toothed at the apex. Anthers apiculate. *Capsules* about 1.5 in. across, globose or ovoid, woody, 1-5 valved, rose-pink inside covered with bristles .1 in. long, somewhat dilated towards the top, plumose with hairs, seeds arillate.

KHASI HILLS up to about 4000 ft.

Wood white, soft with large often partitioned pores.

Flrs. 9? Fr. 10-12?

E. Sigun. Blume. A tree. *Leaves* 3-5 by 1-2 in., ovate, oblong or lanceolate, shortly acuminate, chartaceous, glabrous but with a tuft of hairs at the nerve axils; lateral nerves 5-6 on either side,

the first pairs subbasal, very oblique, base rounded, petiole 1-1.5 in. long. *Flowers* solitary, crowded at the base of ^acurrent year's shoots; peduncle .1 in. long, dilated upwards. *Disk* thick, rusty tomentose. *Style* combined, .2 in. long. *Ovary* ovoid or conical, densely tomentose (also with small bristles). Capsule subglobose about 1.4 in. long, generally 4 valved; prickles .2-.4 in. long, blunt, thicker at the base, irregularly set, about .1 in. apart.

* Said to occur in KHASI HILLS, but the only specimens I have seen in Calcutta Herbarium are from Java.

Fr. 10-11.

VOL. I. (PART II).

LINACEÆ TO MORINGACEÆ

*Published under the authority of the Government
of Assam.*

PRICE RS. 8/-

PREFACE

Part II of Vol. I includes the botanical and vernacular names of species described in both Part I and II. The vernacular names alone cannot be used for the identification of the species, as these vary from district to district and even within the limits of one district. In many cases several species are known locally by the same vernacular name. It is therefore necessary to issue a warning and to point out the necessity for checking the plants in detail with the description given in the Flora.

Since sending the materials of the Parts I and II of Vol. I to the press, the following species have been collected from the province, but it was too late to incorporate the descriptions in their proper places. It is however proposed to publish their descriptions as an 'addendum' later on.

PART I.

<i>Species.</i>	<i>Natural Order.</i>
1. <i>Ranunculus lætus</i> Wall.	Ranunculaceæ.
2. <i>Dillenia parviflora</i> Griff.	Dilleniaceæ.
3. <i>Magnolia obovata</i> Hast.	Magnoliaceæ.
4. <i>Polyalthia obliqua</i> Hk. f. & T.	Anonaceæ.
5. <i>Cocculus villosa</i> DC.	Menispermaceæ.
6. <i>Gynandropsis speciosa</i> Halter.	Capparidaceæ.
7. <i>Homalium ciliatum</i> Debb.	Flacourtiaceæ.
8. <i>Polygala persicariæfolia</i> DC.	Polygalaceæ.
9. " <i>erioptera</i> DC.	"
10. <i>Salomonina cantoniensis</i> Lour.	"
11. <i>Garcinia ovalifolia</i> Hk. f.	Guttiferæ.
12. " <i>Mangostana</i> Linn.	"

FLORA OF ASSAM

DISCIFLORÆ.

FAM. 27. LINACEÆ.

Herbs, shrubs or infrequently trees. *Leaves* alternate, simple; stipules lateral, intrapetiolar or 0. *Flowers* regular, bisexual, often 2 or more-morphic. *Sepals* 5 (or 4), free or connate at the base, imbricate. *Petals* 5 or (4), hypogynous or slightly perigynous, imbricate, often contorted, usually fugacious. *Stamens* 1-2 (or sometimes 3) times as many as the petals, occasionally with staminodes united at the base into a ring or short tube; filaments inserted on or near the apex of the tube; anthers versatile. *Disk* of 5 glands-sometimes two-lobed, united to the staminal tube or 0. *Ovary* free, 3-5 celled; ovules 1-2 in each cell, pendulous; styles 3-5, free or connate; stigmas usually terminal. *Fruit* a septicidal capsule, often splitting into cocci or a drupe.

Fruit capsular :—

Calyx glabrous :—

Undershrub; Stamens 5; staminodes 5. .. 1. Reinwardtia.

Small tree; stamens 10. .. 2. Ixonanthes.

Calyx with gland tipped bristles. .. Anisadenia.

Fruit a drupe; stamens 10. .. 3. Erythroxylon.

1. REINWARDTIA Dumort.

Reinwardtia trigyna Planch (incl. *R. tetragyna* Planch). Vern. *Puinli-phul*, Beng., Nep.; *Tin-wa-lei*, *Syntew-lang-ksir*, Kh.

A glabrous undershrub about 3-4 ft. high often with rooting branches. *Leaves* 1-5 by 4-1.5 in., oblanceolate or narrow oblong-lanceolate, usually mucronate, entire or with few minute teeth; lateral nerves fine, variable, usually 5-9 on either half, uppermost pair converging to the apex, membranous; base narrowed and decurrent into slender or ordinary short petiole; stipules minute, caducous. *Flowers* 1-2 in. across, bright golden yellow, solitary, often on short branchlets or in axillary or terminal cymes; pedicels up to 1 in. long. *Sepals* 5, persistent, lanceolate, 4-5 in. long. *Petals* 5, 1-1.5 in. long, obovate, somewhat abruptly narrowed towards the base; stamens 5, included, alternating with as many staminodes, longer than the styles in some flowers and shorter than them in others. *Disk* glands 2-3.

Styles 3, sometimes 4-5 (*R. tetragyna*), more or less connate at the base. *Capsule* globose with thin papery walls, .25 in. across.

Foot of NAGA HILLS in LAKHIMPUR & SIBSAGAR and probably in similar localities elsewhere; KHASI & JAINTIA HILLS ascending to about 6000 ft., sometimes cultivated in gardens. Sometimes gregarious and very showy with its golden yellow flowers.

Flrs. Autumn and winter.

2. IXONANTHES Jack.

Ixonanthes khasiana Hk. f. Vern. *Theibar*, Tipp.; *Selbal*, Garo; *ching-buphai*, Kuki.

A moderate to fairly large glabrous tree attaining 120 ft. in height and over 30 in. in diameter in favourable localities, fluted at the base. *Bark* thin, greyish, rough outside; dark red inside with very fine lines of lighter tissue. *Leaves* 3-6 by 1.2-2.4 in., elliptic-lanceolate to oblong, obtusely acuminate, entire, membranous; secondary nerves about 6-9 on either half with many intermediate nerves of equal thickness, lower oblique, upper arcuate; base narrowed and decurrent into a short petiole. *Flowers* about .2 in. across, in. long peduncled, axillary, cyme bearing panicles; peduncles 1.5-3.5 in. long, more or less flattened and obscurely winged; bracts and bracteoles minute, acute; pedicels .08-.15 in. long. *Sepals* usually 5, shortly connate at the base; persistent, oblong-ovate. *Petals* 5, perigynous, suborbicular-contorted, persistent, enlarged and hardened round the fruit. *Stamens* 10, inserted outside the perigynous annular disk. *Ovary* free, 5-celled; style simple. *Capsule* 5 valved, oblong, pointed at the apex, about 1.5 in. long. *Seeds* winged at the top, about 1 in. long including the wing; wing .15-.2 in. broad, obliquely oblong.

SYLHET, GARO HILLS, and CACHAR.

Wood light brown, even grained, traversed by numerous wavy concentric but discontinuous bands of soft tissue, medullary rays very fine. Takes a fine polish and ornamental in appearance, should prove suitable for cabinet work.

Leaves dry reddish brown.

Flrs. 4. Fr. 12?

ANISADENIA Wall.

Perennial herbs or undershrubs. *Leaves* alternate or somewhat whorled at the top of the stem; stipules intrapetiolar, striate. *Flowers* in terminal spicate racemes; bracts minute, concave, caducous; pedicels short, ultimately reflexed. *Sepals* 5, lanceolate with gland tipped bristles outside. *Petals* 5, contorted, fugacious. *Stamens* 5, hypogynous, connate below, alternating with interposed staminodes. *Glands* 3, one very large. *Ovary* 3 celled; styles 3. *Capsule* oblong, membranous, 1 seeded.

A. saxatilis Wall.—An undershrub or perennial herb, with weak ascending stems upto 18 in. high; lower part often creeping and rooting. *Leaves* 2-4 by .8-1.2 in., lanceolate to oblanceolate or elliptic lanceolate, shortly acuminate, or acute, entire or nearly so, glabrous above, sparingly pubescent and pale beneath; petiole upto .7 in. *Racemes* 2-5 in. long. *Flowers* .3-.25 in. across, pink; pedicels minute.

KHASI HILLS, 4-6000 ft.

Flrs. 7-8. Fr. 10-11.

A. pubescens Griff.—A perennial herb often gregarious in patches, more slender in habit than the preceding. *Leaves* 1-1.5 by '5-'8 in. long, elliptic to lanceolate, acute or shortly acuminate; base acute to cuneate, undersurface pubescent or villous with adpressed silky hairs. *Flowers* about '5 in. long, white, much larger than in *A. sextilis*.

KHASI HILLS, 5-6000 ft.

Flrs. 7-8. Fr. 10-11.

3. ERYTHROXYLON Linn.

Erythroxyton Kunthianum Wall, Vern. *Dieng-pyllengtham*, *Dieng-pain-khar*, Kh.; *Dieng-juwat*, *Dieng-sugsi*, Synt.

A shrub or a small tree; branchlets lenticellate, younger shoots reddish. *Bark* greyish; rough, thin, inside reddish with white streaks which turn brown on exposure. *Leaves* 1.3-3 by '6-1 in., oblong to elliptic lanceolate or obovate-lanceolate, subacute or bluntly acuminate, rarely rounded at the apex, entire, chartaceous, glabrous above, glaucous beneath, red when young; midrib prominent; lateral nerves fine and rather indistinct, similar to intermediate nerves, looping at a short distance from the margin; base narrowed; petiole '1-'1.5 in. long, usually red; stipules intrapetiolar, subulate, setulose on the margin. *Flowers* white, '1.5 in. across, solitary, axillary, often 1-sexual; pedicels slender, thickened upwards, about .3 in. long. *Sepals* 5, ovate acuminate, free nearly to the base. *Petals* 5, up to '1.5 in. long, elliptic-oblong with a 2-fid white ligulate appendage near the base. *Stamens* 10, unequal, usually alternately short; filaments dilated towards the base and united into a tube half way down, free end puberulous. *Ovary* 3-celled; styles 3. *Fruit* a ventrally curved, 3-gonous, more or less erect, glabrous, shining, drupe '5 by '2.5 in., seated on the persistent calyx, red when ripe.

KHASI and JAINTIA HILLS 3000-5500 ft.

The bark is said to be used for chewing with *pan*. Wood light brown, hard, takes a beautiful polish, pores mostly in radial strings joined by numerous very fine transverse lines.

Flrs. 4. Fr. 9.

FAM. 28. MALPIGHIACEÆ.

(Indian genera).

Usually scandent shrubs. *Leaves* opposite, simple, entire, usually exstipulate. *Flowers* regular or irregular, bisexual, 5-merous, white or yellow in axillary or terminal panicles; pedicels articulate, bracteate. *Calyx* deeply 5-partite, in some genera with a gland outside. *Petals* 5, free. *Disk* obscure. *Stamens* 10, hypogynous,

equal or unequal; filaments free or connate below. *Ovary* free, 3-celled, 3-lobed; cells 1-ovuled; styles 1-3. *Fruit* of 1-3 samaras. *Seeds* exalbuminous.

Flowers irregular; calyx glandular; style 1; carpels winged only at the apex.

.. 1. *Hiptage*.

Flowers regular; calyx glandular; styles 3; carpels surrounded by a continuous wing.

.. 2. *Aspidopterys*.

1. HIPTAGE Gærtn.

Climbing shrubs or rarely small trees. *Leaves* opposite, coriaceous, entire, sometimes with intramarginal glands, exstipulate. *Flowers* in simple racemes or leafy panicles, irregular. *Calyx* 5-partite with one large gland outside, partly on the pedicel. *Petals* 5, one differently coloured, unequal, clawed, silky. *Stamens* 10, declinate, one much larger than the others; filaments connate at the base. *Ovary* 3-lobed; styles 1-2, at first coiled; stigma capitate. *Fruit* of 1-3, 3-winged samaras. *Seeds* globose, cotyledons unequal.

Leaves usually acute; shortly acuminate.

Terminal racemes paniced and usually exceeding the leaves.

.. 1. *H. Madablota*.

Leaves usually caudate acuminate.

Racemes much smaller than the leaves

.. 2. *H. acuminata*.

1. *Hiptage Madablota* Gærtn. Vern. *Madhabilata*, Sans., Beng. and Manip.; *Basanti*, Beng.; *Kerek-lata*, Ass.; *Dim-tri-rang-rikang*, Mik.; *Dugrak*, *Dugrak-budu*, Garo.; *Meisheim*, Khasi.

A large evergreen scandent shrub; young shoots more or less pubescent; branches dark brown or black, covered with numerous round lenticels. *Leaves* 4-6 by 1.5-2.5 in., oblong or ovate-lanceolate, acuminate, coriaceous, glabrous, dark-green, shining above, reddish-brown when very young, turning yellow before falling; main lateral nerves 4-6 on either half, arcuate; base acute, rarely rounded; petiole .2-.5 in. long, channelled above. *Flowers* .6-.8 in. diam., more or less scented, in large terminal and smaller axillary leafy panicles or racemes; pedicels .5-.7 in. long, bracteate at the base and with 2 setaceous bracteoles about the middle where they are joined. *Calyx* with a large oblong gland outside; segments .25 in. long, imbricate, silky pubescent. *Petals* .4-.6 in. long, unequal, obovate, clawed, fimbriate, 4 white, the 5th wholly or partly pale-yellow. *Stamens* 10, declinate, one much larger than the rest; filaments shortly connate at the base. *Style* 5, filiform. *Carpels* pubescent; wings 3, oblong-obovate or oblanceolate, sometimes deeply notched at the broad apex, the largest up to 2 by .4 in. *Seeds* globose.

Throughout ASSAM ascending to 2500 ft. in K. & J. HILLS.

Flrs. 1-3. sometimes 11? Fr. 4.

2. *Hiptage acuminata* Wall. Vern. *Jeremai-soh-pad-purao*, Kh.

A spreading bush or a strong climber (?), branchlets pubescent when young, very rugose. *Leaves* 3-7·5 by 1·2-2·5 in., lanceolate, usually caudate-acuminate; lateral nerves 4-7 on either half, oblique to arcuate, tertiaries subparallel, strong, sometimes with remote, deeply impressed glands or points or finely reticulate intramarginal nervules; base narrowed obtuse or rounded; petiole 2·3 in. long, stout, pubescent when young. *Racemes* rusty tomentose, axillary, about 1-2 in. long; pedicels 7-1 in. long, bracteate, with a pair of subulate bracteoles half way up. *Flowers* about 7 in. across; stamens much shorter than the style; samaras generally 3-winged, wings unequal 1-2·5 by 3·6 in., rather membranous, faintly longitudinally nerved.

MANIPUR, Watt! NAGA HILLS, KHASI HILLS up to 4500 ft.-Lyngkerdem, Cherra-Collet! ASSAM-Jenkins.

Flrs. 3-5. Fr. 5-7.

The habit is generally said to be that of a spreading bush but one of my specimens sheet 6198 is from a strong climber.

2. ASPIDOPTERYS A. Juss.

Climbing shrubs. *Leaves* entire; stipules small or 0. *Flowers* small, inodorous, in panicles or fascicles; peduncles bracteate; pedicels slender, articulate, often 2 bracteolate. *Sepals* 5, short, eglandular. *Petals* 5, entire. *Stamens* 10; filaments free or connate at the base; anthers ovate. *Ovary* 3-locular; styles 3. *Fruit* of 1-3 samaras, with a shield-like membranous wing round the nucleus. *Seeds* oblong, cotyledons straight, equal.

I. *Leaves* nearly glabrous or glabrous, samara hairless:—

Samaras narrowly ovate or oblong, more or less narrowed at the apex, nucleus not crested between the wings.

.. 1. *A. glabriuscula*.

Samaras orbicular, often broader than long, nucleus crested in the concavity of the wings.

.. 2. *A. elliptica*.

II. *Leaves* silky pubescent or tomentose beneath; wings of samara more or less hairy, elliptic ovate.

.. 3. *A. nutans*.

1. *Aspidopterys glabriuscula* (Wall) A. Juss. Incl. *A. Roxburghiana* F. B. l. Vern. *Mei-thit*, Khasi.

A woody climber; young parts pubescent but soon glabrescent; stem grey-brown. *Leaves* 2-4 by 1·2-2 in., elliptic or elliptic-lanceolate to ovate, shortly and somewhat abruptly acuminate, rounded or cordate at the base, quite entire, membranous or thinly chartaceous, glabrous above, sparsely pubescent along the midrib and nerves beneath; lateral nerves 4-7 on either half, arcuate, the lowest pair subbasal; petiole 3-7 in. long, channelled. *Flowers* in terminal and axillary, lax, rusty pubescent panicles, panicle branches usually verticillate; pedicels subumbellately crowded or racemed on the ultimate branches of the panicles

filiform, jointed below the middle, pubescent throughout or glabrescent. *Calyx-lobes* 5, up to .1 in. long, obovate oblong to elliptic, pubescent or glabrescent. *Petals* 5, .15-.25 in. long, obovate-oblong, oblong-elliptic or ovate, rounded at the apex, ultimately reflexed. *Stamens* 10, all fertile; filaments filiform, jointed a little below the middle. *Ovary* 3-celled, pilose or glabrescent. *Samaras* 1-3, nucleus not crested, wing 1.15 by .4-.6 in., continuous, peltate, ovate-oblong to ovate-lanceolate or oblong, narrowed upwards and rounded or sometimes truncate at the apex, membranous, finely veined, translucent, glabrous.

SIBSAGAR, LAKHIMPUR, DARRANG, GOALPARA, N. CACHAR HILLS. SYLHET, KHASI & JAINTHIA HILLS up to 1000 ft., chiefly in scrub forests and old village sites, probably all over the province.

Flrs. 5-7. Fr. 11-1.

Niendenzu in Das Pflanzenreich distinguishes the following varieties:—

Var. 1. *subrotunda*; *A. Henryi* Hutchinson. Leaves broadly ovate to orbicular ovate, shortly but sharply acuminate, sometimes tomentose beneath; style glabrous. *Samara* elongate oblong.

ASSAM—Masters! Jenkins!

Var. 2. *brevicuspis*; *A. floribunda* Hutchinson. Leaves mostly obovate to oval, very shortly acuminate. *Ovary* glabrous or more or less puberulous; *samara* oblong to oblong lanceolate.

Tharia—KHASI HILLS, Simmons! Clarke! CACHAR, Keenan!

Var. 3. *longicuspis*.—Leaves ovate-lanceolate to lanceolate, rather long acuminate. *Ovary* glabrous to more or less puberulous.

KHASI HILLS, up to 5000 ft.

2. *Aspidopterys elliptica* A. Juss? Vern. *Ka-chali*, Kh.

A large woody climber with greysih lenticellate branches; young parts and inflorescence thinly adpressed pubescent but soon becoming glabrous. *Leaves* 4-6 in. by 2-3.5 in., broadly elliptic or ovate-lanceolate, shortly and often somewhat abruptly blunt acuminate, chartaceous; lateral nerves 5-6 on either side, arcuate; petiole .4-.8 in. long. *Flowers* white, panicles lax, terminal and axillary, usually with corymbose or subumbellate branches; pedicels filiform, up to .8 in. long, umbelled or subumbellately corymbose on slender peduncles, jointed below the middle. *Sepals* up to about .1 in. long, ovate to oblong, margins ciliolate, thin. *Petals* .2-.25 in. long, ovate oblong, rounded at the apex; *ovary* glabrous. *Samaras* 1.5-2.5 in. across, orbicular, sometimes broader than long, often emarginate at the apex with a crest .9-1.2 in. long and up to about .3 in. broad on the nucleus, nerves prominent ending in submarginal loops.

KHASI HILLS—Nongpoh about 2000 ft., N. CACHAR HILLS—Borail Reserve, about 700 ft.

The bark is said to be chewed with *pan* in the Khasi Hills.

Flrs. 5-6. Fr. 12.

The description applies to Assam Herbarium Sheets Nos. 9783, 4005 and 5695. These agree with the sheets identified as *A. elliptica* at Kew with the exception of the fruit which is larger in our specimens.

3. *Aspidopterys nutans* Hk. f., non *A. nutans* (Wall) A. Juss; *A. lanuginosa* Wall (A. Juss). Vern. *Dusisimmak*, Garo; *Jarmaitodong-khnai*, Khasi.

A woody climber; young shoots and inflorescence adpressed grey or brownish silky tomentose. *Leaves* 4-10 in. long, broad

ovate or suborbicular, shortly acuminate; lateral nerves about 6 pairs, arcuate, adpressed-pubescent on the nerves beneath, rather thinly in the intermediate spaces and on the upper surface; petiole .75 to 2 in. long, puberulous. *Panicles* lax; pedicels .5-.7 in. long, jointed about or below the middle, glabrous above the articulation. *Sepals* obtuse, .05 in., glabrous or glabrescent. *Petals* oblong to elliptic. *Ovary* villous. *Wings* of samara elliptic ovate, reticulate, somewhat narrowed and often with a shallow notch towards the apex, adpressed pubescent on both sides round the nucleus, sparsely elsewhere, reticulate, membranous, translucent, 1.2-1.5 by .7-1.2 in.

DARRANG, GOALPARA, GARO HILLS, KAMRUP. KHASI & JAINTIA HILLS ascending to 2000 ft.

Flrs. rainy season. Fr. 10.

A. lanuginosa (Wall) A. Juss should probably take priority over Hooker's name, but I have retained it on account of its being better known to Foresters.

Aspidopterys oxyphylla A. Juss.—A rather imperfectly known woody climber. *Leaves* 3-4 in. long, ovate or elliptic ovate, acuminate, pubescent beneath. *Panicles* tomentose. *Flowers* small, white. *Samara* with orbicular wings not crested above the nucleus.

KHASI HILLS up to 3000 ft. Mahadeo, *Clarke!* Tharia, Wallich etc., SYLHET Wallich-No. 7264.

These sheets are in flower and had been included by Hooker under *A. Roxburghiana* A. Juss., the fruit not being known to him. Hutchinson in his revision of the Indian species of the genus (Kew Bulletin, 1917) has shown that the plant has orbicular fruits—quite different to that of the plant grouped by Hooker under this name.

Aspidopterys sp. near *A. oxyphylla* A. Juss.—A climber with glabrous or nearly glabrous branchlets. *Leaves* 4-7 by 1.2-2 in., lanceolate, acuminate, chartaceous, glabrous or slightly puberulous on the nerves beneath: lateral nerves 4-5 on either half, tertiaries subparallel; base narrowed. *Panicles* terminal or axillary, pubescent, the latter shorter than the leaves. *Bracts* leafy, upper small, grading into leaves; bracteoles minute, concave, acute; panicle branches opposite or whorled. *Panicles* racemed; pedicels articulated about the middle, glabrous in fruit, up to .6 in. long. *Flowers* not seen. *Samara* about 1 by .5-.6 in., ovate-elliptic to suborbicular elliptic, membranous, larger nerves ending in submarginal loops, nucleus not crested.

Kanjilal sheet No. 4622, KHASI HILLS—Mahadeo, 3000 ft., does not match with any named sheets at Calcutta or Dehra. The leaves match with sheets of *A. oxyphylla* in Wallich's Catalogue in Kew Herbarium. But as the Wallichian sheet is not in fruit, the plant has been tentatively separated till it can be studied with more complete material.

Fr. 10.

FAM. 29. OXALIDACEÆ.

(Engler and Prantl III. 4.15)

Generally herbs or undershrubs, rarely trees. *Leaves* alternate, compound. *Flowers* regular. *Sepals* 5, imbricate. *Petals* 5, generally contorted in bud. *Stamens* 10, of which 5 are sometimes reduced to staminodes. *Ovary* 5-celled; styles 5, distinct. *Fruit* a loculicidal capsule or a 5-lobed berry.

AVERRHOA Linn.

Averrhoa Carambola Linn. Vern. *Kordoi*, Ass.; *Kamaranga*, Beng.; *Heinohjom*, Manip.; *Amrenga*, Garo; *Thei-rhei-ol*, Kuki; *Dieng-soh-treng*, Khasi.

A small tree up to 35 ft. in height; stem irregularly fluted. *Bark* rough, dark-grey with horizontal wrinkles outside, very finely fibrous in thin layers, uniformly light reddish inside. *Leaves* imparipinnate, 4-10 in. long, exstipulate; leaflets 5-11, subopposite, 1-3 by 1-1.5 in., ovate, rhomboid or lanceolate, unequal sided, the lateral nerves gradually smaller upward, acuminate, acute at the base, entire, membranous, glabrous above, glaucous and pubescent along the midrib and nerves beneath; petiolules about 1 in. long, pubescent. *Flowers* small, variegated, white and purple, in short axillary and terminal panicles. *Calyx* glabrous, lobes 5, about 1 in. long. *Petals* 5, about .25 in. long, twisted. *Stamens* 10, 3-5 usually shorter and antherless. *Ovary* 5 ridged, sparsely pubescent. *Fruit* 3 in. long, oblong in outline, sharply 3-5-angled; *Seeds* many, arillate.

Cultivated in villages in most districts up to 2000 ft. for the fruits. Occasionally found as an escape. Two varieties with sweet and sour fruits are known.

The wood is reddish and fine grained suitable for scantlings for buildings. Twigs of the tree are kept in houses with the belief that they keep off measles.

Flrs, 8-9. Fr. 11-1.

FAM. 30. RUTACEÆ.

Trees or shrubs, usually aromatic. *Leaves* usually alternate, generally compound, exstipulate; leaflets usually with numerous translucent dots. *Flowers* regular, 2-sexual, sometimes polygamous, in simple or paniced cymes or corymbs. *Disk* annualar, more or less lobed. *Calyx* of 4-5 imbricate segments, often connate below. *Petals* ordinarily as many as the calyx-segments, usually hypogynous, imbricate or valvate. *Stamens* as many or twice as many as the petals; sometimes many; anthers 2-celled, often versatile. *Ovary* usually of 4-5, rarely more, free or connate carpels; styles 1-5, free or sometimes united. *Fruit* baccate and large, or of 1-4 indehiscent or capsular cocci, less frequently drupaceous. *Seeds* various; radicle superior.

I. Flowers usually polygamous, ovules 1-2 in each cell:—

A. Ovary deeply lobed; styles free, fruit of capsular cocci:—

Leaves opposite. Unarmed trees. ..
Leaves alternate. Armed, erect or
scandent trees or shrubs. ..

.. 1. **Evodia.**

.. 2. **Zanthoxylum.**

B. Ovary entire or slightly 2-5 lobed, styles united, fruit baccate or drupaceous :—

1. Stem prickly; scandent shrub :—
Leaves alternate, digitately tri-
foliolate. ..
2. Unarmed erect shrubs or small
trees :—
Leaves 1-foliolate opposite ;
petals 4 ; stamens 8. ..
Leaves simple, alternate, petals
and stamens each 4-5. ...

.. 3. *Toddalia*

.. 4. *Acronychia*.

.. 5. *Skimmia*.

II Flowers usually 2-sexual ; * Ovary entire, style combined, fruit baccate :—

A. Ovules 1-2 in each cell :—

1. Unarmed :—

- a. Leaves 1-5, rarely 7-foliolate ;
petals imbricate ; style per-
sistent. ..
- b. Leaves imparipinnate, style
deciduous, usually jointed to the
top of the ovary :—
Petals imbricate ; filaments dila-
ted below the subulate tip. ..
Petals imbricate, filaments subu-
late (not dilated), ovary linear
2-celled ; cotyledons fleshy
planoconvex. ..
Petals valvate, filaments subulate,
ovary 4-5 celled ; cotyledons
leafy ; crumpled. ..

.. 6. *Glycosmis*.

.. 7. *Clausena*.

.. 8. *Murraya*.

.. 9. *Micromelum*.

2. Mostly armed ; pericarp leathery :—

a. Leaves 3-foliolate :—

Flowers 4-5-merous ; leaflets
coriaceous, entire ; scandent
shrub. ...

.. 10. *Luvunga*.

b. Leaves 1-foliolate :—

Erect ; flowers small, fascicled
or shortly racemose ; disk
annular or cupular. ..

.. 11. *Atalantia*.

Often scandent, flowers large,
about 1 in. across, solitary or
fascicled, disk columnar. ..

.. 12. *Paramignya*.

B. Ovules many in each cell, stamens 10 or more :—

Leaves 1-foliolate ; pericarp leathery. ..

.. 13. *Citrus*.

Leaves 3-foliolate ; pericarp woody. ..

.. 14. *Ægle*

1. EVODIA Forst.

Evergreen trees or shrubs, unarmed. *Leaves* opposite, simple. 1-3 foliolate or imparipinnate ; leaflets punctate, usually quite entire. *Flowers* small, 1-sexual, in axillary or terminal panicles ; peduncles generally flattened. *Sepals* 4-5, imbricate. *Petals* 4-5, valvate or slightly imbricate. *Stamens* 4-5, inserted at the base of the disk ; filaments subulate, anthers oblong. *Ovary* 4-celled, deeply 4-lobed ; ovules 2 in each cell ; stigma 4-lobed. *Fruit* of 4 coriaceous, 2-valved, generally 1-2 seeded, dehiscent cocci ;

* Flowers often polygamous in *Citrus medica*.

endocarp horny. *Seeds* globose or oblong; testa blackish, horny, shining; hilum linear, often extending along the entire length of the seed; albumen and cotyledons oily.

Leaves 3-foliolate :—

Small tree; branchlets puberulous when young, inflorescence equalling or exceeding the petioles.

.. 1. *E. Roxburghiana*.

Shrub; branchlets glabrous; inflorescence much shorter than the petioles.

.. 2. *E. triphylla*.

Leaves imparipinnate :—

Leaflets usually entire and pubescent or puberulous; seeds rounded :—

Large tree; leaves aromatic, pedicels and panicle branches slender, spreading; bracts small, deciduous; capsule slightly rugose outside.

.. 3. *E. meliæfolia*.

Small tree; leaves inodorous; pedicels and panicle branches stout, compact, bracts large, persistent; capsule very rugose outside.

.. 4. *E. rutæcarpa*.

Leaflets usually crenulate* glabrous or glabrate, nervules distinct; bracts minute; capsule dotted; seeds compressed at the angles

.. 5. *E. fraxinifolia*.

1. *Evodia Roxburghiana* Benth. Vern. *Midauma-baphang*, Cach.

A tree up to 50 ft. in height and nearly 4ft. in girth with opposite branches; tender parts and inflorescence puberulous. *Bark* corky and greyish white outside, slightly reticulately fissured; inside greenish white with a touch of red, fibrous, 2·3 in. thick. *Leaves* 3-foliolate; pet. 2-6 in. long, terete. *Leaflets* 4-8 by 2·2-4·5 in., elliptic, obovate or oblong, generally acuminate, narrowed at the base, membranous, bluish green, glabrous and shining above, with close amber-coloured pellucid dots; puberulous or glabrescent beneath along the nerves; midrib impressed above, prominent beneath; lateral nerves 12-18 on either half, slender, almost horizontal at the base and slightly arched upwards; petiolules 1·15 in. long. *Flowers* diœcious, small, generally 4-merous, bracteate, in dense umbellate cymes, which are arranged in axillary or terminal panicles with spreading opposite and flattened ramifications; pedicels short, panicles as long as or exceeding the petioles. *Calyx* very small; lobes rounded with ciliate margins. *Petals* whitish, about 1 in. long, ovate oblong. *Male flowers*.—Stamens 4; filaments glabrous; disk pubescent. *Female flowers*.—Ovary pubescent; style short, thick; stigma obsoletely 4-lobed; staminodes 4. *Cocci* 4, 2-valved, globose; endocarp crustaceous; seeds black, hard, shining, 1 or 2 in each coccus, globose if single, faceted if in pairs (as in my No. 6519).

SIBSAGAR DISTRICT, between Nichugard and Garampani; N. LAKHIM PUR near Gagaldhubi, NOWGONG—Dhansiri reserve, KHASI & JAINTIA HILLS, Raliang, up to 4000 ft.

* Assam form.

Wood greyish-white, even-grained ; weighing 35-40 lbs per c. ft. ; pores scattered in small groups in zig-zag lines, medullary rays very fine.
Flrs. 8-9. Fr. 12-1.

2. *Evodia triphylla* DC.

A shrub ; young parts, common petiole, petiolules and midrib dotted with minute reddish or yellowish glands. *Leaves* aromatic, opposite, usually 3-foliate ; common petiole 3-5 in. long, slender, slightly margined towards the top. *Leaflets* 3.5-7.5 by 1.5-2.3 in., terminal usually largest, lanceolate oblong-elliptic or oblong-lanceolate, acuminate, entire, membranous, puberulous along the margins when very young, perfectly glabrous afterwards ; lateral nerves 12-16, prominent beneath, looping near the margin and forming a continuous intramarginal nerve ; base usually oblique, acute and continued into the short petiolule. *Panicles* small, much shorter than the common petiolule. *Flowers* small, on slender pedicels. *Petals* 4 ; filaments glabrous. *Ovary* puberulous, 4-celled. *Cocci* usually 4, dotted.

NORTH CACHAR HILLS—above Jatinga, 2400 ft.

Flrs. 2-3.

3. *Evodia meliæfolia* Benth. Vern. *Maiphak*, Ass, *Namsing-asing*, *Muka-asing*, Abor : *Bora-asing*, Miri ; *Theng-hanjan*, *Pag-rak* (?), Mik. ; *Machli-poma*, Sylh. ; *Dieng-si-ing*, Khasi (Shella) ; *Dieng-saw-ngiang-jerep*, Khasi (Tharia) ; *Dieng-soh-tong-klong*, Synt.

A tree up to 85 ft. in height and nearly 8 ft. in girth, rather variable in most of its characters ; branchlets generally slender, lenticellate. *Bark* greenish white, nearly smooth but covered with large lenticels ; inside uniformly pale or dun-yellow, soon turning to chocolate colour, fibrous, 2-5 in. thick, somewhat mucilaginous. *Leaves* imparipinnate ; rachis often with a sharp ridge above, otherwise terete, pubescent or glabrescent. *Leaflets* usually 9-15, sometimes as few as 3 only, opposite, 3-6 by 7-2 in., lanceolate, ovate or oblong-lanceolate, more or less unequal sided except the terminal one, long-acuminate, quite entire, thinly chartaceous, glabrous and shining above, glaucous beneath ; midrib prominent underneath, generally pubescent or puberulous, rarely glabrate on both surfaces, usually aromatic, turning yellow before falling ; lateral nerves 10-15 on either half, slender, arched ; tertiaries very finely reticulate ; base abruptly narrowed to the petiolule ; lateral petiolules 1-6 in. long, terminal, 6-12 in. long. *Flowers* very small, generally 5-merous, in umbellate pubescent cymes arranged in terminal and axillary brachiate panicles, 5-8 in. long. *Sepals* minute, obtuse. *Petals* hairy within. *Cocci* generally 5, usually 1-seeded ; seeds black, globose, hard, shining.

Occurs sporadically in all the DISTRICTS ascending to about 1000 ft.

Wood light yellowish white or grey turning light brown, even-grained, not liable to warp or split ; pores moderate sized to large ; medullary rays rather broad and continuous. It is much used for shingles by planters and for looms by the Assamese. Little or not attacked by white ants.

Flrs. 4-7. Fr. 11-1.

4. *Evodia rutæcarpa* Hk. f. & Thom. Vern. *Bora-asing*, Miri; *Muka-asing*, Abor.

A shrub or a small tree about 30 ft. in height clothed with velvety pubescence. *Leaves* imparipinnate, 12-18 in. long; rachis nearly terete, velvety; leaflets 3-5 pairs, usually inodorous, 2.5-6.2 by 1-2 in., lanceolate or oblanceolate, acuminate, entire, lateral nerves up to 10-15 on either half, more densely hairy on the undersurface; base unequal, usually narrowed to the very short petiole. *Flowers* 4-5 merous, small in brachiate cymes; peduncles of cymes and panicle branches stout; panicles 3-4.5 in. across; bracts up to 4 in. long, persistent. *Petals* pubescent within; filaments hairy, anthers large. *Capsule* 3 in. across, rugose outside, cocci 4.

KHASI HILLS—Rang-kheng-sning at about 5000 ft. and also probably in N. E. FRONTIER between Kobo and Pillang (material insufficient for determination).

Flrs. 7-8? Fr. 9.

5. *Evodia fraxinifolia* Hk. f. Vern. *Dieng-sngiyat*, *Dieng-borapram*, Kh., *Dieng-sah-iaru*, *Dieng-sa-tyng-klong*, *Dieng-subu-klong*, Synt.

Small to moderate sized tree. *Bark* brown or light to ashy grey rather smooth but warty with rather large lenticels, yellowish white inside; young shoots pubescent. *Leaves* 8-14 in. long, rachis slightly ridged above; leaflets usually 9-11, sometimes only 5, 3.5-8 by 1.2-3 in., lanceolate or oblong-lanceolate, finely acuminate, usually crenulate with a gland at each sinus, thin, glabrous when mature or puberulous on the midrib above; lateral nerves 12-15 on either side, nervules finely reticulate, distinct; base unequal, usually narrowed and often continued into the short petiole. *Cymes* brachiate, panicles shorter than the leaves, spreading, branches compressed, finely pubescent; bracts minute; pedicels short. *Flowers* greenish-white; sepals small; petals pubescent within, much longer. MALE FLRS.—*With* 4 rudimentary carpels; filaments somewhat hairy. FEMALE FLRS.—*Ovary* glabrous. *Capsule* red, cocci usually 4; seeds rather compressed, dark brown.

KHASI & JAINTIA HILLS 3000-5000 ft.

Flrs. 5-6. Fr. 2.

The leaflets are sometimes entire but in all Assam specimens examined by me they are crenulate.

2. *ZANTHOXYLUM* Linn.

(*Fagara* Schreb.)

Trees or shrubs, sometimes scandent, and generally armed with prickles, those on stem and larger branches on a conical corky base. *Leaves* alternate, 3-foliolate or imparipinnate, rarely paripinnate; leaflets opposite or alternate, entire or crenate, punctate, aromatic. *Flowers* small, often 1-sexual, in axillary or terminal peduncled, panicked cymes. *Calyx* 3-8 fid or rarely 0.

Petals 3-5, rarely 0, imbricate or induplicate-valvate. *Disk* small or obscure. *Stamens* 3-5, reduced to scales in female flowers, rudimentary in male flowers, hypogynous. *Ovary* rudimentary in male flrs.; of 1-5 oblique carpels in female flrs.; styles sublateral, free or connate at the apex; ovules 2 in each cell, usually collateral. *Fruit* of 1-5, 1-seeded carpels, which dehisce ventrally, endocarp horny. *Seeds* shining, blue or black; albumen fleshy; cotyledons flat.

I. Leaves imparipinnate :—

A. Trees or erect shrubs :—

1. Rachis not winged; panicle branches opposite; petals present :—

a. Leaflets entire, ovate or ovate-lanceolate, caudate acuminate, rather membranous, pale or glaucous beneath. Flrs. 4-merous. Prickles on old stems somewhat distant, aerial roots 0. ..

.. 1. *Z. Rhetsa*,

b. Leaflets crenulate lanceolate or oblong lanceolate with a prominent gland at each crenature, caudate acuminate, subcoriaceous, green beneath. Flrs. 4-merous, aerial roots 0. ..

... 2. *Z. Budrunga*.

c. Leaflets crenulate, elliptic or oblong, abruptly short acuminate, very coriaceous, pale green beneath. Flrs. 5-merous, aerial roots often present. ..

.. 3. *Z. myriacanthum*.

2. Rachis winged, panicle branches alternate, petals 0 :—

Leaflets entirely glabrous, glossy above. Flowers yellowish, cymes in lax panicles, usually exceeding 1 in. ..

.. 4. *Z. alatum*.

Leaflets puberulous on both surfaces not glossy above. Flrs. purplish; cymes dense, usually under 1 in. long. ..

.. 5. *Z. acanthopodium*.

B. Scandent shrubs, panicle branches alternate; petals present :—

I. Leaflets 3-6 in. long :—

Leaflets 7, all opposite. ..

.. 6. *Z. Hamiltonianum*.

2. Leaflets under 3 in. long, leaflets 7-21 :—

a. Leaflets alternate and opposite crenate. Flowers large, umbelled on the branches of panicles, ..

.. 7. *Z. oxyphylum*.

b. Leaflets mostly alternate, entire or minutely crenulate. Flowers minute not umbelled. ..

.. 8. *Z. khasianum*.

II. Leaves trifoliate, erect trees, panicle branches alternate. ..

.. 9. *Z. ovalifolium*.

1. *Zanthoxylum Rhetsa* DC. Vern. *Bajarmani*, *Bajarmali*, Ass. *Onger-asing*, Miri & Abor; *Hanjor*, *Theng-nang-arong*, Mik.; *Malaphang*, *Thenthe-lau-phang*, *Jingir-phang*, Cach.; *Jur-thoum-thing*, Kuki; *Hechui-ching*, Naga; *Bolmicheng*, *Shumi-chheng*, Garo, *Dieng-soh-mirik*, Khasi (Isamati); *Dieng-nadkor*, Khasi (Shella); *Dieng-soh-aruin*, Khasi.

A deciduous tree up to 75 ft. in height and 4-5 ft. in girth, with a large crown, covered with sharp prickles, those on the

branches incurved, and on the trunk with conical corky bases; pith large, septate with thin transverse membranes. *Bark* corky and pale yellow outside; light-brown inside, soon turning dark-chocolate on exposure. *Leaves* paripinnate or imparipinnate, crowded at the ends of the branchlets, 1-2 ft. long; rachis terete, glabrous. *Leaflets* 16-25, opposite, 3-5 by 1·2-2 in., subfalcately oblong or ovate-lanceolate, very unequal sided, caudate-acuminate, the larger half rounded at the base, the smaller half cuneate and above the base of the other half, quite entire, membranous or thinly coriaceous, glabrous and shining above, glaucous underneath at least when young, turning yellow before falling, very faintly or not at all aromatic; main lateral nerves in the larger half up to 22, in the smaller 2 or 3 fewer, almost straight; pellucid dots extremely minute or invisible; petiolules 15-5 in. long. *Flowers* small, 4-merous, light-green or pale yellow, in large crowded terminal and subterminal puberulous panicles of cymes with opposite branches up to 9 in. long; bracts minute, caducous; pedicels very short; sometimes prickly. *Calyx lobes* minute, triangular, acute. *Petals* 4, elliptic, or elliptic-obovate, valvate. *Anthers* versatile. *Ripe carpels* globose, 2-valved. *Seeds* solitary, globose, 2 in. across, bluish-black, shining.

Sporadic throughout the PROVINCE, but gradually more scarce in the UPPER DISTRICTS ascending to about 2000 ft.

Wood yellowish grey, close grained, moderate hard; pores scanty in the brownish autumn wood; annual rings marked by a thin band of soft tissue of light colour; weight 40 lbs. per c. ft. The cork from the base of the prickles of the trunk is turned into beads and other articles of ornament by the Cacharies and the tender leaves are eaten cooked by the Aitonias. In Southern India the unripe carpels and the seeds are used as condiments. An essential oil is obtained from the fruit, which is used medicinally.

Flrs. with new leaves 3-4, Fr. 11-12.

2. *Zanthoxylum Budrunga* Wall Cat. Vern. *Bajarmuni*, Ass.; *Buxarnali*, Ass. (Kam.); *Bajna*, Ass.; *Bux-ruli*, Mech; *Chingirphang*, *Bajrang*, Cach., *Tingang-arong*, Mik.; *Ongret*, Naga; *Bajrang*, Sylh.; *Nyngdong*, Manip.; *Sing-i-te*, Kuki; *Sumet-chheng*, Garo; *Dieng-ka-synrang*, Khasi.

An evergreen tree up to 50 ft. in height and 4 ft. in girth, very doubtfully different from the preceding species and very difficult to separate it from herbarium material. *Size* for *size* the trunk is very much more closely studded with prickles which have also larger corky base about (3 by 2 by 2·5 in.), and the branches are fewer and crowded at the top of the tree, the crown being consequently more or less flat-topped. *Bark* grey and finely reticulately fissured outside; green underneath the corky layer, inner layers pale with streaks of purplish tissue, both soon turning deeper on exposure. *Leaves* 1-2·5 ft. long, generally imparipinnate; rachis sometimes armed. *Leaflets* 15-21, opposite, 3-6 by 1-1·5 in., oblong-lanceolate, very oblique, caudate-acuminate, distantly crenulate with a large reddish pellucid dot at each sinus or entire, quite glabrous, aromatic, turning yellow before

falling; main lateral nerves 20-22 up to the base of the acumen in the larger half, 2-3 fewer in the other half; pellucid dots minute or fairly large; petiolules .1-15 in. long. *Flowers* minute, greenish-white in 3-chotomous cymes arranged in crowded terminal panicles; peduncles sometimes armed. *Petals* 4. *Fruit* and *seed* as in *Z. Rhetsa*.

Throughout the province extending to low foot hills, fairly common in many districts.

Wood close grained, moderately hard, uniformly white, with pores uniformly distributed; annual rings sharply marked by a thin line of soft tissues; weight about 48 lbs. per c. ft. The Kukis prize the wood for house post and the Meches use it for looms. The leaves are known to be edible, the cork of the prickles is used in the same way as of *Z. Rhetsa* and the fruit and seeds have the same economic uses. The Nagas catch fish by poisoning the water with the powder of the seeds.

Flrs. 3-4. Fr. 8-9.

3. *Zanthoxylum myriacanthum* Wall. ? (or nov, sp. ?).

A large evergreen tree up to 70 ft. in height and nearly 5 ft. in girth, often with strong aerial roots; all parts excepting the ramifications of inflorescence perfectly glabrous; branchlets fleshy, covered with slightly incurved sharp prickles. *Bark* grey, with sharp prickles and transversely oblong corky protuberances near the base; dun-yellow inside. *Leaves* paripinnate, 9-14 in. long; rachis armed; peduncle 5-6 in. long. *Leaflets* 6-8 (?), opposite or subopposite, 4-7 by 2-3 in., oblong or elliptic, abruptly short acuminate, slightly oblique but generally unequal-sided at the base, which is rounded on both halves, minutely crenulate, very coriaceous, dark-green and shining above, pale-green and also shining beneath, very aromatic, pellucid dots large—containing fragrant essential oil; main lateral nerves about 18 in larger half, one or two fewer in the smaller half, arched, bifurcating beyond the middle; petiolules .1-6 in. long. *Flowers* 5-merous, very small, bracteolate, crowded in much branched spreading paniced cymes; ramifications of inflorescence patently puberulous; bud globose. *Calyx-lobes* rounded, glabrous. *Petals* 5, orbicular, glabrous, strongly imbricate. *Filaments* short, tapering, glabrous. *Carpels* up to 3 in the female flowers. *Ripe carpels* not seen, but assuming that the tree has been correctly identified, they ought to be, according to the Fl. Br. Ind., .12 in. cross., compressed, apiculate.

Only found in the Dulong Reserve, NORTH LAKHIMPUR.

Wood golden yellow when fresh-cut, afterwards tan-brown; pores large, often in strings of 2-6; medullary rays fairly broad and equidistant showing conspicuous silver-grain on a radial section; annual rings marked by a very thin line of softer tissue. Weight about 32 lbs. per c. ft. It seems to be suitable for tea boxes.

Flrs. 3-4.

4. *Zanthoxylum alatum* Roxb.

A small, strongly aromatic tree attaining about 25ft. or a shrub; young shoots glabrous. *Prickles* straight or incurved from a broad base which is enlarged and becomes woody in old stems.

Bark greyish brown in old trees with corky furrows, twigs grey or greenish grey smooth, but lenticellate. *Blaze* yellowish, turning blackish-brown. *Leaves* imparipinnate, rachis 2-4 in. long, glabrous with foliaceous wings which are broader upwards, jointed at the insertion of leaflets. *Leaflets* 5-11, opposite, 1-4 by 1-4-1-2 in., lower smaller, narrow to oblong lanceolate, subacute, obtuse or acuminate, glabrous, dark green and shining above, paler beneath, subcoriaceous; lateral nerves 10-16 on either half, bifurcate near the margin, serrulate or subentire, prominently pellucid punctate on each serrature and sparsely elsewhere; base more or less oblique; petiolule 0 or very short. *Flowers* small, yellowish in lax pyramidal pubescent panicles 1-2 in. long, terminating lateral shoots or axillary; pedicels short. *Calyx* 6-8, linear. *Petals* 0. *Stamens* 6-8, in male flowers. *Ripe carpels* 1-2, less often 3, in each fruit, red, size of a pepper-corn, somewhat compressed, tubercled; seeds black, globose, rugose.

KHASI HILLS 2-6000 ft. often in the vicinity of villages where it is sometimes planted in hedges.

The ripe fruits are used as a specific for toothache.

Fls. 4-6 ? Fr. 10-11.

Differs mainly by its glabrous rachis and leaflets and laxer inflorescence from the next species and is doubtfully specifically different.

5. *Zanthoxylum acanthopodium* DC. Vern. *Jayurkhlan*, *Dieng-soh-mio*, *Soh-jing-buin*, *Dieng-jaior-khlaw*, *Dieng-soh-maijur*, *Dieng-soh-khlam*, Khasi; *Jaur*, *Dieng-ja-iaur*, Synt.

A straggly thorny aromatic shrub or small tree; young shoots pubescent or puberulous. *Bark* greenish grey, smooth and lenticellate in young stems; greyish, corky and reticulately fissured when old. *Blaze* greenish; prickles nearly straight or incurved from a broad base, polished and enlarged with woody base in old trees. *Leaves* imparipinnate, rachis 2-4 in. long, puberulous, with foliaceous wings which are gradually broader upwards, jointed at the insertion of leaflets, usually prickly when young; leaflets 5-9, 13 according to some authorities, rarely 3, opposite, 1-4 by 1-5-1-2 in., smaller downwards, elliptic oblong or ovate, acute, acuminate or subacute at the apex, serrate or serrulate, prominently pellucid-punctate at each serrature, elsewhere glands few, not prominent, pubescent or puberulous along the nerves on both surfaces; lateral nerves 14-19 on either half, bifurcating near the margin; midrib prickly in young leaves; base often oblique; petiolules 0 or very short. *Cymes* often in pairs from leaf axils, dense, about 1-5 in. long, puberulous. *Flowers* purplish, small; pedicels very short. *Calyx* 6-8 lobed; lobes linear, ciliate. *Stamens* 6-8 in male flowers. *Fruit* forming dense sessile clusters; ripe carpels 1-3 in each fruit, red; seeds globose, similar to that of last species.

KHASI HILLS up to 6000 ft.

Fruit is said to be used for killing fish.

Fls. 9-10 Fr. 12.

6. *Zanthoxylum Hamiltonianum* Wall. Vern. *Texmoi*, *Tejmai-bih*. Ass. (common) ; *Texmuri*. Ass. (Numaligarh) ; *Bagh-anchora*, Ass. ; *Rikam-ruibi*, Miri ; *Changre*, Naga ; *Tes-moi*, Mech.

A large evergreen scandent shrub, armed with recurved prickles which, on very old stems have more or less cylindrical and corky bases ; young parts pubescent or velvety ; pith small, not septate. *Bark* dark-grey outside, cream-coloured inside. *Leaves* imparipinnate, 9-15 in. long ; rachis terete, pubescent or glabrous, armed with recurved prickles. *Leaflets* 5-7, the lateral opposite 3-7 by 1·7-3 in., ovate, oblong or elliptic, abruptly or gradually narrowed into a broad emarginate apex, rounded or subacute at the base, scarcely oblique, usually entire, chartaceous, shining on both surfaces, wholly glabrous or pubescent along the midrib beneath, which is sometimes armed with a few recurved prickles, generally with a few large pellucid dots filled with an essential oil ; main lateral nerves 10-15 on either side of the midrib, arched, generally looping ; petiolules 1·15 in. long. *Flowers* about 2 in. across, dull-white, shortly pedicelled, in slender, puberulous axillary fascicled cyme-bearing panicles 1·5-3 in. long. *Calyx lobes* minute, triangular-ovate. *Petals* 4-5, ovate, subimbricate. *Filaments* about 12 in. long, very slender ; anthers basifixed. *Fruiting carpels* 2-4, rarely 5, 1·6 in. across, obliquely set, globose, somewhat compressed, pitted outside ; seeds pitted, brownish black, very glossy.

Fairly common throughout the province in low level forests except in KHASI AND JAINTIA HILLS.

Wood pale yellow, compact ; pores orbicular, rather small for a climber ; medullary rays nearly equidistant, somewhat wavy. The fruit is used for poisoning fish.

Flrs. 3-4. Fr. 5-6.

7. *Zanthoxylum oxyphyllum* Edgw. Vern. *Mexenga*, Ass. (Lakh).

At first a slender erect shrub but afterwards scrambling on trees, very aromatic, glabrous, prickles usually hooked ; pith large, septate. *Leaves* 6-14 in. long, rachis armed with prickles beneath and with 2 faint longitudinal ridges above. *Leaflets* strongly aromatic, very variable in size and shape, opposite and alternate, 1-3 by 5-1·6 in., elliptic or lanceolate, often taper-pointed, subcoriaceous, entire, crenate or crenulate with a large translucent gland at each sinus ; lateral nerves 10-12 on either side of the midrib ; base acute ; petiolules 0·5-2 in. long. *Flowers* 4-merous, 15-3 in. across, umbelled in much branched paniced axillary cymes ; pedicels slender. *Petals* obtuse, imbricate. *Ripe carpels* 2-4, tubercled. *Seeds* 15 in. across, globose, blue-black, shining.

Makum, LAKHIMPUR ; near Nazira, SIBSAGAR and in the Charduar Reserve, DARRANG, Adgiri, GARO HILLS (record based on fragmentary material). KHASI HILLS 4-6000 ft. F. B. I.

The tender shoots are eaten cooked as a vegetable.

Flrs. 4-5. Fr. 8-9.

8. *Zanthoxylum khasianum* Hk. f. Vern. *Soh-mrit*, *Dieng-tiw-shiah*, *Soh-umiw*, Kh.

A large aromatic woody climber or straggling shrub ; young parts and inflorescence very pubescent. *Bark* thin, rough, grey ; prickles recurved. *Leaves* imparipinnate ; rachis very variable in length, ordinarily 4-11 in., often with sharp recurved prickles, channelled, at first pubescent, glabrate with age ; leaflets very variable 9-19, rarely 21, alternate, subopposite or less often opposite, 1.2-2.2 by .5-.8 in., often oblique, elliptic or oblong-elliptic, apex often subfalcate, bluntly acuminate, generally caudate, minutely crenulate, glandular at crenatures, shining, glabrous or puberulous along the lower half of midrib on either surface ; lateral nerves 7-10 on either half ; base often unequal, narrowed to the petiolule ; petiolules margined, up to .15 in. long. *Flowers* greenish, about .1 in. long, in panicles of cymes up to 2.5 in. long ; panicle branches alternate ; bracteoles ovate ciliate. *Calyx* lobes 4, ovate-oblong, obtuse, ciliate on the margins, up to .15 in. long. *Petals* obovate, concave. *Stamens* 4 in male flowers. *Carpels* 4 in female flowers. *Drupels* 1-3, slightly compressed, obovoid, of the size of a pepper corn with aromatic, pellucid dots ; rugose when dry. *Seeds* globose, shining, black, slightly uneven.

KHASI HILLS 5000-6400 ft.

Sometimes the rachis is very short, 2 in. only with as few as 7 leaflets and totally unarmed.

Flrs. 5. Fr. 9-10 ?

Zanthoxylum sp., Vern. *Kunja-shia-khuat*, Kh. ; *Dieng-tinat-syar* (lit. cock's spur) Synt., closely allied to the above, scandent ; leaflets up to 41, 6-1 by .3-.5. Flrs. and fruit not seen.

KHASI HILLS, Raithwan, Nong-kersein, Upper Shillong etc.

9. *Zanthoxylum ovalifolium* Wight. Vern. *Dieng-sinialh*, *Tew-kalong*, *Dieng-shih*, Kh.

A small aromatic tree or shrub, sometimes unarmed. *Bark* grey or brownish with pale streaks outside, pale yellowish, turning light brown inside, prickles slightly incurved or straight from broad bases, conical on old stems ; branches lenticellate, glabrous ; buds tomentose. *Leaves* trifoliolate, sometimes 1 or 2 ; leaflets aborted ; common petiole 1.7 in., slightly margined. *Leaflets* 2.5-6.5 by 1.2-2.4 in., lanceolate, elliptic or obovate, blunt acuminate, usually with emarginate tip, obscurely crenate, crenatures glandular, coriaceous, glabrous on both surfaces, lateral nerves prominent beneath, 14-16 on either half, mostly forming loops near the margin, with many intermediate ones, base tapering or narrowed to the short margined petiolule ; petiolule up to .1 in. long. *Flowers* small, 4-5 merous, greenish in pubescent axillary and terminal peduncled panicles of cymes shorter than the leaves ; bracts and bracteoles minute, acute, panicle branches alternate. *Calyx* lobes minute, triangular, acute.

Petals about .1 in. long, obtuse, valvate. *Ripe carpels* red, solitary, size of a pea, slightly pitted; seeds globose, black, shining.

KHASI HILLS 4-5000 ft.

Wood light yellowish white, hard, close grained.

Flrs. 5. Fr. 10-1.

3. TODDALIA Juss

Toddalia aculeata Pers. Syn. *T. asiatica*, Lamk. Sans. *Dahaka*, *Kanchana*. Vern. *Warplap-rikang*, Mik.; *Mulkiber-doukha*, *Ingeorach*, *Newraji-doukha*, Kach.; *Ling-seru*, Kuki; *Nachi-wagum*, Garo.; *Soh-sat-khlaw*, Khasi (Nongston); *Shia-sien-ung*, *Sia-soh-sat*, Khasi; *Saryng-khlem*, Synt.

A large scandent evergreen shrub armed with curved or straight prickles, those on large stems on large conical bases; young shoots rusty tomentose. *Leaves* alternate, 3-foliate; common petiole .7-1.7 in. long. *Leaflets* sessile, 1.5-4 by .6-1.5 in., obovate, oblanceolate or lanceolate, usually bluntly long-acuminate, cuneate at the base, crenulate or subentire, more or less coriaceous, glabrous, minutely pellucid-punctate, aromatic, pungent to the taste; lateral nerves many, slender, straight. *Flowers* white or pale yellow, unisexual .2 in. across, usually in pubescent axillary cymes, which are often paniced; panicles sometimes terminal; bracts minute; pedicels very short. *Calyx* 5-lobed, small, glandular, pubescent outside. *Petals* 5, induplicate-valvate, about .1 in. long, oblong or lanceolate, hooded at the apex, gland-dotted. *Disk* fleshy, grooved, glabrous. MALE FLRS.—*Stamens* 5: filaments slender and longer than the petals; anthers round with a gland on the back; ovary rudimentary, cylindric-oblong. FEMALE FLRS.—*Staminodes* 0. *Ovary* 4-celled, more or less 5 grooved; style very short or 0; stigma 5-lobed; ovules 2 in each cell, superposed. *Fruit* a globose berry, .3-.4 in. across, generally 5-grooved or -lobed, pale-orange when ripe, pitted on the rind. *Seed* one in each cell, reniform, rounded on the back; testa coriaceous; embryo curved, terete.

Generally in shady and swampy localities in all the DISTRICTS particularly DARRANG, ascending to 6400 ft. in KHASI HILLS.

The bark of the roots yields a yellow dye and a bitter aromatic tonic which is believed to be more efficacious as an antiperiodic than quinine. It contains small quantities of the alkaloid Berberine. The fruit is often attacked by insects which change them into galls of various shapes and sizes. Wood yellow.

Flrs. 1-10, Fr. 8-1.

4. ACRONYCHIA Forst.

Acronychia laurifolia Bl. Vern. *Ing-long-pharse-arong*, Mik., *Kogema-iaopa-phang*, Kach., *Paling-changne*, Daff.; *Bol-thimatchi*, *Bolgrak*, Garo; *Dieng-soh-phlang*, Khasi; *Sarmon-blai*, *Dieng-soh-newriong-blei*, Synt.

A small unarmed evergreen tree up to about 40 ft. in height and nearly 3 ft. in girth; young shoots glabrous. *Bark* grey or brown, corky outside, about .5 in. thick; inside greenish brown on young stems, reddish with fine white streaks on mature trees, sweetish to the taste and aromatic. *Leaves* usually opposite, 1-foliolate. *Leaflets* 3-6 by 1-2.2 in., oblong or obovate-lanceolate, obtusely acuminate, entire, thinly coriaceous, aromatic with the smell of green mango, glabrous, shining above, pale green or glaucous beneath, turning yellow before falling; translucent dots minute; lateral nerves about 12 on either half, joining to form a much looped jagged intermarginal nerve well away from the margin; base acute; petiole .3-1 in. long, slightly channelled, somewhat dilated at the base and swollen at the upper extremity where the blade is articulated. *Flowers* white, faintly scented, polygamous, in long peduncled, paniculately corymbose axillary cymes; peduncles up to 3 in. long, panicle branches upto 1 in. long; pedicels .2 in. long, slender; buds oblong. *Calyx* very small, lobes 4, acute. *Petals* 4, valvate, .2 in. long, tapering to a more or less cucullate tip, hairy at the base inside. *Disk* thick, hairy. *Stamens* 8, shorter than the petals and alternately longer; filaments very finely pointed. *Ovary* 4-celled with 2 superposed ovules in each cell. *Fruit* a capsule, .8-5 in. diam., usually 4-lobed and beaked, glabrate.

Throughout ASSAM ascending to about 4000 ft. in KHASI HILLS (near Cherrapunji).

Wood pale-white, fine and even-grained, weighing about 40 lbs. per c. ft.

Flrs. 12-4. Fr. 11-2 (of the following year?).

5. SKIMMIA Thunb.

Skimmia laureola Hk. f.

An aromatic evergreen shrub up to 10 ft. high branched from the base, all parts glabrous. *Bark* greyish-white, smooth; branches with scattered warty lenticels. *Leaves* crowded at the ends of branches alternate, simple, very variable in size and shape, 2-5 by .7-1.6 in., oblanceolate, lanceolate or oblong-lanceolate, acuminate, softly coriaceous, glabrous, dark green above, paler beneath, lateral nerves indistinct, midrib prominent; base narrowed; petiole narrowly margined, .2-.5 in. *Flowers* white or greenish yellow, polygamous, .8-.5 in. across in terminal erect usually compact panicles, .7-2 in. long; bracts .1 in. long, persistent, ovate oblong, acute, ciliolate; bracteoles similar but small, deciduous; pedicels very short. *Calyx* persistent, lobes imbricate, suborbicular-ovate, obtuse, ciliolate. *Petals* 5, subimbricate, about .15 in. long, oblong, much longer than the calyx. *Disk* obsolete. *Stamens* 5, hypogynous about as long as the petals; filaments subulate; anthers dorsifixed. *Ovary* ovoid. 2-5 celled; ovule 1 in each cell, pendulous from the top; style stout; stigma capitate, 2-5 lobed. *in male flowers* ovary usually of 2-3 (sometimes up to 5) rudimentary carpels, free except at

base, free ends subulate. *Fruit* subglobose. 3-4 in. across, containing 3-2, sometimes 1, cartilaginous 1-seeded stones, albumen fleshy ; cotyledons flat.

KHASI & JAINTIA HILIS—Lumsuiyar (Dumpep) 6390 ft.-not common.
Flrs. 4, sometimes 11-a second flush ? Fr. rainy season.

6. GLYCOSMIS Correa.

Glycosmis pentaphylla Corr. incl. *G. arborea*, DC. Vern. *Hengna-poka*, *Hengena-poka*, Ass. (Sib.) *Tultha-poka*, Ass. (Now) ; *Chagol-ladi*, *Chaul-dhowa*, Ass. (Kam) ; *Pleg-ik-arong*, *Hiunmuchu*, *Theng-lokso-arong*, *Jami-reng-reng-arong*, *Chingchor-arong*, *Thengpitungmeng*, *Wo-chora-a-anarong*, Mik. ; *Tasung-changne*, Daff. ; *As-sera*, Beng. ; *Mathhila*, E. Bengal ; *Bon-jamir*, Sylh. ; *Dieng-soh-sning*, *Dieng-kasiar*, Khasi ; *Dieng-kajat-ske*, Synt. *Serebilijira*, Cach.

An evergreen shrub or small tree up to 15 ft. in height with corky grey or blackish bark. *Leaves* imparipinnate, rachis variable up to 3.5 in. long. *Leaflets* 1, 3 or 5, very rarely 7 usually alternate, very variable in size and shape, 3-12 by 1-5 in., elliptic, ovate, obovate oblanceolate or lanceolate acute or acuminate, entire or crenulate, thinly chartaceous, dark green above, pale beneath, giving an unpleasant smell when bruised ; translucent dots not distinct, lateral nerves 8-10, anastomosing at the outer extremities, tertiaries laxly reticulate ; base cuneate or acute ; petiolule usually up to about 2 in. long, sometimes more. *Flowers* variable in size, generally in axillary but sometimes also in terminal rusty often furfuraceous, pubescent or puberulous erect panicles, very short to 4 in. long ; bracts small, ovate acute ; pedicels minute. *Calyx-segments* 4-5, imbricate, more or less rounded, ciliolate. *Petals* 4-5, imbricate, 2 in. long, obovate. *Stamens* twice as many as the petals ; filaments subulate, free ; anthers introrse, with a dorsal or apical gland. *Ovary* sunk in the disk or more or less free, more or less rugose with glands ; style short. *Fruit* a berry, white or pinkish when fully ripe.

Of this very variable plant several varieties and subvarieties are recognized by Hooker but all more or less connected by intermediates. The forms commonly found in our area may be classified as follows :-

Var. I.—*Leaves* usually 3, less often 1-or 5-foliolate, large oblong or obovate-lanceolate, entire or obscurely crenulate ; panicles elongate, many flowered, often towards the ends of the branches ; ovary usually rugose with mamillate glands, 5-celled, connate at the base with the disk.

Var. II.—*Leaves* 3-5 foliolate, rarely 1-foliolate (Sub var *longifolia*) ; panicles small, few-many flowered ; ovary 4-5 celled, constricted at the base and thus free from the disk, scarcely mamillate.

Sub var. 1. *longifolia* Hk. f. *Leaves* 1-foliolate, large, often acuminate, panicles short.

Sub var. 2. *macrophylla* Hk. f. *Leaves* 3-5 foliolate or 1-foliolate, disk thick, broader than the ovary.

Sub var. 3. *angustifolia* Hk. f. *leaflets* usually 3-5, not large, narrow and lanceolate, entire, panicles short, sometimes arboraceous.

Mostly low hills--N. CACHAR, KHASI HILLS up to 2000 ft.

Sub var. 4? Often attaining the dimension of a small tree; leaflets 3-5, sometimes 1, usually acuminate, large to medium sized; style long almost equalling the ovary.

Ascending to 2000 ft. in the KHASI HILLS.

Generally in the neighbourhood of swamps or on banks of sluggish streams or under bamboo and mango-topes, all over the province, ascending to about 2000 ft.

Wood white, compact, suitable for tent-pegs, handles of tools etc. *Branchlets* are used as tooth-brushes. The ripe berries are edible.

Flrs. & Fr. 1-4, often throughout the year.

7. CLAUSENA Burn.

Unarmed shrubs or small trees. *Leaves* imparipinnate, deciduous; leaflets alternate. *Flowers* small, 4-5 merous, in terminal or axillary paniced cymes or racemes. *Calyx* 4-5 lobed or partite. *Petals* imbricate. *Stamens* 8-10; filaments alternately shorter, abruptly dilated below the subulate tip. *Ovary* stipitate, usually 4-5 celled; style deciduous. *Berry* oblong or globose. *Seeds* with membranous testa; cotyledons plano-convex.

Small shrub. Leaflets never exceeding 11 in number, glabrous. Ovary glabrous.

.. *C. heptaphylla*.

Large shrub. Leaflets never less than 15 in number, pubescent beneath. Ovary hairy.

.. *C. excavata*.

1. *Clausena heptaphylla* W. & A. Vern. *Kebu-taye*, Abor; *Dieng-siang-mat*, Khasi (Nongkla); *Ja-lamari*, Khasi (Shella); *Santhlung-suurhui*, Lush.; *Arhit-thi*, Kuki.

A small bushy shrub, smelling of aniseed; branchlets thin, glabrous, terete. *Leaves* 9-15 in. long; petiole terete, as thin as branchlets, glabrous or minutely pubescent; leaflets 9-5, rarely 11, 2-6 by .5-2 in., elliptic-lanceolate, caudate, usually emarginate, tapering to an acute base, slightly crenulate, membranous or thinly coriaceous, glabrous, pale beneath; translucent dots of unequal sizes, thinly scattered; main lateral nerves slender, 6-8 on either side of the midrib; base more or less oblique; petiolule .1-15 in. long. *Panicles* terminal and axillary, 1-4 in. long, with short slender spreading racemose branches. *Calyx-lobes* 4-5, short, broadly oblong-ovate, acute. *Flowers* .15 in. diam., on slender short panicles. *Petals* 4-5, white, fading to pale yellow, oblong glabrous. *Ovary* 4-grooved, glabrous. *Berry* .5 in. long, glandular, orange or red when ripe.

Pillung, N. E. FRONTIER, not common, LUSHAI HILLS-Tipaimukh; CACHAR-Sonai reserve, KHASI & JAINTIA HILLS up to 2000 ft.

The leaves are chewed with *pan* leaves and are also used for flavouring tobacco.

Flrs. 4-5. Fr. cold season.

2. *Clausena excavata* Burn. Vern. *Narasingha*, Ass. (Sib.); *Bengjari*, Ass. (Nowg.); *Theng-sah-soh-arong*, Mikir; *Samdaukhi*, Kach.; *Sam-sweg*, Garo; *Dieng-tyrur*, Khasi.

A large shrub 8-12 ft. high, sometimes a small tree up to 20 ft. in height, unpleasantly aromatic, closely resembling

Murraya Kœnigii Spreng, in this respect, also in foliage and habit ; young parts and inflorescence grey-tomentose. *Leaves* 8-30 in. long ; rachis terete, tomentose ; leaflets 15-30, rarely up to 35, shortly petioluled, 1-3 by .3-1 in., obliquely-oblong to ovate-lanceolate, acute, finely crenulate, with large marginal translucent pubescent glands, membranous, pubescent beneath. *Panicles* 4-12 in. long with spreading (alternate cyme-bearing) branches ; pedicels slender up to .15 in. long. *Flowers* tetramerous, .15 in. across, dull-white ; calyx lobes hairy, broad, acute ; petals oblong, glabrous ; ovary villous. *Fruit* .75 in. long, oblong or obovate.

Fairly common under sal in NOWGONG and also GARO HILLS, N. CACHAR HILLS, Dimapur-SIBSAGAR, KHASI HILLS-foot hills, Shella.

The leaves and twigs are put to much the same uses as those of *Murraya Kœnigii* Spreng-also used medicinally.

Flrs. 3-4.

C. sufruticosa W and A. An undershrub growing in shade in deep jungle. *Leaves* imparipinnate, common petiole terete, tomentose, 10-15 in. long. *Leaflets* 5-17, 1.5-4 in. long, ovate to lanceolate, acute or acuminate, entire, softly tomentose (often silky) especially when young, more densely beneath, very oblique at the base ; petiolule short. *Panicles* 2-5 in. long, lax below the leaves and at the base of current year's shoots ; pedicels filiform, .2-.4 in. long. *Flowers* .2 in. across, sepals 4, ovate, acuminate, puberulous outside. *Petals* 3-4, slightly imbricate, oblong-obovate, blunt, slightly glandular puberulous. *Stamens* 8, free, hypogynous ; filaments dilated below. *Ovary* 4-celled on a hypogynous disk ; style cylindrical, thick ; stigma terminal. *Fruits* not seen.

KHASI HILLS, *De-Silva* ! LUSHAI HILLS, *Gage* ! ASSAM, *Simmons* ! CHITTAGONG HILL TRACTS ; *Prain's* collector ! *Lister* ! *Gamble* !

Flrs. 3-6.

8. *MURRAYA* Linn.

Unarmed shrubs or small trees. *Leaves* alternate, imparipinnate. *Leaflets* alternate, petioluled. *Flowers* 2-sexual, in cymes or corymbs, generally terminal, sometimes solitary. *Calyx* 5-fid. *Petals* 5, valvate, slightly imbricate. *Stamens* 10 ; filaments subulate, alternately shorter ; anthers short. *Ovary* usually 2-celled ; style simple, long, articulated, deciduous. *Fruit* a berry. *Cotyledons* fleshy, plano-convex.

An evergreen shrub or small tree. *Leaflets* 3-9, glossy green. *Flowers* 1 in. long. Ripe fruit red. .. 1. *M. exotica*.

A deciduous shrub. *Leaflets* 9-25, dull green.

Flowers scarcely .5 in. long. Ripe fruit black. .. 2. *M. Kœnigii*.

1. *Murraya exotica* Linn. Vern. *Kamini*, Beng. and Ass. ; *Kolong-asing*, Miri and Abor ; *Deijir* or *Dengjir-arong*, Mik., *Misai-athep*, *Sinsri-kanthou*, *Chinjai-mailo-phang*, Kach., *Dem-dem-ali*, Kuki ; *Ling-kun*, Lushai.

A very handsome shrub or small tree up to 20 ft. in height ; bark corky outside, very thin ; fragrant, compact and granular within, branches greenish grey, striate, young parts puberulous. *Leaves* 3-9 foliolate ; rachis 1.5-4 in. long, finely channelled, glabrous or slightly puberulous above. *Leaflets* 1-4 by .5-1.8 in.,

obliquely rhomboid or elliptic lanceolate, bluntly acuminate with notched tip or acute entire, thinly coriaceous, dark-green and shining above, totally glabrous when mature; base broadly cuneate; petiolule 1 in. long. *Flowers* 1 in. long, milky-white, sweet-scented, in terminal or axillary few-flowered puberulous corymbs, sometimes solitary when axillary. *Sepals* minute, acute pubescent, dotted. *Petals* oblong-lanceolate. *Ovary* linear, 2-celled. *Berries* 5-7 in. long, 2-seeded, narrowed at both ends, rugose, dotted, red or deep orange when ripe.

Not uncommon in shady ravines throughout ASSAM extending to low hills. Often cultivated as an ornamental plant.

Wood light-yellow, close grained and hard, capable of being used as a substitute for box wood for engraving purposes; weight 62 lbs. per c. ft. The branches make very good handles for implements, also walking sticks, while the twigs are much used for cleaning teeth. The Mikirs distill a thick gum by burning green wood, which their women use to blacken their teeth.

Flrs. 3-5. Fr. 12-1.

2. *Murraya Koenigii* Spreng. Vern. *Narasingha*, *Bishahari*, Ass.; *Nor-hing*, Ass. (Kam.); *Thengsakso*, Mik., *Sam-khatsi*, Garo.

A deciduous shrub with a strong smell; bark thin, dark-brown or almost black outside, blaze greenish-white; young parts downy. *Leaves* 6-12 in. long; rachis terete, pubescent; leaflets 11-35, 1-2 in. long, ovate or lanceolate, oblique at the base, obtusely acuminate or retuse, subentire or irregularly crenulate; glabrescent except along the midrib on either surface; petiolule 1 in. long, puberulous. *Flowers* white, 3-5 in. long, white, in terminal corymbose panicles. *Sepals* small, acute. *Petals* oblong, dotted. *Ovary* 2-celled. *Fruit* 3 in. across, subglobose, rugose, black when ripe. *Seeds* 2, imbedded in mucilage.

Recorded from all Districts except LAKHIMPUR, ascending to 3000 ft. in KHASI HILLS. It has often a gregarious tendency.

It very closely resembles *Clausena excavata* so as to share the same vernacular names and to be applied to the same uses with it. The leaves are much used for flavouring curries in the Madras Presidency and probably also by the Mikirs.

Flrs. 2-3. Fr. 4-5.

9. MICROMELUM Bl.

***Micromelum pubescens* Bl.** Vern. *Sagladi*, *Bon-jamir*, Ass. (Sib); *Hilaguti-gach*, Ass. (Darr.); *Gobor-huti*, *Bhaura*, *Bhaluk-dat*, *Padragota*, *Gobor-hura*, Ass. (Kam.); *Koroiphula*, Syl.; *Thenghanse*, Mik., *Galing-asing*, Abor., *Silkhoh*, *Marsusepel*, Garo., *San-mani*, Mech., *Dieng-tyrpei*, Synt.; *Dieng-soh-tlai-shree*, Synt., (Raliang); *Dieng-syrngam*, Khasi (Shella); *Dieng-soh-rang-soi*, *Dieng-soh-sat*, Khasi, (Nongkla), *Dieng ja-iao*, Kh.

A handsome small evergreen tree, 15-30 ft. in height; young parts pubescent; bark yellowish-grey, somewhat rough outside, thin; yellowish inside. *Leaves* 9-20 in. long, rachis terete, pubescent; leaflets 7-15, generally alternate, occasionally sub-

opposite, 2-6 by 1·25-2·5 in., obliquely ovate-lanceolate, wavy or obscurely crenulate at the margins, thinly coriaceous, glabrous above, tomentose or pubescent beneath along the nerves, closely gland dotted; main lateral nerves 8-10 on either side of the midrib; base cuneate, petiolule 1·15 in. long. *Flowers* dull white, strongly scented, 3·5 in. across, in spreading terminal corymbose-ly decompound panicles of tomentose cymes; pedicels 1·3 in long, minutely bracteate, up to 6·5 in. long; buds oblong; calyx truncate or with triangular lobes; petals 5, valvate, narrow-oblong, pubescent; stamens 10, alternately long and short; ovary usually 5-celled, villous along lines running lengthwise, shortly stipitate; style deciduous, articulate with the ovary; stigma capitate; ovules 2, superposed in each cell. *Fruit* a dry berry, 2·3 in. long, oblong, orange-yellow when ripe, usually 1-seeded. *Cotyledons* green, leaf-like, crumpled.

Fairly common throughout ASSAM, ascending to 4000 ft. in KHASI HILLS.

Flrs. 12-2. Fr. 3-4.

10. LUVUNGA Hamilt.

Luvunga scandens Ham. Vern. *Long-phul*, Ass., *Lavanga-lata*, Beng., Sans. *Luvungalata*.

A powerful scandent evergreen shrub, generally tufted from the ground with strong axillary sharp straight or slightly recurved spines. *Bark* ash-coloured, somewhat rough, about 1 in. thick; cream-coloured inside. *Leaves* alternate, simple on young shoots, afterwards digitately 3-foliate; petiole 6·3 in. long, finely channelled above, glabrous. *Leaflets* 4-9 by 1·2-2 in., oblong-lanceolate, narrowed at both ends, quite entire, firmly coriaceous, dark-green, quite glabrous, minutely punctate both above and beneath; lateral nerves about 15 on either side, arched, very slender, scarcely visible in green leaves; petiolules 2·3 in. long, margined. *Flowers* white, fragrant, about 1 in. diam., in axillary branched racemes with cymose branches, sometimes from old wood, shorter than the petioles; pedicels about 3 in. *Calyx* cup-shaped, about 15 in. long, minutely 4-6 toothed. *Petals* 4-5, 4·5 in. long, linear-oblong, fleshy, recurved. *Filaments* 8-10, glabrous, united below; anthers linear. *Disk* fleshy, annular. *Ovary* 3-celled with 2 superposed axile ovules in each cell. *Fruit* an oblong berry, about 8 in. long, obscurely 3-lobed, 1-3 seeded, with an aromatic pulp. *Seeds* ovoid, pointed; radicle superior; cotyledons green, fleshy; albumen 0.

Only found in the Nambor Reserve by Mr. Mann (who has described it as a tree 4ft. in girth) and on the Sadasew hillock and Nigheriting, DISTRICT SIBSAGAR, by my collector Babu Ramesh Chandra Purkayastha.

A very ornamental plant worthy of a place in gardens.

Flrs. 2-4. Fr. 3-9.

11. ATALANTIA Correa.

Atalantia monophylla Correa. Vern. *Ching-kamla*, *Bankamla*, Manip., *Ramser*, Lushai.

A small tree or large shrub ; stems greenish-brown outside, pale greenish-yellow inside, branches rigid, older armed with sharp axillary spines ; branchlets puberulous. *Leaves* 1-foliolate ; leaflets 2·5-4·5 by 7-17 in., lanceolate or elliptic-ovate-lanceolate, bluntly acuminate, emarginate at the tip, entire, coriaceous, glabrous ; lateral nerves 10-12 on either half with many intermediates between, looping near the margin, ends forming a very wavy more or less continuous nerve ; base cuneate ; petiole 1-3 in., channelled with two subulate stipular scales at the base. *Flowers* white, in puberulous fascicles or contracted corymbose cymes in leaf axil ; pedicels 15-4 in. long ; bracts minute. *Calyx* irregularly split at the base at the time of flowering or after it to the base, lobes very short, ciliate. *Petals* 4 in. long, obovate-oblong, adnate to the staminal tube. *Stamens* 8 ; filaments united almost through their entire length into an irregularly cleft tube ; anthers small, elliptic ; disk inconspicuous, short. *Ovary* tapering to the style ; 3-5 celled ; style long, cylindrical ; ovules 1 or 2, collateral. *Berry* globose like a lime, rugose and glandular outside, 6 by 5 in., 4-celled ; cells 1-seeded.

N. CACHAR HILLS, Borail Res. ; CACHAR, Rukni Inner line reserve ; Barak Inner line reserve ; Mynadher ; KHASI HILLS at the foot bordering SYLHET-Thienpyryngam.

Wood yellowish, hard.

Fr. 5.

The apex of the leaves is described as "obtuse" by several authorities but this does not apply to any of the Assam specimens examined by me.

Atalantia caudata Hk. f. Unarmed shrub. *Leaflets* 3-7 in., very variable, linear lanceolate to elliptic, obtuse, or obtusely acuminate, emarginate at the tip, glabrous, subcoriaceous, entire ; base with a pair of slender sub-basal nerves ; Petiole channelled, 7-8 in. long. *Flowers* 2-3 in. across, white, fragrant, in very short glabrous racemes with slender pedicels. *Calyx* very small, sub-regularly 4-5 lobed ; petals obovate-oblong ; stamens free ; disk narrower than the ovary. *Ovary* 2-celled ovules 2-collateral. *Fruit* globose, 5-8 in. across.

ASSAM—Masters (!) ; CACHAR (Jirighat), Prazer (!) ; KHASI HILLS—Cherra-Hooker.

Flrs. 3-5. Fr. 11-12.

Atalantia ? sp.—A small tree about 25 ft. in height and 2 ft. in girth, bark greyish-white, warty and also with lines of fine lenticels, thick, blaze reddish with green edges ; young parts puberulous. *Leaflets* 5-6·5 by 1·3-2 in., obovate or obovate-oblong, acuminate, subcoriaceous glabrous, lateral nerves 20-24, ends looping near the margin, gland dots close ; base gradually narrowed ; petiolule indistinctly jointed, channelled, puberulous or glabrate. Flrs. and fr. not seen.

Incomplete specimens from Dirju, LAKHIMPUR (Sheet 4388). Further material needed for correct determination.

12. PARAMIGNYA Wight.

Scandent or erect shrubs, armed with axillary spines or unarmed. *Leaves* 1-foliolate, entire, subcoriaceous. *Flowers* rather

large, axillary, solitary or fascicled. *Calyx* teeth 4-5, small. *Petals* 4-5, free, imbricate, rarely valvate. *Disk* thin, columnar. *Stamens* 8-10, free, filaments inserted round the disk, usually hairy, anthers linear-oblong. *Ovary* 3-5 celled; style elongate, deciduous; stigma capitate; ovules in each cell 1 or 2, obliquely superposed. *Fruit* an ovoid or subglobose berry, 1-5 seeded, rind thick; seeds large, oblong, compressed; testa membranous, cotyledons fleshy, equal.

I. *Calyx* not cupular; teeth acute:—

Flowers less than .7 in. across:—

Leaves pubescent along the midrib above, tomentose beneath. Flowers over .5 in.

across. Berry rounded, not pointed at apex. .. 1. *P. Griffithii*.

Leaves glabrous, except along the midrib beneath. Flower .3 in. across. Berry obtusely 5-angled, pointed. .. 2. *P. citrifolia*.

II. *Calyx* cupular; teeth obscure, rounded if present.

Berry small. .. 3. *P. monophylla*.

1. *Paramignya Griffithii* Hook. f. Vern. *Bonjora*, Ass.; *Ingsuthesolo-rikang*, Mik.; *Thaisa-gulangi*, *Thai-saiya-suggur-biding-doukha*, Kach.; *Soh-nari-khlaw*, Khasi.

An evergreen scandent shrub with strong axillary recurved spines; young parts tomentose. *Bark* grey-corky and vertically fissured on old stems, yellow inside. *Leaflets* 2.5-5 by 1-2 in., oblong or elliptic, bluntly acuminate, entire or nearly so, rounded or sub-cordate at the base, thinly coriaceous, glabrous above except along the midrib, softly tomentose beneath at least when young, afterwards sometimes glabrescent; translucent dots numerous; main lateral nerves 10-12 on either side of the midrib; petiolule indistinctly jointed with the petiole, both together .2-.3 in. long, generally twisted, pubescent. *Flowers* white, .5-.6 in. long, solitary or a few together in short axillary cymes; pedicels hairy, jointed near the base up to .15 in. long. *Calyx* hairy outside, with 5 deltoid teeth. *Petals* 5, .4-.5 in. long, lanceolate, imbricate, glabrous. *Stamens* generally 10, nearly as long as the petals; filaments tapering, shaggy except near the thin upper extremity; anthers scarcely .1 in. long, oblong. *Ovary* 5-celled, hairy; style .4 in. long, hairy only at the base. *Fruit* .8-1.2 in. diam., globose or slightly ovoid, terete, glabrous, rugose and usually dark-green; pulp aromatic, very acid.

Gaurisagar, Kujibali, Mahmora, Akhoiphutia, Rengma Res., etc., in SIBSAGAR, generally in shady marshy localities; ravines in the MIKIR HILLS; KAMRUP, Garuchara forest; GOALPARA; N. C. HILLS, KHASI & JAINTIA HILLS up to about 3000 ft., Barpani.

Flrs. 3-4. Fr. 9-1.

2. *Paramignya citrifolia* Hk. f. Vern. *Mei-soh-khar-khlaw*, Kh.

An armed shrub with grey stem; spines recurved .3-1 in. long, base greenish, tip polished; twigs greenish grey; young shoots puberulous. *Leaflet* 3-6 by 1.3-2.6 in., faintly unpleasantly scented, elliptic-ovate or oblong, bluntly acuminate, entire, slightly

glabrous on both surfaces except along the midrib beneath, coriaceous with numerous translucent glands which appear as raised dots on the undersurface ; lateral nerves rather obscure, 10-12 on either half, forming loops near the margin, with many intermediates of nearly equal thickness ; base rounded or obtusely narrowed ; petiolules somewhat obscurely articulated to the petiole, both twisted pubescent and together up to .4 in. long. *Flowers* axillary, about .3 in. across, white ; peduncle about .25 in., jointed near the base, pubescent ; bracts minute, inserted at or below the joint. *Calyx* pubescent with 5, triangular acute teeth. *Petals* 5, oblong, smooth. *Filaments* 10. *Fruit* about 1 by .8 in., ovoid and of the colour of a lemon and with a similar rind, obtusely 5-angled, pointed about 1 by .8 in. ; seeds 3-5, large.

KHASI HILLS on the foot hills above SYLHET ascending to about 2000 ft. —Nongkla, Thleusyrungam, Sutynga, Raliang,

Flrs. hot season. Fr. 12.

The description of the floral organs have been taken from Roxburgh's *Flora Indica*.

3. *Paramignya monophylla* Weight.

A scandent shrub ; younger branches terete, pubescent or glabrous, green. *Leaflet* 2.5-5 in., ovate-lanceolate, elliptic or somewhat obovate, bluntly acuminate, both surfaces nearly alike, undersurface dotted ; petiolule obscurely jointed to petiole, both twisted and .5-.75 in. long. *Flowers* axillary .1 in. across, white, drooping ; pedicels curved .2 in. long, puberulous, jointed, with 2 or 3 subulate bracts inserted at or below the joint. *Calyx* cup-shaped, obscurely toothed. *Petals* 5, linear-spathulate, .5-.6 in. by .2 in., broad at base, spreading, erect, imbricate with green pellucid dots. *Stamens* 10, free ; filaments thick, hairy inside, .4 in. long, curved backwards at the apex. *Ovary* 3-celled. *Berry* ovoid, size of a nutmeg, "very much like a lime"—Roxburgh. *Seed* 1 in each cell.

KHASI HILLS—Hooker. There are no specimens at Calcutta from our area.

Flrs. 4. Fr. 8 (Darjeeling).

13. CITRUS Linn.

Trees or shrubs usually with sharp axillary spines. *Leaves* alternate, 1-foliate, coriaceous, pellucid, punctate, aromatic ; petiole often winged. *Flowers* fairly large, axillary, white or pinkish, sweet scented, solitary or in small cymes or racemes, sometimes 1-sexual. *Calyx* cup-shaped, 3-5 toothed. *Petals* 4-5, rarely more, fleshy, gland-dotted, imbricate in bud. *Disk* fleshy, annular or cup-shaped. *Stamens* 20-60 ; filaments flattened at the base, usually united into several bundles. *Ovary* many-celled ; style stout, deciduous ; ovules in 2 series in each cell. *Berry* globose or oblong, fleshy, rind leathery, many celled with membranous septa, filled with transverse fusiform vesicles containing acid or sweet juice. *Seeds* few in each cell ; testa

leathery ; embryo sometimes two or more in each seed ; albumen 0 ; radicle superior.

- I. Petiole not or narrowly winged ; leaves glabrous :-
 Flowers tinged with red, often 1-sexual. .. 1. *C. medica*.
 Flowers pure-white, always 2-sexual. .. 2. *C. Aurantium*.
- II. Petiole broadly winged. Flowers generally white :-
 Leaves glabrous. Vesicles colourless coherent. .. 3. *C. Hystrix*.
 Leaves pubescent beneath. Vesicles pinkish or pale yellowish. Fruit 4-8 in. in diam. .. 4. *C. decumana*.

The above classification has been drawn up for separating the well marked forms that are commonly found in our area. Dr. Bonavia who devoted several years to the study of limes, citrus and oranges of India has shown (*Cultivated oranges and lemons of India and Ceylon*) that such definite lines cannot be drawn between the races now cultivated. The pumelo approaches in many respects *C. Hystrix*, while the limes come near to the some of the forms of the true orange. Dr. Bonavia also maintains that all true limes have been derived from *C. Hystrix* (Journ. Linn. Soc. XXII-23). He also hazards the opinion that *C. decumana* may have developed from the Malta or Portugal orange or derived from a common ancestor both having red vesicles. It seems probable therefore that *C. Hystrix* is the ancestral forms of all limes and oranges of which the wild forms now found in several parts of India are local manifestations.

1. *Citrus medica* Linn. Vern. *Bakol-khowa-tenga, Jora-tenga*, Ass. ; *Tume-han-thor*, Mik. ; *Naya-changney*, Duff. ; *Haijange*, Manip. ; *Missar*, Tipp. ; *Shashni-jamir*, Sylhet ; *Soh-manong*, Khasi ; *Dieng-soh-sarman*, Synt.

A bushy shrub ; young shoots glabrous, somewhat angled ; spines ascending, straight, 2-1 in. long. *Bark*: greenish, on old stems with close shallow vertical fissures, greenish white. *Leaflets* light green, 3-6 by 2-2.5 in., elliptic-ovate or oblong, oblong-lanceolate or obovate rounded or with an obtuse apex, narrowed or cuneate at the base, crenulate-serrate, with translucent dots at the sinuses, chartaceous, aromatic, covered with translucent dots ; main lateral nerves 10-12 on either side of the midrib, slender, irregular ; petiole 25-4 in. long, naked or very narrowly winged. *Flowers* waxy-white, usually tinged with red, sweet-scented, solitary or up to 10 in a raceme, nearly 1 in. long ; pedicels up to 2 in. long, often 1-sexual ; buds oblanceolate. *Calyx* obconic, truncate or very shallowly toothed. *Petals* linear—oblanceolate, gland-dotted. *Stamens* 20-40 ; filaments reddish, pubescent. *Fruit* 3-5 by 2-3 in., obovoid-oblong, often mamillate at the apex, yellow when ripe, very aromatic, with the thick spongy rind and coherent colourless small vesicles filled with acid aromatic juice.

Common along edges of marshes and sluggish streams throughout ASSAM, ascending about 4200 ft. in KHASI HILLS,

The acid juice of the fruit as also its sweetish inner rind is eaten. Of the other cultivated varieties some forms of *Var. acida*, the acid lime of India are commonly cultivated, the other varieties being practically unknown. The wood is white and fine-grained suitable for agricultural implements when of sufficient size. The branches make good walking-sticks.

Flrs. throughout the year but chiefly 3-5. Fr. 10-2.

2. *Citrus Aurantium* Linn. Vern. *Humutia-tenga*, Ass., *Rebo-singking*, Abor; *Generu-ay*, Miri. The orange.

A small tree with darker and denser foliage than the preceding species, smaller and narrower leaflets and smaller and weaker spines; petiolar wing generally very narrow or 0. *Flowers* white, much smaller than of *C. medica*. *Fruit* depressed-globose, oblate, never mamillate, bright-orange; pulp whitish, unpleasantly acid.

Near Pillung in the E. FRONTIER DISTRICT.

This plant is probably the true wild orange. It should be further studied in the field.

Flrs. 12.

Excellent oranges are grown in the neighbourhood of Shella in KHASI HILLS, KAMRUP, Margherita and Jeypur in LAKHIMPUR and near Mariani in SIBSAGAR. In the cultivated fruit when ripe the vesicles of the pulp is of a dun orange colour, never white.

The race known as Santara orange, and only to a limited extent in the KHASI HILLS, the Mandarin oranges are cultivated.

3. *Citrus Hystrix* DC. Vern. *Hampur-arong*, Milk., *Chamar-baphang*, Cach., *Satkora*, Sylhet; *Soh-Kyniet*, *Soh-kymphor*, Khasi; *Diengsoh-bah*, Synt.

A tree up to 50 ft., or more in height and 3 ft. in girth; stem sometimes fluted at the base; branchlets compressed and angled; spines ascending, small. *Bark* grey or black, very thin, hard, granular, pale-brown inside with white vertical lines. *Leaflets* 1·3-3·5 by ·7-2 in., ovate elliptic or lanceolate on petioles which are winged so as to be equal to or even larger than the leaflets in size and generally obcordately obovate or oblanceolate in shape, retuse at the apex, entire or minutely crenulate, coriaceous, dark-green, glabrous, punctate with oily gland-dots; lateral nerves close and irregular; portion of petiole below the wings 2-3 in. long, channelled or margined. *Flowers* white or light purplish, 6-8 in. diam., axillary, solitary or in few-flowered short cymes; pedicels up to about 2 in. long, buds obovoid. *Calyx* small with 4-5 deltoid teeth. *Petals* 4, obovate or oblanceolate, 3-4 in. long. *Stamens* 20-25; filaments free, stout, glabrous. *Ovary* globose, glabrous; style 2 in. long, stout; stigma large, globose. *Fruit* 1·5-2 in. diam., 15-20 celled; rugose outside with large oil glands; vesicles of pulp small, coherent, colourless; juice very acid.

Fairly common in the MIKIR HILLS chiefly on their eastern and southern slopes down to the foot; Garampani, Dhansiri, etc., also in KHASI HILLS where it is sometimes gregarious (e.g. Marrung); NOWGONG (Lamsakhang), N. C. HILLS.

In cultivation the fruits are usually large and resemble a small pumelo. Sometimes cultivated in gardens.

Wood of cream-colour, hard, very tough, fine and even grained weighing 71 lbs. per c. ft. Medullary rays numerous, very fine, straight; pores of moderate size, scanty, irregularly scattered, solitary or in radial groups; annual rings indistinct but there are numerous fine concentric lines which do not represent annual growth. Well worth a trial as a substitute for box wood.

Flrs. 3-4. Fr. 9-11.

Probably the same as *C. ichangueusis* Swingle, which is also said to occur in the Khasi Hills. The older name has been therefore retained for the present.

4. *Citrus decumana* Linn. Vern. *Rebab-tenga* Ass., *Batavi-nebu*, Beng., The Pumelo or Shaddock.

This wellknown fruit tree is cultivated in homestead compounds in the villages and towns of UPPER ASSAM. Young parts pubescent. *Bark* thin, greyish or greenish brown. *Leaflets* 2-6 by 1-2.5 in., oblong or ovate-oblong, crenate, shining above, pubescent at least along the midrib beneath; petiole broadly winged, obovate or oblanceolate in shape. *Flowers* white, sweet-scented; stamens 15-25; style short; stigma capitate. *Fruit* 6-8 in. diam., globose or broadly pyriform, yellow when ripe; vesicles of pulp large, loose, filled with sweet or acid juice; rind thick, spongy, white inside.

The wood is similar to that of the preceding species, but much lighter.

14. ÆGLE Corr.

Ægle Marmelos Correa. Vern. *Bilwa*, Sans., *Bel*, Ass. & Beng.; *Sherbili-phang*, Cach; *Belethi*, Garo., *Soh-Bel*, Khasi. The Bael tree.

This well-known spinous aromatic tree is not indigenous in UPPER ASSAM except along its western boundary, but is cultivated almost everywhere near Hindu Temples. Its characters are so well known that no detailed description is necessary. The spines are straight and axillary up to about an inch in length. The leaves are normally 3-foliolate, but occasionally some are found digitately 5-foliolate. *Flowers* greenish-white, sweet-scented about 1 in. diam., in few-flowered short lateral panicles. *Petals* 4-5, imbricate, fleshy, gland-dotted. *Stamens* up to 50 or more. *Fruit* 2-7 in. diam., 10-15 celled, with a strong clear mucus imbedded in a mass of sweet aromatic mealy pulp.

Wood even and close grained, tough and strong, but liable to split in seasoning; weight 50-60 lbs. per c. ft. The pulp of the ripe fruit is a laxative and mixed with a little milk and sugar makes a very cooling *sherbet*. The unripe fruit either boiled or roasted is used as a specific for diarrhœa and dysentery. The pulp is also used in Bengal and Upper India to strengthen mortar. The mucus of the cells is used for adhesive purposes and is often mixed with water-paints to add to their strength and brilliancy. *Snuff-boxes* are made of the shell of fruits of small size. The leaves are very bitter and are used as a febrifuge; they are also lopped for cattle-fodder. They are considered indispensable for Hindu worship, especially of the God *Siva* and the wood is one of the few prescribed by the Hindu scriptures for sacred fires.

About 150 seeds weigh 1 oz.

Flrs. 3-5. Fruit ripens 3-6, next year.

31. SIMARUBACEÆ.

Trees or shrubs with bitter bark. *Leaves* alternate, unequally pinnate (in the genera found in Assam), usually exstipulate. *Flowers* in axillary paniced cymes, small, regular, generally unisexual. *Calyx* 3-5 lobed, valvate or imbricate. *Petals* 3-5, rarely 0. *Disk* entire or lobed, rarely 0. *Stamens* as many or twice as many as the petals, hypogynous, inserted at the base of the disk; filaments free, often with a scale at the base. *Ovary* 1-6 celled, usually deeply lobed or with distinct carpels; ovules solitary in each cell. *Fruit* drupaceous or samaroid, rarely baccate or capsular, usually carpels more or less distinct. *Seeds* usually albuminous.

Fruit winged. Stamens in flowers twice as many as petals. Large trees. ..
Fruit not winged. Stamens in flowers as many as petals. Small or middle-sized trees :—

.. 1. *Ailanthus*.

Drupe supported by persistent calyx and petals.

.. 2. *Picrasma*.

Calyx and petals deciduous ..

.. 3. *Brucea*.

1. *AILANTHUS* Desf.

Ailanthus grandis Prain. Indian Forester Vol. XXVIII-P. 131-34, Vern. *Borpat*, Ass. (N. E. Fr.); *Saragphula*, Ass. (N. Lakh.), *Borkeseru*, Ass. (Lakh.); *Koronga*, Ass. (Darr); *Ring*, Ass.; *Sileng-asing*, Miri & Abor; *Diang-ehao*, Khasi; *Lalang-baiong*, Jaintia.

A lofty tree up to 150 ft. in girth with a cylindrical bole. *Bark* grey outside, nearly smooth excepting for deep horizontal wrinkles, 1-1.5 in. thick; inside yellowish-brown, mottled with white specks and traversed by coarse strands of amber-brown. *Leaves* alternate, 2-3.5 ft. long; leaflets alternate, 6-8 by 2.5-4 in., oblique ovate lanceolate, shortly acuminate, entire or sinuate, chartaceous, glabrous; lateral nerves 10-12 on either half, 1 or 2 pairs with glands; base obliquely cuneate; petiolules .3-.6 in. long. *Panicles* axillary, about a foot long. *Flowers* not seen; pedicels in fruit about 1.2 in. long. *Fruit* of 1-3 samaras with wings both above and below the seed, 4-5 by 1.2-1.5 in. including the glabrous finely nerved wings which are perfectly flat, apex rounded, obtuse, the inner margin of the lower end of the wing thickened by the funicular cord of the seed which is near the middle of the samaras, outer edge of base subtruncate; seed flat, .6 in. across; testa membranous, light-brown; cotyledons oily.

Khairan, Bomjur. N. E. FRONTIER; Rangagora, Digboi, Jaipur LAKHIMPUR; Barpathar, Merapani—SIBSAGAR, Lambabak, Barak, CACHAR; LUSHAI HILLS, GARO HILLS, N. CACHAR HILLS, KHASI & JAINTIA HILLS—Nongkha.

Wood light, white, soft, but can be used for tea-boxes and other packing cases.

Flrs. 9-9 ? Fr. 12-1.

2. PICRASMA Bl.

Trees ; every part very bitter. *Leaves* large, imparipinnate. *Flowers* small, unisexual or polygamous, in axillary corymbose panicles. *Calyx* very small, 4-5 toothed. *Petals* 4-5, valvate, very often enlarging after flowering. *Disk* thin, entire. *Stamens* 4-5 ; filaments hairy, not scaly. *Carpels* 3-5 ; styles free at the base and apex but united in the middle ; ovules erect, solitary. *Fruit* of 1-5 fleshy or coriaceous drupes supported by the persistent calyx and petals. *Seeds* erect, albuminous.

Leaflets 9-15, serrate.
Leaflets 3-7, entire

..
..

.. 1. *P. quassioides*.
.. 2. *P. javanica*.

1. **Picrasma quassioides** Bennet. Vern. *Dieng-khlang*, Khasi.

A small tree ; young parts brown, tomentose ; twigs dotted with circular lenticels ; bark perhaps more bitter than that of *P. javanica*—dark grey to black, fairly smooth or slightly rough outside, dull-white inside. *Leaves* lyrate imparipinnate ; rachis 3·5-6·5 in. long, puberulous ; leaflets 9-15, lowest pair smallest, penultimate pair largest, opposite or subopposite, 1·5-4 by ·5-1·6 in., ovate to lanceolate, long acuminate, serrate, membranous, glabrate with age ; lateral nerves 7-9 on either half, prominent beneath, nervules finely reticulate ; base often oblique ; petiolules of lateral leaflets very short up to ·08 in., of the terminal leaflet ·5-1 in. long. *Flowers* green, ·2-·3 in. across in axillary corymbose puberulous panicles up to 6 in. long 5(-4) merous ; pedicels ·2-·4 in. long, jointed below the middle. *Calyx* lobes small, imbricate. *Petals* ovate or oblong-obovate ; filaments with thick hairy bases. *Drupels* ·25-·3 in. long, 1-5 together, obovoid or globose, black when ripe, supported by the much enlarged coriaceous petals and calyx.

KHASI HILLS above 3000 ft.
Flrs. 4-6. Fr. 7-9.

2. **Picrasma javanica** Bl. Vern. *Putisal* or *Putichhal-asing*, Miri ; *Singka-asing*, Miri and Abor ; *Nimtita*, Ass. (Lakh.) ; *Bon-poshla*, Ass. (Sib.) ; *Putichhal*, Ass. (N. E. F.) ; *Aeo*, Naga ; *Sheng-lokso*, Mik. ; *Bor-jagrenq*, Garo ; *Teju*, Nep.

A middle-sized tree ; bark thin, dark-brown or black and more or less smooth outside, dun-brown and reticulated underneath the cuticle, white inside, very bitter ; young parts pubescent. *Rachis* 3·5-8 in. long, glabrous. *Leaflets* 3-7 but generally 7·2·5 by 1-2 in., oblong ovate, elliptic or obovate-oblong, abruptly and somewhat bluntly tailed ; quite entire, thinly coriaceous, dark-green, glabrous ; main lateral nerves 5-7 on either half, much arched ; base cuneate, sometimes oblique ; petiolule ·1-·15 in. long, channelled. *Panicles* peduncled, corymbose, axillary, 2-4·5 in. long ; branches slightly pubescent. *Flowers* polygamous, dull-white, about ·3 in. across ; pedicels at first villous, elongating in fruit and then ·3-·5 in. long. *Calyx* small, 4-toothed,

obes ciliolate. *Petals* 4, about .15 in. long, valvate with slightly conduplicate margins, ovate. *Stamens* 4; filaments short, subulate, hairy. *Carpels* generally 4, alternating with stamens or staminodes with barren anthers. *Drupels* 1-4, subglobose, .3-.5 in. long, black when ripe, shining, seated on the cushion-like disk and supported by the accrescent coriaceous petals and calyx which then attain up to .5 in. in length.

Fairly common in shady parts of evergreen forests, throughout the province, ascending to 2000 ft. in KHASI HILLS.

The bark is very bitter and is used as a febrifuge by Miris and Abors, also by the Nepalese.

Wood light, white and soft, weighing 27 lbs. per c. ft.

Flrs. 4-5. Fr. 10-11.

P. Nepalensis Benn. Vern. *Thigisin*, Garo-has been united with the above by Sir George King (Journal Asiatic Soc. Vol) a view with which I entirely agree, as I cannot find any constant character by means of which the two could be separated. It is a small tree, which in all characters closely resembles forms of *P. javanica* with narrow leaflets and slender panicles. The fruit is reported to be edible when ripe by local officers, a statement about which I have serious doubts.

GARO HILLS—planted near villages.

Fls. 3. Fr. 4?

3. BRUCEA Mill.

Brucea mollis Wall Cat. Vern. *Dieng-la-kasein khlow*, Synt.

A small shrub; branches speckled with close set lenticels; stems reddish-brown, elegantly marked with reticulate lines; young parts tomentose. *Leaves* alternate, imparipinnate; rachis pubescent, 7-14.5 in. long; leaflets 7-13, lateral opposite, lowest pair smallest, larger upwards, 2-5 by .7-1.7 in., ovate or oblong-lanceolate, acuminate, entire, membranous, pubescent on both surfaces, more densely beneath; lateral nerves 8-11 on either half, arcuate; base often unequal, rounded or cuneate. *Flowers* green, minute, polygamous, in small cymes arranged in axillary pubescent racemes 4-9 in. long; pedicels short. *Calyx* minute, 4-partite; lobes imbricate. *Petals* 4, minute, imbricate, linear, longer than the stamens. *Disk* 4-lobed: stamens 4, inserted beneath the disk; filaments naked. *Ovary* deeply 4-lobed, glabrescent; styles deflexed. *Fruit* of 1-2, less often 3 or 4 drupels, .4-.5 by .3 in., orange red when ripe, somewhat fleshy, ovoid, pointed at the apex; stone reticulated; seed exalbuminous; cotyledons fleshy.

KHASI AND JAINTIA HILLS above 3000 ft., KAMRUP-bet. Agrang and Doimari.

Fr. 1.

B. sumatrana Roxb.—A large evergreen shrub, often epiphytic; branchlets stout, tomentose, as are also leaves and inflorescence. *Leaves* 12-15 in. long, imparipinnate; rachis terete; leaflets 9 or 13, 2.5-4 by 1-1.4 in., ovate-lanceolate, coarsely serrate, green above, pale or tawny beneath; base acute; petiolules slender. *Flowers* purplish, small in distant cymes arranged on axillary racemes up to 14 in. long. *Calyx* very small. *Petals* larger than calyx segments. *Drupes* .25 in. long, ovoid, somewhat compressed and ridged, black when ripe, stone reticulate.

ASSAM—Hooker, Brandis. I have however seen no specimens at Calcutta from our area.

Flrs. 3-7. Fr. 4-8.

FAM. 32. OCHNACEÆ.

Glabrous shrubs or trees with watery juice. *Leaves* alternate, usually simple, coriaceous; stipules 2. *Inflorescence* paniced or umbellate; flrs. rarely solitary, bracteate. *Flowers* hermaphrodite, conspicuous, usually yellow or orange; sepals 4-5, free, imbricate, persistent, sometimes coloured in fruit. *Petals* 5, rarely 4 or 10, free, hypogynous, imbricate, longer than the sepals, deciduous. *Disk* enlarged after flowering. *Stamens* various, sometimes indefinite, inserted on the disk; filaments persistent; anthers basifixed, sometimes deciduous, dehiscing longitudinally or opening by terminal pores. *Ovary* short, 2-10 celled, sometimes deeply lobed; placenta axile or parietal; style simple, subulate or free at the extremity; ovules 1-2 in each cell or indefinite, ascending or rarely pendulous; raphe ventral. *Fruit* of several drupels or pyrenes each with 1-4 seeds, or capsular; albumen fleshy or 0.

OCHNA Linn.

Deciduous trees, shrubs or undershrubs. *Leaves* serrate. *Flowers* large yellow in bracteate panicles or umbels. *Sepals* 5, coloured, persistent in fruit; petals 5-12; disk lobed, thick. *Stamens* indefinite, shorter than the petals; anthers generally opening by terminal pores, deciduous. *Ovary* deeply 3-10 lobed, each lobe 1-celled. *Drupels* 3-10, each one seeded, seated on the enlarged disk.

Large shrubs or small trees, shoots perennial; branchlets annulate with scars of bud scales; inflorescence corymbose:—

- | | |
|---|------------------------------|
| Anthers equalling or a little longer than the filaments in the fully opened flower. Petals usually much exceeding the sepals. | ... 1. <i>O. Wallichii</i> . |
| Anthers several times longer than the minute filaments in the fully opened flower. Petals as long as the sepals or a little longer. | ... 2. <i>O. squarrosa</i> . |
| Undershrubs; shoots annual; branchlets not annulate; inflorescence umbellate. | ... 3. <i>O. pumila</i> . |

1. *Ochna Wallichii* Planch? Vern. *Khimdabeng*, Garo.

A small deciduous tree; bark dark-brown outside; blaze dark red striated with fine brown veins, pale-green on the edges; bud scale dry, oblong, parallel-veined, concave, unequal up to about .5 in., scars annulate, prominent. *Leaves* 4-9.5 by 1.3-2.3 in., lanceolate or oblong lanceolate, acute or shortly acuminate, cuspidate serrate, thinly coriaceous; lateral nerves 15-19 on either half, ends meeting near the margin and more or less contiguous, fine; nervules indistinct, straight, mostly subparallel; petiole very short; stipules .15 in. long, subulate, intrapetiolar. *Flowers* before the leaves, in few flowered corymbs, mostly at the ends of short

lateral woody branches ; pedicels .5-1 in. long, jointed near the base. *Sepals* 5, obtuse-oblong, about .5 in. long. *Petals* .6-.9 by .25-.4 in., obovate, clawed. *Filaments* a little shorter than the anthers or equalling them. *Drupels* 3-5 on a large hemispheric disk, reticulate when dry. *Fruiting sepals* reflexed, reddish, purple, coriaceous.

GARO HILLS near Tura, Rongrengiri reserve, Songsak road ;

CACHAR—Katakhal Forests—Mann ! SYLHET, *Brandis*.

Wood is used for rice pounders.

Flrs. when leafless 3-4 ?

2. *Ochna squarrosa* Linn.

A small subdeciduous tree or shrub ; branchlets annulate with scars of fallen bud scales. *Leaves* 2.5-5 by 1-2 in., obovate, elliptic or oblanceolate, acute usually at both ends, firmly coriaceous or subcoriaceous, remotely but sharply serrate ; petiole .15-.2 in. long, stouter than in *O. Wallichii* ; stipules .15-.25 in. *Flowers* while the leaves are still on, fragrant, from ends of short lateral branches or scars of fallen leaves, in corymbose racemes ; pedicels 1-1.5 in. (stouter than in last sp.) long. *Sepals* .5-.7 in. long. *Petals* 5-12, as long as sepals, or a little longer, clawed ; anthers several times longer than the filaments, .3-.4 in. long ; filaments minute ; lobes of disk ridged. *Drupels* .3 in. long. *Fruiting sepals* erect.

KHASI HILLS, SYLHET—Clarke (!) GARO HILLS, Rongrengiri.

Flowers 3-4. Fr. 5-6,

3. *Ochna pumila* Ham.

An undershrub usually with annual shoots from a perennial woody root-stock. *Leaves* 3.5-6 by 1.3-2 in., oblanceolate or obovate, obtuse or subacute at apex, spinous serrulate, coriaceous ; lateral nerves 10-12 on either half, fine, slightly raised, tapering to a short petiole ; stipules .25-.3 in. long, lanceolate, margins toothed. *Flowers* bright yellow, 1.5-2 in. across, fragrant, few together, subumbellate at the ends of long axillary and terminal peduncles, 2-3 in. long ; pedicels .7-1.5 in. long, joined below the middle. *Sepals* up to .5 in. long, elliptic-oblong. *Petals* yellow, delicate, obovate, much exceeding the sepals ; filaments a little shorter than or equalling the anthers ; style with 4 linear segments near the top. *Drupels* up to .5 in. long, greenish when ripe.

LOWER ASSAM—Mann ! ASSAM—Fisher !

Flowers 3-5. Fr. rainy season.

FAM. 33. BURSERACEÆ.

Resinous trees or erect shrubs. *Leaves* alternate, usually imparipinnate in the Genera described here, generally exstipulate. *Flowers* small, 2-sexual or polygamous. *Calyx* free, 3-7 cleft, valvate or imbricate. *Petals* 3-7, usually distinct. *Disk* annular or cup-shaped. *Stamens* as many or twice as many as the petals; filaments usually free, inserted on the margin or outside at the base of the disk; anthers 2-celled. *Ovary* free, 2-5 celled, with 2-axile pendulous ovules in each cell; style simple. *Fruit* a drupe, either with 1-5 pyrenes or with a 1-3 celled and 1-3 seeded stone. *Seeds* exalbuminous.

Calyx lobes 5, stones 1-celled, 1-seeded :—

Flowers terminal or at the ends of branches; disk lining the calyx tube.

.. 1. *Garuga*.

Flowers axillary or from axils of fallen leaves; disk annular.

.. 2. *Bursera*.

Calyx lobes 3; stones 3-celled, usually 1-2 seeded.

.. 3. *Canarium*.

1. GARUGA Roxb.

Middle-sized or large trees; branchlets pubescent when young. *Leaves* exstipulate, crowded towards the ends of branches; leaflets opposite, subsessile. *Flowers* polygamous in much branched panicles. *Calyx* campanulate, 5-fid, valvate, clothed within by the large, but thin, crenate disk. *Petals* 5, inserted on the tube of the calyx, induplicate-valvate. *Stamens* 10, equal, in 2 series, inserted at the mouth of the hollowed disk. *Ovary* sessile, ovoid, 4-5 celled; style erect; stigma capitate. *Fruit* a globose fleshy drupe with 1-5, 1-seeded pyrenes. *Seeds* with a membranous testa; albumen 0; cotyledons contorted.

Leaflets turning red before falling. Panicles usually under 9 in., not slender. Calyx deciduous. Ovary usually tomentose. Drupe .5-1 in. diam.

... 1. *G. Pinnata*.

Leaflets turning yellow before falling. Panicles up to 16 in., slender. Calyx persistent. Ovary usually glabrous or nearly so. Drupe under .2 in. diam.

... 2. *G. Gamblei*.

1. *Garuga pinnata* Roxb. Vern. *Thotmola*, *Rohimola*, *Thotmela*, Ass.; *Kechkechi*, Ass. (Darr.); *Pani-amora*, Ass. (Sib.); *Rohimala*, Ass. (Nowg.); *Tejhi-arong*, *Timur*, Mik.; *Bonkung-asing*, Miri; *Bonthai-phang*, *Roun-poma*, Kach.; *Sibon-asing*, Abor; *Thing-rot*, Kuki; *Chigambol*, *Chidampha*, *Dumi*, *Agri*, *Garó*; *Toisim-taito*, *Bombus*, *Bombuk*, Tipp.; *Sri-amla*, *Pahari-jiga*, *Jharua*; *Engla*, *Hengela*, Sylh.; *Dabdabi*, Nep., *Dieng-khiang*, *Khasi*; *Dieng-soh-pujjar-synrang*, *Dieng-soh-khmud*, *Khasi* (Umling).

Usually a middle-sized deciduous tree. *Bark* grey or brown outside up to 1 in. thick, generally rough and exfoliating in round

hard flakes; blaze red or deep-pink, somewhat aromatic, often with distant streaks of white tissue; young parts and inflorescence pubescent. *Leaves* 9-18 in. long. *Leaflets* 11-19, variable in size, 2-6 by 1-1.7 in., oblong- or ovate-lanceolate, somewhat oblique, caudate-acuminate, turning red before falling, crenate, subcoriaceous, more or less pubescent, especially beneath, often invested with large reddish galls; lateral nerves about 18 on either half, straight, often almost transverse; base oblique; petiolule .1-1.5 in. long or 0. *Flowers* greenish-yellow, .15-.25 in. long, in cymes arranged in large terminal panicles usually up to 9 in. long before or with the leaves; bracts linear, deciduous; pedicels up to .2 in. long, tomentose. *Calyx* campanulate, green; segments triangular or ovate, valvate. *Petals* 5, yellow, linear or oblong, acute, alternating with the calyx-segments and twice as long, tomentose outside. *Filaments* hairy as also are the ovary and style; stigma capitate, 4-5 lobed. *Drupe* irregularly globose, .5-1 in. across; pyrenes 2-3.

Throughout the province, chiefly in deciduous or open forests, ascending to about 2500 ft.

The heartwood is reddish-brown and has a reputation for durability. Weight about 40 lbs. per c. ft. The bark may be used for tanning and the leaves are good fodder for buffaloes. The tree can be grown from cuttings.

Leafless 2-3. Flrs. 3-4. Fr. 5-12.

A form with leaves about 2 ft. or more in length; leaflets attaining 8.2 by 3.5 in. more pubescent than in the type, and inflorescence attaining 20 in. has been collected by Mr. C. Purkayastha from Dibru Reserve, Lakhimpur. This form which has been recorded also from Jalpaiguri (R. C. Sircar!), Sibsagar (Peal!) Tounegoo (C. S. Rogers No. 210!), Kachin Hills (Pottinger!) has not been separated in the Calcutta Herbarium. Further observation is needed for determining its position.

2. *Garuga Gamblei* King (W. W. Smith). Rec. Bot. Surv. Ind. iv. 262. Vern. *Bon-misri*, (also *Bonthai-phang*), Kach.; *Bankung-asing*, Miri; also most of the other names for *G. pinnata*.

A very large tree up to 10 ft. in girth and up to 70 ft. to the lowest branch with a spreading crown, often buttressed at the base. *Bark* ashy-grey and nearly smooth outside except for faint vertical fissures and scattered warts, exfoliating in irregular flakes; inside uniformly reddish-brown or light red in thin concentric layers, fibrous, often with broad streaks of firmer tissue of brown colour, .3-.5 in. thick, not aromatic; young parts puberulous. *Leaves* alternate, generally imparipinnate, 12-18 in. long, exstipulate; rachis pubescent when young, afterwards glabrous. *Leaflets* 13-17, 2-6 by 1-2 in., subsessile or on petiolules up to .1 in. long, ovate-oblong or oblong-lanceolate, caudate acuminate, crenate-serrate, membranous, sparsely pubescent when young, afterwards glabrous, turning yellow before falling; lateral nerves upto 20 on either half, arching; base oblique, the upper half beginning from opposite the second nerve of the lower half. *Panicles* on extremities of leafless branchlets, 8-12 in. long, lengthening in fruit up to about 16 in. with racemose branches and cymose branchlets; rachis pubescent, but ultimately glabrous

towards the base; bracteoles .15-.3 in. long, lower 3-lobed, deciduous. *Flowers* small, about .2 in. across; pedicels up to .1 in. long. *Calyx* glabrous inside, minutely tomentose or puberulous outside; lobes 5, triangular, persistent in fruit. *Petals* 5, ovate, about .1 in. long, glabrous inside. *Stamens* 10, inserted on the margin of the disk; filaments glabrous. *Ovary* 5-celled, glabrous or minutely pubescent; style .15 in. long, stout, glabrous. *Drupe* .15-.2 in. across, generally with 1-2 woody pyrenes.

Sporadic in hilly tracts and in the vicinity of hills up to 3000 ft., e.g., N. E. F. DISTRICT; Charduar Reserve in DARRANG; Sonaikusi reserve—NOWGONG; Dalu, GARO HILLS; Nongpoh, KHASI HILLS.

Leafless 1-4. Flrs. 3-4. Fr. 5-6-12.

The tree has probably the same economic uses as *Garuga pinnata*. Wood grey, with large pores and fine equidistant medullary rays; weight about 40 lbs. per c. ft., heartwood not seen.

2. BURSERA Linn.

Bursera serrata Colebr. *Neoli*, Mech; *Mirtenga*, Ass. (Kam.); *Bil*, Lushai; *Engla* or *Hengla*, Cach; *Thikring*, Garo; *Nihor*, Jharua; *Kisianthor-arong*, *Kichejanthar*, Mik.; *Dieng-soh-mir*, Kh.

A medium sized or large tree. *Bark* brownish or light grey outside exfoliating in irregular flakes, inside pink changing to reddish brown, softly fibrous, about .75 in. thick; young parts pubescent. *Leaves* alternate, imparipinnate; rachis 7-14 in. long, terete, pubescent. *Leaflets* 5-11, opposite, .3-5.5 by 1-.5-2 in., ovate to oblong, sometimes elliptic-lanceolate, somewhat bluntly caudate, almost entire to coarsely serrate, coriaceous, pubescent when young, ultimately glabrous above, thinly pubescent or glabrate beneath; lateral nerves 8-14, prominent beneath, arcuate, upper meeting in loops near the margin; base oblique, narrowed or rounded; petiolules .3-.7 in., usually swollen both at apex and base. *Flowers* small, about .1 in. across, green, hermaphrodite, pentamerous in lax panicles from leaf axils or axils of fallen leaves and shorter than the leaves; pedicels short. *Calyx* small; lobes rounded, pubescent externally. *Petals* valvate in bud, ovate oblong, acute, pubescent outside; stamens 10, nearly equal. *Disk* annular, crenate. *Ovary* hairy surrounded by the disk; stigma sessile or subsessile. *Drupe*s on thick peduncles, .5-.75 in. across, 2-3 furrowed; exocarp bright pink, inside with 1-3 stones in white soft, pleasantly acid, edible pulp.

KAMRUP, CACHAR, NOWGONG, GARO HILLS, LUSHAI HILLS, GOAL-PARA, and KHASI HILLS—at the foot; probably all over the province. Gregarious in some places e.g. Tepaimukh.

Wood hard, sapwood light brown, heartwood red, close grained, "medullary rays fine, making a good silver grain"—Gamble.

It is said to be an excellent wood for furniture. The fruit is eaten. It coppices well.

Flrs. 3-4. Fr. .

3. *CANARIUM* Linn.

Large resinous trees. *Leaves* alternate, imparipinnate, stipulate or exstipulate. *Flowers* bracteate, 2-sexual or polygamous. *Calyx* valvate, cup-shaped or urn-shaped, persistent, 3-lobed. *Petals* 3-5, imbricate or valvate, usually exceeding the calyx, inserted outside the disk. *Stamens* usually 6, free and inserted on the disk, monadelphous and distinct from the disk. *Ovary* usually 3-celled; style short or stigma subsessile; in male flowers reduced to a pistillode. *Drupe* more or less trigonous, containing a single bony 3-celled stone, usually with one seed, rarely with two (one each in two of the cells); testa thin; cotyledons often divided, very oily.

Leaflets entire, thinly coriaceous, glabrous at least when mature.

.. 1. *C. bengalense*.

Leaflets serrulate, thickly coriaceous, ferruginous-tomentose even when fully mature.

.. 2. *C. resiniferum*.

1. *Canarium bengalense* Roxb. Vern. *Komker-asing*, Miri & Abor; *Dhuna* Ass.; *Hjung-arong*, *Inghet-ki-ik-arong*, Mikir; *Gokul*, Nep.; *Borsamphol*, Garo; *Satrai-phang*, Cach.

Generally a middle-sized tree but at times a lofty one up to 12 ft. in. girth. *Bark* exfoliating in thin irregular flakes, 7 in. thick; inside light yellowish-brown to reddish-brown according to age, mottled with streaks of darker brown or pink; extremities of branches rusty pubescent, otherwise glabrous. *Leaves* 1-3 ft. long, more or less crowded at the ends of the branchlets; stipules subulate. *Leaflets* generally 13-15, sometimes up to 21, 3-9 by 1-3 in., opposite or subopposite, ovate-oblong, lanceolate, rather bluntly acuminate, entire, thinly coriaceous, glabrous and shining above, almost with a metallic lustre when dry, thinly pubescent when young but soon glabrescent beneath; lateral nerves generally 10-15, sometimes up to 20, on either half, prominent beneath, tertiaries and quarternaries closely reticulate; base oblique; petiolule 1-15 in. long, terete, stout. *Flowers* in narrow axillary or supra-axillary raceme-like panicles up to 15 in. long, thinly pubescent; buds oblong; pedicels short, about 3 in. long. *Calyx* cup-shaped with three broad teeth, fleshy. *Petals* 3, obovate-oblong. *Disk* 3-lobed, concave, hirsute. *Filaments* connate, half way up. *Drupe* 1-3-1-7 in. long, ellipsoid, pruinose; mesocarp fleshy, aromatic; stone 3-gonous, usually 3-celled, 1-2 seeded.

Fairly common in evergreen forests throughout ASSAM, ascending to 3000 ft., in KHASI HILLS.

The wood is very open-grained and evidently not strong. But it does not warp and seems to be suitable for tea boxes. Weight 39 lbs. per c. ft. A clear amber-like resin exudes from wounds in the bark, which is burnt as an incense.

Flrs. 5-7. Fr. 11-1.

2. *Canarium resiniferum* Brace, King in Journ. As. Soc. Beng. Vol. 62 (1893). Vern. *Silum-pakia*, Abor and Miri; *Dhuna*, Ass.; *Satrai-phang*, Kach.; *Mekruk*, Manip.; *Bero-thing*, Kuki;

Beroh, Lush. and Kuki; *Hijung*, Mikir; *Bero-rata*, Tipp.; *Beri-rata*, Sylh.; *Bot-sasat*, *Dong-kh reng*, Garo.

A gigantic * tree buttressed at the base and with a spherical crown after height growth is completed. *Bark* light-greenish grey outside, exfoliating in long hanging and over-lapping flakes, about .5 in. thick; vivid green underneath the cuticle, inside brown or reddish brown, fibrous, hard but brittle, somewhat aromatic. *Leaves* 1-2 ft. long; rachis sub-sulcate. *Leaflets* 3-13, opposite or subopposite, 3.5-8 by 1.5-4 in., ovate to oblong-lanceolate, sometimes cbovate to oblanceolate or elliptic, somewhat abruptly and obtusely acuminate, finely serrulate or crenulate, tough and coriaceous, glabrous and shining above, ferruginous tomentose or tardily glabrate beneath; lateral nerves 10-24 on either side of the midrib, rather abruptly arched towards the extremity, very prominent beneath; tertiaries transverse and parallel; quaternaries very finely reticulated; base usually rounded, more or less oblique; petiolules .1-.25 in. long. *Panicles* supra-axillary, 12-15 in. long with a peduncle half its length; branches short, cyme bearing, densely ferruginous-tomentose; pedicels short; buds elongate. *Calyx* about .1 in. long, cup-shaped, with 3 shallow and rounded teeth, tomentose outside. *Petals* 3, oblong, .2-.3 in. long, overlapping to the left. *Stamens* connate into a tube half way up, enclosing the very bristly disk. *Drupe* up to 2 by .8 in., almost exactly like that of *C. bengalense* but generally more pointed at both ends.

Not common; on lower hills or on plateaus throughout the province.

The bark exudes a blackish tar-like resin which finds its way in the markets in large round lumps. Bees often gather it before it hardens (for their hives?).

Flrs. 6-7. Fr. cold season.

A closely allied form—*Silampakiak*, Miri—my sheet 3203 collected at Pasighat N. E. Frontier may perhaps be *C. strictum* Roxb. or an intermediate form, but material at my disposal is insufficient for correct determination. It is a lofty tree with bark exfoliating in overlapping plates, and brown blaze with bands of light red; the leaflets are mostly tomentose beneath.

***Balsamodendron Roxburghii*, Arn.** A small resinous tree; branchlets often ending in spines. *Leaves* alternate, 1-3 foliolate; leaflets 1-2.5 by .5-1.2 in., oblanceolate or spatulate, closely serrate with 6-7 fine lateral nerves; base tapering to the petiole which is .2-.8 in. long. *Flowers* and *fruits* not seen.

There is one poor specimen with leaves only in Calcutta herbarium and none from our area.

It is said to occur in SYLHET and ASSAM according to Hooker and should be looked for.

* A tree 150 ft. high, 90 ft. up to the lowest branch and 14 ft. 4 in. girth was measured in December 1913.

FAM. 34. MELIACEÆ.

Trees or erect shrubs. *Leaves* alternate, normally pinnate; leaflets generally oblique at the base; stipules 0. *Flowers* regular, generally 2-sexual, in paniced cymes. *Calyx* small, 3-6 lobed; lobes generally imbricate in bud. *Petals* 3-6, usually free, imbricate. *Stamens* as many, or more frequently twice as many as the petals; filaments generally connate into a tube, rarely free; anthers 2-celled, introrse, erect, usually sessile on the tube, included or excluded. *Disk* surrounding the ovary and often adnate to it, annular or tubular. *Ovary* 3-5 celled; style simple or stigma sessile; ovules generally two in each cell, collateral or superposed, rarely solitary or numerous. *Fruit* a drupe, capsule or berry; seeds often arillate, with or without albumen; radicle superior.

- I. Ovules 1-2 in each cell; seeds not winged :—
 - A. Fruit drupaceous; leaflets generally serrate :—
 - Leaves pinnate. .. 1. *Azadirachta*.
 - Leaves 2-3 pinnate. .. 2. *Melia*.
 - B. Fruit capsular or baccate; leaflets entire or nearly so :—
 - 1. Fruit capsular :—
 - a. Filaments free towards the apex; disk annular. .. 3. *Heynea*.
 - b. Filaments completely united :—
 - i. Staminal tube linear or oblong; style long; petals 4-5; ovary 3-4 celled :—
 - *Trees; petals free; anthers more or less included in the staminal tube :—
 - Flowers bisexual; anthers short; ovules 2 in each cell. .. 4. *Dysoxylum*.
 - Flowers polygamous; anthers long; ovule 1 in each cell. .. 5. *Chisocheton*
 - **Undershrub; petals united about half way; anthers exserted. Flowers bisexual. .. 6. *Munronia*.
 - ii. Staminal tube globose; style 0*; petals 3, ovary 3-celled; anthers included. .. 7. *Amqora*.
 - 2. Fruit a berry :—
 - Anthers 5, included in the more or less globose staminal tube; style 0. .. 8. *Aglala*.
 - Anthers 10, exserted; filaments free or nearly so; style present. .. 9. *Walsura*.
 - II. Ovules many in each cell; seeds winged; fruit capsular :—
 - Filaments connate into a cylindrical tube; disk 0; capsule 3-celled; seeds packed transversely in each cell. .. 10. *Chickrassia*.
 - Filaments free; disk conspicuous; capsule 5-celled; seeds packed lengthwise in each cell. .. 11. *Cedrela*.

* Assam species.

1. AZADIRACHTA A. Juss.

Azadirachta indica A. Juss. Syn. *Melia Azadirachta* Linn., F. B. I. *Melia indica* Brandis For. Flor. Vern. *Nim*, Ass.; Beng. *Nimba*. Sans.

A well known large to middle sized handsome tree, sometimes planted in homesteads and found as escape throughout the plains of Assam. *Leaves* imparipinnate, 9-15 in. long, crowded towards the ends of branches; rachis glabrous. *Leaflets* 9-15, terminal, often aborted, subopposite, 2-4 by 1-5 in., obliquely lanceolate to ovate-lanceolate or falcate, very unequal sided, gradually acuminate, coarsely serrate, glabrous, dark green and shining above; petiolules very short. *Flowers* white, about 4 in. across, scented, in axillary lax, glabrous, panicles, shorter than or as long as the leaves. *Calyx* small, 5-fid, divided almost to the base; segments broad, rounded. *Petals* 5, about 2 in. long, spreading, oblong-spathulate, ciliolate, pubescent inside along the middle; staminal tube dilated at the base and apex, usually pubescent inside near the top, 10-12 toothed. *Anthers* inserted inside the staminal tube, opposite the teeth. *Ovary* flask-shaped, 3-celled; style as long as staminal tube, expanded into the 3-lobed fleshy stigma. *Drupe* 5-7 in. long, ovoid, oblong, 1-celled, 1-seeded, smooth, greenish-yellow, when ripe.

Heartwood dark-red, very hard, weighing about 50 lbs. per c. ft., good for furniture. It makes good sonorous drums. In Assam, however, the tree is chiefly valued for its bark and leaves which are used in medicine. An oil is expressed from the pulp of the fruit, which is valued for its antiseptic properties and considered to be very good for small pox and sores in general.

Flrs. 3-4. Fr. 7-8.

2. MELIA Linn.

Middle-sized or large trees. *Leaves* 2-3 pinnate. *Flowers* in large much-branched axillary panicles. *Calyx* small, 5-6 lobed, imbricate. *Petals* 5-6, free, convolute in bud. *Disk* annular. *Stamens* 10-12, united in a cylindrical tube dilated below and above, striate, toothed at the edge; anthers inserted on or near the mouth of the tube. *Ovary* 3-6 celled with two superposed ovules in each cell; style slender; stigma capitate, deciduous. *Fruit* a dry or fleshy 1-5 celled drupe; seed solitary in each cell, pendulous.

I. Branchlets thin; leaves 2-pinnate; staminal tube slender, purple, glabrous, suddenly expanded at mouth.

.. 1. *M. Azedarach*.

II. Branchlets stout; leaves 2-3 pinnate; staminal tube stout, more or less hairy, not suddenly expanded:—

Leaflets on fairly long slender petiolules; reticulations fine but distinct; staminal tube with 10 bi-fid teeth.

.. 2. *M. composita*.

Leaflets on very short winged petiolules; reticulations indistinct; staminal tube with at least 30 teeth.

.. 3. *M. superba*.

1. **Melia Azedarach** Linn. Vern. *Abari-asing*, Miri and Abor ; *Thai-mado* or *Themdou-phang*, Kach. ; *Nim-tita-arong*, Milk. ; *Bokain*, Hin. ; *Ghora-nim*, Mahanim Beng & Ass. ; *Dieng-jah-rasang*, Khasi.

Usually a small or middle-sized deciduous tree* with a short trunk and large spreading crown ; branchlets slender ; young parts and inflorescence covered with stellate scurfy hairs ; bark greenish brown and smooth but lenticellate on young stems ; dark-grey, exfoliating in rectangular pieces and about 5 in. thick on mature trees ; blaze dark-brown. *Leaves* 10-20 in. long, 2-pinnate, rarely 3-pinnate by a few leaflets of the lowest pinnæ being further subdivided ; pinnæ 5-9. *Leaflets* 3-7 on each pinna, 5-2 by 3-1 in., somewhat obliquely ovate-lanceolate, acuminate, unequally serrate or sometimes lobed, membranous ; petiolules 1-2 in., slightly margined, those of terminal leaflets longest. *Flowers* lilac-blue, up to 4 in. long, in numerous axillary cyme bearing panicles ; peduncles 3-4 in. long, ultimately glabrous ; ramifications slender ; pedicels 0-3 in. long, very slender ; bracts and bracteoles minute. *Calyx* deeply 5-lobed, stellate-tomentose ; lobes elliptic to ovate-oblong. *Petals* 5, 2-3 in. long, linear-oblong or oblanceolate, with a faint midrib, pubescent outside when young. *Staminal-tube* 2 in. long, purple, cylindrical, longitudinally ribbed, glabrous, suddenly expanded at the apex with 20-30 linear teeth with 10-12 apiculate anthers at their base. *Ovary* 5-celled ; stigma capitate. *Drupe* 5-6 in. across, globose, generally 5-celled and 5-seeded, yellow when ripe, at first quite smooth but wrinkled in drying, remaining long on the tree after ripening.

Fairly common, especially under cultivation in tea gardens, where it is often planted for firewood, as it grows very fast, and coppices extremely well.

Heart-wood reddish brown and takes a good polish ; weight about 40 lbs. per c. ft. The bark is very bitter and is used as an anthelmintic. The leaves also have medicinal properties and are lopped for fodder.

Leafless 12-3. Fl. 3-5. Fr. cold season.

2. **Melia composita** Willd. incl. *M. Toosandan*, Sieb. et Zucc. Syn. *M. dubia*, *F. B. I.* Vern. same as of the preceding species,—also the following :—*Hanti-phi-arong*, *Han-hodak*, Mik. ; *Kerewal*, Kuki ; *Aming-gok*, *Gingsimok* or *Gingsinmok*, Garo ; *Dieng-jah-rasang*, *Soh-dieng-lang*, Khasi.

A fairly large deciduous tree up to 65 ft. in height and 6 ft. in girth. Bark blackish and with close vertical fissures outside, creamy white or very light-brown inside ; young shoots and inflorescence covered with scurfy stellate tomentum ; branchlets stout, speckled with raised round lenticels. *Leaves* 1-2 ft. long, 2-3 pinnate ; pinnæ 3-5 pairs ; rachis terete. *Leaflets* 5-11 or 3 ;

* A tree 50 ft. in height and 6 ft. 7 in. in girth was measured on 25th March 1914 in front of the Inspection Bungalow at North Lakhimpur.

petiolulate, ovate-lanceolate to ovate round, acuminate often more or less oblique at the base, serrate or entire, membranous, glabrescent with age; main lateral nerves 6-10 on either side of the midrib, sub-horizontal; nervules finely reticulate; petiolules up to .3 in., those of the terminal leaflets usually longest. *Panicles* 5-7 in. long, many flowered. *Flowers* .3-.35 in. long, white or light mauve, inodorous. *Calyx* 5-partite, tomentose; lobes ovate-oblong. *Petals* linear-spathulate, concave, pubescent outside, puberulous inside. *Staminal tube* white, gibbous at the base, slightly expanded at the apex, with 10 bifid teeth, nearly glabrous or pubescent inside; anthers sessile, inserted behind the teeth. *Style* as long as the staminal tube; stigma large, globose 5-toothed. *Drupe* .8-1.2 by .7-.9 in., smooth but speckled with raised round dark-brown dots; stone perforated at both ends, deeply lobed at the apex, 5-7 celled, 1-6 seeded; seeds lanceolate, with a black shining testa; cotyledons oily.

Throughout UPPER ASSAM ascending to about 5000-ft. in KHASI HILLS in deciduous tracts, not very common.

Economic uses same as of the last species.

Leafless 12-3. Flrs. 3-4. Fr. ripens-12-2.

3. *Melia superba* Roxb. Syn. *M. birmanica* Kurz. Vern. same as of the preceding species.

A large tree supposed to differ from the foregoing species by having larger leaves, ovate or ovate-cordate, obscurely reticulate leaflets on winged petiolules, greenish-white; flowers with an offensive smell, 10-ribbed, wooly staminal column and a globose smooth fleshy drupe. Other characters are more or less identical.

Hardly a different species.

Found in the same localities as, and very liable to be mistaken for, *M. composita*.

3. HEYNEA Roxb

***Heynea trijuga* Roxb. Vern. *Theng-are-arong*, Mik.; *Rolang-phang*, *Rathang-phang*, Cach.; *Komal-siuli*, Nep.; *Khag-man-chhi*, Tipp.**

A handsome tree up to 40 ft. in height and 3 ft. in girth, practically evergreen; young parts pubescent; bark dark-brown, vertically furrowed, rough, bright-red underneath the thick corky layer, .3 in. thick, inside very 'cheesy,' in extremely fine concentric layers which are more or less wavy or even looped at intervals. *Leaves* alternate, somewhat crowded at the ends of branchlets, imparipinnate, having a bitter taste, 9-15 in. long; rachis terete, jointed at the nodes; leaflets 5-11, usually 7, the lateral opposite, 2-6 by 1-3.5 in., terminal largest, ovate-oblong or lanceolate, acuminate, oblique at the base, entire, membranous, dark-green and glabrous above, pale or glaucous, sometimes pubescent beneath; lateral nerves 10-14 on either side of the

midrib, anastomosing towards the outer extremity, the lowest pair or two sub-basal; nervules very fine and elegantly reticulate; petiolules '3-8 in. long. *Panicles* axillary, 9-12 in. long including the 5-7 in. long peduncle, corymbosely branched, with small subulate bracteoles at the base of ramifications, extremities bearing short cymes, pubescent. *Flowers* white, about '2 in. across; buds globose; pedicels short. *Calyx* small, usually 5-fid, hairy outside, broadly ovate. *Petals* usually 5, puberulous outside, suberect, narrowly imbricate, margins finely ciliate. *Staminal-tube* short, 8-10 lobed; lobes bifid, yellow, hairy within, alternately slightly shorter; anthers apiculate, inserted between the clefts of lobes. *Disk* fleshy, annulate. *Ovary* sunk in the disk, 2-3 celled with two ovules in each cell; style short, dilated upwards; stigma bluntly 2-fid with a thickened discoid base. *Capsule* about '5 in across, globose, splitting into two valves, remaining long on the tree after splitting; seed solitary, with a thin white aril, exalbuminous; testa brown, turning almost black, shining.

DARRANG in UPPER ASSAM, fairly common in the NORTH CACHAR and JAINTIA HILLS, also sal forests in NOWGONG, e. g., Kholahat Reserve ascending to about 2000 ft.

Wood grey, moderately hard, fine grained, weighing about 55 lbs., per c. ft., suitable for posts and agricultural implements. The seeds give an oil which can be burnt in lamps.

Fls. 1-5. Fr. 9-1.

4. DYSOXYLUM Bl.

Trees, often with a garlic-like smell. *Leaves* pinnate; leaflets opposite or alternate, entire, acuminate, more or less oblique at the base. *Flowers* hermaphrodite, in lax axillary panicles of cymes. *Calyx* 4-5-fid, open in bud. *Petals* 4-5, oblong, spreading. *Staminal column* cylindrical, toothed at the mouth; anthers 6-10, small, inserted below the edge of the staminal tube. *Disk* tubular surrounding and often exceeding the ovary. *Ovary* hairy, free, 3-4 celled, usually with two ovules in each cell, narrowed into a long style; stigma broadly capitate. *Capsule* pear-shaped or globose, coriaceous, loculicidally 1-4 celled; seeds exalbuminous, sometimes arillate.

I. Panicles spreading. Leaflets opposite or alternate :-

A. Disk densely hairy at the mouth; leaflets glabrous; capsule usually up to 2 in. across. .. 1. *D. procerum*.

B. Disk glabrous at the mouth :-

Leaflets opposite, glabrescent beneath; capsule less than 1 in. in length. .. 2. *D. Hamiltonii*.

Leaflets alternate, velvety beneath; capsule 2 in. or more in length. .. 3. *D. grande*.

II. Panicles narrow, racemiform or spicate. Leaflets alternate :-

A. Calyx bowl-shaped, sub-entire :-

Leaflets glabrous, obliquely broad ovate; tertiary nerves indistinct.

.. 4. *D. binectariferum*.

B. Calyx cup-shaped, deeply lobed :-

Leaflets broad ovate-oblong ; tertiary nerves indistinct ; disk glabrous both outside and inside, capsule pubescent. Leaflets narrowly oblong or lanceolate ; tertiary nerves strongly reticulate ; disk glandular-pubescent.

.. 5. *D. pallens*... 6. *D. reticulatum*.

1. *Dysoxylum procerum* Hiern. Vern. *Katum-asing*, Abor ; *Galing-libor*, Miri & Abor ; *Khrang*, Mik. ; *Amari*, Lali, Ass. ; *Kasshok*, *Thing-tupui*, Kuki (N. C. Hills) & Lushai ; *Ratasahatta*, Lushai ; *Thakhau-phang*, Cach. ; *Patamari*, Mech. ; *Bol-chhachhat*, Garo, *Chachat*, *Bol-sachat*, *Makhaibo*, Garo.

A fairly large tree ; bark greenish-grey or greyish-brown, fairly plain up to middle age, afterwards somewhat rough with distant irregular scales, inside pink or reddish-brown with distant white streaks, exuding white milky resin ; young shoots slightly pubescent. *Leaves* 1·5-2 ft. long, pari- or impari-pinnate ; rachis terete ; leaflets 7-13, opposite or alternate, 6-12 by 2·5-4·5 in., obovate or elliptic-oblong, slightly oblique at the base, thinly coriaceous, glabrous ; lateral nerves 12-16 on either side of the midrib ; petiolules stout, 2·5 in. long. *Panicles* erect, stiff, 12-26 in. long with short horizontal puberulous branches ; bracts subulate ; pedicels very short, bracteolate ; buds pubescent. *Flowers* 3·5 in. long, cream-white, fragrant. *Calyx* pubescent ; lobes acute, short. *Petals* 4, oblong, valvate. *Anthers* 8, subsessile. *Disk* about one-third to two-thirds the length of the staminal tube, hairy at the mouth, encircling the hairy ovary ; style slightly exceeding the staminal tube. *Capsule* up to 2·5 in. long, pyriform ; seeds 2-3, black and shining with an orange aril.

Fairly common throughout the province, especially in the evergreen forests of UPPER ASSAM. Heartwood bright red, weighing about 40 lbs per c. ft., much used for doors and windows.

Flrs. 12-1. Fr. 5-7.

2. *Dysoxylum Hamiltonii* Hiern. Vern. *Gendheli-poma*, Up. Ass. ; *Keotai*, Ass. (Darr.) ; *Siti-asing*, Miri ; *Situk-payu*, Abor ; *Mauhidai*, Cach. ; *Thing-saphu*, *Inthei*, Kuki ; *Bol-asin*, Garo ; *Dieng-kyrbei*, Khasi.

A fairly large evergreen tree ; bark splits from below and thus overlaps like scales, dark-brown outside, pale-brown or whitish inside with reddish-brown streaks strongly smelling of garlic. *Leaves* 1·5-2·5 ft. long, suberect, generally paripinnate ; rachis terete ; leaflets usually 10-18, but on young poles up to 42, opposite or subopposite, drooping, 4-6 by 1·5-2 in., oblong to oblong elliptic, subfalcate, caudate acuminate, oblique at the base, membranous, glabrous or hairy beneath, smelling of garlic when bruised, turning pale-yellow when old ; lateral nerves 12 on either side of the midrib, slender, dilated at the base and slightly concurrent with the midrib. *Panicles* about 6-9 in. long with puberulous branches ; bracts and bracteoles minute ; pedicels

slender up to 1 in. long. *Flowers* 4-merous, about .25 in. long, greenish-white. *Calyx* very small, pubescent. *Petals* 4, glabrous. *Staminal tube* pubescent, bearing 8 anthers. *Disk* glabrous, twice as long as the pubescent ovary. *Capsule* about 1 in. diam., globose, 4-celled, 4-seeded, pale-yellow or almost white, smelling very strongly of garlic; seeds with a pale or reddish aril.

N. E. F. DISTRICT, LAKHIMPUR, SIBSAGAR, CACHAR, Bhuban hill, DARRANG, NOWGONG, KHASI HILLS up to 2500 ft., SYLHET and GARO HILLS, not common.

Heartwood red, moderately hard; weighing about 40 lbs per c. ft., used for boats and house-building, said to be very durable. The fruit is greedily eaten by monkeys.

Flrs. 11-12. Fr. 1-2.

3. *Dysoxylum grande* Hiern. Vern. *Boga-banderdima*, Ass.

A middle-sized tree; bark thin, dark-grey, fairly smooth outside; young shoots including leaves and inflorescence covered with velvety greyish tomentum. *Leaves* 1.5-2 ft. long; common petiole flattened or slightly channelled near the base. *Leaflets* 12, alternate, 5-8 by 2-3 in., oblong, caudate acuminate, rounded at the base, chartaceous, glabrous or glabrescent above except along the midrib and lateral nerves, grey-velvety beneath; main lateral nerves 20-25 on either side of the midrib, rather straight; petiolules about .25 in. long. *Panicles* about as long as the leaves. *Flowers* .15-.2 in. long, 4-merous, in small cymose clusters; pedicels slender, very short. *Calyx* very small, pubescent; lobes short, acute. *Petals* grey, pubescent outside. *Staminal-tube* thinly pubescent or glabrous outside, terminating in bifid teeth. *Disk* glabrous, exceeding the hairy ovary. *Capsule* 2 in. or more (?) in length, pyriform, glabrous, generally 1-seeded; seed ellipsoid about 1 in. long; testa dark-brown, shining.

Either rare or often mistaken for its other co-geners, Nambor forest, SIBSAGAR, SYLHET-Brace (!).

Wood weighs 47 lbs per c. ft. and is apparently put to the same uses as of the preceding species.

Flrs. Rainy season. Fr. 12-1?

4. *Dysoxylum binectariferum* Hk. f. et Bedd. Vern. *Galingasing*, Miri; *Bandardima*, Ass.; *Khrang-kelok-arong*, *Khrang*, Mikir; *Bon-dau-iung*, *Rata*, Cach.; *Kakso-kchal*, Kuki; *Heren-thak-chi-ching*, Naga; *Kaksok*, Tipp.; *Hota-rata* Sylh.; *Dingari-guphut*, *Dingari*, *Dingyi-bomphang*, Mech.; *Bol-narang*, *Masispel*, Garo.

A tree up to 50 ft. in height and 4 ft. in girth; young shoots and inflorescence minutely pubescent; bark grey outside, nearly smooth and warty on young stems, afterwards with light vertical fissures and horizontal wrinkles peeling off in thin papery flakes, pale, yellowish brown inside, mottled with coarse strands of darker brown. *Leaves* 1-1.5 ft. long; leaflets 6-8, alternate, 3-7.5 by 1.5-3.5 in., obliquely ovate-oblong, short-usually abruptly

acuminate, entire or with obscure distant teeth, thinly coriaceous, glabrous and dark-green above, pale underneath; lateral nerves 5-10 on either side of the midrib, much arched; tertiary nerves invisible; petiolules 2-3 in. long, channelled. *Panicles* 9-15 in. long; branches short. *Flowers* pale-white, about 25 in. long, tetramerous. *Calyx* thick, cup-shaped, subentire, about half as long as petals. *Petals* velvety outside. *Staminal tube* mealy. *Disk* much exceeding the ovary, glabrous inside, 8-toothed; anthers 8. *Ovary* hairy. *Capsule* 2-2.5 in. long, globose with a narrowed base, smooth, at first pale-yellow, turning deep-orange, 4-celled, 4-seeded; seeds shining purple with a large yellow hilum; aril white; cotyledons green, plumule hairy.

Fairly common throughout the province up to 3000 ft. in the hills.

Wood red or reddish grey, rough, weighing 44 lbs per c. ft., pores joined by wavy concentric lines of softer tissue.

It is made into planks and used for house building.

Flrs. 4-5. Fr. cold season.

5. *Dysoxylum pallens* Hiern. Vern. *Bandordima*, Ass., *Makkhaibo*, Garo.

A small tree with a spreading crown, somewhat resembling *D. binectariferum* in general appearance and foliage; bark dark-brown and plain outside, reddish brown with streaks of lighter colour inside. *Leaves* usually 1-2 ft. long; leaflets 6-10, alternate, 4-9 by 2-4 in., oblong or ovate-oblong, apex shortly but somewhat abruptly tailed, thinly coriaceous, oblique at the base, glabrous; lateral nerves 15-20 on either side of the midrib, arched, slender but prominent; tertiary nerves indistinct; petiolules 2-2.5 in. long, stout. *Racemes* spike-like, 1-10 in. long, puberulous; pedicels about 1 in. long, stout. *Flowers* greenish-white, sweet-scented, 2-3 in. long. *Calyx* cup-shaped, deeply 4- (rarely 5) -lobed, puberulous. *Petals* 4, rarely 5, thick, valvate, pubescent outside. *Staminal tube* and *disk* wholly glabrous, the latter scarcely exceeding the ovary, somewhat unevenly about 20-toothed. *Anthers* exserted. *Style* columnar. *Capsule* 1-1.5 in. diam., velvety outside.

UPPER ASSAM, e.g. LAKHIMPUR, SIBSAGAR and DARRANG.

The wood is not used as timber.

Flrs. 2-3.

6. *Dysoxylum reticulatum* King. Journ. As. Soc. Beng. Vol. 65 ii. 114. (1897). Vern. *Bandordima*, Ass.

A small tree up to about 35 ft. in height with a cylindrical straight trunk; bark grey and warty outside, hard and fibrous, pale yellow inside with golden-brown streaks. *Leaves* usually 1-1.5 ft. long, pale-green; rachis flattened above; leaflets about 14, alternate or subopposite, rarely opposite, 3-7 by 1.5-3 in., ovate or ovate-lanceolate, finely acuminate, chartaceous, glabrous; lateral nerves about 15 on either side of the midrib, arcuate, tertiaries conspicuous, subparallel, closely reticulate; base rounded or acute, unequal; petiolules 1.5-2 in. long. *Racemes* about

10 in. long. *Flowers* 4-merous, .25 in. long ; buds ovoid. *Disk* fleshy, glandular-pubescent. *Capsule* 2.5-3 by 2-2.5 in., pyriform, yellow (drying dark-brown), verrucose, with numerous more prominently verrucose longitudinal ridges ; seeds 1.2 by 1 in., cotyledons green.

LAKHIMPUR and SIBSAGAR Divisions, possibly also DARRANG.

Fls. 4-5 (?), Fr. ripens 3-4.

5. CHISOCHETON* Bl.

Chisocheton paniculatus Hiern. Vern. *Bandordima*, Ass. ; *Diengsoh-monashrieh*, *Dieng-mar-iony*, *Dieng-soh-khyllam-blang*, *Dieng-soh-run-blang*, Kh. ; *Rata*, *Thaikhukisin-bapang*, Cach. ; *Khrankerarong*, *Theng-kippi*, Mik. ; *Sahata-pui*, Kuki ; *Masrusiphel*, *Makkhaibo*, Garo ; *Ratapangpa*, Tipp. ; *Chota-Dingari*, Mech.

A small tree scarcely exceeding 40 ft. in height and 2.5 ft. in girth, with ascending branches and a narrow crown ; young shoots and inflorescence brown hirsute ; bark dark-brown outside, plain but warty, exfoliating in distant round flakes, often with white blotches (of lichen ?) ; inside light dun-brown oxidising to dirty purple on exposure. *Leaves* 2-4 ft. long, dark-green ; rachis hairy ; leaflets 7-33, opposite or subopposite, 3-10 by 1-4 in., oblong ; ovate-oblong, or lanceolate, acuminate, entire, chartaceous, glabrescent above, thinly pubescent, especially along the nerves beneath ; lateral nerves 7-13 on either half, obliquely arcuate, ends parallel to the leaf margin, prominent beneath ; petiolules short. *Panicles* axillary, 2-3 ft. long, drooping with elongated lax branches. *Flowers* polygamous, pale yellow, .5-7 in. long, faintly scented, 4-merous ; pedicels 1-1.5 in. long, articulated below the calyx ; buds .5-6 in. long, club-shaped. *Calyx* small, cup-shaped, sub-truncate. *Petals* starp-shaped, imbricate, minutely puberulous. *Staminal* tube white, as long as the petals, with 6-8 obscure bifid lobes, more or less pubescent ; anthers 8, sessile, linear, included. *Disk* short, fleshy. *Ovary* 4-celled, each cell usually with one ovule ; style slender, pubescent below, slightly exceeding the anthers. *Fruit* a capsule, 1.5-3 in. across, globose with a pyriform base, smooth and shining, dark orange or red ; seeds black, shining with a white or yellow aril ; endocarp fleshy.

Fairly common throughout the province ascending to about 3000 ft., the mature fruit hangs in long drooping bunches.

Wood yellowish, sometimes used for house posts.

Fls. 6-7. Fr. cold season.

6. MUNRONIA Wight.

Munronia Wallichii Wt. Vern. *Nolsing* Garo.

An undershrub about 3 ft. in height ; young shoots and inflorescence hirsute. *Leaves* crowded at the ends of the shoots,

* Also written Schizocheton.

alternate, imparipinnate, 5-12 in. long ; rachis pubescent. *Leaflets* 7-9, opposite, 1-5 by 4-1.7 in., lanceolate or ovate to oblong-lanceolate, blunt acuminate, entire or obscurely sinuate, pubescent along the midrib and nerves beneath ; lateral nerves 5-6 on either half, distant, arcuate ; base rounded or narrowed, often oblique ; petiolules of lateral leaflets short, of terminal leaflets up to 5 in. long. *Flowers* conspicuous, white or pale pink, hermaphrodite, hairy outside, few, clustered on axillary peduncles towards the ends of shoots ; peduncles 4-7 in. long ; pedicels 2-4 in. long ; bracts linear, small. *Calyx* 5-partite ; segments 25 in. long, oblong-spatulate, persistent and becoming red in fruit. *Petals* about 9 in. long, imbricate, narrow-spathulate, long clawed, claws cohering for most of their lengths. *Staminal tube* about 6-7 in. long, dilated upwards, 10 toothed at the apex, glabrous ; anthers 10, terminal, alternating with the teeth, apiculate, pilose on the back along the connective. *Disk* membranous, tubular, entire, glabrous, enclosing the ovary and the base of the style. *Ovary* 5-celled, each cell 2-ovuled ; ovules superposed ; style slender, exceeding the staminal tube, lower half pilose ; stigma capitate. *Capsule* 5-75 in. across, depressed, globose with uneven surface, hairy, bright red, loculicidally 5-valved, valves separating from the axis ; seeds black, shining, plano-convex, not winged, hilum hollowed, with radiating lines ; albumen thin.

GARO HILLS, KHASI HILLS ascending to 4400 ft. ; in thick forest undergrowth.

Flrs. & Fr. cold season.

7. AMOORA Roxb.

Trees generally with resinous milky juice. *Leaves* imparipinnate, exstipulate ; leaflets opposite or alternate, quite entire, oblique. *Flowers* polygamous, as a rule 3-merous, male paniculate, female spicate or racemose. *Calyx* 3-5-fid. *Petals* usually 3, thick, concave, imbricate. *Staminal tube* globose, crenate or toothed at the apex ; anthers 6-10, included, inserted at the crenatures. *Disk* obsolete. *Ovary* short, usually 3-celled ; stigma usually sessile. *Fruit* a loculicidally 3-5 valved capsule. *Seeds* arillate ; testa coriaceous, shining ; albumen 0 ; cotyledons connate.

- I. Leaflets opposite. Flowers subsessile, male on branched, female on simple spikes. Calyx 5-partite. .. 1. *A. Rohituka*.
- II. Leaflets opposite or subopposite, not lepidote. Flowers pedicelled. Calyx 3-lobed :—
 - Leaflets obtuse. Male racemes paniced, female simple, short. Anthers 10. .. 2. *A. cucullata*.
 - Leaflets abruptly acuminate, racemes as in 1 or male and female flowers on the same panicle. Anthers usually 8. .. 3. *A. Wallichii*.
- III. Leaflets alternate, lepidote along petiole and nerves. Flowers pedicelled. Calyx cup-shaped, obtusely 3-toothed or truncate. Stamens 6. .. 4. *A. chittagonga*.

1. **Amoora Rohituka** W&A. Vern. *Amari*, *Boga-Amari*, *Hakhori-bakhori*, Ass. (Kam); *Titraj*, *Tiktaraj*, Beng.; *Wokek-turang*, Mik., *Galua*, Naga; *Biqu-rata*, *Thai-thor*, *Thai-dau-ing*, *Mouksa-khaslam-phang*, *Kak-sok-thing*, *Thing-ril-char*, Kuki; *Gokul*, Nep.; *Baidraj*, *Beri-Rata*, Sylh.; *Bagu-Rata*, Cach.; *Eng-Gokmi*, *Bolsamphal*, Garo; *Bhoto-mayna*, *Jharua*; *Dieng-Rata*, Khasi; *Dieng-lang-marei*, Khasi (Shella); *Dieng-soh-khyllam-blant*, Khasi (Thlew-slyrngam).

A middle-sized evergreen tree with a dense spreading crown; bark greyish-brown outside exfoliating in circular pieces, warty, bright red underneath the corky layer, red inside, gradually lighter inwards, with distant broad streaks of lighter tissue, fibrous, aromatic, generally exuding milky resin from the inner layers; young parts tawny pubescent. *Leaves* crowded at the ends of the branchlets, 12-24 in. long, vivid green; leaflets 9-19, opposite, 3-9 by 1.5-4 in., ovate, oblong or obovate, acuminate, often abruptly; lateral nerves 12-16 on either side of the midrib, slender, slightly arched, subcoriaceous, ultimately glabrous; base very oblique; petiolules 1.5-2 in. long. *Male spikes* panicle about as long as the leaves; *female* simple, much shorter. *Flowers* sessile, rarely very shortly pedicelled, dull-white; bracts minute at the base of the fls.; *female* about .25 in. long, *male* much smaller. *Calyx* 5-partite; lobes rounded and with very thin ciliate margins. *Petals* 3, broad elliptic to orbicular, concave. *Anthers* 6, about .1 in. long, lanceolate. *Ovary* 3-celled with two superposed ovules in each cell. *Capsule* 1-1.5 in. long, obovate in outline, yellow when ripe, smooth, 3-valved. *Seeds* usually not more than 2 in each fruit, with a red aril and shining black testa, oblique.

Common though not abundant, throughout the province, excepting hills above 2500 ft.

The timber weighs about 40 lbs per c. ft. and is moderately hard and even and close-grained, but it is brittle and is not much used. An oil is obtained by boiling the macerated seeds in water. It is burnt in lamps and is also used as a liniment in rheumatism and as a dressing for sores.

Fls. 10-11. Fr. 2-3.

2. **Amoora cucullata** Roxb. Vern. *Bor-amari*, Ass. (Sibs.); *Samphal*, Garo.

An evergreen tree up to 80 ft. in height and 7 ft. in girth with grey bark and numerous blind suckers from the roots. *Leaves* 1.5-2.5 ft. long; leaflets opposite or subopposite, 3-13, ovate-oblong, obtuse at both ends, subcoriaceous, glabrous, oblique at the base, the terminal one often falcate; main lateral nerves about 16 on either side of the midrib; petiolules up to about .5 in. long. *Male panicles* drooping, about as long as the leaves; *female racemes* much shorter, few-flowered. *Flowers* yellow, each supported by a pair of caducous bracts. *Calyx* 3-lobed. *Petals* 3. *Staminal tube* turbinate. *Anthers* sessile, included. *Ovary* 3-celled with 2 ovules in each cell. *Capsule* 2.5 in. diam., pyriform-globose, obtusely 3-lobed, 3-valved. *Seeds* 3, with an orange-coloured fleshy aril which covers about three-quarters of each seed.

Very rare. Only once found in the Daigurung Reserve, SIBSAGAR DIVISION.

Wood red, hard and close-grained, weighing about 43 lbs per c. ft. Being liable to split it is seldom used as timber.

Fls. 10-11 (?). Fr. 4-5.

3. *Amoora Wallichii* King. incl. *A. spectabilis* F. B. I, Vern *Amari*, *Bhoto-mayna*, Ass.; *Galing-asing*, Miri; *Dire-asing*, Abor; *Bong-lepbuphang*, Cach.; *Rongi-Rata*, *Phul-Rata*, Cach. and Sylh. *Ringok-me*, *Samphal*, Garo; *Sahatcha-kung*, Tipp.; *Pat-amari*; *Mech*; *Wang-la-bei*, Khasi.

An evergreen tree up to 80 ft. in height and 8 to 9 ft. in girth; often buttressed at the base; bark even but not smooth, grey, about 3 in. thick, light pink inside with streaks of darker pink or white, exuding white gum, turning brown after exposure; young parts brown pubescent. *Leaves* 1.5-2 ft. long, tawny puberulous when young; leaflets 11-13; 4-8 by 1.5-2.5 in., opposite or subopposite, oblong, usually abruptly acuminate, thinly coriaceous, shining above when mature, glaucescent beneath; lateral nerves 10-12 on either side of the midrib, slender but raised and distinct-beneath, slightly arched; base rounded; petiolules 2-3 in. long. *Panicles* axillary or supra-axillary, puberulous; *male* much branched and many flowered, 15-18 in. long; *female* 6-8 in. long, less profusely branched. *Flowers* very small. *Calyx* minute, obtusely 3-lobed, tawny-puberulous. *Petals* 3, about 1 in. long, suborbicular, minutely stellate pubescent. *Staminal tube* urceolate, glabrous. *Anthers* usually 8, slightly exserted. *Capsule* 1-1.5 by .8-1 in., pyriform. tomentose.

Fairly common in UPPER ASSAM in evergreen forests, also in the SURMA VALLEY.

Wood red, hard, close-grained, weighing about 49 lbs. per c. ft., med. rays uniform, pores large. It is a very good timber for furniture and doors and windows.

Flrs. 8-9. Fr. 1-2.

4. *Amoora chittagonga* Hiern. Vern. *Gangru-changne*, Duff.; *Ponthikechauphang*, Mik.

Apparently a very precocious tree, saplings not more than 10 or 12 ft. in height being found with flower or fruit; young parts also calyx and fruit lepidote with thin silvery scales; bark greyish-brown, smooth on old stems, exfoliating in small scales or peeling off in scrolls; 3 in. thick; inside whitish, exuding milky resin. *Leaves* 6-12 in. long; rachis lepidote; leaflets generally 4-6, alternate or subalternate, 2.5-7 by .8-3 in., elliptic, oblong-elliptic to lanceolate or obovate, bluntly acuminate, slightly or not oblique at base, almost membranous, lepidote along the midrib and nerves esp. when young; lateral nerves 12-16 on either half; petiolules 1-1.5 in. long, stout. *Male panicles* fascicled from the axils of leaves, 4-6 in. long, lax, with slender ramifications and pedicels; *female* shorter, few-flowered with shorter and stouter pedicels. *Calyx* cup-shaped, usually 3-lobed.

Petals 3, sometimes 4. *Staminal tube* urceolate. *Fruit* indehiscent, 2-3 celled, obovoid-globose, about 1 in. long, usually not more than 2 seeded.*

Fairly common in UPPER ASSAM, esp. NORTH LAKHIMPUR and DARRANG.

Wood hard and heavy, used for house posts. The lac insect is sometimes reared on this tree.

Flrs. 3-4. Fr. 11-12.

8. AGLAIA Lour

Trees or shrubs, often lepidote. *Leaves* pinnate or 3 foliolate; leaflets generally opposite, quite entire. *Flowers* polygamous, usually very small, in large panicles. *Calyx* with 5 imbricate lobes. *Petals* 5, concave, imbricate. *Staminal tube* urceolate or globose, 5-toothed at the apex or truncate; anthers usually 5, rarely more, erect, included or half exserted. *Disk* obscure. *Ovary* 1-3-celled with 2 or 1 ovule in each cell. *Fruit* a dry berry, 1-2 celled and 1-2 seeded. *Seed* with a fleshy testa, without albumen.

I. Shoots and inflorescence covered with round scales; adult leaflets glabrous:—

A. Leaflets 3-7:—

Panicles much shorter than the leaves.

Flowers .2 in. across.

.. 1. *A. khasiana*.

Panicles about as long as the leaves.

Flowers about .75 in. across.

.. 2. *A. Roxburghiana*.

B. Leaflets 9-13:—

Panicles about as long as the leaves.

Flowers minute.

.. 3. *A. perviridis*.

II. Shoots and inflorescence covered with scales and stellate pubescence, undersurface of leaves more or less stellate pubescent:—

Panicles about as long as the leaves.

Flowers small.

.. 4. *A. edulis*.

1. *Aglaia khasiana* Hiern.

A small tree; young parts lepidote. *Leaves* 6-12 in. long; leaflets 3-5; 4-8 by 1-2 in., narrow-elliptic, glabrescent; petiolules .3-1 in. long, slender. *Panicles* much shorter than leaves, dense, with short patent branches, ferruginous. *Flowers* large for the genus, generally .2 in. across, subsessile. *Fruit* 1 in. diam.

MIKIR HILLS; also KHASI and NORTH CACHAR HILLS.

2. *Aglaia Roxburghiana* Miq. Syn. *A. odoratissima* Blume.

A small tree (in our area) attaining about 35 ft. with brownish-grey somewhat rough bark; blaze red, fibrous; young parts lepidote. *Leaves* 3-8 in. long; rachis ultimately glabrate; leaflets 3-7, opposite, 2-6 by 1-2.5 in., elliptic-oblong or oblong,

* This description has been given from specimens identified as *Amoora chittagonga* Hiern, at the Sibpur Herbarium. It however agrees in many respects with that of *A. canarana* Benth, which according to Talbot occurs in Assam and Eastern Bengal.

obovate to ovate ; apex subobtusely or bluntly short acuminate, often emarginate, subcoriaceous. glabrous above, sparsely lepidote along midrib and nerves beneath ; base rounded or cuneate ; petiolules 2-5 in. long (those of the terminal leaflets longest). *Panicles* axillary or supra-axillary, about as long as the leaves, pyramidal, lepidote. *Flowers* globular ; pedicels short. *Calyx* lobes rounded, ciliolate, lepidote-pubescent outside. *Petals* yellow, 5 in. long, much exceeding the calyx, glabrous. *Staminal tube* shorter than the petals, obscurely 5-lobed. *Ovary* small, stellately lepidote. *Berry* up to 7 in. long, subglobose, buff tomentose, usually 1-seeded.

A solitary record from Sanitarium hill GARO HILLS about 4000 ft. (Sheet No. 5245).

The pulp of the fruit is edible.

Flrs. rainy season. Fr. cold season.

3. *Aglaia perviridis* Hiern. Vern. *Thaidubriki-buphang*, Cach.

A small tree ; young parts lepidote. *Bark* greyish-brown, rather rough outside and fibrous, reddish-brown with beautiful streaks of deeper red and with an aromatic smell inside. *Rachis* 6-11 in. long, more or less lepidote, glabrate with age. *Leaflets* 9-13, opposite or sub-opposite, 3-6 by 7-2 in., lanceolate, narrow lanceolate or ovate-oblong, acuminate, glabrate with age, coriaceous ; lateral nerves 14-18 on either half ; base narrowed or rounded ; petiolules 3-5 in., that of the terminal leaflet longest, channelled. *Panicles* axillary about as long as the leaves, at first lepidote, glabrate with age ; bracts and bracteoles very small, lanceolate ; buds puberulous. *Flowers* white, minute. *Fruit* obliquely globose ; about 12 in. long, closely invested with brown scales.

CACHAR HILLS, KHASI HILLS ascending to 2000 ft. (Hooker).

Wood reddish brown, med. rays fine, pores joined by fine wavy concentric lines of soft tissue.

Flrs. 5-6. Fr. 12 ?

4. *Aglaia edulis* A. Gray. Vern. *Khrang*, Mik. ; *Thing-ril-char*, Kuki ; *Dieng-soh-longar*, Khasi.

A fairly large tree up to 75 ft. in height and 6 ft. in girth with fluted stem ; young parts covered with stellate hairs and scales mixed ; bark grey, plain outside, exfoliating in round or irregular-shaped flakes, red underneath the epidermis, 2 in. thick, reddish-brown and softly fibrous inside with very faint white streaks exuding a thin milky sap. *Leaves* 1-2 ft. long : leaflets 9-13, 3-9 by 1-3 in., opposite or subopposite, broad-elliptic to narrow-oblong, or lanceolate, obtusely acuminate, chartaceous, covered with stellate hairs, mixed with ferruginous scales, specially on the nerves beneath or glabrescent ; lateral nerves about 16 on either side of the midrib ; base of lateral leaflets slightly oblique ; petiolules 2-3 in. long, stout. *Panicles* 5-8 in. long, pyramidal. *Flowers* small, pedicelled. *Fruit* about 1 in. across, globose, covered with thin buff scales, up to 3-celled, usually 2-seeded.

Soudangpathar in the Doyang Reserve, SIBSAGAR. Also south-eastern slopes of the MIKIR HILLS, and the NORTH CACHAR HILLS; up to 1900 ft. in KHASI HILLS.

Wood dark-brown with wavy bands of softer tissue, very hard, medullary rays very fine, close and parallel, pores scanty. Suitable for posts, tent-pegs and agricultural implements. The fleshy integument of the seeds is eaten.

Flrs. ? Fr. 2-3.

A. Wallichii Hiern.—*Branchlets* terete. *Leaf rachis* sharply margined. *Leaflets* 5-9, very thinly coriaceous, 2-2·5 by 1·8-1 in., elliptic or ovate lanceolate, acuminate; lateral nerves about 10 on either half, indistinct near the apex; petiolule 1·5 in., channelled. *Panicle* with angled rachis and branches, mostly puberulous, about equalling leaves. *Flowers* minute. *Calyx* lepidote, shortly ciliate. *Corolla* glabrous. *Berry* not seen.

SYLHET (Wallich) Record based on a solitary specimen No. 8036 Wallich's catalogue in Herb. Calcutta.

9. WALSURA Roxb.

Trees. *Leaves* 1-foliate or pinnately 3-5 foliate; leaflets opposite, entire, pale beneath. *Flowers* 2-sexual, small, in axillary and terminal panicles. *Calyx* short; lobes 5, imbricate. *Petals* 5, ovate-oblong, spreading, slightly imbricate or subvalvate. *Stamens* usually 10; filaments free and thin, linear or subulate, or connate in a tube, usually notched at the apex, each bearing an anther at the notch. *Disk* annular. *Ovary* small, 2-3 celled, imbedded in the disk; style short; ovules 2 in each cell. *Fruit* indehiscent, 1-2 seeded; seeds enclosed in a fleshy aril, exalbuminous.

Leaflets usually 3. Stamens connate the whole way. .. 1. *W. tubulata*,
 Leaflets usually 5. Stamens free or only slightly
 connate at base. .. 2. *W. robusta*.

1. Walsura tubulata Hiern.

A small tree up to about 40 ft. in height and 2·5 ft. in girth; branchlets covered with raised lenticel specks; young shoots and inflorescence brown pubescent; bark light-grey, thin. *Leaves* 3-foliate; common petiole flattened above; leaflets 3-9 by 1-3 in., lanceolate to ovate or elliptic-oblong, acuminate, subcoriaceous, glabrous and shining above, glaucous beneath; lateral nerves about 10 on either side of the midrib, arched; tertiaries very close and finely reticulate; petiolules somewhat flattened, swollen at both extremities, of lateral leaflets 2-8 in. long, of terminal leaflet about double that length. *Panicles* racemose, shorter than the leaves. *Flowers* about 25 in. long, rather large for the genus, yellowish; bracts small, boat-shaped. *Calyx* 5-partite, pubescent. *Staminal tube* 5-lobed at the apex, glabrous outside, thinly pubescent inside; lobes notched at the extremity. *Fruit* not seen.

Dry forests in the neighbourhood of Lumding, NOWGONG Division, not very common. Also KHASI HILLS.

Wood hard, weighing about 60 lbs per c. ft., but liable to split irregularly.

Flrs. cold season.

2. *Walsura robusta* Roxb. Vern. *Lali*, Ass. ; *Theng-rali*, Mik. ; *Mogchouphong*, Cach. ; *Makhang-thing*, Kuki ; *Bol-khrenchi*, *Bol-dublok-Khrauchi*, Garo ; *Diengsoh-phlang*, Khasi.

A small or middle-sized tree up to 70 ft., in height and 5-6 ft. in girth ; bark dark-brown covered with fat corky warts, greenish-red underneath the corky layer which is easily separated and the inner surface of which is red and of a chequered pattern ; blaze about 5 in. thick, pinkish red, fibrous, with fine wavy streaks of whitish tissue ; branchlets covered with lenticels ; young shoots pubescent. *Leaves* 6-10 in. long ; rachis slightly flattened above ; leaflets generally 5, sometimes 3 ; 2-6 by 1-2.5 in., elliptic or oblong lanceolate, bluntly acuminate, chartaceous, glabrous, shining above, pale beneath, reddish brown, when young, turning yellow before shedding ; lateral nerves 5-7 on either half, arched, nervules closely reticulate but indistinct ; base acute ; petiolules of lateral leaflets 2-5 in. long, of terminal leaflet 1-1.5 in. long. *Panicles* mostly terminal, 4-8 in. long, rachis somewhat flattened ; branches pubescent ; bracts caducous, lanceolate, acute. *Flowers* white, about 2 in. across ; pedicels short. *Calyx* about 1 in. across, minutely 5-toothed, ferruginous-pubescent. *Petals* about 1 in. long, ovate, acute, spreading, thinly pubescent outside. *Filaments* usually 10, white, subulate, tapering to a fine point, each point bearing a globose yellow anther, subconnivent over the stigma, free or slightly connate at the base. *Disk* fleshy, slightly lobed. *Ovary* 2-celled ; style short ; stigma capitate. *Fruit* 5-7 in. long, subglobose, pubescent outside.

Foot of the MIKIR HILLS towards Lumding ; also NORTH CACHAR, GARO & foot of KHASI HILLS.

Wood brown or light red, very hard, weighing about 65 lbs per c. ft., pores joined by fine wavy concentric lines, med. rays very fine, close, liable to split, but seems suitable for agricultural implements.

Flrs. 3-5. Fr. 12-3.

10. CHICKRASSIA* Andr. Juss.

Chickrassia tabularis Andr. Juss. Vern. *Boga-poma*, Ass. (Sibs.) ; *Chokori-poma*, Ass. (Nowg.) ; *Lahripoma* (Goalpara) ; *Silling* or *Silengasing*, Miri ; *Harbi-beh*, *Haribe*, *Chany-hedim*, Mik., *Bon-ridim-phang*, Kach. ; *Jong-mel*, Kuki ; *Haithna-poma*, Sylh. ; *Thing-poi*, Tipp. ; *Bol-dorek*, *Chuma*, Garo ; *Rata-tuni* Nep.

A handsome lotty tree—(a tree 160 ft. high and 28 ft. 5 in. in girth has been measured near Pillung, N. E. F. District, in December 1913) ; branchlets lenticellate. *Bark* dark-grey outside, deeply cracked, inside fibrous, pink or light red, 5-1 in. thick. *Leaves* 12-20 in. long, often softly pubescent when young ; rachis terete ; leaflets 10-24, usually alternate, 2-6 by 2.2-3 in., ovate or elliptic-lanceolate, acuminate, entire, thinly

* Original spelling *Chukrasia*.

chartaceous, glabrescent; lateral nerves about 10 on either side of the midrib, nervules closely reticulate; base oblique and unequal-sided; petiolules .15-.2 in. long. *Panicles* terminal, shorter than the leaves. *Flowers* white, .5-.6 in. long. *Calyx* small, dentate. *Petals* white, oblong, erect, imbricate in bud. *Staminal tube* cylindrical, dark purple, 10-toothed at the apex and bearing anthers on the edge. *Ovary* hairy, usually 3, sometimes 4 celled. *Fruit* a septicidally 3 valved capsule, .15-.2 in. long, ellipsoidal, speckled with lenticels outside, valves entirely separating from the axis and consisting of two plates, inner woody, septate, striate. *Seeds* about .2 in. long, elliptic, flat with a dark-brown wing. .3-.6 in. long, very closely and transversely packed, the seed and tail ends in each series alternating, exalbuminous.

Common in the N. E. FRONTIER DISTRICT, but occurs in varied proportions in evergreen forests in all the other Districts of the province.

Wood hard, reddish-brown with a satiny lustre, weighing about 50 lbs per c. ft., very suitable for planking and furniture, but difficult to saw and plane owing to uneven course of the fibres. The bark possesses astringent properties.

Fls. 5-7. Fr. 12-3.

11. CEDRELA Linn.

Tall deciduous trees with red aromatic wood. *Leaves* pinnate. *Leaflets* opposite, subopposite or alternate; stipules 0. *Flowers* white or pale yellow in terminal or subterminal panicles of cymes, often dimorphic; pedicels often jointed. *Calyx* small, 5-cleft. *Petals* 5, imbricate, suberect, usually keeled inside at the base. *Disk* thick, 4-6 lobed. *Stamens* 4-6, rarely 10, free, inserted on the top of the disk, sometimes reduced to staminodes in the female flowers; anthers versatile. *Ovary* 5-celled; style simple; ovules pendulous, 8-12 in each cell in two series. *Fruit* a capsule, septifragally 5-valved. *Seeds* compressed, albuminous, winged at both ends (in the species described below).

Leaves mostly paripinnate, with opposite or subopposite leaflets:—

Capsule smooth or minutely lenticellate, generally not exceeding 1 in. in length; common petiole and petiolules usually glabrous.

.. 1. *C. Toona*.

Capsule nearly 2 in. long, conspicuously warty; common petiole and petiolules pubescent.

.. 2. *C. febrifuga*.

(Var. *assamensis*).

Leaves usually, imparipinnate; leaflets mostly alternate; common petiole and petiolules pubescent; capsule .6-.8 in. long, verrucose.

.. 3. *C. microcarpa*.

1. *Cedrela Toona* Roxb. Vern. *Poma*, Ass. Sylh. and Jharua; *Tun*, Beng.; *Banji-asing*, *Poma-asing*, Miri; *Poma*, *Khat-mai*, Cach.; *Hulu*, *Antei*, *Kuki*; *Tairel*, *Taireny*, Manip.; *Jia-poma*, Ass. and Mech; *Jati-poma*, Ass.; *Suruj-bed*, *Surja-poma*, Sylh.; *Intei*, Tipp.; *Harbi-beh-arong*, *poma-arong*

Mikir; *Dieng-biti*, Khasi; *Dieng-sali*, (Bhoi country), *Dieng-tyllyeny*, Khasi (Shella); *Dieng-saw*, Khasi (Isamati); *Kuma*, Synt.; *Bot-bret*, Garo.

A large handsome tree. *Bark* grey exfoliating with distant flakes of irregular shape, .6-.8 in. thick, fibrous, pinkish-red inside, mottled with fine radial streaks of white, turning brown on exposure. *Leaves* generally paripinnate, 1-2 ft. long, somewhat crowded at the ends of branchlets; common petiole glabrous, terete: leaflets 8-25, opposite or alternate, 2-5 by .7-2 in., lanceolate or ovate-lanceolate, caudate-acuminate, entire but with wavy margins, chartaceous, glabrous and shining above, often minutely pubescent and with a tuft of hairs at the axils of the secondary nerves beneath; lateral nerves 10-15 on either side of the midrib, slender, arched; base acute, oblique; petiolule .2-.5 in. long. *Panicles* shorter than the leaves, pyramidal with slender ramifications. *Flowers* white, faintly fragrant. *Calyx* small; lobes broad ovate, subacute or obtuse, grey-ciliate, puberulous outside. *Petals* .15-.2 in. long, oblong or obovate oblong, obtuse with ciliate margins. *Disk* with five hairy orange-coloured lobes. *Stamens* 5; filaments glabrous, connective apiculate. *Stigma* capitate, depressed at the apex. *Ovary* hairy. *Capsule* .7-1 in. by .2-.3 in. diam., oblanceolate, dark-brown, usually smooth outside, sometimes lenticellate. *Seeds* tan-brown, very light, winged at both ends, .5-.6 in. long including the wings.

Wood brick-red, soft, shining, open grained, fragrant, weighing about 35 lbs per c. ft. It seasons well and takes a good polish. It is much used for furniture and doors and windows. 8000-12000 seeds weigh 1 oz.

Flrs. 3-4. Fr. 5-7.

The above description applies to var. *typica*, which is fairly common throughout Assam, but less so than Var. *pilistaminea* C. D. C. Vern. *Jatipoma*, Ass., which is a smaller tree with smaller and more membranous longer-petioluled fewer leaflets, pilose filaments and shorter but stouter capsules often with minute lenticels. The bark exfoliates in regular papery flakes. The wood is less porous than of the type and weighs about 50 lbs. per c. ft.

Flrs. 1-2. Fr. 3-4.

Var. *multijuga* Kurz. *Khatmaiphang*, Cach.—*Branchlets*, rachis of leaves, petiolules and inflorescence permanently pubescent or puberulous, petiolules up to .6 in. long. *Filaments* glabrous, other characters as in Var. *typica*.

N. CACHAR HILLS.

Flrs. 3.

2. *Cedrela febrifuga* C. DC. Var. *assamensis* C. B. Cl. Vern. *Jati-poma*, *Phata-poma*, Ass.; *Kimbou-phang*, Kach.; *Inse-chang*, Naga; *Bol-bret*, Garo.

A middle sized tree up to 50 ft. in height; branchlets rather thick. *Bark* rough with vertical cracks, peeling off in oval flakes, .3 in. thick, red inside. *Leaves* paripinnate, 1.5-2.5 ft. long; common petiole terete, pubescent at least when young; leaflets up to 20 (?) mostly subopposite, 3-6 by 1-2.5 in., ovate-oblong, ovate or lanceolate, shortly caudate-accuminate, more or less rounded or subacute at the base, entire, rather membranous, concolorous on both surfaces, minutely puberulous along the

midrib and nerves or glabrate above, more or less pubescent along nerves beneath; lateral nerves 16-20 on either half, more transverse and less arched than in *C. Toona*; petiolule .15-.2 in. long, stout, puberulous. *Panicles* 16-20 in. long, narrower than in the preceding species, puberulous; pedicels velvety. *Flowers* small; buds almost globose. *Calyx* 5-toothed, hairy outside, margins ciliolate; petals obtuse at both ends, hairy specially along the middle on both surfaces, ciliate on the margins. *Filaments* and *Ovary* hairy. *Capsule* 1.5-2 in. long and up to .6 in. across, ovate-oblong, black, with large oblong brown warts outside. *Seeds* numerous, compressed, less than .25 in. long; upper wing .3 in., lower .7 in., long, tan-brown, membranous.

Occurs in evergreen forests of LAKHIMPUR and SIBSAGAR, e.g. Jeypur, Tippum, Deroi Reserve, Dikhari, etc.

Flrs. 7-9. Fr. 12-1.

Var. *Peali*, *C. DC.*—*Calyx* glabrous, rugulose outside; petals glabrous outside, sparingly pilose inside. *Capsule* unknown.

SIBSAGAR (G. E. Peal).

3. *Cedrela microcarpa* C. DC. Vern *Jati-poma* Ass.; *Khatmai-phang*, Cach.

A fairly large evergreen tree. *Bark* dark-brown, exfoliating in thin flakes, fibrous and uniformly red inside, turning yellowish-brown on exposure, aromatic, .5-.7 in. thick. *Leaves* 12-15 in. long; common petiole slender, terete; leaflets mostly alternate and then 9-15, (8-16 when opposite), 3-5 by 1-2 in. long, falcately lanceolate or ovate, caudate- acuminate, entire, membranous, glabrous and shining above; lateral nerves 8-12 on either side of the midrib, usually with a dense tuft of bristle-like brown hairs at the axils beneath; base oblique; petiolules .1-.4 in. long, slender, channelled. *Panicles* shorter than the leaves, ramifications somewhat zigzag and irregularly compressed, hairy. *Flowers* small. *Calyx* nearly glabrescent, ciliate, broad ovate or suborbicular, subacute or obtuse. *Petals* about .1 in. long, oblong, slightly hooded at the apex, glabrous, minutely ciliate on the margins; filaments densely pilose, connective apiculate. *Disk and ovary* densely hairy; style glabrous. *Capsules* .6-.8 in. long, dark-chocolate or black and verrucose outside. *Seeds* very light, .5-.6 in. long, winged at both extremities.

Rather rare, usually in hilly country ascending to 4000 ft.

The wood is finer-grained and less porous than, and used for the same purposes as, that of *C. Toona*. Weight about 36 lbs. per c. ft.

Flrs. during the rains (?). Fr. 11-1.

Cedrela Mannii*, C. DC. *Rachis* minutely puberulous. *Leaflets* 6 pairs ? opposite or subopposite, about 4.3 by 1.5 in., oblong or ovate-oblong, somewhat obtusely acuminate, entire, minutely puberulous on the midrib above, glabrous beneath; lateral nerves about 20 on either side; base oblique, usually rounded; petiolules very short. *Panicles* puberulous; pedicels short; calyx bluntly 5-toothed, ciliolate on the edges. *Petals* about .15 in. long, oblong, obtuse, margins ciliate; filaments densely pilose, connective of anthers not apiculate. *Disk and ovary* hirsute; style glabrous.

* Records of Bot. Survey of India Vol. III. P. 374-375.

FAM. 35. CHAILLETIACEÆ.

DICHAPETALACEÆ Engler.

Trees or shrubs. *Leaves* alternate, entire, simple; stipules 2, deciduous. *Flowers* small, 1-sexual or polygamous; *males* in axillary and terminal paniced cymes; *females* generally solitary on the axils of leaves with the peduncle often partly adnate to the petiole. *Sepals* 5, unequal, imbricate. *Petals* 5, free, equal or unequal, notched or 2-fid. *Stamens* 5, free or adnate to the petals; anthers oblong, introrse; connective often thickened at the back. *Disk* of 5 glands or scales inserted opposite the petals. *Ovary* free, 2-3 celled; ovules in collateral pairs, anatropous, pendulous from the apex of each cell. *Fruit* drupaceous, densely velvety-pubescent, compressed, with one pendulous seed in each cell. *Seed* with a large hilum and membranous testa; albumen 0; radicle superior; cotyledons thick.

1. DICHAPETALUM Dup. Thouars.

CHIALETTIA DC.

Dichapetalum gelonioides Engl. Syn. *Chailletia gelonioides* Bedd. *C. sumatrana* Micq. Vern. *Rokpoletak*. Miri & Abor; *Dingrali-arong*, Mik.

A small evergreen tree up to 40 ft. in height and 2.5 ft. in girth with spreading branches; young parts and inflorescence grey pubescent. *Bark* thin, greyish-brown, somewhat rough with lenticels, light-brown inside, turning yellow on exposure. *Leaves* bifarious, 2.5-6 by .8-2.5 in., elliptic to ovate-lanceolate, usually abruptly caudate-acuminate, chartaceous, narrowed to a very short petiole; lateral nerves generally 4-5 on either half, much arched, the lowest basal or sub-basal; tertiary nerves closely reticulate, more or less transverse; stipules 2-3 in. long, subulate, densely grey-hairy. *Flowers* polygamo-monœcious, in dense cymose clusters, generally paniced at the ends of branches of leaf axils; panicles up to 3 in. long; bracts and bracteoles small. *Male flrs.*—*Sepals* up to .1 in. long, unequal, united at the base, elliptic, subacute or obtuse, densely pubescent. *Petals* 5, about slightly longer than the sepals, linear oblong, deeply notched at the apex, adnate at the base to the sepals. *Stamens* inserted at the base of the calyx, nearly as long as the petals, connective broad. *Disk* of 5 quadrate scales. *Female flrs.*—As in the males but with sterile anthers; ovary broad, wooly; styles 2, recurved. *Drupe*

when perfect about .5 in. long, .7-.8 in., broad and .3-.4 in. thick, 2-lobed, transversely oblong or obcordate with two stones but sometimes only one carpel, perfect and thin, oblong and oblique with 1-stone, densely buff-felted outside; pericarp splits along the broader periphery exposing the orange-coloured thin mesocarp; endocarp rough, crustaceous; testa dark-red; cotyledons very fleshy, oily.

Evergreen forests of the N. E. F. DISTRICT, LAKHIMPUR and SIBSAGAR, not very common—Nizamghat, Borjan, Gaurisagar, Jamuguri; SYLHET, foot of the KHASI HILLS.

Wood light yellowish-brown, tough and hard, capable of being used for agricultural implements, tent-pegs, etc.

Flrs. 4-5. Fr. 11-1.

FAM. 36. OLACACEÆ.

Trees or shrubs, sometimes climbing, rarely undershrubs. *Leaves* usually alternate, simple, penni- or palmi-nerved; stipules 0. *Flowers* small, regular, cymose, bracteate, generally 2-sexual. *Calyx* usually small, of 4-5 teeth, sometimes reduced to a rim, rarely 0, often accrescent, valvate or imbricate. *Petals* 3-6, free or connate, valvate, rarely imbricate. *Stamens* 3-15; filaments free or adnate to the petals or fertile or some reduced to staminodes; anthers erect, 2-celled, introrse. *Ovary* free or adnate to the calyx, 1-celled or imperfectly 2-5 celled; style simple or 0; ovules 1-5, generally pendulous from the apex of a free central placenta. *Fruit* drupaceous, indehiscent, 1-celled, 1-seeded. *Seed* pendulous, albumen fleshy.

I. Calyx and corolla both present, the former accrescent:—

A. Bracts not connate, minute and caducous or

0. *Staminodes* 5:—

Generally erect shrubs, without tendrils.

Petiole less than .5 in. long.

Climbing shrubs with tendrils. Petiole 1-2 in. long

.. 1. *Olax*.

.. 2. *Erythralium*.

B. Bracts connate forming a persistent epicalyx.

Staminodes 0. Trees

.. 3. *Schœpfia*.

II. Perianth of one whorl of inflorescence supported by large broad (hop-like) bracts.

Staminodes 0. Small trees.

.. 4. *Lepionurus*.

1. OLAX Linn.

Trees or shrubs, sometimes climbing and spinescent, rarely undershrubs. *Leaves* alternate, often distichous, entire. *Flowers* in axillary short, simple or branched racemes. *Calyx* truncate or nearly so, enlarging in fruit. *Petals* 3-6, more or less coherent or free, valvate. *Fertile stamens* 3-5, usually 3, attached to the

base of the petals ; staminodes usually 5-6. *Ovary* free, usually seated in a cup-shaped disk, 1-celled above and more or less 3-celled below ; ovules 3, pendulous from the apex of a free central placenta ; style simple ; stigma 3-lobed. *Drupe* surrounded by the accrescent calyx ; stone crustaceous ; seed albuminous, embryo minute.

Shrub or a small tree ; leaves green beneath, acuminate at apex ; flowers in very short racemes. Undershrub with annual shoots, leaves glaucous beneath, obtuse at apex ; flowers usually solitary on slender peduncles.

.. 1. *O. acuminata*.

.. 2. *O. nana*.

1. *O lax acuminata Wall.** Vern. *Han-misang, Han-boka, Han-maljiangarong, Han-kanoj, Mik., Misen-baphang, Yao-laisaphang, Cach., Shamakubu, Mithi-phang-thing, Kuki ; Bol-narang, Moen, Garo ; Dieng-tyrut, Dieng-tilut, Khasi.*

A large shrub or small tree up to 16 ft. in height and a foot in girth ; branches dark-green, smooth and with shallow but long longitudinal fissures ; bark thin, greenish-white inside ; branchlets angular. *Leaves* 2-4 by '6-1'5 in., elliptic or oblong lanceolate, acute or acuminate, entire, membranous, glabrous, shining above, pale beneath, giving a foetid smell when bruised ; main lateral nerves 7-10 on either side of the midrib, very slender, more or less anastomosing at the outer extremities to form an uneven intramarginal nerve ; petiole about '1 in. long, margined. *Inflorescence* axillary, scarcely exceeding '3 in., 3-7 flowered, solitary or fascicled ; bracteoles ovate, minute, caducous ; buds elliptic-ovoid. *Flowers* white, '15-'2 in. long ; pedicels ascending, short. *Calyx* very small, salver-shaped, almost imperfectly 3-toothed, accrescent in fruit. *Petals* 3, oblong, valvate, each bearing at the base one short fertile stamen along the middle and two long staminodes, one on either side of the stamen ; anthers 2-celled, adnate, oblong. *Style* simple. *Drupe* '65 in. long by '5 in. diam., ellipsoid or ovoid-oblong, seated inside the cup-shaped accrescent calyx, orange-red when fully ripe ; stone 1-celled, 1-seeded.

Round the base of the Mikir Hills from the Doyang Reserve, SIBSAGAR on the east to the Kholahat Reserve, NOWGONG, on the west. Distribution the N. C. HILLS, SYLHET, CACHAR, Bijni Reserve in GOALPARA, the GARO HILLS, KHASI & JAINTIA HILLS up to about 2500 ft.

Wood cream coloured, tough and close-grained. The Mikirs eat the leaves cooked, especially with fish and meat.

Flrs. 4-5. Fr. 5-7.

2. *O lax nana* Wall.

A switchy undershrub about 2 ft., high, stems striate. *Leaves* subsessile, 1-2'7 by '3-'6 in., narrowly oblong-lanceolate or ovate-

* M. T. Masters in the Fl. Br. Ind. suspects *O lax acuminata* Wall, to be, and Mr. Gamble has described it as a climbing shrub. But the plant as described above has no climbing tendency. It can hardly be *O. zeylanica* Linn., which has 5 petalous flowers. If it is not *O. acuminata* Wall, can it be a new species ?

lanceolate, obtuse at the apex, entire. margins often recurved. glabrous above, glaucous beneath; lateral nerves indistinct. *Flowers* white, about .25 in. long, solitary, on slender axillary peduncles up to .5 in. long; buds clavate, oblong. *Petals* 3, oblong, obtuse at the apex, cohering towards the base. *Fertile stamens* 3, opposite the centre of the petals; staminodes 6, one on each edge of the petals, bifid. *Drupe* subglobose, .25 in. long, nearly covered by the accrescent scarlet calyx.

Foot of KHASI HILLS (record based on incomplete material), ASSAM—Fisher (!) LOWER ASSAM—Gustav Mann (!), grass land near Raimona, GOALPARA DISTRICT—C. Purkayastha. Among grass in drier districts.

The fruits are edible but they are insipid.

Flrs. 3-5. Shoots are annually produced from a woody rootstock.

2. ERYTHROPALUM Bl.

Climbing shrubs with axillary tendrils. *Leaves* alternate, simple, palminerved at the base. *Inflorescence* axillary, dichotomous, ebracteate. *Flowers* very small. *Calyx* 4-5 lobed, adherent to the ovary, accrescent. *Petals* 5, valvate, combined into a campanulate corolla. *Stamens* 5, opposite the petals and inserted on them; filaments very short; anthers adnate, incurved; connective thick. *Staminodes* 5, inserted with the stamens on the petals and alternating with them. *Ovary* conical, half immersed in the disk, 1-celled; style simple, short; ovules 1-3, naked. *Fruit* indehiscent, crowned by the tips of the enlarged calyx-lobes. Seed 1, pendulous; embryo minute; albumen fleshy.

Leaves subcoriaceous. Ripe fruit whitish, smooth. ...

1. *E. Vagum*.

Leaves membranous. Ripe fruit yellowish, rough. ...

2. *E. scandens*.

1. *Erythropalum vagum* Mast. Vern. *Lojangthu*, Mik.

A rambling climber with whitish stem. *Leaves* 4-6 by 1.7-4 in., ovate oblong, acute or acuminate or obtuse, subcoriaceous, shining above, glaucous beneath, subpeltate, usually 5-nerved at the base with 3 or 4 lateral nerves on either side of the median nerve; base truncate or subacute; petiole 1-2 in. long, terete. *Inflorescence* 8-10 in. long, laxly branched; peduncles 5-7 in. long, slender, terete. *Calyx* obscurely 5-lobed. *Corolla-lobes* oblong-ovate, reflexed. *Filaments* very slender. *Ovary* 1-celled with a large 5-lobed disk on the top; ovules 3, pendulous. *Fruit* .6-1 by 4-6 in., ellipsoid or ovoid-oblong whitish, narrowed at the base to a stipe, spongy inside. *Seed* solitary, large, naked.

Fairly common along the foot of the NAGA HILLS and MIKIR HILLS, c. g. Merapani, Kalioni, Garampani, etc.

Flrs. Rainy season, Fr. cold weather.

2. *Erythropalum scandens* Bl.

Closely resembling the foregoing species and hardly a distinct species. The *leaves* are ovate to ovate lanceolate, thinner, pale beneath, generally 3-nerved at the base, often subcordate; *inflorescence* shorter, fruit yellowish when ripe, not so smooth outside as of the other species.

Western half of the SIBSAGAR DISTRICT.

Distribution KHASI HILLS along its southern slopes, ascending to 2500 ft., Hat Mawdan, Syndai, etc.

Fls. Rainy season. Fr. cold weather.

3. SCHŒPFIA Schreb.

Schœpfia fragrans Wall. Vern. *Soh-kymphurkhlaw*, *Dieng-khao-khorai*, Khasi; *Dieng-shleng-khlaw*, Khasi (Mairang); *Dieng-sarumi*, Synt.; *Dieng-sa-niriang-blai*, Synt. (Raliang).

A small evergreen tree up to about 40 ft. in height and 1 ft in girth; branchlets angular. *Bark* pale-brown or grey, corky, closely but not deeply reticulate, with fine horizontal fissures, .2-.6 in. apart; inside pale-brown, turning deeper brown on exposure. *Leaves* 2-3.5 by .5-1 in., lanceolate, acuminate, with entire and slightly revolute margins, thinly coriaceous, glabrous; lateral nerves indistinct, about 5-7 on either side of the midrib; tertiaries laxly reticulate; petiole .2-.3 in. long, margined. *Racemes* axillary, up to about an inch long, usually 3-6, sometimes 9 flowered; buds ellipsoid-oblong; pedicels slender, .2-.3 in. long. *Flowers* yellowish-white, exquisitely fragrant, .4-.5 in. long, each supported by an epicalyx of 3 ciliate bracts, connate into a cup. *Calyx* obconic in flower, with a truncate or obsoletely 4-5 lobed margin, accrescent in fruit and remaining attached to it. *Petals* usually 5, combined up to about three-fourths of their length, free portion valvate in bud; tips slightly hooded and with a tuft of hairs inside about the middle and behind the anthers. *Stamens* included; filaments adnate to the petals nearly their whole length. *Ovary* half superior, 1-celled above, 3-celled beneath, surmounted by a fleshy conical lobed disk; style glabrous; stigma with 3 globular lobes. *Fruit* a 1-celled 1-seeded drupe, .5-.6 in. long, ellipsoid, supported by the epicalyx and covered up to the top with the accrescent calyx, white and succulent when ripe, stone thin-walled, striated; seed white, conforming with the stone; embryo minute at the apex of the fleshy albumen.

Jaipur, LAKHIMPUR, but likely to occur in similar localities in UPPER ASSAM; KHASI HILLS, 3-6000 ft.

Wood pale-white with close soft wavy bands of softer tissue, weighing 33 lbs. per c. ft., not used for timber.

Fls. 9-1. Fr. 2-4.

Schœpfia acuminata Wall. A small tree. *Leaves* 1.5-3.5 by .8-1.7 in., elliptic acuminate; lateral nerves very slender, 3-5 on either half, tertiaries not visible; petiole flattened, .15-.2 in. long. *Raceme* about 1 in.; pedicels stiff, .2-.3 in. *Flowers* .6 in. long. *Corolla* tubular campanulate, lobes ovate. *Stamens* and *ovary* as in *S. fragrans*.

Very doubtfully different from *S. fragrans*. The difference is supposed to consist in its broader leaves, shorter pedicels and larger flowers. The only difference I am able to make out is a slight one, in the venation of leaves, which would not entitle it to specific rank.

Only one sheet from Mismi country collected by Griffith in Sibpur herbarium, KHASI HILLS about 6000 ft. Laitkor (My sheet No. 7222)?

Flrs. 7-9. Fr. 10-12.

4. LEPIONURUS Bl.

Lepionurus sylvestris Bl. Syn. *L. oblongifolius* Mast. Vern. *Impai-kelok*, Mik.

A large shrub or small tree with grey bark and long switchy green branches, somewhat lanky in habit. *Leaves* alternate, 4-7 by 1·2-3 in., oblong-lanceolate to elliptic or obovate, acute or acuminate, entire, membranous, glabrous, covered on both surfaces with numerous raised pustules; lateral nerves 6-9 on either side of the midrib, slender, arched; base acute; petiole 1·2 in. long, margined. *Flowers* greenish, faintly scented, 2-sexual, about 0·7 in. diam., tetramerous, in umbel-like groups of 3-9 on small bracteate protuberances on the rachis of fascicled, axillary or slightly supra-axillary slender racemes, 1-2·5 in. long, ovate, membranous, ciliate. *Calyx* 0. *Perianth* urceolate, 4-lobed; lobes ovate, subvalvate, velvety outside. *Stamens* 4, opposite the perianth lobes; anthers subsessile. *Staminodes* 0. *Disk* fleshy, lining the base of the perianth-tube. *Ovary* free; 1-celled; stigma sessile. *Fruit* a 1-seeded glabrous drupe, 5 in. long by 2·5 in. across. *Seed* pendulous; cotyledons ternate.

In damper parts of evergreen forests in the N. E. F. DISTRICT, LAKHIMPUR, SIBSAGAR and DARRANG, N. C. and KHASI HILLS.

Flrs. generally 3-4, occasionally in October. Fr. rainy season.

Anacolosa illicoides Mast.—A small tree, branchlet pale white. *Leaves* 1·5-6 by 6-2 in., elliptic or oblong elliptic, acute at both ends, lateral nerves 6-8 on either side, slender; petioles 2-4 in. long. *Flowers* small, about 0·8 in. diameter, 2-6 (?) together in lax umbellate peduncled cymes; peduncles axillary, half the length of petioles. *Calyx* cup-shaped, glabrous, 5-6 toothed. *Petals* 5-6, much exceeding the calyx, oblong, concave at the base, inserted with the stamens on the disk. *Stamens* slightly adnate to the petals, opposite and concealed by them, filaments broad, glabrous. *Ovary* imperfectly 3-celled, depressed, conic; ovules 3.

Only one sheet from KHASI HILLS in Sibpur herbarium, collected by Wallich. Purkayastha has made further collection in 1935 from Umsaw K. & J. Hills.

Fam. 37 ICACINACEÆ.

Trees or shrubs, the latter sometimes climbing. *Leaves* generally alternate, simple; stipules 0. *Flowers* small, 2-sexual, polygamous or dioecious, in corymbose cymes, racemes or heads. *Calyx* small and 5- (rarely 4- or 6) lobed or partite or wanting. *Petals* or perianth segments 5, rarely 4 or 6, free or connate. *Stamens* isomerous and generally alternate with the petals or perianth-segments, in female flowers reduced to staminodes. *Ovary* generally 1-celled, occasionally 2-celled, with 1-2 ovules, pendulous from the apex of each cell. *Fruit* a 1-seeded drupe.

- I. Trees or shrubs generally erect :—
 A. Flowers 2-sexual, petals free :—
 Petals glabrous within, ovary oblique. .. 1. *Apodytes*.
 Petals villous within, ovary straight. .. 2. *Mappia*.
 B. Flowers polygamous diœcious, petals connate. .. 3. *Gomphandra*.
 II. Climbers. Flrs. diœcious :—
 A. Leaves alternate. Stamens alternate with the petals :—
 Flowers in heads, calyx 0. .. 4. *Miquelia*.
 Flowers in supra-axillary racemes, calyx present. .. 5. *Nastiatum*.
 B. Leaves opposite or nearly so, stamens opposite the petals. Flrs. in cymes ; calyx persistent. .. 6. *Iodes*.

1. APODYTES Meyer.

Apodytes Benthamina Wight. Vern. *Dieng-sormi*, Synt. ; *Dieng-lapitri-jem*, Khasi.

A handsome tree with a clean cylindrical trunk, up to 80 ft. in height and 5 ft. in girth ; young shoots pubescent. *Bark* outside with warts, 5-7 in. thick, light brown, mattedly fibrous and granular inside with a few faint streaks of whitish tissue, turning to chocolate brown on exposure, exuding a colourless watery sap from the cambium. *Leaves* alternate, 2·5-4·5 by 1-2 in., elliptic-oblong to oblong-ovate or lanceolate, acute, subacute or shortly acuminate, sometimes with blunt tip, margins revolute, thinly coriaceous, glabrous, often slightly puberulous along the midrib above, somewhat unequal at the base, turning black in drying ; main laterel nerves 4-7 on either half with 1-2 intermediate ones between each couple, arched, slender ; tertiaries very lax, inconspicuous ; base acute or obtuse ; petiole 5-1 in. long, finely channelled, puberulous. *Inflorescence* a terminal corymbose panicle, 3-5 in. long and almost as broad ; branches and pedicels buff puberulous ; pedicels short ; buds oblong. *Flowers* white, sweet scented. 2-sexual. *Calyx* very small, salver-shaped, hirsute, 5-toothed. *Petals* 5, valvate, about 16 in. long, oblong, rather fleshy, inflexed at the tip, quite free, glabrous. *Stamens* 5, alternating with the petals ; filaments inserted below the ovary, slightly dilated downwards, glabrous ; anthers sagittate, dorsifixed, slightly puberulous, dehiscing longitudinally. *Ovary* hairy, 1-celled, with two superposed pendulous ovules ; style 1, persistent, slightly excentric in flower, but gradually pushed downwards as the fruit develops, ultimately forming a beak near the base of the mature fruit. *Fruit* a compressed drupe, 3 by 25 in., obovoid, longitudinally striated, hirsute, furnished with a lateral orbicular shield-like appendage which goes on growing as the fruit develops and turns deep reddish-brown in ripe fruit. *Seed* 1, conforming with the fruit, albuminous.*

* My specimens of this tree have been identified at Sibpur as *A. Benthamina*, but the above description does not quite agree with that given for that species in Fl. Br. Ind. It may turn out to be a new species or at least a variety peculiar to Assam.

Dhansiri Reserve, NOWGONG, N. CACHAR HILLS and KHASI and JAINTHIA HILLS up to 4000 ft.

Wood deep tan brown weighing 45 lbs. per c. ft., fine grained, polishes well, medullary rays of two kinds, very fine with a few slightly thicker, joined by many fine transverse bars. The leaves emit a bad smell when bruised.

Flrs. 4-5. Fr. 9-1.

2. *MAPPIA* Jacq.

Mappia foetida Miers.

Generally a tree with a strong smell, which when old shows a climbing tendency and splits into numerous separate stems. *Bark* greenish-grey, wrinkled; young shoots pubescent. *Leaves* alternate or subopposite, 2-8 by 1-3 in., ovate or elliptic, acute or acuminate, entire, sub-coriaceous, at first thinly pubescent, especially underneath afterwards glabrescent; lateral nerves 4-7 on either side of the midrib, the lowest basal or sub-basal, much arched, tertiaries transverse; base more or less rounded or subacute; petiole 1-2 in. long, channelled, puberulous. *Flowers* small, yellow, with an unpleasant smell, in terminal corymbose panicles; pedicels short, strigose. *Calyx* minute, 5-lobed, hairy. *Petals* 5, villous within. *Stamens* 5, hypogynous, cup-shaped. *Ovary* hairy, 1-celled; ovules 2, pendulous; style terminal. *Fruit* an oblong drupe up to .75 in. in length; seed solitary, pendulous, albuminous; radicle superior.

Only once found near Borjan, Makum Range, Dist. LAKHIMPUR. Distribution MYSORE and the NILGIRIS.

Wood soft and porous.

Flrs. 3-7.

3. *GOMPHANDRA* Wall.

Gomphandra axillaris Wall.

A large shrub or small tree with glabrous twigs, buds pubescent. *Leaves* alternate, 2-farious, 3-7 by .5-2.5 in., oblong or lanceolate, acuminate, often abruptly thinly subcoriaceous, glabrous on both surfaces, paler beneath; lateral nerves 7-9 on either half, slender, raised beneath, oblique, specially the sub-basal pair, tertiaries more or less transverse and subparallel, specially towards the margin, nervules laxly reticulate; base rounded or narrowed; petiole .2-5 in. long, stout, channelled. *Flowers* small, unisexual or polygamous in puberulous axillary or extra-axillary paniculate, few flowered cymes up to .4 in. long. *Calyx* minute, cup-shaped, 4-5 toothed. *Petals* about .15 in. long, inserted on a short hypogynous disk and connate into a tubular campanulate corolla, much exceeding the calyx lobes, ovate, inflexed at the tip, ultimately spreading. *Stamens* 5, alternating with the petals; filaments thick, flat on the back and hollowed near the top in the front to receive the anthers, pilose with glandular hairs at the apex, which exceed the anthers; anthers pendulous from the apex of the filament.

Ovary rudimentary in the male and oblong and obtusely 4-5 gonous in the female flr., 1-celled; stigma discoid*. *Fruit* drupaceous, '5-'6 in. long, oblong, crowned by the remains of the stigma. *Seed* large, striated outside.

Nongkila-KHASI & JAINTIA HILLS, Balijan, Tengalibam, Prains collector (!)
LUSHAI-Præzer (!) Gauhati-Jenkins (!).
Flrs. 5-7. Fr. 10-12.

4. MIQUELIA Meissn.

Miquelia Kleinii Meissn.

A fairly large harsh climber with corky bark and very large wood vessels. *Leaves* alternate, 5-9 by 1·5 in., elliptic oblong or lanceolate, abruptly acuminate, generally entire, membranous or thinly coriaceous, strigose when young; main lateral nerves 7-12 on either side of the midrib, arcuate, the lowest from near the base; petiole 1·5-2 in. long. *Flowers* greenish in pubescent heads, diœcious. *Perianth* supported by a 3-5 cleft involucre. MALE FLOWER HEADS 15-20 flowered; peduncles 1-2 in. long, filiform, racemosely disposed on a short supra-axillary protuberance. *Perianth* separated from the involucre by a pedicel, up to '15 in. long, puberulous outside, 4-5 lobed, lobes elliptic valvate, equalling or slightly shorter than the tube. *Filaments* very short; anthers oblong. FEMALE FLOWER HEADS about 10-15-flowered; peduncles solitary, about '5 in. long, thick, involucre persistent. *Perianth-tube* short or 0, lobes reflexed. *Staminodes* minute. *Ovary* ovoid; stigma sessile, 4-lobed. *Fruit* a compressed drupe, '5-'6 by '3 by '2 in., tubercled outside, 1-seeded, putamen pitted; albumen copious; radicle superior; cotyledons flat, leafy, as broad as the seed.

Dikrang in LAKHIMPUR, Joboka, Mohmara, Dumardalang in SIBSAGAR, Charduar in DARRANG, KHASI HILLS. Not very common.
The thin flexible shoots are used for binding purposes.

Flrs. 4-5. Fr. 10-11.

5. NATSIATUM Ham.

Natsiatum herpeticum Ham. Vern. *Target-riube*, Miri.

A semi-herbaceous climbing shrub with tuberous roots and harsh stem, shoots densely strigose; wood very porous. *Leaves* alternate, 3-6 by 2-5 in., broadly ovate, acute or acuminate, repand or dentate, membranous, scabrid with adpressed stiff white hairs, palmately 7-9 nerved at the base, each main nerve giving off 1-2 lateral ones; base truncate or abruptly cuneate; petiole 2-6 in. long, very strigose. *Flowers* greenish-yellow, diœcious, bracteate, in supra-axillary hirsute, slender, spiciform racemes up

* The discoid stigma on the top of the ovary is regarded by some to be in reality on accrescent epigynous disk concealing the true style and stigma—F. B. I.

to 4·5 in. long ; bracts linear ; pedicels up to 1·5 in. *Calyx lobes* valvate, linear-lanceolate, shaggy outside with coarse hairs. *Petals* 5, up to 1 in. long, alternating with calyx-lobes and slightly longer than them, lanceolate, hairy. *Fertile stamens* opposite the calyx-lobes ; filaments short ; anthers bright-yellow, sagittate. *Staminodes* (in female flowers) subulate. *Ovary* 1-celled, hairy ; style 2-3 fid. *Fruit* a compressed ovate drupe, somewhat oblique and tapering, 3 by 2·5 by 2 in., rugose ; stone crustaceous ; seed solitary ; albumen fleshy ; cotyledons leafy.

Along the Buri-suti in the N. E. FRONTIER DISTRICT, the Mikir Hills Namchang (foot of the NAGA HILLS), LAKHIMPUR, SIBSAGAR, GOALPARA, SYLHET and foot of the KHASI HILLS.

The leaves and tender shoots are eaten by the Miris cooked as a pot herb, especially with fish.

Flrs. 12-1. Fr. 1-2.

6. IODES Bl.

Iodes Hookeriana Baill.

A fairly large climbing shrub ; young stems covered with soft bristles, old with corky warts. *Leaves* opposite or subopposite, 4-8 by 1·5-3·5 in., oblong-ovate or obovate, abruptly acuminate, entire, subcoriaceous, glabrous above, pilose beneath along the nerves, strongly and closely reticulate ; lateral nerves 7-9 on either half, very prominent beneath ; base rounded or shallowly cordate ; petiole 3-7 in. long, shaggy with brown bristles. *Inflorescence* extra-axillary, cymose, the lower peduncles often reduced to tendrils. *Flowers* dioecious. *Calyx* minute, salver-shaped, with 5 short deltoid lobes. *Petals* 5, valvate, oblong, thick, free in the male flower, combined and tubular in the female, hairy outside at the base. *Stamens* 5, hypogynous, opposite the petals or corolla-lobes and shorter than them ; filaments glabrous ; anthers sagittate. *Ovary* 1-celled with 2 pendulous ovules ; style 0 ; stigma 5-lobed. *Fruit* a drupe of the size and shape of a large almond, supported by the persistent calyx, orange-red when ripe ; seed solitary, ovate ; albumen fleshy ; cotyledons flat, leafy.

Barpathar, SIBSAGAR ; also pabhoi, DARRANG and KHASI HILLS (Hooker).
Flrs. cold season. Fr. 7-9.

***Cardiopteris lobata* R. Br.**—is a curious climbing herb of doubtful affinity with a milky juice found in forest glades in SIBSAGAR, and possibly elsewhere. The *leaves* are deciduous, polymorphous, generally palmately 7-9 nerved at the base, membranous, long-petioled. The fruit is surrounded by a thin, shining, silky obovate obcordate wing which is about 1 in. long and 75 in. broad. Vern. *Lalruna-buphai-thup*, Lushai.

FAM. 38. AQUIFOLIACEÆ (ILICINÆ).

Trees or shrubs generally evergreen. *Leaves* alternate, simple, glabrous, usually coriaceous ; stipules 2, minute or 0. *Flower* regular, usually diœcious, sometimes bisexual, small, in axillary fascicles, umbels or congested cymes. *Calyx* 3-6 cleft or lobed ; segments or lobes imbricate, persistent. *Petals* 4-5, rarely 6-8 or more or less connate in the male flowers, imbricate, deciduous. *Stamens* 4-5, adnate to the petals or free and hypogynous (imperfect) in female flowers. *Disk* 0. *Ovary* free, (rudimentary in male flowers), 3-16 celled ; style short ; ovules 1-2, pendulous. *Fruit* a drupe with 2 or more 1-seeded stones ; seed with a membranous testa ; embryo minute.

ILEX Linn.

The characters of the family.

Blaze oxidizes rapidly on exposure.

I. Leaves quite entire, flowers in umbellules :—

A. Flowers unisexual :—

- a. Umbellules often arranged racemosely, peduncles '3-'8 in. long. Flowers 4-5 merous. Lofty tree ; branchlets pubescent, leaves thinly coriaceous. .. 1. *I. Godajam.*
- b. Umbellules solitary, peduncles '5-1 in. long. Flowers 4-5 merous ; middle-sized trees, branchlets glabrous, leaves membranous. .. 2. *I. sulcata.*
- c. Umbellules cymose, solitary or crowded on a short rachis ; peduncles '3-'6 in. long. Flowers 4-6 merous. Moderate sized tree, branchlets green, glabrous ; leaves thickly coriaceous. .. 3. *I. venulosa.*

B. Flowers bisexual :—

Umbellules mostly solitary, sometimes several on short shoots. Flowers 4-merous. .. 4. *I. Doniana.*

II. Leaves serrate or serrulate :—

1. Leaves not gland dotted :—

a. Fem. flrs. fascicled :—

Male flowers in dense corymbose cymes, branched from near the base. Flowers 4-5 merous. .. 5. *I. theæfolia.*

Male flrs. in peduncled umbellules, peduncles '2-'5 in. long. Flowers 4-merous. .. 6. *I. embelioides.*

Male flrs. fascicled. Flowers often more than 5-merous. Leaves membranous, strongly reticulate beneath. .. 7. *I. fragilis.*

b. Fem. flrs. solitary :—

Male flrs. on peduncled umbellules, peduncles '5-1 in. long. Flrs. 4-merous. .. 8. *I. Griffithii.*

2. Leaves dotted with raised dark glands beneath :—

Fem. flrs. mostly solitary. Flrs. 4-merous. .. 9. *I. Thomsonii.*

1. *Ilex Godajam* Coleb. Vern. *Hati-kerepa*, Ass. (Sib.) ; *Born-bokul*, Ass. (Larr.) ; *Theng-tuni*, *Theng-sang-proth-arong*, Mik. ; *Theny-ngoithel*, Tipp.

A large deciduous tree with spreading branches attaining often over 100 ft. in height and 8 or 9 ft. in girth ; young shoots and inflorescence pubescent. *Bark* grey, plain, excepting for warts and fine close horizontal wrinkles ; inside granular or mealy, at first light brown, but soon turning dark-brown or black. *Leaves* 3-5 by 2-2.5 in., ovate elliptic or oblong, generally bluntly short acuminate, entire, often undulate, thinly coriaceous, glabrous and shining above, pale beneath ; mid-rib and main lateral nerves often thinly pubescent beneath when young ; lateral nerves 8-10 on either half, slender, arched ; base generally acute ; petiole .5-1 in., puberulous or glabrescent, channelled ; stipules minute. *Flowers* about .15 in. diam., 4-5 merous, pale, fragrant ; male flowers in simple or paniced, pedunculate umbels ; panicles up to 2 in. ; peduncles .3-.8 in. long, pedicels slender up to about .1 in. long. *Calyx-lobes* orbicular, more or less ciliate. *Petals* broadly obovate or ovate oblong, slightly united at the base about .1 in. long. *Filaments* very slender, exceeding the petals. *Fruit* ovoid, about .1 in. across, sulcate, with 4-6 stones.

Along the foot of the MIKIR HILLS from Amguri in NOWGONG to Barpathar in SIBSAGAR, SYLHET, GARO HILLS and N. CACHAR HILLS.

Wood of a dull pale colour weighing about 40 lbs. per c. ft., not used except as firewood.

Flrs. 2-4. Fr. 4-6.

2. *Ilex sulcata* Wall. Vern. *Bikha-kulia*, Ass. (Darr.) *Kotoki*, Ass. (Kam.) ; *Cheknan*, *theng-pisuni*, Mik. ; *Bol-thajong*, *Bol-mikachhak*, Garo ; *Dieng-jali*, Khasi.

Usually a middle-sized deciduous tree, but sometimes as large as the preceding species, very young branchlets thinly pubescent. *Bark* greyish-white outside ; plain or with shallow horizontal wrinkles ; blaze greenish next to the cuticle, deeper layers cream-coloured, pinkish near the cambium, but all soon turning black on exposure, soft, granular. *Leaves* elliptic, elliptic-oblong or ovate, 2.5-5.5 by 1.3-2.5 in., somewhat abruptly acuminate, quite entire and with a thin translucent margin, membranous, glabrous, pale beneath ; lateral nerves 8-12 on either half, very slender, somewhat irregular, anastomosing into loops at the extremities ; tertiaries very scanty, laxly reticulate ; base acute ; petiole .4-.8 in. long, margined, puberulous when young. Umbels 12-20 flowered, generally solitary below the leaves on leaf-bearing branchlets ; peduncles .6-1 in. long, compressed towards the apex ; pedicels about .1 in. long, both more or less puberulous. *Calyx-lobes* orbicular, pubescent outside. *Petals* 4-5 in the male flowers, up to 6 in the female, orbicular or broadly oblong, glabrous. *Filaments* slightly longer than the petals, glabrous. *Drupe* .2 in. across, globose ; stones up to 8, trigonous.

NOWGONG and DARRANG generally in deciduous forests, KAMRUP—Mann (!), low elevations in KHASI HILLS and GARO HILLS.

Wood white, compact and very fine-grained; pores very small and scanty. Weight about 50 lbs. per c. ft. capable of being used for scabbards, platters and toys.

Flrs. 3-4. Fr. 5-6.

3. Ilex venulosa Hk. f. Vern. *Dieng-lalih*, *Dieng-soh-saw*, Khasi.

A moderate-sized tree with green glabrous branchlets covered usually with large lenticels. Bark grey, fairly smooth, lenticellate; blaze greenish-white, turning brownish, edges (layers below the dead tissue) green. Leaves 3-7.5 by 1.2-2.5 in., oblong or elliptic-oblong, usually abruptly caudate, quite entire, glabrous, brownish-red when young, coriaceous, midrib prominent beneath; lateral nerves strong, 10-14 on either half, arcuate towards the free end, anastomosing into loops near the margin, nervules laxly reticulate; petioles .5-1.2 in. long, stout, channelled. Flowers whitish, about .1 in. across, polygamous, 4-6 merous; male flowers in slender cymose umbellules, usually branched from a rachis up to 1 in. long; female flowers in axillary peduncled umbellules, either solitary or crowded on a short rachis up to 1 in. long; peduncles .3-.6 in. long, stouter than in male flowers; pedicels up to .15 in. Calyx broad ovate, obtuse. Petals oblong or obovate, combined at the base in both sexes. Stamens inserted between them at the base. Stigma large discoid, subsessile. Drupe globose, red when ripe, .15 in. across, stones 4-6.

KHASI HILLS, 4000-5500 ft.

Flrs. 4. Fr. 11.

4. Ilex Doniana DC. Syn. *Ilex excelsa* Wall. Vern. *Dieng-soh-syrtet*, *Dieng-soh-tyrlang*, *Dieng-lali*, *Dieng-soh-lali*, Kh.; *Dieng-lihsyrang*, Synt. *Bol-ai*, Garo.

A small or medium sized tree; young shoots pubescent or nearly glabrous beneath, often stout. Bark light to dark-grey with horizontal wrinkles and covered with lenticular warts, otherwise smooth, blaze cheesy pale-dun or yellowish white, darkening and turning, rather dirty brown to almost black on exposure. Leaves 2-3.5 by 1.25-1.75 in. ovate, elliptic or elliptic-oblong, acuminate in some forms, entire, subacute, thin or subcoriaceous when mature, glabrous, dark-green and shining above, glabrous or pubescent beneath; lateral nerves 6-9 on either half, slender, arcuate, anastomosing near the margin; petiole .3-1 in. long, slightly channelled, puberulous or glabrescent. Flowers 2-sexual, 4-5 merous, .15 in. across in axillary pubescent peduncled umbels, sometimes in short panicles; peduncles .2-.5 in. long, stout, up to 15 flowered; pedicels about .1 in. long. Calyx-lobes broad ovate to rounded, more or less hirsute outside at least when young, ciliate. Petals suborbicular-oblong or obovate, united at the base. Stamens alternating with the petals and inserted

at their base. *Drupe* '2 in. across, globose, bright red with 4-5 trigonous stones.

KHASI & JAINTIA HILLS generally above 3000 ft., N. CACHAR HILLS about 1600 ft., GARO HILLS-Dambu Reserve.

Wood brownish or greyish white, medullary rays broad with very fine ones between, pores small; takes a fine polish—not used.

Flrs. 3-4. Fr. 11-12.

The following forms may be mentioned.

Form 1. young shoots and undersurface of leaves at least along the midrib pubescent. Leaves often elliptic oblong and generally with subacute tip, umbels often in short panicles.

GARO HILLS. NORTH CACHAR; Jowai—KHASI HILLS etc.

Form 2. Branchlets stout, usually glabrous. *Leaves* entirely glabrous, sub coriaceous, broader than in the last, acuminate; lateral nerves somewhat distant, usually not more than 6, umbels never paniced.

KHASI HILLS between 4000 & 6000 ft.

5. *Ilex theæfolia* Hk. f. Vern. *Dieng-soh-tyrlong-kynti*, *Dieng-shieng*, Khasi.

A moderate-sized to small tree; young parts and inflorescence puberulous. *Bark* grey, lenticelled, thin; blaze pale-brown with white streaks, granular. *Leaves* 1'5-3 by '6-1'4 in., elliptic-oblong, lanceolate or oblong-lanceolate, shortly caudate acuminate, serrate or serrulate, coriaceous, shining above; lateral nerves 7-9 on either half, anastomosing near the margin, slender, not prominent; base acute, cuneate or narrowed and obtuse; petiole up to '3 in. long, slightly margined, channelled. *Flowers* whitish, 4-5 merous, about '2 in. across, male flowers in dense axillary corymbose cymes branched from the base, up to '5 in. long; pedicels slender up to about '2 in. long, female flowers fascicled or crowded on short axillary protuberances or branches; pedicels stouter than in male flrs.; about '2 in. long. *Calyx* broad ovate, subacute, round, ciliolate. *Petals* broadly obovate or obovate-oblong, connate at the base in male, free in female flrs. *Stamens* longer than the petals in male flowers; staminodes in female flrs shorter than the petals. *Drupe* globose about '2 in. across, reddish-brown when ripe; stones 3-4.

KHASI HILLS 4000-6000 ft.

Flrs. 4-6 ? Fr. 7 ?

6. *Ilex embelioides* Hk. f. et Thom.

A small tree. *Bark* thin, greenish-grey, nearly smooth, distantly warty and with faint horizontal wrinkles; blaze dull greenish white, turning dirty on exposure, granular; shoots and inflorescence finely puberulous. *Leaves* 2-farious, deep green, 1'2-2'5 by '5-8 in., elliptic to oblong-lanceolate, caudate with a blunt apiculate tip, with few distant spinous teeth or nearly entire, shining above, finely puberulous along midrib on both surfaces, ultimately glabrous; base acute or cuneate; petiole channelled up to '25 in. long. *Flowers* 4-merous, white, about '1 in. across. *Males* in peduncled umbellules, clustered at the ends of branches or leaf axils, often on very short branches, sometimes solitary; peduncles

of umbellules '2-5 in. long; pedicels slender, short; buds globose. *Female* flowers in fascicles at the leaf axils often on very short branches. *Calyx* lobes puberulous outside, broad, subacute or obtuse, ciliate. *Petals* suborbicular, ovate or oblong, cuneate at the base in both sexes. *Stamens* nearly as long as the petals, inserted at their base and alternating with them. *Pistillode* in male flower globose. *Drupe* globose, '15-2 in. across, with 1-3 stones.

KHASI HILLS 4000-6000 ft.

Flrs. 4-5. Fr. 10.

7. *Ilex fragilis* Hk. f. Vern. *Dieng-lali-iong*, Khasi.

A small tree, with fragile branches and greyish-white warty bark; blaze pale yellow, turning blackish on exposure. *Leaves* 2-3.5 by 1-2.2 in., elliptic or ovate, acuminate, serrate or serrulate, teeth generally apiculate, membranous, glabrous, midrib and main lateral nerves prominent beneath, the latter 6-9 on either half, tertiaries distant, more or less transverse and raised; forming large strong reticulations with the lateral nerves, nervules fine; base cuneate to rounded; petiole winged up to '25 in. long. *Flowers* white, up to about '15 in. across; both males and females fascicled, often from short peduncles; pedicels up to '2 in. long. *Calyx* lobes 5-8, rounded, somewhat unequal, ciliate. *Petals* 5-8, combined at the base in both sexes, suborbicular or broad-oblong to ovate, obtuse. *Stamens* as many as the petals, shorter than them and inserted at their base; filaments very short. *Stigma* tumid. *Drupe* globose, red, '2 in. across, crowned by the stigma with 5-8 stones.

KHASI HILLS 5000-6000 ft.

Wood white, not used.

Flrs. 4-5. Fr. 7-8.

Hooker describes the flowers as pentamerous but from a large number of specimens examined by me, I conclude they are 5-8 merous.

8. *Ilex Griffithii* Hk. f. Vern. *Kynja-jakrai*, Khasi.

A large bushy evergreen shrub or small tree with spreading branches; branchlets virgate, sparingly pubescent or glabrescent; bark grey or dark-brown, thick, nearly smooth, lenticellate. *Leaves* 1.5-3 by 1-1.5 in., obovate or elliptic, acute, obtuse or rounded at the apex, finely serrulate, thinly coriaceous, glabrous, dark-green and shining above, pale beneath; midrib channelled above prominent beneath; lateral nerves 6 or 7 on either half, very slender; base acute or cuneate; petiole '25-3.5 in. long, channelled. *Flowers* 4-merous, pale-white; males about '2 in. across, in umbel-like compound cymes; pedicels slender. *Female* usually solitary, about '25 in. across, axillary; pedicels quadrangular, stout, about '2 in. long. *Calyx-lobes* orbicular, ciliate. *Petals* broad, oblong, connate below in both sexes. *Stamens* inserted on the corolla. *Ovary* globose; stigma sessile. *Drupe* globose, about '25 in. diam., black when ripe; stones 1-3, rarely 4, coriaceous.

Found in damp places in the plains, e.g. Bechapati, Doloni near Laluka, LAKHIMPUR; Sepakhati, Deroi Reserve and Gaurisagar in SIBSAGAR, SYLHET also KHASI HILLS, 4,-6000.

Flrs. 3-4. Fr. cold season.

9. *Ilex Thomsonii* Hk. f.

A shrub or a small tree attaining 18 ft., with a dense crown; young shoots and inflorescence puberulous. *Leaves* '5-1'5 by '3-6 in., obovate or oblanceolate, acute or subacute, apiculate, margin with few distant teeth, coriaceous, glabrescent above, dotted with dark raised glands beneath; lateral nerves indistinct, 4-6 on either half; base narrowed into the short petiole. *Flowers* 4-merous, white, nearly '1 in. across. *Males* in axillary, peduncled few flowered (usually 3-flowered) cymes; peduncles sometimes 1-flowered, slender up to '3 in. long; pedicels up to '15 in. long. *Females* usually solitary on axillary peduncles; pedicels and peduncles thickening with age. *Calyx* suborbicular or broad ovate. *Petals* suborbicular obovate or oblong, connate at the base in both sexes. *Stamens* nearly as long as petals and inserted at their base. *Stigma* sessile; pistillode in male flowers globose. *Drupe* up to '25 in. across, black when ripe, globose; stones usually 2, planoconvex.

KHASI HILLS 4000-5000 ft.

Flrs. 5-6. Fr. 12.

Fam. 39. CELASTRACEÆ.

Trees or erect or climbing shrubs, sometimes with spinescent branches. *Leaves* opposite or alternate, simple, stipules caducous or 0. *Flowers* regular, small, 2-sexual or polygamous, usually cymose. *Calyx* small, 4-5 lobed, persistent; lobes imbricate. *Petals* 4-5, rarely 0, imbricate, inserted on or below the disk. *Disk* generally conspicuous lobed or entire. *Stamens* as many as petals, inserted under or on the margins of the disk and alternating with the petals, or when the petals are absent opposite to the calyx lobes. *Ovary* 2-5 celled, free on the disk or immersed in it; ovules usually 2 in each cell, rarely 1 or more than 2; style none or 1, rarely 2, short; stigma simple or lobed. *Fruit* capsular, berry-like or drupaceous. *Seeds* usually arillate, sometimes winged; albumen fleshy, sometimes 0.

I. Leaves opposite :—

A. Petals free ; capsule 3-5-celled :—
Trees or erect or climbing shrubs ;
ovules 2 in each cell ; petals not
pitted.

Trees or erect shrubs ; ovules 1 in
each cell ; petals pitted.

Trees ; petals continuous with the
lobes of the disk, crested ; ovules
4 or more in each cell of the ovary.

B. Petals connate at the base ; capsule
1-celled, 1 seeded.

II. Leaves alternate :—

A. Inflorescence paniculate or racemose :—
Scandent shrubs ; leaves serrate ; ovary
not bearded ; style 1.

Trees ; leaves entire ; styles 2.

B. Inflorescence of dichotomous cymes :—
Ovary sunk in the disk : trees
or erect shrubs.

.. 1. *Euonymus*.

.. 2. *Glyptopetalum*.

.. 3. *Lophopetalum*.

.. 4. *Microtropis*.

... 5. *Celastrus*.

.. 6. *Kurrimia*.

.. 7. *Gymnosporia*,

1. EUONYMUS Linn.

Trees or shrubs, sometimes trailing or creeping with adventitious roots, rarely scandent. *Leaves* usually opposite ; stipules caducous. *Flowers* bisexual ; inflorescence usually axillary and 2-3 cychotomously cymose. *Calyx* 4-5-fid ; lobes spreading or recurved. *Petals* 4-5 ; stamens 4-5, inserted on the disk ; anthers broad, 2-celled. *Disk* large, fleshy, 4-5 lobed. *Ovary* sunk in the disk, 3-5 celled ; style short or 0 ; stigma 3-5 lobed ; ovules 2 in each cell, attached to the inner angle, one ascending and sub-basal and the other suspended and on the axis. *Capsule* 3-5 lobed, angled or winged, 3-5 celled, sometimes by abortion 1-celled, coriaceous, rarely echinate ; cells 1-2 seeded, loculicidal. *Seeds* covered by aril, albuminous.

I. Fruits unarmed :—

A. Flowers over '5 in. across ; cyme 3-flowered,
peduncles fairly stout up to 2 in. long.

B. Flowers under '5 in. across, cymes usually
more than 5 fld.* :—

1. Leaves always entire ; flowers usually
5-merous.

2. Leaves usually serrulate or serrate ;
flrs. 4-merous :—

a. Trees :—

i. Leaves not bullate ; petals not
thick :—

Peduncles rather stout ; petals
ovate or oblong.

Peduncles capillary ; petals
orbicular ; capsule deeply
lobed.

ii. Leaves bullate ; petals thick.

b. Usually climbing-sometimes erect
shrubs :—

i. Peduncles under '75 in. long,
never filiform ; style
conspicuous :—

.. 1. *E. grandiflorus*.

.. 2. *E. attenuatus*.

.. 3. *E. Hamiltonianus*.

.. 4. *E. Lawsonii*.

.. 5. *E. bullatus*.

* 3 fld. in some forms of *E. Hamiltonianus*.

Climbing by means of adventitious roots or erect ; nervules of leaves conspicuously reticulate. Flrs. '25 in. across when fully expanded.

.. 6. *E. theæ folius*.

Scandent ; leaves small, nervules not conspicuous. Flowers small ; peduncles flattened.

.. 7. *E. vagans*.

ii. Peduncles usually over 1 in. long, filiform ; style very short or obsolete ; leaves with conspicuous nervules

.. 8. *E. frigidus*.

II. Fruit echinate :—

Creeping shrub ; leaves obovate or oblanceolate.

.. 9. *E. cinereus*.

1. *Euonymus grandiflorus* Wall. Vern. *Si-san*, *Soh-iong-trong-kynther*, *ja-minrei-dykharr*, *Dieng-sit-um*, Kh. *Goldari*, Nep.

Small tree or large shrub, with somewhat obscurely quadrangular branchlets. Bark grey or brownish grey, sometimes almost blackish outside with shallow vertical fissures ; white inside. Leaves 1·5-4·5 by '8-1·6 in., obovate to oblong or elliptic, bluntly short acuminate or acute, serrulate, glabrous, subcoriaceous, nerves impressed above ; lateral nerves fine, somewhat indistinct on either half ; base acute or cuneate ; petiole '2-2·5 in. long. Peduncles usually 3, less often up to 5-flowered, 1-2 in. long, slender, flattened ; pedicels '2-3 in. long. Flowers about 1 in. across, greenish or yellowish-white, 4 merous, Calyx lobes rounded. Petals orbicular or nearly so. Capsule '3-5 in. across, sharply 4-gonous, capped by the short style ; seeds with scarlet aril.

KHASI & JAINTIA HILLS 5000-6000 ft. ; Jeypore-LAKHIMPUR, (Sheet 113 P. T. C.)

Flrs. 5. Fr. 10.

var. A shrub ; leaves linear to narrow oblong-lanceolate, '3-7 in. broad ; nerves quite distinct.

Umjaisai, Nongkersin forests, KHASI & JAINTIA HILLS.

2. *Euonymus attenuatus* Wall.

A tall shrub or small tree with spreading branches and greyish-bark. Leaves 2·5-5·5 by '7-1·7 in., lanceolate-oblong or oblong-elliptic, bluntly acuminate, sometimes abruptly entire, glabrous, coriaceous ; lateral nerves 6-8 on either half, faint ; base cuneate or acute, petiole '2-5 in. long. Flowers usually 5-merous, '25 in. across, in dichotomously branched peduncled cymes. Peduncles thickening in fruit, axillary or from axils of bracts, '5-2 in., long ; pedicels '15-3 in. long. Calyx lobes obtuse, unequal. Petals '25 in., obovate-orbicular. Capsule red, obovoid, 5, sometimes 4-lobed ; aril yellow, seeds black.

Dulong Reserve—LAKHIMPUR, Banks of Loobah Lake—SYLHET, KHASI & JAINTIA HILLS—2-4000 ft.

The leaves in some forms are narrowly lanceolate.

3. Euonymus Hamiltonianus Wall. *Dieng-soh-sat-khlaw, Jamin-rei-dkhar, Kh.*

A small to medium sized tree attaining about 40 ft. in height and nearly 6 ft. in girth; bark grey or greyish-brown, thick, reticulately furrowed and rough outside; white and soft inside. *Leaves* opposite or subopposite, 2-6 by 1-2·2 in., lanceolate, elliptic to oblong or sometimes ovate elliptic, acuminate, finely serrate with deciduous cuspidate teeth, thin; main lateral nerves 7-12 on either half, arcuate; petiole 2-6 in. long. *Flowers* 4-merous, dull-white, 3 in. across in few flowered 2-3-chotomous peduncled cymes; peduncles from leaf axils or often extra-axillary at the base of the growing shoot, flattened, 4-1·5 in.; pedicels rather thick, 1-3 in. long. *Calyx lobes* 1-1·2 in. broad, inner pair larger and subpetaloid, generally broader than long, rounded, ultimately reflexed. *Petals* broadly oblong or ovate oblong, entire, margins reflexed. *Stamens* about half as long as the petals. *Style* prominent, nearly as long as the stamens. *Capsule* 3 in. long, turbinate, deeply 3-4 lobed; seeds enclosed in scarlet aril.

KHASI HILLS 5000-6000 ft., often near villages.

Wood yellowish white, soft, close grained, med. rays extremely fine, takes a good polish. According to Gamble used for carving into spoons and in China for engraving. Not used in this province.

Flrs. 4-5; sometimes 10-second flush? Fr. 10-11.

Var. Cymes not branched usually 3-flowered, peduncles 25-5 in. long.

4. Euonymus Lawsonii C. B. Clarke and Prain. in Journal As. Soc. of Bengal LXXIII, P. 195. Vern. *Soh-dadin, Kh.*

A small tree; bark grey, corky and reticulately fissured outside; white and finely fibrous inside. *Leaves* 2-5 by 1-2 in., elliptic, elliptic-oblong or lanceolate, acuminate, serrate, thinly coriaceous; lateral nerves 7-10 on either half, conspicuous on both surfaces, arcuate, tertiaries prominently reticulate; base cuneate to subrounded; petiole up to 25 in. long. *Flowers* about 2 in. across, dull-white, 4-merous; peduncles 3-7 in. long, slender; dichotomously branched, few flowered from leaf axils or axils of bracts; pedicels filiform, 15-3 in. long. *Calyx segments* broad, obtuse or rounded, concave, entire. *Petals* greenish, broader than long, rounded, revolute at the top. *Capsule* deeply 4-lobed; lobes compressed, 5-6 in. across; seeds with orange aril.

KHASI HILLS 4000-5500 ft., Bishops falls, Mawmulah, Nongstien etc.

Flrs. 5-6. Fr. 10.

5. Euonymus bullatus Wall.

A small tree 15-20 ft. in height; branchlets stiff. *Leaves* 3-8 by 2-3·5 in., ovate to lanceolate, often tapering to a fine point, entire or serrulate, coriaceous when mature, bullate with depressions above along the lateral nerves, which are 5-8 on either side, arcuate, very prominent beneath, tertiaries indistinct; petiole 3-6 in. long, stout, channelled. *Inflorescence* 3-5 in. long,

umbellately or repeatedly 2-chotomously branched. *Flowers* 2 in. across, 4-merous. *Petals* square, thick, red. *Ovary* sessile. *Fruit* 4-gonous, obconic, about 4 in. long.

SYLHET-Wallich! KHASI and JAINTIA HILLS, Cherapunji-Mann! Mausmai-Clarke!—Mamluh, MANIPUR, Watt.
Flrs. 2-5. Fr. 10-12.

6. *Euonymus theæfolius* Wall.

A shrub, sometimes trailing on other trees with adventitious roots, less often epiphytic on other trees, bark brownish or greyish-brown; in old stems rough with lines of lenticels. *Leaves* 2-4·5 by 7-2 in., very variable, usually lanceolate, oblong to elliptic or ovate, acuminate, serrulate or entire; lateral nerves prominent on both surfaces, 7-10 on either half, arcuate, anastomosing near the margin, tertiaries conspicuously reticulate; base acute or cuneate; petiole channelled, 2-3 in. *Flowers* 4-merous in once dichotomously branched peduncled cymes 25 in. across; peduncles 25-5 in. long; pedicels 1-2 in. long. *Calyx lobes* rounded, broader than long. *Petals* red (or white?) about 2-12 in., orbicular, short clawed, entire. *Stamens* smaller than the petals. *Style* short. *Capsule* about 3 in. across, globose, obscurely angled or not, aril yellow or orange.

KHASI HILLS 5000-6500 ft. in shady situations.

Wood light-brown, pores more numerous in spring wood, medullary rays few, very broad and distant and numerous close, with fine ones between; annual rings eccentric, takes a good polish, but liable to crack.

Flrs. 4-5. Fr. 10.

7. *Euonymus vagans* Wall.

A climbing shrub; branchlets quadrangular greyish and covered with warty lenticels when older. *Leaves* 1-2·3 by 5-1 in., ovate, elliptic or oblong lanceolate acuminate, sharply but somewhat distantly serrate, membranous; lateral nerves 5-7 on either half; petiole 1-15 in. *Flowers* 4-merous, small, greenish-white. *Cymes* peduncled, dichotomously once branched; peduncle 3-6 in. long, flattened; branches up to about 25 in. long; pedicels 1-2 in. long. *Calyx lobes* suborbicular, obtuse or rounded, *Petals* minutely crenate or nearly entire; style minute. *Capsule* "size of a pea minutely tubercled."—Lawson in *F. B. I.*

KHASI HILLS-5000 ft.

Flrs. 3-4.

Sub sp. *macrophylla*. A shrub creeping on trunks of trees by means of adventitious roots; branchlets with 4 sharp ridges, glabrous. *Bark* on old stems dark grey or brown to almost black, lenticellate and rather rough. *Leaves* 3-6·5 by 1·2-3·2 in., obovate, elliptic to oblong or oblanceolate, acuminate or acute, cuspidate serrate or serrulate, subcoriaceous, glabrous; lateral nerves 5-7 on either half, arched, tertiaries inconspicuous; base cuneate; petiole 3-5 in. *Calyx* spreading, broader than long, rounded with brown dots inside, *Petals* orbicular, often broader than long, erose, white, usually with close purplish-brown dots. *Stamens* 4; filaments very short. *Style* short. *Capsule* up to 3 in. across, globose, minutely verrucose, indistinctly 2-4 lobed, 1-4 seeded. *Seeds* about 15-1 in., aril orange red, testa brownish-grey, minutely reticulated.

Saral bhanga block-GOALPARA-Muktarchapar-an island opposite Dibrugarh on the Brahmaputra.

Growth of stem eccentric, annuai rings widest on the side of the supporting tree, the original stem forming a vertical ridge on the outer side of the stem. Wood light brown, structure resembling that of *E. theæfolius*.

Flrs. 1-2. Fr. 12-1. (next year).

8. *Euonymus frigidus* Wall.

A shrub about 4-5 ft. high, stem brown, shining with round lenticels, branchlets sharply 4-angled, youngest channelled. *Leaves* 2·5-5·5 by 1·2 in., lanceolate or linear lanceolate, caudate acuminate, sharply serrate, glabrous, tough and thin; lateral nerves 8-12 on either half, irregular, arcuate, prominent beneath; base tapering; petiole 2·4 in. long. *Flowers* 15 in. across, 4-merous, greenish-yellow in few flowered axillary and extra-axillary branched cymes; peduncles very slender, 1-1·5 in. long, branches filiform, 2·3 in.; pedicels filiform, about 1 in. long. *Calyx lobes* suborbicular ovate, obtuse or rounded. *Petals* orbicular, entire. *Style* very short or 0? *Capsule* 4 lobed or winged or not lobed.

Flrs. 5-6. Fr. 9-11.

KHASI HILLS 5000-6000 ft.

Var. 1. A shrub creeping on trees, rock etc. by means of adventitious roots; stem greyish-brown, somewhat rough with lenticels; branchlets sharply 4-angled, youngest channelled. *Leaves* 1·7-3·5 by 1·5 in., lanceolate, oblong-lanceolate, elliptic-ovate to oblong, acuminate, sharply serrate, thinly coriaceous; lateral nerves 7-10, conspicuous, arcuate, anastomosing near the margin. *Flowers* apparently 4-merous. *Peduncles* slender, 3-5 in. long; pedicels filiform, 15 in. *Fruit* about 2 in. across, globose, not lobed; style 0, (?) aril yellowish.

Kynshi forests. KHASI & JAINTIA HILLS.

Fr. 10.

Var. 2. *elongata* King mss.—has leaves 6-8 by 2·5-3 in.

MANIPUR—Watt!

9. *Euonymus cinereus* Lawson.

A scandent shrub which creeps on trees by means of adventitious roots, branches 4-gonous, grey, glabrous. *Leaves* 1·5-3 by 1 in., obovate or oblanceolate, membranous, pale beneath, serrate, glabrous; lateral nerves 3-7 on either side, very slender; petiole 2·3 in. long, channelled. *Inflorescence* usually axillary; pedicels 1·5-2 in. long. *Flowers* 2 in. across, 4-merous. *Sepals* ovate, acute. *Petals* 4, orbicular, toothed, except at the base. *Capsule* echinate, seeds subglobose.

Nambor Forests-Watt.

Flrs. 4-5.

***Euonymus echinatus* Wall.**—A trailing evergreen shrub with numerous adventitious roots on the stem by means of which it climbs on trees and rocks; branchlets with 4 raised lines. *Leaves* 1-3 by 1·3 in., elliptic to ovate lanceolate, acute or acuminate, serrate, sometimes coarsely; thinly coriaceous, nerves conspicuous, lateral nerves 6-8 on either half; petiole

·1·25 in. long. *Flowers* 4-merous in axillary cymes; peduncles ·5-1 in. long; pedicels ·1·3 in. long. *Calyx*-lobes entire, rounded. *Petals* orbicular, minutely toothed or nearly entire. *Style* thick. *Capsule* ·3 in. across, globose, covered with conical tubercles; aril scarlet.

Rsong forests at 4200 ft.—Sutynga, KHASI & JAINTIA HILLS. Material (My sheet No. 6473) rather incomplete for satisfactory determination.

2. GLYPTOPETALUM Thwaites.

Glyptopetalum Griffithii Prain.

A shrub about 8 ft. high, branchlets glabrous, often grooved, when young. *Leaves* opposite, extipulate, 3·5-6 by 1·5-2·7 in., elliptic-oblong to lanceolate, bluntly short acuminate, crenate-serrate, sometimes obscurely entire towards the base, thinly coriaceous, glabrous, lateral nerves prominent, 6-8 on either half, arcuate, upper end nearly parallel to the margin; base acute or subobtuse; petiole channelled, stout, ·2-4 in. long. *Flowers* small, 4-merous, usually in axillary and terminal cymes; peduncles up to ·4 in. long, sometimes obscure, branches ·25-·4 in., but sometimes up to 1 in. (at least in fruit) long; * pedicels usually longer than the peduncles. *Calyx* persistent, lobes spreading, rounded, broader than long, about ·1 in. across. *Petals* with 2 shallow pit-like depressions on the upper surface. *Stamens* inserted above the disk, connective dilated. *Disk* 4-lobed. *Ovary* immersed in the disk, 4-lobed, 4-celled; stigma capitate; ovule 1 in each cell, pendulous. *Capsule* ·3-·6 in. across, globose, rugose outside, walls coriaceous. *Seeds* 1-4, suspended at the apex from a concave shield-like placental (?) outgrowth, covered with red aril, albuminous.

Pasighat—N. E. FRONTIER DISTRICT.

Fr. 12.

3. LOPHOPETALUM Wight.

Lophopetalum fimbriatum Wight. Vern. *Rumu*, Ass. *Sutrong*, Sylh., *Dieng-ja-rem*?, Khasi.

A large tree attaining nearly 100 ft. in height. *Bark* grey, rough outside with horizontal wrinkles, uniformly pink inside, branchlets glabrous. *Leaves* opposite or subopposite, 3-6 by 1·5 to 3·2 in., ovate or ovate-oblong, entire, shortly acuminate or acute, subcoriaceous; lateral nerves 10-12 on either half, arcuate, nervules conspicuously reticulate; base rounded; petiole ·4-8 in. long. *Flowers* dark-red, ·4-·5 in. across, 5-merous in axillary or terminal divaricating, paniculate cymes, 1·5-4 in. long; pedicels up to ·25 in. long, bracteoles minute. *Calyx* lobes short, broad, obtuse, erose. *Petals* continuous with the disk, persistent, ·15 in. long, orbicular with a fimbriate crest. *Stamens* inserted on the disk. *Disk* large, 5-lobed. *Ovary* sunk in the disk, triquetrous, 3-celled, each cell with few superposed

* The branches are sometimes absent or obscure.

ovules on axile placentas, contracted into the short style.
Fruit not seen.*

Kwasing reserve, Barduar reserve-KAMRUP; Longai reserve-SYLHET; Shella-KHASI & JAINTIA HILLS? (materials insufficient for correct determination).

Wood considered to be one of the best for tea chests and said to be as good as *Poma* for this purpose.

Flrs. 4.

4. MICROTROPIS Wall.

Microtropis discolor Wall. Vern. *Toykhata*, Lush.;

A small glabrous evergreen tree or large shrub. *Bark* brown or grey exfoliating in rectangular or irregular flakes, .5-1 by .2-.5 in., thin; blaze finely fibrous, greenish-brown, brittle. *Leaves* opposite, 2-farious, stipulate, 2-5 by 1.2-2.5 in., elliptic to obovate or oblanceolate, abruptly caudate-acuminate, the extremity of the tail rounded but generally with a short cusp, quite entire, membranous, flat, glabrous, dark-green above, pale beneath; lateral nerves about 5-9 on either side of the midrib, indistinct; base cuneate; petiole .3-.6 in. long, channelled, margined. *Flowers* greenish-white, 2-sexual, 4-5 merous, in compact, pedunculate, axillary or more generally supra-axillary 3-chotomous, bracteate cymes; peduncles .1-.25 in. long; pedicels very short or 0. *Calyx-lobes* orbicular, about .05 in. across, imbricate, green but with a narrow brown margin. *Petals* about .15 in. long, elliptic, concave, imbricate. *Disk* obsolete. *Filaments* very short, subulate. *Ovary* free, 2-3 celled with 2-collateral ovules in each; style very short. *Fruit* a 1-celled 2-valved 1 seeded capsule, .5-.7 by .3-.7 by .3-.4 in., ellipsoidal or ovoid, supported by the persistent calyx, somewhat verrucose outside. *Seed* stipitate, remaining on the tree even after the dehiscence of the capsule, bright red and beautifully veined outside; embryo straight; radicle inferior; cotyledons flat; albumen pearly-translucent, reddish.

Bhoreli Reserve-NORTH LAKHIMPUR; Barpathar and Garampani in SIBSAGAR; SYLHET, CACHAR and the KHASI HILLS up to 4500 ft.

Wood white, soft, weighing 30 lbs. per c. ft.

Flrs. & Fr. throughout the year, especially the cold season.

5. CELASTRUS Linn.

Shrubs, usually climbing anticlockwise. *Leaves* alternate, serrate; stipules 0 or minute and deciduous. *Flowers* small, polygamous, usually 5-merous, in axillary or terminal panicles or racemes. *Calyx* 5-cleft. *Petals* 5, spreading. *Disk* broad, concave. *Stamens* 5, inserted on the edge of the disk. *Ovary* free, 2-4 celled with 2 ovules in each cell; style short; stigma 3-lobed.

* In the genus a 3-4 an led 3-4 celled loculicidal capsule.

Fruit a globose or obovoid loculicidal capsule, 1-3-celled, 1-6 seeded. *Seeds* arillate, albumen fleshy; cotyledons leafy.

Branchlets lenticelled, terete :—

Flowers in large terminal panicles; style simple. ... 1. *C. paniculata*.

Flowers in axillary or terminal, short or racemose cymes; style 3-cleft. .. 2. *C. stylosa*.

Branchlets not lenticelled. Flowers in axillary and terminal narrow cyme-bearing panicles :—

Branchlets terete, style simple. .. 3. *C. venulosa*.

Branchlets quadrangular; style 3-cleft at top; capsule 1-celled, 1-seeded. ... 4. *C. monosperma*.

1. *Celastrus paniculata* Willd. Vern. *Pokitai*, Miri; *Samhaplau*, Kach.; *Malkagni*, Beng. & Hind.; *Mi-keroat*, *Mei-la-lih*, Khasi; *Tylle-soehlain*, Synt.

A large woody climber with corky bark; young shoots marked with lenticels. *Leaves* very variable in size and shape, generally 2.5 by 1.5-3 in., obovate, orbicular, elliptic or oblong-lanceolate, shortly acuminate, crenate or crenulate, more or less coriaceous, glabrous; base acute; lateral nerves 4-8 on either half, almost parallel to the margin; petiole .4-.6 in. long. *Panicles* terminal, large, drooping, pubescent, branching into compound cymes; pedicels very short. *Flowers* .15 in. across, pale-green. *Calyx* lobes rounded, minutely toothed. *Petals* oblong. *Anthers* large, about as long as the petals, small and without pollen in female flowers. *Pistillode* in male flowers rudimentary. *Disk* larger in female flowers. *Style* simple. *Capsule* .4-.6 in. across, globose, usually 3-celled, bright or orange yellow when ripe, marked outside with parallel horizontal wrinkles. *Seeds* 1-2 in each cell, enclosed in a red aril, albumen translucent, very oily; cotyledons green.

Throughout ASSAM ascending to 2500 ft., in KHASI HILLS.

The seed yields an oil which has diuretic and diaphoretic properties and is believed to be a specific for Beri-beri. It can also be burnt in lamps. Powdered dry bark is applied on cuts for healing.

Flrs. 4-5. Fr. cold season.

Var. *venulosoides*—both the valleys in Assam with leaves almost as strongly reticulate as those of *C. venulosa*. The panicles are generally shorter and narrower but the seeds are somewhat larger than in the type.

2. *Celastrus stylosa* Wall. Vern. *Mei-jendru*, Khasi.

A woody climber resembling the last species; branchlets terete, brown or dark-brown, almost black, closely lenticellate. *Leaves* 2.5 by 1.2-8 in., elliptic, oblong-elliptic to lanceolate or obovate, shortly acuminate, often abruptly acute or cuspidate-serrate, midrib often red beneath in young leaves; lateral nerves 5-8 on either half, arcuate; petiole up to 1 in. long, often red. *Flowers* greenish-white, up to .2 in. across in axillary and terminal, puberulous, short or racemose cymes, much shorter than the leaves; pedicels capillary up to .1 in. long. *Calyx* segments green with thin white margins, oblong or ovate, minutely erose, with rounded or obtuse apex. *Petals* .2 in. long, oblong or spatulate, membran-

ous, with wavy hyaline margins; style elongate, 3-cleft. *Capsule* .25-.3 in. across, crowned by the remains of the style, yellow when ripe, transversely shrivelled in drying. *Seeds* about .2 in. long, enclosed in red aril, drying dark brown or almost black, perhaps less oily than of the preceding species.

Sarman-bheti in the Mikir Hill reserve-SIBSAGAR-probably also other parts of Mikir Hills, KHASI HILLS up to 5500 ft.

Flrs. 3-4. Fr. 10-12.

3. *Celastrus venulosa* Wall.

A large woody climber which when cut exudes copious clear potable water, branchlets not lenticelled. *Leaves* 3-6 by 1.5-2.5 in., elliptic-oblong or obovate, abruptly and shortly acuminate, cuspidate-serrulate, chartaceous, shining on both surfaces; turning yellow before falling; lateral nerves 7-8 on either half, arched, prominent beneath, tertiaries transverse, closely and conspicuously reticulate; base acute or cuneate; petiole .3-.5 in. long, channelled. *Flowers* white, articulate with the short pedicels and soon breaking off from them, generally in long narrow-cyme-bearing terminal panicles, sometimes in shorter axillary ones. *Calyx-segments* rounded, somewhat laciniate. *Petals* 5, about .15 in. long and almost as broad, on large cup-shaped disk. *Stamens* 5; style not lobed. *Capsule* not seen.

Charduar Reserve in DARRANG, SYLHET, Wallich.

Flrs. 1-2. Fr. 3-4 (?).

4. *Celastrus monosperma* Roxb. Vern. *Gelomtaru*, Duff., *Bhumlati*, Ass.

A large glabrous woody climber, branchlets quadrangular, not lenticelled, hollow. *Leaves* 2-5 by 1.2-2.7 in., elliptic, oblong or obovate, abruptly and bluntly short acuminate, cuspidate serrate or serrulate, chartaceous, dark green and shining above, pinkish beneath; lateral nerves 5-7 on either half, much arched, tertiaries slender, sub-scalariform; base subacute to almost rounded; petiole .2-.3 in. long. *Flowers* whitish, .15 in. across, in peduncled cymes, often arranged on elongated terminal and axillary panicles up to 7 in. long, rachis quadrangular; buds globose; pedicels about .1 in. long, bracteoles minute, persistent. *Calyx lobes* orbicular in bud, slightly elongated in open flowers, usually minutely erose. *Petals* .1 in. long, broadly oblong or obovate-oblong. *Anthers* very broad, purplish-brown, dotted. *Style* 3-lobed at the apex, gradually narrowed upwards from the ovary. *Capsule* about .5 in. long, 3-valved 1-seeded. *Seed* about .3 in., ellipsoid.

Dulong Reserve—LAKHIMPUR; NAGA HILLS; probably also in SYLHET, KHASI HILLS and KAMRUP.

Flrs. 3-4. Fr. 10?

***Celastrus Championii* Benth.** A large woody climber. *Branchlets* terete, lenticellate, youngest hollow. *Leaves* 3.5-6.5 by 1.2-3 in., obovate-elliptic, oblong or oblong lanceolate, bluntly short acuminate, chartaceous or coriaceous, somewhat distantly cuspidate serrulate; lateral nerves 5-7 on either

half, tertiaries sub-scalariform; petiole '3-5 in. long, grooved. *Cymes* peduncled, sometimes racemose, often somewhat distantly arranged on axillary terminal panicles. *Flowers* '15-2 in. across; pedicels '1 in. long, bracteoles persistent. *Calyx-lobes* orbicular, minutely laciniate. *Petals* broadly oblong, anthers broad, purplish-brown, dotted; style 3-grooved at the apex, distinct. *Capsule* '6-8 in. obovoid, 3 valved 1 seeded. *Seed* '5 by '3 in., ellipsoid, enveloped in bright orange-yellow aril which is mealy astringent and sweetish; albumen fleshy.

Umta sail; Mynso road—KHASHI HILLS, 3500-5500 ft., NAGA HILLS, SYLHET-Brandis.

Closely allied to *C. monosperma* of which it may be regarded as a robust form.

***Celastrus membranifolia* Prain.**—A shrub, leaves membranous, ovate lanceolate, serrate; petiole '6 in. long.

KHASHI HILLS. I have seen no specimens.

6. KURRIMIA Wall.

***Kurrimia pulcherrima* Wall.** Vern. *Hinguri*, Ass. (Nowg.); *Tamser*, Mik.; *Makhang*, Kuki; *Dieng-mat-wei*, *Dieng-soh-ngang*, Khasi.

A large glabrous evergreen tree, up to 90 ft. in height and 5 ft. in girth with an oval crown and spreading branches; trunk much fluted and buttressed at the base when old. *Bark* dark greyish-brown outside, somewhat rough and of a darker colour with age, light greenish-brown and mottled with minute dots inside. *Leaves* alternate, bifarious, very variable in size and shape. 3-10 by 1-3.5 in., elliptic to oblong lanceolate, shortly acuminate, quite entire, chartaceous or coriaceous, quite glabrous, shining above, red when very young; lateral nerves 10-16, on either side of the midrib, arched, very slender, raised on the lower surface, tertiaries extremely fine, about '01 in. apart, parallel and transverse to the midrib; base more or less rounded; petiole slender, '5-1 in. long, swollen below the base of the blade, finely channelled above; stipules lanceolate, convolute. *Flowers* white, about '15 in. across, shortly pedicelled, in axillary, solitary or paired, simple, rarely compound racemes, 3-5 in. long. *Calyx* 5-fid; segments recurved, subpersistent. *Petals* 5, about '1 in. long, oblong, recurved, inserted on (?) the margin of the cup-shaped fleshy 5-lobed puberulous disk. *Ovary* crowned at the top with a tuft of hairs; styles 2, filiform; ovules 2 in each cell, erect. *Fruit* a 2-valved 1-celled capsule, generally 1-seeded, lanceolate in outline, '8-1.5 by '3.5 in. *Seed* erect; aril fleshy, yellow, complete except for a small terminal aperture; albumen fleshy, white.

Fairly common, though not abundant throughout the PROVINCE.

Wood coarse grained, reddish-brown with close concentric lines of soft tissue and close and regular medullary rays thus presenting appearance of coarse cloth on a transverse section. Weight varies between 44 and 48 lbs. per c. ft. It is said to be brittle.

Flrs. 9-10. Fr. 1-3.

7. GYMNOSPORIA W. & A.

Shrubs or small trees often armed. *Leaves* alternate, usually serrate, stipulate or extipulate. *Flowers* 2-sexual, small, greenish or yellowish in axillary or subaxillary often clustered dichotomous cymes ; cymes often much contracted. *Calyx* 4-5 fid or 4-5 partite. *Petals* 4-5, spreading. *Stamens* 4-5, inserted usually below the disk. *Disk* broad, sinuate or lobed. *Ovary* confluent at the base with the disk or more or less sunk in it, 2-3 celled, with short style and 2-3 stigmas ; ovules 2 in each cell. *Capsule* usually obovoid, rarely globose, 3-gonous, 2-3 celled, 1-4 seeded ; seeds aluminous, aril partially or entirely covering the seeds or rarely 0.

Armed ; spines not bearing leaves, inflorescence usually reddish.

.. 1. *G. rufa*.

Unarmed ; inflorescence yellowish green.

.. 2. *G. acuminata*.

Gymnosporia rufa Laws.

An erect shrub or small trees often armed with simple axillary spines up to .4 in. long, all parts glabrous or the branchlets glaucous. *Bark* dark grey or brown, rough, often reticulately fissured ; blaze red with fine white lines. *Leaves* 2-5 by .5-1.5 in., oblong-lanceolate to elliptic-lanceolate, bluntly rarely sharp acuminate, crenate serrate, thinly coriaceous ; lateral nerves 7-10 on either half ; base narrowed ; petiole .1-.3 in. long, reddish, slightly margined towards the top ; stipules deciduous, up to .1 in. long, subulate, margins setose. *Flowers* about .1 in. across, greenish white. *Cymes* axillary or below the leaves ; peduncles up to .8 in. long ; reddish, filiform ; pedicels very slender. .1 in. long ; bracts and bracteoles very small. *Calyx* 5, triangular ; petals 5, sub-orbicular. *Capsule* .3 in. across ; 2-3 valved, opening along the upper portions of valves and septa, aril covering nearly the whole seed when mature.

KHASI HILLS ascending to about 4000 ft.

Flrs. 4. Fr. 5-6.

2. Gymnosporia acuminata Hk. f. Vern. *Dieng-chandre*, Kh.

A small unarmed tree attaining 30 ft. *Bark* brown to almost blackish, rough, warty ; blaze red with vertical white lines. *Leaves* usually 2-5 by 1-2 in. (according to F. B. I. 5-8 by 2-3.3 in.) lanceolate, elliptic-lanceolate or oblanceolate, short acuminate, serrate, thin ; lateral nerves 7-9 on either half ; base cuneate ; petiole .2-.25 in. long, channelled. *Flowers* small in yellowish dichasial peduncled cymes ; peduncles yellowish green, very slender, fascicled on axillary tubercles, .5-1 in. long ; pedicels up to .1 in. long. *Calyx* lobes triangular ovate, minutely erose. *Petals* a little longer. *Capsules* .3 in. long, mostly 2-celled, compressed, lower half covered with lacerate aril.

KHASI HILLS 2500-4600 ft. Nangkhlaw, Syndai.

Flrs. 4. Fr. 6 ?

G. salicifolia *Lawson*. A shrub (?). *Leaves* 3-5 by 1.5 in., narrowly lanceolate, serrate, glabrous; lateral nerves faint, 12-15 on either side; petiole 2 in. long. *Cymes* paniced, axillary, branches of panicles filiform. *Flowers* 15 in. across. *Capsule* not seen.

A solitary specimen in Calcutta Herbarium "Digunaddi—GARO HILLS" collected about 1850.

Flrs. 3-5.

Imperfectly known species :-

G. neglecta *Wall. Cat.* A shrub? with stout branches. *Leaves* 4-6 by 2-2.5 in., ovate-elliptic, acute or subacuminate, entire or very faintly serrate towards the apex, coriaceous, glabrous. *Flowers* small in very slender dichotomous cymes. *Fruit* nearly globose about .25 in. across, 3-celled, 1-3 seeded—*F. B. I.*

SYLHET—Wallich.

FAM. 40. HIPPOCRATEACEÆ.

Small trees or erect or climbing shrubs. *Leaves* opposite or alternate, simple, often coriaceous. *Flowers* usually very small in axillary dichotomous cymes or clustered, often on tubercles. *Calyx* 5 lobed, lobes imbricate. *Petals* 5, inserted below the disk. *Disk* fleshy, cup-shaped. *Stamens* usually 3, inserted on the inner side of the disk, at first erect, then recurved; filaments dilated. *Ovary* more or less sunk in the disk, 3-celled; style 1; stigmas usually 3 lobed; ovules 2 or more in each cell, on an axile placenta. *Fruit* of samaroid carpels or baccate and 1-3 celled. *Seeds* usually many, often angular, sometimes winged; albumen 0; cotyledons large.

Fruiting carpels samaroid, dehiscent, seeds winged.
Fruit globose, baccate, seeds not winged.

.. 1. *Hippocratea*.
.. 2. *Salacia*.

1. HIPPOCRATEA Korth.

Climbing glabrous shrub (Assam species); branches opposite, often coiled. *Leaves* opposite, usually 2-farious, serrate or crenate; stipules small, caducous. *Flowers* small, sometimes minute, bracteate, in axillary umbelliform cymes or in axillary and terminal paniced cymes. *Calyx* small, 5-partite. *Petals* 5, thick, imbricate or valvate. *Stamens* 3, ultimately recurved. *Ovary* 3 celled; style very short or 0; ovules in 2 series, 2-10 in each cell. *Fruit* samaroid with 1-3 wing-like flattened carpels which dehisce in a straight slit along their centre. *Seeds* compressed, winged, the wing being pointed towards the base of the fruit; albumen 0; cotyledons large, connate.

- I. Flowers minute not exceeding .05 in. in diam., mostly in axillary umbelliform cymes; valves of samara coriaceous, striated; wing of seed oblong, greenish-brown :—
 Leaves narrowly elliptic or lanceolate, membranous. .. 1. *H. indica*.
 Leaves ovate or broadly elliptic, chartaceous or thinly coriaceous. ... 2. *H. arborea*.
- II. Flowers up to .2 in. in diam., mostly in terminal paniced cymes; valves of samaras woody, scarcely striated; wing of seed ovate-elliptic, red :—
 Leaves broadly elliptic, very coriaceous, entire or nearly o. .. 3. *H. macrantha*.

1. Hippocratea indica Roxb. Vern. *Atari-lata*, Beng. (Cach); *Sibrai-ia-dam*, Cach., *Phirke-lera*, Nep.; *Bom-pel-thing*, Kuki.

A bushy shrub with sarmentose branches which climb by means of coiled branchlets. *Leaves* very variable in size and shape, drying green, 2-7 by 1.2-3.5 in., ovate, elliptic oblong or lanceolate, finely acuminate, serrate with deciduous cusps, membranous, more or less shining; lateral nerves 4-6 on either half, slender, much arched, raised on both surfaces; base cuneate, often slightly oblique; petiole .5-8 in. long, deeply channelled. *Inflorescence* axillary, 5-chotomously branched. *Flowers* very small, rusty yellow, sweet scented in axillary and terminal repeatedly trichotomous or dichasial compound pedunculate cymes, bracteate at the joints and also at the base of the pedicels, ultimate branches umbel-like; bracts subpersistent, acuminate, lacinate or ciliate; buds globose. *Calyx* segments triangular or ovate, ciliolate. *Petals* usually 6, elliptic-oblong, concave. *Mature carpels* 2-3.5 by .7-1 in., oblong, usually 2-seeded; valves leathery, longitudinally striated outside; seed about .5 in. long, wing 1.5-2 by .5-6 in., oblong, sub-chartaceous, with a strong dorsal and a median nerve, glabrous.

South-Western parts of the SIBSAGAR DISTRICT from Barpathar to Dimapur; GOALPARA, N. C. HILLS, SYLHET and CACHAR.

Wood white, tough and compact. The Nepalese use the switchy branches with portions of the branchlets for spinning strands in making ropes.

Frs. 5-6. Fr. 10-12.

The plant is often affected by Fulgorid bugs.

2. *Hippocratea arborea* Roxb.

A tall climber apparently never bushy, climbing by means of hooked branches and spreading itself on crowns of tall trees. *Leaves* generally much larger than those of the preceding species, 4-7 by 2-3.5 in., ovate, obovate or elliptic, acute or bluntly acuminate, cuspidate-serrate, with deciduous black or brown tips, chartaceous; lateral nerves 5-7 on either side of the midrib, slender, much arched; base cuneate; petiole .6-8 in. long, stout, channelled. *Inflorescence* and flowers* as of the preceding species. *Mature carpels* 3-4.5 by 1 in., oblong with cuneate base, generally 2-seeded; valves leathery, longitudinally striated outside, smooth

* The flower is sometimes attacked by a gall-insect which transforms the fruit into fleshy globose bodies about .25 in. across.

inside ; seed about 1 by .4 in. ; wing 2 by .75 in., scarcely veined with a thick corky back ; median nerve very faint or obsolete.

Barpathar, Merapany also the Mikir Hills in SIBSAGAR and KAMRUP.
Fls. 5-6. Fr. 12-1.

As pointed out by Lawson in Flora of British India, this should be properly regarded as a variety of the last species from which it differs in but little except its more robust size.

3. *Hippocratea macrantha* Korth.

A very large woody climber which climbs to the top of tall trees and spreads itself on their crowns ; bark grey outside, reddish inside. *Leaves* 4-7 by 2-3 in., generally elliptic, often oblong or obovate, rounded or bluntly short acuminate, minutely cuspidate, crenate or subentire, thickly coriaceous, dark-green, shining on both surfaces ; lateral nerves generally 6 on either side of the midrib, arched, raised and conspicuous on the undersurface ; base usually cuneate ; petiole .5-.7 in. long, stout, margined. *Inflorescence* a cyme-bearing panicle, 3-5 in. long, axillary as well as terminal, the latter often terminating in a pair of small thin leaves. *Flowers* white or pale-yellow, about .16-.2 in. across. *Calyx lobes* 5, ovate or deltoid with thin reddish margins. *Petals* 5, apparently dimorphic in some flowers (males ?), strap-shaped with convolute margins, in others (females ?) ovate, much shorter, broadly imbricate, the latter on shorter and stouter pedicels. *Mature carpels* 3-5 in. by 1-1.3 in., flat, woody, reddish inside, generally 4-seeded. *Seeds* .6-.7 by .2-.3 in. ; wing 2-2.5 by .6-.7 in., reddish, very thin, shining with a thin, dorsal and slender but distinct median nerve.

Mikir Hills in SIBSAGAR and Charduar in DARRANG. Distribution KAMRUP.

Fls. 11-12. Fr. January onward.

2. SALACIA Linn.

Sarmentose shrubs, sometimes small trees. *Leaves* opposite, exstipulate. *Flowers* small, solitary, few or many, generally in axillary clusters. *Calyx* small, 5-partite. *Petals* 5, imbricate in bud. *Disk* thick, broad or conical. *Stamens* usually 3 ; filaments recurved ; anthers small, sometimes dehiscing transversely. *Ovary* immersed in the disk, 3-celled ; style very short ; ovules 2-8 in each cell, generally in 2 series. *Fruit* a berry, fleshy or leathery. *Seeds* usually angular, not winged ; albumen 0 ; cotyledons corrugated.

Berry smooth, not exceeding .5 in. in diam., 1-celled on a slender pedicel, .5 in. long.

Berry wrinkled, 1.5-2 in. diam., 2-3 celled, subsessile.

.. 1. *S. prinoides*.

.. 2. *S. Roxburghii*.

1. *Salacia prinoides* DC.

A semi-scandent woody shrub ; branches very smooth, more or less 4-cornered ; bark white inside. *Leaves* 1.5-3 by .7-1.2 in.,

oblong elliptic or lanceolate, bluntly acuminate, crenate, coriaceous, dark-green and shining above, pale beneath; main lateral nerves 5-6 on either side of the midrib, faint; base cuneate petiole 2-3 in. long, slender, margined. *Flowers* about 2 in. across, pale-green or yellowish, with an offensive smell, usually fascicled on axillary tubercles; pedicels 2-3 in. long, slender. *Sepals* small, puberulous, ciliate. *Petals* clawed, about 1 in. long, broadly obovate, entire but with a wavy margin. *Disk* cup-shaped, fleshy, persistent and accrescent in fruit. *Stamens* on the inner margin of the disk; filaments slender, terete, but with an abruptly dilated broad base. *Ovary* 3-celled. *Berry* 1-celled, 1-seeded, 3-5 in. across, globose, minutely rugose outside, red when ripe; seed conforming, not angular, surrounded by a white sweet pulp.

Barpathar and Kamargaon in SIBSAGAR, generally in scrub forest, KAMRUP.

Fls. 1-3. Fr. 2-4.

2. *Salacia Roxburghii* Wall. Vern. *Ain-kimbel*, Abor; *Sibraietam*, Kach.

A large woody climber; branchlets more or less angular; bark dark-grey, rough; inside white with brown streaks, fibrous. *Leaves* 3-5 by 1-2 in., elliptic-oblong or oblong lanceolate, caudate-acuminate, entire or nearly so, coriaceous, glabrous, dark-green and shining above; lateral nerves 6-8 on either side of the midrib, arched; base acute or subacute; petiole 2-3 in. long, margined, rather thick. *Flowers* greenish, about 15 in. across, in fascicles of 3-6 from axillary bracteate tubercles; pedicels slender, 3-6 in. long. *Sepals* small, orbicular, subciliate. *Petals* suborbicular, about 1 in. long, not clawed. *Filaments* short, dilated; anthers transverse. *Berry* deep pinkish red, 1.5-2 in. across, globose, 2-3 celled with one seed in each cell; rind thick and leathery; pulp red, gelatinous, edible.

Fairly common in evergreen forests throughout UPPER ASSAM, e.g. Nizamghat and Pasighat, NORTH EAST FRONTIER DISTRICT; Sola, Deroi and Nambor Reserves in SIBSAGAR; Bahali in DARRANG.

Wood yellowish. The ripe fruit is eaten.

Flrs. 12-3. Fr. 7-10.

***Salacia membranacea* Laws.**—*Leaves* 3-5 by 1-3 in., ovate elliptic or lanceolate, more or less caudate-acuminate, membranous or thinly coriaceous, entire; main lateral nerves about 8 on either half; base abruptly cuneate; petiole 3-3.5 in. long, channelled. *Flowers* small in axillary fascicles. *Fruit* globose, (?) about 3 in. across (?).

ASSAM—Jamuna falls—Jenkins!

According to Gamble only a form of *S. Roxburghii*.

Flrs. 2-3.

***Salacia floribunda* Wight.**—A scandent shrub. *Leaves* 3-6 by 1-2 in., elliptic or oblong shortly and obtusely acuminate, sharply serrate, coriaceous, glabrous, dark-green, shining above; lateral nerves 9-12 on either half, slender, arched; petiole 3-5 in. long, channelled. *Cymes* peduncled, usually axillary, often with supra-axillary pair. *Berry* globose, about 9 in. across (sometimes up to 2 in. long, (Mann's sheet in Sibpur herbarium) with irregular ridges.

ASSAM and KHASI HILLS—*Griffith*, SYLHET—*De Silva*.

FAM. 41. RHAMNACEÆ.

Trees or shrubs, often armed, sometimes climbing, rarely cirrhose. *Leaves* simple, generally alternate, rarely opposite, often with strong basal nerves ; stipules small, deciduous or changed into prickles and persistent. *Flowers* hermaphrodite or polygamous, regular, small, greenish, usually in axillary simple or paniced cymes. *Calyx* 4-5 cleft, generally inferior ; segments valvate, triangular, often with a median ridge within. *Petals* 4-5, rarely 0, inserted on the calyx tube, usually clawed, and hooded, *Stamens* 4-5, opposite to the petals and often enclosed within their folds ; filaments usually filiform ; anthers versatile. *Disk* fleshy or thin, usually glabrous. *Ovary* free or more or less immersed in the disk or calyx-tube, usually 3-celled with one erect ovule in each cell ; styles united, short. *Fruit* various, generally indehiscent, 1-4 seeded. *Seed* with copious albumen, rarely exalbuminous ; embryo large, erect.

- I. Ovary superior or half superior :—
 - A. Fruit dry, winged or compressed at the apex like a wing :—
 - Unarmed climber ; fruit indehiscent with a long terminal wing. .. 1. Ventilago.
 - Unarmed climber, fruit capsular, compressed like a wing above the seed. .. 2. Smythea .
 - B. Fruit not dry, not winged :—
 - a. Leaves more or less oblique, 3-5 nerved at the base ; disk thick, lining the calyx-tube :—
 - Erect or scrambling shrubs, armed with stipular prickles ; peduncle not thickened in fruit, fruit with solitary stone. .. 3. Zizyphus.
 - Unarmed tree, peduncle thickened in fruit, fruit with 3 pyrenes. .. 4. Hovenia.
 - b. Leaves symmetrical without basal nerves, disk thick, lining the calyx-tube :—
 - Leaves alternate, nerves prominent, parallel ; stone solitary, 2-celled, 3-seeded. .. 5. Berchemia.
 - Leaves opposite or subopposite, nerves not parallel, fruit with 3 1 seeded pyrenes ; straggling shrubs. .. 6. Sageretia.
 - c. Leaves symmetrical, disk thin, lining the calyx tube, spinescent or unarmed erect shrubs, fruit with 2-4 pyrenes. .. 7. Rhamnus.
- II. Ovary inferior, Shrubs climbing by tendrils. Leaves symmetrical alternate, fruit a 3-winged capsule. .. 8. Gouania.

1. VENTILAGO Gaertn.

Unarmed scandent shrubs ; stem generally blackish, occasionally with some of the branchlets coiled round the supports. *Leaves*

alternate, bifarious ; stipules small, caducous. *Flowers* small, 2-sexual, bracteate, in axillary and terminal panicles. *Calyx* 5 fid, lobes spreading, keeled within. *Petals* 5, deltoid, hooded, spreading. *Stamens* 5, adnate to the base of the petals ; connective produced. *Disk* 5-lobed, filling the calyx-tube, *Ovary* 2-celled, globose, sunk in the disk ; style very short, bifid ; ovule one in each cell. *Fruit* a 1-celled 1-seeded nut seated on or partly enclosed by the persistent and adherent calyx tube and prolonged above into a linear-oblong coriaceous wing with a prominent midrib and crowned by the remains of the stigma ; seed subglobose, exalbuminous.

Leaves usually acuminate, glabrescent, with generally 6-8 secondary nerves ; nut girt by the calyx-tube below the middle, wing glabrous. .. 1. *V. maderaspatana*.
Leaves obtuse, velvety-pubescent with 4-5 secondary nerves ; nut girt by the calyx-tube round the middle, wing usually yellow-pubescent. ... 2. *V. calyculata*.

1. Ventilago maderaspatana Gærtn. Vern. *Riko-riubi*. Miri & Abor ; *Bor-kalia*, Ass. ; *Sher-kharuang*, Khasi (Bhoi).

A large woody climber with long sarmentose branches ; bark dark-grey, furrowed, red in the furrows, branchlets glabrescent. *Leaves* bifarious, 2.5-4 by 1-1.5 in., elliptic or oblong-lanceolate, crenate or crenate-serrate or nearly entire, thinly coriaceous, glabrous or glabrescent, turning yellow before falling ; lateral nerves 5-8 on either side of the midrib, slender, much arched ; tertiary nerves transverse to the midrib, very fine, close and parallel ; base more or less acute, subsymmetrical ; petiole .15-.2 in. long, channelled ; stipules small, subulate. *Flowers* small, fascicled in groups on large leafy pubescent panicles. *Calyx* puberulous outside, glabrous within, lobes keeled within with an incurved pointed apex. *Petals* spatulate, shorter than the calyx-lobes, enveloping the stamens. *Disk* glabrous or thinly pubescent. *Ovary* hairy at the base. *Nut* globose, about .2 in. across, girt by the calyx-tube below the middle ; wing 2-2.5 by .3-.4 in., oblong, thin, glabrous and shining, finely veined.

Low-lying places in UPPER ASSAM, e. g. the Majuli in SIBSAGAR, Gotonga in NOWGONG.

The bark of the stem gives good cordage fibre (Haines), and the root bark a dye (Gamble).

Flrs. 9-12. Fr. 12-4.

2. Ventilago calyculata Tulasne. Vern. *Ancham-chamkai*, Kuki ; *Mei-bynoh*, Khasi (Syl. border) ; also generally the names given to the foregoing species.

A very large woody climber ; branchlets grey-velvety, finely ribbed ; bark black, furrowed. *Leaves* 2-farious, variable, 2-5 by 1.25-2 in., elliptic ovate or oblong, bluntly short acuminate or obtuse, cuspidate-serrate, chartaceous, dark-green, glabrous and shining above, more or less velvety pubescent beneath along the midrib and nerves, yellow before falling ; lateral nerves 4-6 on either half, slender, much arched, tertiaries transverse, very close

and parallel; base unequally rounded and somewhat unsymmetrical; petiole 1-2 in. long, terete or imperceptibly channelled, hairy. *Flowers* small with a somewhat offensive smell, greenish-tomentose, very numerous in large dense terminal leaf-bearing grey velvety panicles. *Calyx* pubescent. *Petals* 5, tomentose, deflexed. *Disk* villous. *Nut* 2 in. across., globose, yellow or brown-pubescent, girt about the middle by the rim of the adherent calyx-tube; wing 2-2.5 by 3-4 in., strap-shaped, more or less pubescent with a strong straight midrib and 4-6 less prominent shorter veins parallel to the midrib.

Usually treated as a variety of the last species and more common than it generally in deciduous forests throughout the province up to about 1500 ft. in the hills.

Flrs. 12-1. Fr. 3-5.

2. SMYTHEA Seem.

Smythea calpicarpa Kurz. Vern. *Mai-ryn-nao*, Khasi.

A large woody evergreen climber; branches green with continuous vertical lines of grey lenticels alternating with obscure flutings; branchlets rusty tomentose, often cirriform. *Leaves* 2-farious, of two sizes,—ordinary 2-4.5 by 6-1.5 in., lanceolate, oblong or ovate-lanceolate, acuminate, often caudate, crenate serrate, serratures usually cuspidate, membranous but tough, dark-green and almost concolor on both surfaces, shining above, glabrous with age but usually with tufts of hairs on the axils of lateral nerves; lateral nerves generally 6-7 on the outer half and 5-6 on the inner, prominent beneath, converging upwards, tertiaries very close, transverse and parallel; base unsymmetrical, rounded on the inner half, subacute on the outer; petiole 1.5-2 in. long, terete. *Flowers* not seen, in fascicles or solitary? from the axils of reduced leaves (bracts?) at the ends of branches which are 6-1.5 by 2-5 in.; pedicels about 2 in. in fruit. *Calyx* 5-lobed, tube obconic, persistent. *Disk* filling the calyx-tube. *Stamens* 5, free; anthers didymous. *Ovary* immersed in the disk, 2-celled. *Capsule* 1-celled, 1-seeded, adnate at base to the calyx-tube, compressed above the seed, altogether 2-3 in. by 4-5 in., the compressed part oblong, minutely puberulous or glabrescent with a strong straight midrib, terminated by the remains of the style, and with 10-12 fine straight veins, parallel to the midrib; basal portion brown pubescent.

Southern slopes of the KHASI HILLS west of Shella up to 1200 ft.

Closely resembling *Ventilago* in foliage and habit.

Flrs. rains? Fr. 12-1.

3. ZIZYPHUS Juss.

Trees or shrubs, sometimes sarmentose, usually armed with stipular prickles. *Leaves* alternate, more or less 2-farious, usually coriaceous, palmately 3-5 nerved at the base. *Flowers* small, in

fascicles or in sessile or peduncled, sometimes paniced cymes. *Calyx* 5-fid; lobes spreading, keeled within. *Petals* 5, cucullate, deflexed, rarely 0. *Disk* 5-10 lobed, coating the calyx-tube; edges free. *Stamens* 5, often nestling under the hooded petals. *Ovary* 2-4 celled, sunk in the disk and often adnate to it at the base; styles 2-4, free or partially connate. *Fruit* a fleshy or dry drupe with a hard 1-4 celled and 1-4 seeded stone. *Seeds* somewhat compressed; cotyledons thick.

- I. Flowers fascicled or in sessile cymes. Leaves hairy beneath :-
 A tree or erect shrub; drupe orange or red when ripe. .. 1. *Z. Jujuba*.
 A scrambling shrub, drupe black when ripe. .. 2. *Z. Ænoplia*.
- II. Flowers in peduncled simple groups of cymes. Leaves glabrous or nearly so :-
 A tree. Calyx glabrous within. Petals 5. .. 3. *Z. incurva*.
 A shrub. Calyx hairy inside. Petals 0. .. 4. *Z. apetala*.
- III. Flowers in peduncled cymes disposed in large panicles :-
 A tree. Leaves felted beneath. Calyx puberulous within. Petals 0. Fruit terete. .. 5. *Z. rugosa*.
 (type).
 A scrambling shrub. Leaves not felted beneath; petals 0. .. *Z. rugosa*.
 (Var. *glabrescens*).
 A scrambling shrub. Leaves glabrous. Calyx glabrous within. Petals 5. Fruit compressed. .. 6. *Z. funicolosa*.

1. **Ziziphus Jujuba** Lamk. Sans. *Badari*. Vern. *Boguri*, Ass. & Miri; *Gange-asing*, Abor; *Thakri-arong*, Mik.; *Boroi*, Beng. (Cach. & Sylh.) also Kuki; *Thai-ganggi*, Kach.; *Theng-khi*, Garo; *Dieng-soh-broi*, Khasi.

A small tree usually up to 30 ft., in height and 4 or 5 ft. in girth, almost evergreen; bark dark-grey or on old stems nearly black with long vertical cracks, reddish and fibrous inside; young parts rusty tomentose. *Leaves* very variable, 1-3 by 1/2-2 1/2 in., obliquely elliptic-ovate or suborbicular, closely serrulate or entire, dark-green, glabrous and often shining above; densely rusty or grey-tomentose beneath, strongly three-nerved, nerves closely penniveined; base obliquely rounded; petiole 1/2-1 in. long; prickles solitary or in pairs, straight or one of a pair recurved. *Cymes* 1/2-1 in. across, axillary, nearly sessile. *Flowers* small, greenish yellow. *Calyx* glabrous within. *Petals* narrow, concave, reflexed, clawed. *Disk* 10-lobed. *Ovary* 2-celled; styles 2, united to the middle. *Drupe* 1/2-1 in. long, globose or ellipsoidal or obovoid-acuminate, with a fleshy, mealy aromatic acid or subacid pulp, red or orange when ripe; stone 2-celled, tubercled.

Fairly common throughout the plains and up to 2000 ft. in the GARO, KHASI and N. CACHAR HILLS, especially in a degraded form in which it is reduced to bushes.*

* The bushy form may be Var. *fruticosa* Haines. This is a shrub about 4 ft. high. *Leaves* ovate-suborbicular, stipular prickles in pairs both strong. *Fruit* globose, 3/4 in. across. This form never grows to a tree and often forms gregarious patches in grass lands. Further study in the field is necessary to definitely ascertain this.

Wood hard, compact, tough. reddish, weighing 43-52 lbs. per c.ft. Excellent for fuel and charcoal. Lac can be grown on the branches. The leaves are a good fodder for cattle and goats. The fruit is eaten and the bark is said to be useful for diarrhoea.

Flrs. 9-11. Fr. 12-2.

2. Zizyphus Cœnopia Mill. Vern. *Ingsu-dampo*, *Ingsu-damphu*, *Ingsu-rikang*, *Sudomphu*, Mik.; *Anor*, Beng. (Sylh.); *Sumuqujum*, *Thaigangi-jola*, *Thai-gangdi-hagra-biding-doukha*, Cach.; *Ral-ling-rang*, Kuki; *Ling-kemrang*, Tipp.

A bushy thorny shrub with long sarmentose branches; bark rough, dark-grey; branchlets 2-farious, somewhat zigzag. *Leaves* 2-farious, 1-2.5 by .7-1.4 in., ovate-lanceolate, acuminate, obscurely crenate serrate or subentire, nearly glabrous but somewhat harsh above, pale and softly brown pillose beneath, specially along the nerves, 3 sometimes 4 nerved from the base converging to very nearly the apex, side nerves inclined to the main nerves, subparallel; base slightly oblique; petiole .1-.3 in. long, pubescent; prickles solitary and recurved or in pairs when one is often pointed upward; on old stems often developing a broad pyramidal woody base. *Cymes* axillary, small; flowers pedicelled. *Calyx* about .1 in. long, tomentose outside, glabrous within; lobes keeled, broad ovate. *Petals* greenish-yellow, obtriangular, hooded, shorter than the calyx. *Disk* glabrous, 10-lobed. *Stamens* shorter than the petals and embraced by them. *Ovary* glabrous, 2-celled. *Drupe* .25 in. long, obovoid-globose, black when fully ripe; stone usually 1, rarely 2-celled, tubercled.

Fairly common in scrubby forests throughout the plains of both valleys and up to 2,000 ft. in the hills. Not reported from the LAKHIMPUR and N. E. FRONTIER DISTRICTS.

The roots are used medicinally, and the ripe fruit is edible.

Flrs. 9-10. Fr. 11-1.

3. Zizyphus incurva Roxb. Vern. *Dieng-chi-soh-Steing*, Khasi.

Usually a small tree but occasionally up to 80 ft. in height and 7 ft. in girth; bark grey or blackish, studded with horizontal lines of spines on raised woody pyramidal bases, brownish inside; young parts adpressed pubescent. *Leaves* 2-farious, 2-4 by 1-1.5 in., ovate-oblong, acuminate, serrulate or closely serrate, coriaceous, glabrous above, sparsely pilose along the main nerves beneath, unsymmetrically strongly 3-nerved from the base; lateral nerves often forked near the base, side nerves slender, arched; base oblique; petiole .3-.6 in. long, strigose, stipulary prickles 0 on large plants, solitary or in pairs on young plants, one being straight and the other incurved. *Cymes* about 1 in. long, peduncled, pubescent. *Calyx* hairy outside, glabrous within. *Petals* 5, slightly hooded. *Disk* 10-lobed with a pit at base of each lobe. *Ovary* 2-celled; styles 2, connate up to the middle. *Fruit* .4 by .3 in., ellipsoid, woody; stone usually unequally 2-celled.

KHASI HILLS not widely spread, common at Nongstoin 5600 ft., where it grows to be a fairly large tree.

Wood brownish, fine-grained, weighing 40 lbs. per c. ft.; pores evenly scattered, medullary rays very fine, capable of being used for turning.
Flrs. 5-6. Fr. 9-10.

4. Zizyphus apetala Hk. f. Vern. *Bon-boguri*, Ass.

A straggling shrub with rusty-tomentose switchy branchlets; bark blackish-grey with vertical lines of lenticels, 3 in. thick, peeling off when old exposing a reddish-green surface, red inside. *Leaves* 2.5-4 by 1.5-2 in., ovate-lanceolate, caudate-acuminate, sharply serrulate, thinly coriaceous, glabrous above, rusty-silky pilose along the main nerves beneath, 3-nerved from the rounded unsymmetrical base; side-nerves arched; petiole 3-5 in. long, finely channelled, sparsely hairy; stipulary prickles solitary, recurved, rusty-tomentose. *Cymes* 1-1.5 in. long; peduncles and ramifications densely rusty-tomentose. *Flowers* about .25 in. across. *Calyx*-lobes 5, about .1 in. long, ovate, densely hairy outside, minutely hairy within, faintly keeled. *Petals* 0. *Stamens* as long as the calyx-lobes; filaments glabrous. *Disk* 10-lobed, glabrous along the margin. *Ovary* 2-celled, conical, hairy; styles 2, united to above the middle, rarely (by abortion?) solitary. *Fruit* 1-celled, (immature) .5 in. long and broad, .25 in. thick, compressed, glabrous.

From Dirju in NORTH LAKHIMPUR to Pabhoi in DARRANG, not common.

Wood white. The ripe fruit is said to be eaten.

Flrs. 3-4. Fr. 4-6.

5. Zizyphus rugosa Lamk. Vern. *Bon-boguri* Ass. (Nowg.); *Dhidhao-boguri* Ass. (Darr.); *Bata-bakuri-arong* Mik.; *Tauling-asi-kur*, *Thai-gangni-hagra*-(gedeba), Cach.; *Khusuguchhi*, Aka; *Aker-tarug*, Duff.; *Wokner*, Kuki; *Khankhri-wakbuk*, *Thengkhi-makbil*, *Khongkhanimakbul*, *Dumakpul*, Garo; *Bhot-boguri*, *Jharua*; *Sumusram*, *Garosai*, Mech; *Bon-boroi*, Sylh.

A small armed deciduous tree with long straggling branches; young parts generally rusty-tomentose; bark dark grey or nearly black, deeply cracked into thick rectangular scales, somewhat soft and light pinkish-white; inside with distant strands of pure white, .5-.7 in. thick. *Leaves* 2-5 by 1.5-3.5 in., suborbicular-ovate or elliptic, closely serrulate, subacute, obliquely rounded or subcordate at the base, dark-green and glabrous above, densely grey or rusty-felted beneath; basal nerves three, lateral sometimes forked, each closely penninerved; petiole 3-5 in. long, stout, tomentose; prickles few, usually solitary, recurved with laterally compressed often pubescent base. *Cymes* arranged in long axillary or terminal panicles, which are often up to 1 ft. in length, sometimes leaf bearing, rusty tomentose throughout. *Flowers* .2-.25 in. across, yellowish green. *Calyx*-lobes ovate, orbicular, membranous, rusty-tomentose outside, puberulous within, not keeled. *Petals* 0. *Disk* 5-angled, thin, hairy. *Ovary* 2-celled, very hairy; styles 2, united below the middle. *Drupe* .3-.5 in. long, globose or pyriform, 1-celled, 1-seeded; stone crustaceous.

Throughout the province up to about 2000 ft. in KHASI HILLS.

The above description refers to the type which occurs in deciduous forests chiefly in the sal tracts of LOWER ASSAM and GARO HILLS.

Wood reddish, tough, weighing about 40 lbs. per c. ft. The ripe fruit is eaten.

Flrs 3-4.

Var. *glabrescens* Prain-differs by being generally scandent in ASSAM. *Leaves* narrower, not felted underneath. *Drupe*s larger. This variety is common in evergreen forests of UPPER ASSAM, specially SIBSAGAR. The fruit is edible but has very scanty flesh.

Flrs. 3-4. Fr. 5-7.

6. *Zizyphus funiculosa* Ham. Vern. *Bon-Boguri*, Ass. (Sib.); *Tatke-riubi*, Miri and Abor; *Ingsu-dompo*, Mik.

Generally a large, armed, scrambling shrub; young shoots rusty pubescent; bark dark-green, sparingly lenticelled, otherwise nearly smooth. *Leaves* 2-5 by 1-2 in., ovate or elliptic oblong, obtusely acuminate, finely crenulate, thinly coriaceous, glabrous, shining above, strongly 3-nerved and often with one or two slender additional costal nerves; lateral nerves with 5-10 strongly arched, slender branches towards the margins; tertiary nerves transverse, very close, parallel, with very fine reticulations between; base oblique; petiole 2-3 in. long, slightly channelled, prickles short, recurved, usually solitary. *Flowers* greenish-white, sweet-scented, in axillary and terminal pedunculate, panicked cymes; pedicels very short. *Calyx* rusty-velvety outside; lobes, slightly puberulous within, faintly keeled. *Petals* clawed, cucullate, spreading. *Disk* rather flat, obscurely 8-10 lobed, glabrous. *Ovary* 2-celled, glabrous; styles 2, connate only at the base, divergent. *Drupe* 5-7 in. long, obovoid, laterally compressed, furfuraceous-tomentose outside, yellow when ripe, with scanty flesh; stone 1-celled, crustaceous, fibrous outside.

Very common in evergreen forests in the FRONTIER DISTRICT, LAKHIMPUR and SIBSAGAR; also SYLHET, CACHAR and according to Hooker the KHASI HILLS.

The ripe fruit is eaten.

Flrs. 2-4. Fr. 5-6.

HOVENIA Thunb.

***Hovenia dulcis* Thunb.** The coral tree. Vern. *Chetia-bola*, Ass.; *Pike-asing*, *Sinke-laktok*, Abor; *Pinke-asing*, Miri; *Langta-krem*, Khasi; *Dieng-mylliat*, Synt.; *Bol-phukrum*, Garo.

A middle-sized unarmed deciduous tree up to 89 ft. in height and 6 ft. in girth; young shoots generally tomentose; bark green and smooth on branches, greyish white and fairly plain on very old trees, reticulately furrowed and brownish on adult trees, fibrous and reddish inside, often with concentric bands of brown or yellow and distant streaks of white, bright red underneath the cork. *Leaves* 4-7 by 2.5-4.5 in., somewhat obliquely ovate or elliptic to suborbicular ovate, long acuminate, sharply serrate, membranous, glabrescent above, more or less pubescent beneath along the nerves, 3 nerved at the base, the midrib pinnately

branched into 2-5 convergent secondary nerves on either side; the side ribs branched only on the outer side into 6-10 secondary nerves; tertiaries faint, transverse; base abruptly cuneate; petiole .5-1.5 in. long, slender, pubescent; stipules .1 in. long, lanceolate, deciduous. *Flowers* 2-sexual, white, about .2 in. across, in terminal and axillary peduncled 2-chotomously branched tomentose cymes, 1-3 in. long; peduncles and ramifications stout, pedicels very short. *Calyx* 5 fid; tube funnel-shaped; lobes elongate-triangular, faintly keeled. *Petals* 5, clawed, cucullate. *Stamens* 5, slightly exceeding the petals. *Disk* lining the *calyx-tube*; margin hairy. *Ovary* 3-celled, conical; style 3-fid at the apex. *Fruit* about .3 in. across, 3-celled, 3-seeded; pericarp coriaceous, separating from the thin papery whitish endocarp; seeds orbicular, .12-.15 in. across, plano-convex, black, shining. The peduncle and other parts of the inflorescence thicken into a fleshy mass when the fruit ripens, in which it then appears imbedded.

In the hills or on hilly ground up to 5,500 ft. Khairem to Charduar on the north bank of the Brahmaputra and from Margherita to Sonaikusi Reserve, NOWGONG on the south bank, also KHASI & GARO HILLS, N. E. FRONTIER & LAKHIMPUR; Shamuka Block, GOALPARA—Purkayastha. Not recorded from SYLHET, CACHAR.

The wood is dull-white, light, porous, not used except as fuel, the swollen peduncle etc. is sweet in fruit and is eaten.

Flrs. 5-6. Fr. 12-1.

5. BERCHEMIA Neck.

Berchemia floribunda Wall. Vern. *Tiw-ri-lang*, Khasi (Shill.); *Mei-rong-tom*, Khasi (Nongkhlaw).

A handsome unarmed climbing shrub; bark thin, green on branches, whitish outside on old stems, peeling off to expose a purple inner layer. *Leaves* 2-4 by 1-2 in., ovate or oblong, symmetrical, shortly but finely acuminate, entire or with a wavy margin, chartaceous, glabrous, rounded or slightly subcordate at the base; lateral nerves 10-12 on either half; straight and parallel, slender, but very distinct on both surfaces, inclined at a narrow angle to the midrib, tertiaries very fine and close, transverse, subparallel; often anastomosing; petiole .5-1 in. long, slender, terete; stipules intra-axillary, small, 2-fid. *Flowers* up to .1 in. across, 5 merous, fascicled on branches of very large terminal panicles, thinly covered with curled hairs; lower branches often from axils of reduced leaves; pedicels up to .1 in. long, buds globose, about .05 in. across, bracteoles small, broad, ovate, deciduous. *Calyx* 5-fid; lobes triangular. *Petals* 5, spatulate. *Disk* lining the calyx tube, margins free. *Ovary* sunk in the disk but free, 2 celled, narrowed into the 2-fid style. *Fruit* a fleshy drupe, seated on the calyx-tube, ovate-oblong or cylindrical, .3-.5 in. long, covered with a purple bloom; stone 2-celled, 2 seeded.

KHASI HILLS, 3-6000 ft., not very common. Chiefly in shady ravines.

Flrs. 7-9. Fr. 5-6.

6. SAGERETIA Brongn.

Straggling unarmed or spinescent shrubs; branches usually fluted or angular, opposite. *Leaves* mostly opposite or subopposite, penninerved; stipules small, deciduous. *Flowers* 2-sexual, 5-merous, sessile, in clusters supported by bracts, arranged in spiciform terminal or axillary panicles. *Calyx* cup-shaped; segments keeled inside, persistent. *Petals* 5, clawed, hooded. *Stamens* 5, as long as the petals. *Disk* cup-shaped; margin free, 5 lobed. *Ovary* 3-celled; styles 3, connate, short; stigma capitate. *Fruit* a drupe with 3 indehiscent 1-seeded pyrenes; cotyledons foliaceous; albumen thin.

Leaves glabrous, lateral nerves 6-10
on either half; panicles short,
often axillary.
Leaves pubescent beneath, lateral nerves
5-8 on either half; panicles
large, terminal.

... 1. *S. hamosa*.

... 2. *S. oppositifolia*.

1. Sageretia hamosa Brongn.

A woody straggling or bushy shrub; branches terete; branchlets angled, sometimes transformed into short straight or hooked spines. *Leaves* 1·5-3·75 by ·8-1·5 in., lanceolate or oblong, bluntly acuminate, closely and sharply serrate, thinly coriaceous, glabrous but sometimes with scattered hairs along the nerves beneath, dark-green and shining on both surfaces; lateral nerves 6-10 on either half, depressed above, very prominent beneath; tertiary nerves parallel and transverse; base rounded, symmetrical: petiole 2-4 in. long, finely channelled. *Panicles* 3-5 in. long, often with a few obovate, leaflike-bracts about 4 in. long, densely grey tomentose. *Flowers* small, in congested clusters. *Calyx teeth* triangular, erect, about 1 in. long, membranous, keeled inside, puberulous. *Disk* fleshy. *Drupe* about 25 in. long, obovoid, smooth, dark-brown, glaucous, with 2-3 pyrenes.

Only found so far in the KHASI HILLS 5000 to 5500 ft. e. g. Kynshi and Nongkersin.

Flrs. and Fr. 9-11.

2. Sageretia oppositifolia Brongn.

A shrub of the same habit and general appearance as the foregoing species. *Leaves* thinner, usually short, acuminate, sometimes subentire; lateral nerves 5-8 on either half, often subcordate at the base, more or less tomentose beneath, specially when young. *Inflorescence* mostly terminal, often running down into the leaves. *Flowers* in congested clusters. *Calyx* lobes exceeding the tube. *Petals* keeled on the back. *Drupe* turbinate about 25 in. long, succulent and black when ripe.

KHASI and NORTH CACHAR HILLS up to 2000 ft. not very common.

Flrs. Rains. Fr. Cold weather.

:7. RHAMNUS Linn.

Shrubs or small trees, usually erect, often spinescent. *Leaves* alternate, but in some species so close as to appear opposite or fascicled, serrulate. *Flowers* small, sometimes polygamous, in axillary clusters or panicles, rarely solitary; pedicels unequal. *Calyx* 4-5 fid; tube cup-shaped; lobes keeled within. *Petals* 4-5 or 0. *Stamens* 4-5, opposite the petals, inserted on the edge of the disk; filaments short. *Disk* thin, lining the calyx-tube. *Ovary* free, 3-4 celled, tapering to a 3-4 cleft style. *Fruit* drupaceous, generally black when fully ripe; stones obovoid; albumen fleshy.

Spinescent shrub or small tree; branches shining.

Flowers 4-merous.

Unarmed rambling shrub; branches not shining. Flowers 5-merous.

.. *R. virgatus*.

.. *R. nepalensis*.

1. *Rhamnus virgatus* Roxb. Syn. *R. dahuricus* F. B. I.

A shrub not exceeding 10 ft. in height in Assam, deciduous, generally with a stout spine at the forks of the branches; bark dark grey, thin, smooth, shining, peeling off in horizontal rolls. *Leaves* subopposite, opposite or fascicled on arrested branchlets, variable, 5-2.2 by 3-1 in., rhomboidal, obovate to ovate-lanceolate or narrow elliptic-lanceolate, acuminate, minutely serrulate to finely serrate, membranous, slightly pubescent beneath when young; lateral nerves generally 3 on either side of the midrib, rarely 2 or 4-5, slender, much arched, depressed above; tertiaries transverse, parallel, faint; base acute or cuneate; petiole 1.5 in. long. *Flowers* small, pale-green, 4-merous, unisexual, in dense axillary fascicles; buds pointed; pedicels filiform, long or short. *Calyx-tube* campanulate. *Petals* minute, spathulate. *Fruit* 1.5-2.5 in. long, globose; stones 2-4, dark brown, grooved, groove narrow, closed except near the bottom.

KHASI and JAINTIA HILLS, 4-5,500 ft., Kynshi, Nongkaseu, Nongspung, etc. generally on the outskirts of scrub forests.

Wood hard, fairly heavy and close-grained, capable of being used for agricultural implements. The fruit is very bitter and has emetic and purgative properties.

Flrs. 4-6. Fr. 9-11. Often fl. and fr. throughout the year.

2. *Rhamnus nepalensis* Wall. Vern. *Biringa*, *Biring-guli*, Ass.; *Biring-karing-asing*, Miri; *Nakaling-arong*, *Ringkang-uk-ik-arong*, Mik., *Midoubri-doukha*, Kach.; *Thelu-rikang*, N. C. Hills.

A bushy shrub with many long straggling branches; bark thin, blackish and more or less smooth outside, yellow inside, young shoots puberulous. *Leaves* 2-5 by 1-2.5 in., oblong, elliptic or ovate, abruptly short acuminate, serrulate, membranous, glabrous, dark-green and shining above, usually with tufts of hairs on the axils of lateral nerves beneath, yellow when old; lateral nerves 5-7 on either half, slender, slightly arched, tertiary nerves transverse, obscure; base more or less rounded; petiole

2-1 in. long, channelled. *Flowers* very small, green, fascicled in simple or paniced pubescent racemes, often with leaf-like bracts; panicle branches usually 1-2·2 in. long; pedicels 1-2 in. long. *Calyx* salver-shaped, small, tube persistent, accrescent. *Petals* oblong, concave. *Style* 3-4 cleft at the apex. *Drupe* 2-25 in. long, obovoid, dark-red when ripening, black when fully ripe.

Throughout the BRAHMAPUTRA VALLEY from Sadiya to Bijni, generally about streams. Also in the KHASI and JAINTIA HILLS up to 4000 ft.

Flrs. 10. In some localities 4. Fr. 11.

8. GOUANIA Linn.

Gouania leptostachya DC. Vern. *Jwarpat*, Ass.; *Ichhalot*, Sylh.; *Sanjari-bandeo*, *Dou-shrem*, Mech; *Dugithang*, *Dibok-pak-bidu*, *Lumigong*, Garo; *Jermei-ja-main*, *Mei-tein-iang*, Khasi.

An unarmed climbing shrub with grey bark bearing tendrils at the ends of the branchlets; branches glabrous; young parts and inflorescence pubescent. *Leaves* alternate, 2-4 by 1·5-2·5 in., ovate, acuminate, crenate, crenatures glandular, subcoriaceous, sparsely rusty-pubescent beneath when young; lateral nerves 5-6 on either side of the midrib, generally opposite, the lowest pair sub-basal and laterally branched; base rounded or subcordate; 3-1 in. long, slender, pubescent; stipules with persistent base and caducous apex. *Flowers* white, 15 in. across, in clusters on axillary or terminal, often leaf-bearing racemes, which are 6-12 in. long and usually unbranched. *Calyx* superior, 5-fid, keeled within at the apex. *Disk* 5-angled, angles produced into horn-like processes opposite the calyx lobes. *Petals* 5, inserted below the margin of the disk. *Stamens* 5, infolded by the petals. *Ovary* 3-celled, sunk in the disk; style 3-cleft. *Fruit* 5 in. long, 3-winged, 3-celled, 3-seeded, crowned by the remains of the calyx, separating into 3 1-seeded cocci through the wings; seeds somewhat laterally compressed, dorsally convex, polished.

Common in both VALLEYS and up to 2000 ft. in the GARO, KHASI and NORTH CACHAR HILLS.

Water mixed with bruised leaves is used for bath by patients suffering from fever.

Flrs. 8-10. Fr. 11-12.

FAM. 42. AMPELIDACEÆ.

Erect or climbing shrubs, the latter usually cirrhose, generally with copious watery juice; stems and branches nodose. *Leaves* alternate, simple-lobed, digitate or pedate, less often pinnate or 2-3-pinnate, stipulate; petiole thickened at the base. *Flowers* regular, 2-sexual or 1-sexual, in paniced, umbellate, corymbose or spicate cymes which are opposite the leaves or axillary; peduncles tendril-bearing or transformed into tendrils. *Calyx* small, entire or 4-5-toothed or -lobed. *Petals* 4-5, valvate, free or connate. *Disk* free or adnate to the petals, stamens or ovary. *Stamens* 4-5, opposite the petals, inserted at the base or between the lobes of the disk; filaments subulate; anthers 2-celled, introrse. *Ovary* 2-6-celled with 1-2 ovules in each cell; ovules anatropous; raphe ventral; style short. *Fruit* a berry, 1-6 seeded. *Seeds* erect; albumen cartilaginous, sometimes ruminant; radicle short, inferior.

Climbers, usually tendril-bearing; stamens free; ovary 2-celled; cells 2-ovuled.	..	1. <i>Vitis</i> .
Erect shrubs or herbs. Stamens connate at the base; ovary 3-6 celled; cells 1-ovuled.	..	2. <i>Leea</i> .

1. VITIS Linn.

Climbing shrubs or perennial herbs, sinistrorsely twining, usually with leaf-opposed tendrils. *Leaves* simple or 3-foliolate, or digitately or pedately 5-9-foliolate; stipules when present, adnate to the petiole, membranous. *Flowers* usually 2-sexual, sometimes polygamous, ebracteate in cymes disposed in racemes, corymbs, spikes, panicles or umbels. *Calyx* small, 4-5-toothed or -lobed, rarely entire. *Petals* 4-5, cohering at the apex or free. *Stamens* 4-5, inserted below the margin of the disk; anthers free. *Ovary* usually 2-celled with 2-ovules in each cell; style short or 0. *Fruit* berry-like, 1-2-celled. *Seeds* 2-4, with a hard testa; albumen—cartilaginous; embryo minute.

Planchon in his monograph in vol. V of De Candolle's *Monographiæ Phanerogamarum* divided *Vitis* up into a number of genera. As the entire group can be easily made out in the field, it has been kept in tact and arranged under one key for the convenience of Foresters in the field. The following is a key to the genera of Planchon into which the species described here mainly belong:—

- I. Fls. polygamous:—
 - A. Inflorescence usually bearing tendrils on the peduncles; stigma simple:—
 - Petals 3, usually calyptrae. Leaves simple. .. *Vitis*.
 - Petals 4-5, free. Leaves simple or digitate. .. *Ampelocissus*.

- B. Inflorescence not tendril bearing ; stigma 4-lobed :—
 Leaves 3-foliolate or pedately 5-7 foliolate, sometimes 2-1 foliolate by reduction. .. *Tetragastigma*,
- II. Flrs. hermaphrodite -
- A. Petals 5, less often 4, free or sometimes calyptrate ; style short ; stigma capitate. Leaves trifoliolate. .. *Pterisocissus*.
- B. Petals 4, at first connivent, then free :—
1. Leaves usually simple, sometimes 3-foliolate ; fruit 1-seeded. .. *Cissus*.
2. Leaves 3-foliolate, digitate or pedate ; fruit 2-4 seeded. .. *Cayratia*.
- I. Leaves simple often angled or lobed :—
- A. Flowers 4-merous, 2-sexual, in corymbose or umbellate cymes ; inflorescence not tendril bearing :—
1. Stem 4-winged, jointed, fleshy. .. 1. *V. quadrangularis*.
2. Stem not winged :—
- a. Leaves glabrous or nearly so :—
- i. Young shoots glaucous or mealy white. .. 2. *V. repens*.
- ii. Young shoots not glaucous :—
 Leaves variegated ; a slender climber. .. 3. *V. discolor*.
 Leaves not variegated ; a heavy woody climber. .. 4. *V. assamica*.
- b. Leaves more or less hairy :—
- i. Stem hard and woody, bark not corky ; leaves ovate, never broader than long ; dry seeds pitted with angled facets. .. 5. *V. adnata*.
- ii. Stem soft-wooded, bark corky, furrowed ; leaves broad-ovate to orbicular, sometimes broader than long ; dry seeds not faceted. .. 6. *V. repanda*.
- B. Flowers 5-merous, usually polygamous ; inflorescence tendril bearing :—
1. Large woody climbers :—
 Young shoots, peduncles and petioles with long glandular hairs. ... 7. *V. barbata*.
 Glandular hairs absent ; young parts tomentose. .. 8. *V. lanata*.
2. Climbers with herbaceous stems :—
- a. Extensive climber, leaves membranous, glabrous when mature. .. 9. *V. latifolia*.
- b. Trailing creepers with short annual stems :—
 Leaves persistently tomentose beneath ; inflorescence wooly. .. 10. *V. rugosa*.
 Leaves & inflorescence glabrous. .. 11. *V. sikkimensis*.
- II. Leaves usually 3-foliolate, rarely 5 or 1-2 foliolate ; inflorescence tendril bearing :—
 Flrs. polygamous, 5-merous. .. 12. *V. divaricata*.
- III. Leaves 3-foliolate ; inflorescence not tendril bearing :—
 Flrs. usually 4-merous ; rarely 5-merous :—
- A. Flrs. 2-sexual :—
 Stem fleshy, (except towards the base),

leaves pinnately 3-foliolate, leaflets more or less fleshy.
Stem woody, robust, leaves palmately 3-foliolate, leaflets coriaceous.

.. 13. *V. trifolia*.

.. 14. *V. semicordata*.

B. Flrs. polygamo-dioecious :-

1. Fruit turbinate or globose;
leaflets thin; stems slender :-
Cymes lax, on long peduncles;
flrs. pale yellow, minute;
stigma 4-lobed.

.. 15. *V. bracteolata*.

Cymes dense, almost sessile;
flrs. green not minute; stigma
peltate.

.. 16. *V. angustifolia*.

2. Fruit subfalcately oblong or oblong,
stem rather stout, softwooded with
corky furrowed bark, leaflets
coriaceous.

.. 17. *V. campylocarpa*.

IV. Leaves *digitately* 5-foliolate; stem more or less flattened; inflorescence not tendril bearing; flrs. 4-merous :-

A. Leaflets glabrous :-

Stigma undivided. Flrs. 2-sexual.
Fruit elliptic about 1 in. long,
1 seeded.

.. 18. *V. elongata*.

Stigma 4 lobed. Flrs. polygamo-
dioecious. Fruit globose, about
5 in. long, 1-2 seeded.

.. 19. *V. planicaulis*.

B. Leaflets fulvous pubescent; fruit
globose, about 5 in. across,
2-seeded.

.. 20. *V. obovata*.

V. Leaves mostly *pedately* 5-foliolate,
inflorescence tendril bearing; flrs.
4-merous :-

A. Leaflets glabrous :-

i. Slender climbers; leaflets thin :-

a. Leaflets chartaceous; cymes
umbellate :-

Tendrils forked near the apex :-
flrs. polygamo-dioecious.

.. 21. *V. capriolata*.

b. Leaflets membranous; cymes
corymbose :-

Cymes compact, usually short.
Flrs. polygamo dioecious. A
slender woody climber;
tendrils unbranched.

.. 22. *V. oxycphylla*.

Cymes lax, long peduncled.
Flrs. 2-sexual. A herbaceous
climber.

.. 23. *V. tenuifolia*.

ii. Heavy climbers; leaflets
coriaceous, branches warty :-

Fruit smooth; cymes short and
compact.

.. 24. *V. lanceolaria*.

Fruit with a distinct ring often
with minute tubercles below the
middle.

.. 25. *V. rumicispelma*.

[B. Leaflets pubescent, membranous;
branches slender; cymes lax; flrs.
2-sexual.

.. 26. *V. japonica*.

VI. Leaves mostly *pedately* 5-7 foliolate;
leaflets membranous, pubescent or
glabrate. Flrs. 2-sexual:

.. 27. *V. pedata*.)

VII. Leaves pinnately 7-11 foliolate ;
leaflets stalked, usually
pubescent.

.. 23. *V. rubifolia*.

1. *Vitis quadrangularis* Wall. Syn. *Cissus quadrangularis* Linn.
Vern. *Harjora*, *Harenga*, Beng.

Stem stout, fleshy, quadrangular and 4-winged, contracted at the nodes, dichotomously branched, climbing on tall trees or spreading on bushes, nearly deciduous. *Leaves* simple, 1-2 in. long and nearly as broad, cordate or reniform, sometimes 3-5-lobed, fleshy, entire or crenate-serrate, glabrous and smooth on both surface ; petiole short ; stipules moon-shaped, entire. *Tendrils* long, simple, leaf-opposed. *Cymes* axillary, umbelliform, shortly peduncled, small, glabrous. *Flowers* cymose, 4-merous, whitish. *Petals* 4, at first connivent, afterwards free. *Stamens* 4 ; filaments slender. *Disk* adnate to the base of the 2-celled ovary, erect ; style slender, short. *Fruit* .25 in. diam., globose, usually 1-seeded, succulent, red when ripe, very acid.

SYLHET and possibly also CACHAR.

The young shoots are eaten in curries and the juice of the stem has valuable medicinal properties.

Fls. 7-9. Fr. 11-1.

2. *Vitis repens* W. & A. Syn. *Cissus repens* Lamk. Vern.
Mei-hur-jarap, *Mei-ja-khajrap*, Khasi ; *Ja-jaw-chhrub*, Synt.

A handsome trailing glabrous plant ; young shoots succulent, red, covered with a white bloom, pleasantly acid. *Leaves* simple, 2-8 by 1.5-5 in., ovate, broadly cordate, acute, repand, often with a few distant cusps, pale-green, membranous, glabrous ; lateral nerves 3-4 on either half above the basal, arched ; petiole 2-3.5 in. long ; stipules small, rounded, glabrous. *Tendrils* 8-10 in. long, fleshy, usually forked. *Flowers* 4-merous, in compound few-flowered umbels ; peduncles 1-4 in. long, axillary ; pedicels slender, .5-1 in. long. *Calyx* truncate. *Petals* 1-1.5 in. long, triangular, ovate. *Style* conspicuous. *Fruit* globose, about .16 in. in diam., red but turning black when fully ripe ; generally 1-seeded ; seed globose, pyriform, albumen ruminant.

KHASI HILLS, 1-4,600 ft., generally in shady valleys, NAGA HILLS, also NORTH CACHAR HILLS-Phulertul and probably in hilly country in other districts.

The leaves and tender shoots are eaten cooked.

Fls. & fr. 11-1.

3. *Vitis discolor* Dalz. Syn. *Cissus discolor* Bl.

A weak glabrous climber with a woody base ; branches subangular, red and smooth, not glaucous. *Leaves* generally 2-5 by 1-3 in., ovate-lanceolate, acute or acuminate, base cordate to subtruncate bristly or crenate-serrate, membranous, glabrous, generally with irregular translucent white blotches on the upper surface, purple underneath ; lateral nerves 3-5 on either half above the middle, slender, arched ; petiole .3-1 in. long ; stipules

oblong, membranous and somewhat hyaline. *Tendrils* generally forked. *Flowers* 4 merous, in small compound puberulous umbels; peduncles leaf-opposed, scarcely exceeding .5 in. in length; primary branches .6-.8 in. long; ultimate pedicels .1-.2 in. long, very slender. *Calyx* truncate, fleshy. *Petals* .12 in. long, yellowish, glabrous, thickened at the apex. *Disk* 4 lobed. *Style* conspicuous, simple. *Fruit* reddish-purple to black. *Seed* as of *V. repens*.

NAGA HILLS, KHASI HILLS, 3-4,000 ft. also MANIPUR.

Fls. 6-9 Fr. 9-11.

4. *Vitis assamica* Laws. Syn. *Cissus assamica* Craib nov. comb.

A heavy rigid climber, glabrous except very young shoots branches sub-angular, woody. *Leaves* orbicular-cordate, suddenly acuminate, bristly serrate with margins recurved, subcoriaceous, strongly nerved beneath; tendrils simple. *Flowers* 4-merous, in axillary compound umbellate cymes, common peduncle .7-2.5 in. long, pedicels .15-.2 in. long, filiform. *Petals* distinct; style about .1 in. long. *Fruit* turbinate, about .25 in. long, 1-seeded, juicy, edible; seed .2 in. long, pyriform, smooth (in herbarium specimens*) with a continuous ridge from face to back.

ASSAM PROPER and CACHAR.

Planchon in his monograph (Vol. V, p. 495 De Candolle's *Monographiæ Phanerogamarum*) includes this plant under "*Cissus adnata* forma *glabrior*." The seeds of the plant described as *Vitis adnata* Wall. in F.B.I., are however very different to those of *V. assamica*; the two cannot therefore be grouped together.

5. *Vitis adnata* Wall. Syn. *Cissus adnata* Roxb. in part. vern. *Pani-lara*, Nep.; *Down-rang*, Kuki; *Bhatia-lot*, Sylh.

A long but slender climber with woody stem; branches, leaves beneath and inflorescence rusty pubescent. *Leaves* simple, 3-6 by 2-5 in., ovate-orbicular, cordate, shortly acuminate, bristly serrate, membranous, intricately rusty-tomentose beneath, glabrescent and dark-green above; basal nerves 3-5, lateral nerves 4-6 on either side of the midrib, above the basal, slender, only slightly arched, nerves excurrent into teeth; petiole .3-2 in. long; stipules oblong, more or less adnate, small, with a shining centre and a thin translucent margin. *Tendril* forked, woody. *Cymes* axillary, umbelliform, generally compound, more or less compact; common peduncle .5-2 in. long, bracteoles very small, caducous. *Flowers* 4 merous. *Petals* distinct, greenish-yellow, about .05 in. long, oblong-ovate, hooded, pubescent outside; style columnar. *Fruit* about .3 in. long, obovoid, black, smooth, 1-seeded, on recurved and thickened pedicels; seed obliquely pyriform, pitted with irregular polygonal depressions. †

Throughout the plains and up to 3,000 ft. in the hills, neither rare nor very common.

* According to Haines with flabellate scales in fresh specimens..

† According to Haines not evident in ripe fresh seeds

A decoction of the dried root-stocks is used in *W. India* as a diuretic and blood purifier.

Fls. 10-11. Fr. II-I.

Cissus dispersa Hutch. Syn. *C. latifolia*, Vahl. Vern. *Bhatiṭa-lot*, Sylh.

A woody climber with woolly innovations, branchlets slender; tendrils sometimes forked. *Leaves* 2-3.5 in. by 1.25-3 in., acuminate, nerves ending in fine teeth; glabrate above, more or less floccose-tomentose beneath; petiole 1-2 in. long, tomentose. *Flowers* 4-merous, in compound umbellate cymes, peduncles short, usually up to 1 in. long, usually leaf opposed. *Calyx* nearly truncate or lobes short. *Petals* thinly hairy outside; style long, subulate. *Young* fruits obovoid.

SYLHET—Kanjilal sheet No. 4679.

Lawson in F. B. I. had included this plant under *V. adnata*. Further examination is needed to confirm its specific rank.

6. Vitis repanda W & A. Syn. *Cissus repanda* Vahl. Vern. *Medmedia-lot*, Ass. (Sibs.); *Pani-bel*, Hind.

A large climber; young parts adpressed woolly; stem soft and very porous, reticulately corky when old. *Leaves* simple, 4-8 by 3-6 in., sometimes broader than or at least as broad as long, suborbicular, deeply cordate, 5-sometimes 7-angled or -lobed, dentate-serrate, shortly acuminate, membranous, glabrescent except on the nerves beneath with age, basal nerves 5, outermost pair branched from near the origin; secondary nerves 4-6 on either side of midrib above the basal, slender, slightly arched; petiole 3-5 in. long; stipules almost free, hairy, oblong, rounded, sometimes falcate, 2-3 in. long. *Inflorescence* leaf-opposed, lax, adpressed-hairy, repeatedly umbellately or subcorymbosely branched, the ultimate divisions being of about 20-flowered umbels; peduncle 2-5 in. long, ribbed, hairy; bracts and bracteoles woolly. *Flowers* reddish-brown, 1 in. long, 4-merous, bisexual; petals ovate, oblong, hooded, hairy at the apex. *Disk* 4 lobed. *Fruit* 3 in. long, pyriform, apiculate, 1-seeded. *Seed* pyriform, nearly smooth.

Common in the Sal tracts and other deciduous types of forests.

The stem when cut and detached, yields fairly large quantities of clear potable water which is of great help to workmen and way-farers in waterless tracts.

New leaves and flowers 4-5 Fr. 6-7.

7. Vitis barbata Wall.

A large climber with stout hollow branches easily recognized by the long glandular hairs on the young shoots, petioles and peduncles. *Leaves* 8-12 by 6-9 in., ovate-cordate, acute or acuminate, sometimes faintly lobed, distantly dentate, membranous, glabrate above, generally densely brown-felted-beneath; supra-basal lateral nerves 3-4 on either side of the midrib, the lowermost often forked from near the base; petiole 2-3.5 in. long, tomentose as well as bristly. *Inflorescence* of paniculate cymes laxly ovate in outline, 4-6 in. long; peduncles 4-8 in. long, flattened, glandular-hairy, usually with a long, slender, forked tendril from near its apex. *Flowers* sessile, generally 5-merous. *Fruit* elliptic, 4-6 in. long and 3-4 in. in diam., on short stout pedicels, 1-2-seeded; seed 3 by 1.5 in., somewhat compressed,

face wedgeshaped, grooved, back with a narrow oblong tubercle from which shallow fissures radiate to the margin.

KHASI HILLS up to 3,000 ft.

The fruit is palatable and is believed to be a possible new source of grapes.

8. *Vitis lanata* Roxb.

A large climber ; young parts succulent and generally densely tawny tomentose, old stem woody. *Leaves* simple, very variable in size and shape, generally 2-5 by 1·5-4 in., often as broad as long, sometimes attaining 8 in. or more in length, ovate-orbicular from a cordate or truncate base, acute or acuminate, serrate, often angled or lobed, membranous, generally pubescent or more or less laxly or tomentose with rusty-brown wool beneath, glabrate above ; basal nerves about 5, lateral nerves 4-7 on either side of midrib above the basal ; petiole terete, 1·5-4 in. long. *Tendrils* leaf-opposed, generally forked. *Inflorescence* a large paniculate cyme, subcorymbosely branched or thyrse-form, leaf-opposed ; peduncle often bearing a simple or forked tendril. *Flowers* small, green, 5-merous, polygamo-diœcious. *Petals* usually cohering at the apex. *Style* O. *Fruit* globose, succulent, 2-3 in. across, black or dark-purple when ripe, usually 1-2-seeded. *Seeds* about 16 in. long, ob-triangular, slightly emarginate with a spatulate tubercle on the back, face wedge-shaped, 2 furrowed.

Occurs in the KHASI HILLS, 4-6,000 ft.

The root of the plant is eaten, and the fruit of some varieties is edible.

Fls. 5-6. Fr. 9-11.

Var. *glabra* occurs in the Jawai Subdivision, e. g. at Puriem. It differs from the type in having nearly glabrous leaves and thinner stems. *Petiole* slightly pubescent and tufts of scales occur at the axils of the lateral nerves on the under surface of the leaves. *Seeds* up to 4 in each fruit.

Probably the same as *Vitis heyneana* Roem et Schult. as pointed out by Parker in Indian Forester Vol. LIX P 61-63. If this view is correct, this name being earlier should supersede Roxburgh's name.

V. vinifera Linn. The grape vine, belongs to this group of the genus, but the climate of ASSAM is too moist for its successful cultivation.

9. *Vitis latifolia* Roxb. Syn. *Ampelocissus latifolia* Planch. Vern. *Gowalia-lata*, Beng.

A far-climbing herbaceous climber with a perennial rootstock, branches striate, glabrous, smooth ; new shoots glaucous, often purplish at the nodes. *Leaves* 4-11 by 3·5-8 in., ovate, deeply cordate, usually 3-5-7-angled or—lobed, crenate-serrate, membranous, glabrous when mature, shining above, 5-7-nerved at the base ; lateral nerves 5-7 on either half above the base ; petiole about as long as the blade, terete, smooth. *Inflorescence* up to 4 in. long of a compact, ovoid, dense, cyme-bearing panicle on a stout tendril-bearing peduncle. *Flowers* small, reddish-brown, 5-merous, polygamous. *Petals* free, oblong, reflexed. *Style* O. *Berry* about 35 in. long, ellipsoid, black when fully ripe,

usually 2-seeded. *Seed* with margins transversely rugose and a blunt ridge on the face.

The plains of both Valleys, also the KHASI and MIKIR HILLS up to 4,000 ft., generally in village scrub.

Fls. rainy season. Fr. 10-11.

10. *Vitis rugosa* Wall (*non* *V. rugosa* Hk.f. et Th = *V. nervosa* Laws). Syn. *V. macrophylla* Madden, *Ampelocissus rugosa* Planch.

A climber usually trailing on the ground, attaining up to 10 ft. *Stem* annual, soft, fairly stout, from a perennial thickened root-stock, reddish with longitudinal furrows, dotted with raised lenticels; young shoots covered with rusty wool. *Leaves* 5-18 in. or more across, suborbicular, orbicular or sometimes broader than long, shallowly 5-7 lobed, lower lobes somewhat obscure, margin sinuate, shortly toothed, more or less pubescent above, densely felted beneath with rusty or brownish tomentum; base deeply cordate, 5-nerved, basal portion of the lowest pair along the sinus and then forked, nerves depressed above, raised beneath; petiole 2-9 in. long, red, stout, striate. *Flowers* small, reddish, 5-merous, in short, leaf opposed, cymose pedunculate panicles of cymes, 1-5 in. long, usually with a bifurcate tendril on the peduncle. *Inflorescence* floccose-tomentose, with stout branches, pedicels very short, stout; petals free. *Berry* 3-4 in. across, black when ripe; seeds 1-4, with a sub-elliptic pit on the back from which fine, short, depressed lines radiate and a broad ridge on the face.

KHASI HILLS on sunny slopes in the open about 4-6000 ft., not common.

The subacid fruit is edible.

Fl. 6-7. Fr. 9-11.

11. *Vitis sikkimensis* Laws. Syn. *Ampelocissus sikkimensis* Planch. Vern. *Jermei-sheo-shao*, Khasi.

Stem weak, trailing, glabrous; young parts often glaucous. *Leaves* with reddish tinge, up to 18 in. across, orbicular-ovate, deeply rounded-cordate, cuspidately denticulate, somewhat abruptly acuminate, membranous, glabrous; petiole 4-6 in. long, tendrils branched. *Inflorescence*—a panicle of umbellate cymes; peduncle 4-5 in. long with a forked tendril a little below the apex; ramifications divaricate, sub-succulent in fruit. *Flowers* 5-merous; petals free. *Berry* 2 in. long, obovoid, 2-seeded, seed with a spatulate tubercle on the back.

KHASI HILLS up to 5500 ft.—Nongstoin, Shillong, etc.

Fls. 7-8. Fr. 9-10.

12. *Vitis divaricata* Wall. Syn. *Ampelocissus divaricata* Planch.

A much spreading climber with thin round stem, branches with a shining reddish cuticle under a fugacious coat of down; bark fibrous, young parts woolly greyish or rufous tomentose.

Tendrils leaf-opposed 6-10 in. long, forked towards the end. *Leaves* 3-foliolate, rarely 5-foliolate, or 1-foliolate; common petiole 3-4 in. long, stout. *Leaflets* 4-6 by 1.5-3 in., variable, terminal, elliptic to lanceolate; lateral oblique and semicordate, finely acuminate, cuspidate dentate, subentire or sometimes lobed, membranous, glabrate above, more or less softly rusty-pubescent beneath; lateral nerves 9-10 on either half, slender, much-arched, mostly opposite or subopposite, tertiary nerves transverse; terminal petiole about 1 in. and lateral 2-3 in. long. *Flowers* 5-merous, polygamous, reddish-brown, in pubescent long-peduncled compact 2-3 cymose cymes. *Peduncle* up to 5 in. long, forked near the top into a long tendril. *Cyme* branches divaricate with linear bracts at the forks. *Petals* hooded. *Disk* cupular, 10-pleated or lobed. *Style* short. *Berry* about .4 in. long, globose, ellipsoid, black when ripe. *Seed* flat, obovate or elliptic with a pit on the back from which fine grooves radiate, and a ridge on the face which broadens upwards.

Not uncommon in damp evergreen forests of UPPER ASSAM, e. g. Makum, Margherita, etc.

Fl. 6(?) -9. Fr. 10-12.

13. *Vitis trifolia* Linn. Syn *V. carnosa* Wall. *Cayratia carnosa* Gagnepain. Vern *Chepeta-lot*, Ass.; *Takigokang*, Miri; *Amal-lata*, Beng.

A climber with soft stem which becomes flattened with age; young parts pubescent; shoots striate. *Tendrils* wiry, usually branched, often ending in adhesive disks. *Leaves* usually pinnately 3-foliolate—sometimes 2- or 1-foliolate by reduction; common petiole 1-4 in. long, somewhat fleshy, stipules scarious, about .4 in. long. *Leaflets* 2-6 by 1-4 in. long, terminal largest, lateral smaller, usually oblique, sometimes lobed on the broader side, ovate, obovate or elliptic, sharply or broadly acute; base cuneate or rounded, coarsely-toothed, rather succulent, glabrate or more or less pubescent on both surfaces; petiolules of lateral leaflets short. *Inflorescence* up to 8 in. long, leaf-opposed or axillary, of long peduncled, compound, pubescent cymes, initial branches of which are 2-3—sometimes 5 rayed—from the peduncle; peduncle as long as or longer than the petiole and about as thick. *Flowers* small, 2-sexual, 4-merous, greenish. *Calyx* subtruncate; petals free, hooded at the tips; disk 4-lobed, white, crenate; style subulate. *Berry* .3-4 in. long, obovoid or globose, apex depressed, crowned with the remains of the style, usually 2-4 seeded. *Seeds* trigonous, sharply angled and ridged on the face, sides compressed, back rounded, with a linear depressed tubercle.

Fairly common, specially in evergreen forests in UPPER ASSAM.

Flrs. 5-8 Fr. 9-12.

The plant is variable in habit. The stem is sometimes herbaceous and annual from a perennial base and is sometimes softly woody, though

succulent. In the evergreen types of forests it is often a large climber and is generally robust in all its parts. In its ordinary state on the other hand it has annual shoots from a perennial base.

14. *Vitis semicordata* Wall. Syn. *V. himalayana* Brand. *Parthenocissus semicordata* Planch.

A large climber with woody stem; young parts herbaceous, glabrous or slightly pubescent. *Bark* brown, rough, deeply furrowed, fibrous. *Leaves* 3-foliolate; common petiole 4-6 in. long, slender, often sparsely and patently pubescent. *Leaflets* subcoriaceous, glabrous and shining above, of a lighter colour and often pubescent along the midrib and nerves beneath, showing beautiful yellow, orange and red autumnal-tints before falling, sharply serrate, finely and often somewhat abruptly acuminate, secondary nerves 7-8 on either half, tertiary nerves very closely and finely reticulate; terminal leaflet 3-4 in. by 2-3 in., ovate, obovate or rhomboid; base cuneate, petiolule '3-5 in. long; lateral very oblique on short petiolule, outer half rounded or semicordate, inner acute at the base. *Tendrils* branched, ending in adhesive disks or sometimes 0. *Flowers* yellowish-green, 2-sexual, 4-merous or 5-merous, in 4-6-flowered umbels which are borne on 3-sometimes 2-chotomously branched terminal or leaf-opposed panicles, 2-4 in. long; buds '15 in. long, ovoid-oblong; calyx salver-shaped. *Petals* ending a conical hood, reflexed when the flower opens. *Style* short, stout, red. *Berry* globose the size of a pea, 4-seeded, black when ripe; seeds smooth, black.

KHASI and NORTH CACHAR HILLS 2-6,500 ft., NAGA HILLS.

The wood has a pretty silver-grain and can be used for picture-frames and such other purposes.

Fls. 5-8. Fr. Cold season.

15. *Vitis bracteolata* Wall. Syn. *Tetrastigma bracteolatum* Planch. Vern. *Soh-mei-boit*, Khasi; *Duruje-doukha*, Cach.

A handsome vine with slender, wiry, glabrous, reddish, woody stem. *Leaves* 3-foliolate; common petiole 2-3.5 in. long, slightly swollen at the base. *Leaflets* 2-5 by 1.5-2.5 in., ovate or ovate-lanceolate, the lateral somewhat oblique, acute or acuminate, distantly cuspidate-serrate, membranous or thinly coriaceous, glabrous, puberulous or with curled hairs on the nerves beneath, main lateral nerves 5-10 on either side of the midrib, very slender, much arched; ending in serratures; base rounded or slightly cuneate; petiolules slightly puberulous, lateral '2-5 in., terminal '5-1 in. long. *Inflorescence* axillary, upto 4 in. long, of pubescent or puberulous, paniced, cyme-bearing corymbs upto 3 in. long with divaricate ramifications. *Flowers* 4-merous, dioecious, whitish, very small on short filiform pedicels, pubescent outside. *Petals* distinct. *Style* 0; stigma 4 lobed. *Berry* '2-2.5 in. diam., globose, black when ripe, 1-3-seeded. *Seeds* more or less horizontally wrinkled with two ridges on the back between which is a linear furrow and dotted all over the minute yellowish raised dots.

Throughout the plains of the Province and upto about 2,000 ft. in the hills, generally in scrub forest.

Fls. 9-11. Fr. 1-2.

16. *Vitis angustifolia* Wall. Syn. *Tetrastigma Thomsonianum* Planch. Vern. *Nekung-riubi*, Miri.

A herbaceous climber with dark-coloured usually flattened stem. *Leaves* 3-foliolate; common petiole 2-3 in. long, glabrous; stipules ovate-oblong, about 15-25 in. long, coriaceous. *Leaflets* 3-6 by 1-1.5 in., lanceolate or elliptic-lanceolate, distantly serrate, acuminate, glabrous or puberulous on the mid-rib; main lateral nerves 5-7 on either half, slender. *Tendrils* simple, leaf-opposed, very slender. *Cymes* axillary, short—shorter than the common petiole, dense, usually very shortly peduncled, pubescent. *Flowers* 4-merous, diœcious, green. *Petals* free. *Style* 0; stigma large, flat, scarcely lobed. *Berry* globose, about .2 in. across, not juicy, 2-4 seeded. “*Seeds* furrowed on each face and transversely rugose on the sides”—Haines.

Not uncommon in the islands and along the banks of the Brahmaputra. Also found in SYLHET and the KHASI HILLS.

Tender stems and leaves, which are acid, are eaten cooked with fish.

Fls. 9-10. Fr. 12-1.

17. *Vitis campylocarpa* Kurz. Syn. *Tetrastigma Parkeri* Gagnep. ? Vern. *Tusram-doukha*, Kach.; *Bepui-rhui*, Lush.

A heavy fleshy climber with terete stems; old stems soft wooded with corky, furrowed bark; branches smooth. *Leaves* digitately 3-foliolate, sometimes up to 6-foliolate; common petiole 2-4 in. long, stout. *Leaflets* 9.5-7 by 1.3-4 in., the terminal elliptic, ovate or obovate, lateral narrower, very oblique-sometimes almost falcate, acuminate, distantly cuspidate-serrate, entire towards the base, coriaceous, main lateral nerves 4-8 on either side of the midrib, upper ending in serratures, much arched, blade articulated with the petiolule; petiolule of the terminal leaflet up to 1 in., of the lateral leaflets .3-.75 in. long. *Tendrils* leaf-opposed, stout. *Flowers* 4-merous, diœcious, small in shortly peduncled, dichotomously branched axillary subcorymbose pubescent, compound cymes up to 3 in. long; pedicels stout, very short; buds pubescent, narrowed to a truncate apex from a broad base. *Male flowers* not seen. *Style* 0; stigma large, 4-lobed. *Fruit* about .6 in. long, oblong or ellipsoid, slightly curved, smooth, glossy, usually 1-seeded. *Seed* conforming to fruit if 1-seeded, transversely striate, with a groove on the face and another almost continuous one on the back, the latter with a low broad ridge.

Fairly common in the evergreen types of forests in UPPER ASSAM and SURMA VALLEY, especially in the vicinity of hills.

Fls. 11-12. Fr. 3-5.

I am unable to distinguish this from *Tetrastigma Parkeri* of Gagnepain. ms.

18. *Vitis elongata* Kurz. Syn. *Cissus elongata* Roxb. Vern. *Jermei-sein-iong*, Khasi

A robust climber with round or slightly flattened thick fleshy stem, quite glabrous. *Leaves* digitately 5-foliolate; common petiole 4-7 in. long, stout, swollen and with a callosity at the base. *Leaflets* 6.5-10 by 2.5-5 in., obovate-elliptic or oblong acuminate, outermost oblique, distantly minutely cuspidate-serrate, membranous, quite glabrous; lateral nerves 8-10 on either half, slender, arched, tertiary nerves obscure, distant; base attenuate to the petiolule or cuneate, petiolule margined, .5-1.5 in. long. *Tendrils* leaf-opposed, up to 12 in. in length. *Flowers* 4-merous, 2-sexual, at first in umbels which are borne on 2-chotomously branched cymes. *Style* short, subulate. *Fruit* ellipsoid, 1 in. long, 1-seeded. *Seed* .7 in. long, smooth.

Foot of the KHASI HILLS along the SYLHET border, chiefly along edges of ravines. Also Negheriting, SIBSAGAR-Clarke.
Fls. 5-6. Fr. 7-8.

19. *Vitis planicaulis* Hook. f. Syn. *Vitis neurosa* Kurz.
Vern. *Kerkeri-lata*, *Panilata*, *Chepeta-lata*, Ass.; *Turje-doukha*, Cach.; *Rikang-thipu*, Mik.; *Samarang*, Garo; *Soh-lar-pung*, Khasi; *Charchare-lata*, Nep.

A far-reaching large climber; stem soft, much flattened, especially at the base, wholly glabrous except the inflorescence, *Leaves* digitately pentafoliolate; common petiole 3.5-8 in. long. *Leaflets* 3.5-8 by 1.5-3 in., elliptic or elliptic to oblong-lanceolate, lateral oblique, acuminate, distantly cuspidate-serrate, membranous or sub-coriaceous, glabrous; petiolules .1-4 in. long. *Tendrils* leaf opposed, simple. *Flowers* greenish-yellow, 4-merous, sweet scented, in umbels which are borne on a pubescent corymbosely or divaricately branched congested axillary panicle; peduncles .2-1.5 in. long, stout, branches flattened; pedicels slender, up to .15 in. long; buds pubescent, ovoid, truncate at apex. *Flrs.* 4-merous, green; stigma 4-lobed. *Fruit* .6-.8 in. across, globose, succulent, 1-2-seeded. *Seed* .4 by .25 in., whitish, oblong, obovoid, transversely ribbed, with a linear-oblong depressed ridge on the back continuous on the other side but cuneate towards the apex.

Throughout the province chiefly in evergreen forests.

The stem when cut exudes profuse potable sap which the Garos also use to stop bleeding.

Fls. 4-5. Fr. 10-12.

20. *Vitis obovata* Laws. Syn. *Tetrastigma obovatum* Gagnep.
Vern. *Taka-pokang*, Miri; *Soh-lar-pung*, Khasi.

A heavy climber with flattened stem. *Leaves* 3-5 foliolate; common petiole 4-6 in. long, covered with curled brown hairs; petiolules .6-1.5 in. long, hairy like the petiole. *Leaflets* 6-8 by 3-5 in., obovate or elliptic, shortly acuminate, subentire or distantly crenate-serrate, membranous, glabrous above, more or less pubescent, especially along the nerves beneath; lateral nerves 7-8 on either half. *Tendrils* opposite leaf or inflorescence.

generally simple. *Inflorescence* shortly peduncled, corymbose, 3-chotomously branched. *Flowers* not seen. *Fruit* somewhat elongately globose, '6-'8 in. long, 1-3-seeded. *Seeds* '4-'5 in. long, ellipsoid, plano-convex or rounded on the back and wedge-shaped on the face, transversely lined with slender furrows, with a depressed linear oblong ridge on the back which is cuneate towards the apex and continuous on the other side.

Fairly common in evergreen forests in UPPER ASSAM and in shady ravines in the KHASI HILLS, ; ascending to 4,500 ft., Sadiya. Lokpur, Barpani, closely allied to the last species.

Fr. 10-1.

21. *Vitis capriolata* Don. Syn. *Tetrastigma serrulatum* Planch. Vern. *Mei-soh-mynjiriang*, Khasi; *Jermai-slang-ruin*, *Jermai-sara-boj*, Synt.

A wiry climber wholly glabrous, often trailing on the ground. *Leaves* pedately 5-foliolate; common petiole '5-2'5 in. long. *Leaflets* very variable in size and shape, '6-3 by '5-1'5 in., rhomboid to lanceolate, terminal largest, outermost lateral pair smallest and often oblique, finely often cuspidately-acuminate, sharply cuspidate-serrate, membranous or chartaceous; lateral nerves 5-10 on either half, tertiary nerves almost invisible; lateral petiolules '1-'15 in. long; ultimate petiolules extremely short or 0. *Stipules* short, persistent. *Tendrils* slender, generally divided near the extremity, often ending in adhesive disks. *Inflorescence* a compound peduncled umbellate cymes generally axillary or at the extremities of short lateral branches, erect or suberect, 2-3 in. long; bracts scarious, conspicuous; primary peduncles '3-1 in. long. *Flowers* 4-merous on slender pedicels, '2-'3 in. long. *Petals* somewhat thickened at the apex, into a short horn. *Style* 0; stigma flat, spreading, 4-lobed. *Fruit* globose, about '4 in. across, 2-4-seeded, black when ripe, edible. *Seeds* obovoid, rounded and with a linear tubercle on the back, flattened on the face, transversely wrinkled.

KHASI HILLS up to 6,000 ft., GARO HILLS.

Fl. 8-10. Fr. 12-3. The stem often develops adventitious roots.

22. *Vitis oxyphylla* Wall. Syn. *V. dubia* Laws. *Tetrastigma dubium* Pl. Vern. *Soh-mei-boyet*, Khasi; *Dhau-la-dousrem*, Mech.

A slender sinistrorsely-climbing glabrous shrub; older branches striate, warty. *Leaves* pedately 5-foliolate, often 4-3 foliolate by suppression of one or two of the lateral leaflets; common petiole 1-4 in. long, lateral '1-'4 in. long. *Leaflets* 2-8 by '7-2'5 in., terminal largest, outermost pair smallest and usually oblique, elliptic to ovate lanceolate or oblanceolate, bluntly long-acuminate, inciso-serrate, membranous or subcoriaceous, glabrous; lateral nerves 7-10 on either half, arched-except the submarginal basal pair, slender. *Tendril* leaf-opposed, slender, simple. *Flowers* 4-merous, polygamo-dioecious, pale-green, pedicelled, in compact,

axillary, peduncled compound corymbose cymes, .7-4 in. long. *Style* columnar, 4 lobed. *Fruit* globose, .3 in. across., black when ripe, 1-2-seeded. *Seeds* rugose.

Not uncommon in shady forests in the hills and their vicinity up to 5,000 ft in the KHASI HILLS (Shillong).

Fls. 2-3. Fr. 3-5.

In the Index Kewensis *V. oxypphylla* Wall has been made synonymou with *V. bracteolata* Wall. As King has pointed out in the Journal of Asiatics Society Vol. LXV page 113 that *Lawson's V. dubia* is exactly the same as *V. oxypphylla* Wall Cat. 6035 which, I have examined at Calcutta herbarium. The latter name must therefore supplant *V. dubia* Laws. *V. bracteolata* Wall Cat. 6023 is an allied but quite a distinct species.

23. *Vitis tenuifolia* W. & A. Syn. *Cayratia tenuifolia* Gagnep.

A graceful slender herbaceous climber, wholly glabrous. *Leaves* pedately 5-foliolate ; common petiole 2-4 in. long ; lateral petioles .2-.3 in. long, ultimate upto .1 in. long. *Leaflets* 1-3 by .7-2 in., ovate or lanceolate, acute or rounded, sharply cuspidate serrate, membranous. *Tendrils* leaf-opposed, short, slender, simple or forked. *Flowers* 4-merous, 2-sexual, in subcorymbose 2-chotomous, somewhat lax, axillary cymes ; peduncles 1-2 in. long, slender, bracteate ; pedicels about .2 in. long, filiform. *Style* short ; stigma large, peltate. *Fruit* turbinate-globose, 1-4-seeded. *Seed* convex and muricate on the back, ridged in the face.

KHASI HILLS (Shillong, 5,000 ft.) NAGA HILLS.

Fls. Cold season. Fr. 6-7.

24. *Vitis lanceolaria* Roxb. Syn. *Tetrastigma lanceolarium* Planch. Vern. *Tadi-ripun-riubi*, Miri.

A heavy climber with flattish woody stem, sometimes with raised transverse bars at intervals ; bark rough, brown and often tubercled, branches thick, often muricate with corky warts. *Leaves* pedately 5(-3)-foliolate ; common petiole 2-6 in. long, stout ; stipules about .5 in. long, oblong-lanceolate, pubescent, deciduous ; lateral petiolules .7-1 in., ultimate ones .3-.5 in. long, often pubescent. *Leaflets* 3-6 by 1-2-2.5 in., terminal largest, outermost pairs oblique, elliptic, oblanceolate to lanceolate, distantly cuspidate serrate, ovate or shortly acuminate, somewhat fleshy and coriaceous, glabrous ; lateral nerves 8-10 on either side of the fleshy midrib, arched, slender ; tertiary nerves invisible. *Tendrils* leaf-opposed, simple, stout. *Flowers* yellowish, about .1 in. long, dioecious, in axillary subcorymbosely compound, peduncled, compact pubescent cymes, 2-3.5 in. across ; female cymes fewer flowered and usually shorter than male cymes. *Petals* ovate-oblong, pubescent, corniculate at apex. *Style* 0 ; stigma shortly 4-lobed. *Fruit* .5-.7 by .3-.7 in., globose, smooth. *Seed* 1-2, with ruminated albumen, transversely wrinkled, back rounded with an elongate linear tubercle and face with a shallow forked groove.

Common in the FRONTIER DISTRICT, LAKHIMPUR, NAGA HILLS, SIBSAGAR and NOWGONG ; also occurs in evergreen type of forests in other DISTRICTS of both VALLEYS, ascending to about 3000 ft. in the hills.

The ripe fruit is eaten by the Meches of Goalpara, cooked with fish.
Fls. 2-4. Fr. 5-9.

25. *Vitis rumicisperma* Laws.

A large climber with cylindrical stem covered with corky warts or tubercles. *Leaves* pedately 5(-3)-foliolate; common petiole 1.5-4 in. long; lateral petiolules .3-.5 in., ultimate ones 0.1 in. long. *Leaflets* 2-5 by .7-2 in., terminal largest, outermost pair usually oblique and smallest, obovate to oblanceolate, usually finely acuminate, sharply serrate, coriaceous, glabrous; main lateral nerves about 12 on either side of the midrib, somewhat transverse. *Flowers* small, 4-merous, polygamo-dioecious, in repeatedly much branched pubescent, peduncled, axillary and terminal, subcorymbose, spreading compound cymes, usually 3-5 in. long; primary peduncles upto 2 in. long, appearing longer on account of suppression of leaves at the base; pedicels about .1 in. long. *Style* short; stigma 4-cleft. *Fruit* .2-.3 in. diam., usually 4-seeded, turbinate-globose, black when ripe, with a ring often with minute tubercles (indicating the disk?) below the middle, by which character as well as by its seeds this species is very readily distinguished from all its near allies. *Seeds* 1-4, about .3 in. long, triangular obcordate in outline, rugose across the sharp margins, back with an oblong tubercle in a shallow groove, face wedge-shaped, sharply ridged and with two fine grooves radiating at an angle on either side of the ridge.

KHASI and JAINTIA HILLS chiefly along the south face, 3,-5,000 ft.
The ripe fruit is edible.

Fls. 5-6. Fr. 7-9.

***Vitis Hookeri* Laws.**—A stout glabrous climber with cylindrical stem; branchlets glaucous, often warty. *Leaves* pedately 5-3-foliate; common petiole 3-5 in. long, thickened and with a callosity at the base; lateral petiolules .8-1 in. and ultimate petiolules .4-.6 in. long, stout, channelled. *Leaflets* 3-7 by 1.5-3.5 in., ovate, elliptic or oblong, bluntly acuminate, distantly crenate or sub-entire, coriaceous, glabrous; lateral nerves 6-10 on either half, slender, tertiary nerves indistinct. *Tendrils* leaf-opposed, simple, 8-10 in. long. *Flowers* 4-merous, in broad axillary corymbose cymes, on peduncles 3-5 in. long. *Fruit* 1 in. across, pulpy, 2-seeded. *Seeds* about .5 in. long, obovoid.

Reported as occurring in the plains of ASSAM and between 1-4000 ft. in the KHASI HILLS. There are however no specimens in Calcutta Herbarium from our area.

Fls. 9-10. Fr. Cold season (?)

26. *Vitis japonica* Thunb. *Incl.* *Vitis mollis*. Wall; *Cayratia japonica* Gagnep.

A slender climber, branchlets, inflorescence and leaves—specially on the undersurface—pubescent or hairy. *Leaves* pedately 5-foliate; common petiole .7-2.5 in. long; terminal leaflet 1.4-3 by .7-1.3 in., lateral smaller and more or less oblique, lanceolate, elliptic-lanceolate or oblong-obovate, acute or acuminate, rarely subacute, coarsely crenate-serrate; lateral nerves 4-7; tendrils leaf-opposed, at first slender, stouter with age, simple or forked. *Flowers* small, 2-sexual, in compound, subcorymbose cymes, peduncles 1.5-4.5 in. long; pedicels slender, .1-.15 in. long. *Calyx*

nearly truncate, pubescent outside. *Petals* 4, pubescent, specially towards the apex; disk lobes adnate to the ovary. *Ovary* 2-celled with 2-collateral ovules in each cell; style short, subulate. *Berries* obovoid, 2·3 in. long. *Seeds* trigonous, face sharply ridged, sides more or less excavate, back convex, rugose, marked with an elongated tubercle, and few subtransverse wrinkles.

CACHAR HILLS, S. LUSHAI HILLS, KHASI HILLS—Walong, Gauhati—*King's Collector!* Manipore, ascending to 4,000 ft. in the Hills.

Fls. 4. Fr. 5-6.

Closely resembles *V. tenuifolia* from which it can be readily distinguished by its hairiness. The terminal leaflet in some forms attain 4·5 by 2·5 in.

27. *Vitis pedata* Vahl. Syn. *Cayratia pedata* Juss. Vern. *Tusamphor-doukha*, Kach. ; *Uri-ising-thokphi*, Manip. (?) ; *Goalialata*, Beng.

A woody climber with cylindrical stem and striate branches. *Leaves* usually pedately 5-7-foliolate; common petiole 2-5 in. long, stout, fleshy, striate; lateral petiolules up to 1 in. long, ultimate up to 5 in., in length. *Leaflets* 3-8 by 1-3·5 in., elliptic to oblong-lanceolate, lateral very oblique, acuminate, crenate-serrate, membranous, often softly pubescent when young. *Tendrils* leaf-opposed, slender, repeatedly forked. *Flowers* 2-sexual, usually 4-merous, very small, greenish, pubescent, in axillary cyme-bearing corymbs about as long as the petioles; pedicels capillary. *Fruit* 3·4 in. across, depressed-globose, 4-seeded. *Seeds* small, hemispherical and concave, with a thin membrane on the concave side.

Fairly common in the plains and up to about 2,000 ft. in the hills.

The leaves are often used as a domestic remedy on account of their astringent properties.

Fls. 5-8. Fr. Cold season.

28. *Vitis rubifolia* Wall.

A large climber with slender 4-angular branches; young shoots rusty-pubescent. *Leaves* simply pinnate, 7-11-foliolate; rachis 5-9 in. long, pubescent. *Leaflets* opposite, 2-3·5 by 1-2 in., ovate to lanceolate with rounded or cordate base, finely acuminate, coarsely but regularly dentate-serrate, membranous, glabrous and green above, reddish and puberulous beneath; lateral nerves about 7 on either side of the midrib, opposite or sub-opposite, each usually terminating in a serrature on the margin; petiolules 0·5 in. long, pubescent. *Tendrils* forked, often wanting. *Flowers* small, greenish, in subcorymbosely arranged umbellate cymes, 5-7 in. long. *Fruit* depressed, globose, about 2 in. across, red, turning black when fully ripe. *Seeds* small, obovoid, back with a spatulate tubercle, margins transversely rugose, face wedge-shaped.

Joboka and adjoining parts in SIBSAGAR, Prains Collector! also southern faces of the KHASI HILLS, e.g. ; near Jaintiapur; NAGA HILLS, possibly in many other similar localities.

Fls. 8-10. Fr. 10-1.

2. LEEA Linn.

Stout fleshy erect herbs, shrubs or small trees, usually with a large pith; branches furrowed or striate. *Leaves* alternate, usually large, simple or more commonly variously pinnate; petiole sheathing. *Tendrils* 0. *Inflorescence* subterminal or leaf-opposed. *Flowers* small, red, yellow, white or greenish, in corymbose cymes. *Calyx* 5-lobed. *Petals* 5, connate at the base and adnate to the staminal tube, induplicate-valvate and hooded in bud, revolute when fully open. *Stamens* 5, united at the base into an entire or 5-cleft staminal-tube; free ends of the filaments short, reflexed; anthers introrse, free or more or less connate in bud, dehiscing longitudinally. *Ovary* inserted at the base of the staminal tube, 3-6-celled with one ovule in each cell; style short. *Fruit* 3-6-celled, depressed-globose, lobed. *Seeds* wedge-shaped with testa folded and intruded into the albumen.

- I. Petals and inflorescence red :—
 - A. Leaves simply pinnate, petiole-winged :—
 - Leaflets sessile. .. 1. *L. alata*.
 - B. Leaves 2-pinnate, petiole not winged :—
 - Leaflets sessile. .. 2. *L. sp.*
 - Leaflets petioluled. .. 3. *L. acuminata*.
- II. Petals white or greenish; inflorescence not red :—
 - A. Herbaceous :—
 - Ordinary leaves simple*, very large. .. 4. *L. macrophylla*.
 - B. Undershrubs; secondary nerves 1 to each tooth :—
 1. Leaves usually 3-foliate. .. 5. *L. trifoliata*.
 2. Leaves variously pinnate :—
 - a. Stem and peduncle with crisped wings; secondary nerves continuous, each terminating in a serrature. .. 6. *L. crispa*.
 - b. Stem not winged; secondary nerves forked at the extremity, each fork terminating in a serrature. .. 7. *L. aspera*.
 - C. Shrubs or small trees, secondary nerves several to each tooth :—
 1. Leaflets glabrous, acute at the base :—
 - Small tree often stilted on ærial roots; leaflets oblong. .. 8. *L. umbraculifera*.
 - Semi-herbaceous shrub; stem not stilted; leaflets more or less ovate. .. 9. *L. sambucina*.
 2. Leaflets hairy, rounded or subcordate at base :—
 - a. Leaflets with peltate scales underneath. .. 10. *L. æquata*.
 - b. Leaflets without peltate scales :—
 - Inflorescence with numerous conspicuous persistent bracts. .. 11. *L. bracteata*.
 - Bracts not persistent or conspicuous .. 12. *L. robusta*.

1. *Leea alata* Edgew. Vern. *Bon-ou*, Ass.

A somewhat stiff undershrub with annual stem up to 5 ft. in height, glabrous but covered with elevated dots. *Leaves* simply

* Rarely one or two upper leaves are pinnate, the leaflets being very small.

impari-pinnate ; rachis margined ; common petiole 1-2·5 in. long, grooved, winged (not crisped) reddish ; stipules deciduous. *Leaflets* 5-9, usually 5, sometimes 3, sessile or very shortly petioluled, 6-12 by 2-3 in., oblong, oblong-lanceolate, generally acute, sharply serrate, coriaceous, glabrous ; lateral nerves 10-14 on either half, strong, almost straight, very slanting, tertiary nerves numerous, parallel and transverse ; base more or less rounded. *Inflorescence* corymbosely cymose, pubescent, reddish. *Peduncles* 2-7 in. long, subterminal, furrowed ; pedicels very short. *Flowers* red, small, numerous. *Anthers* connate. *Fruit* about ½ in. across, red, turning bluish-purple in ripening, succulent.

LAKHIMPUR DISTRICT, Mann! Probably SIBSAGAR and DARRANG, KAMRUP and low elevations in KHASI HILLS, NAGA HILLS.

The stem dies back annually to a woody base.

Fls. 7-8. Fr. 9-11.

2. *Leea* sp. probably *L. Wightii*. C. B. Clarke. in Trimen's Journal of Botany 1881, p. 105.

An undershrub up to about 6 ft. in height. *Leaves* 2-pinnate ; common petiole and rachis terete, not winged, glabrate ; pinnae generally 4. *Leaflets* 4-6 by 1·2-1·6 in., sessile, lanceolate or oblong-lanceolate, serrate, sharply acuminate, membranous, slightly hispid ; lateral nerves 8-12 on either half, generally opposite, slender, arched, tertiaries transverse, very fine, rather irregular, subparallel. *Inflorescence* and *Flowers* coral-red, flower-buds globose. *Fruit* not seen.

Guma Reserve-GOALPARA, sheet No. 7560. Material incomplete for satisfactory determination.

3. *Leea acuminata* Wall. Vern. *Bujion*, *Kath-thengia*, Ass. ; *Gangma-Sangop*, *Gangma-chi*, *Gangma-jachheng*, Garo ; *Dienglang-karnum-kynthei*, Khasi ; *Asra-jolu*, Mech ; *Uichokpa-khungru*, Tipp. ; *Phuphaira*, Sylh. ; *Charai-thengia*, Ass. (Kam.) also Mikir.

A robust herbaceous shrub up to 15 ft. or more in height, bifariously branched ; stem terete, annulate at the nodes, up to 3 in. diam. at base, with large pith and often with large thick aerial roots ; branches striated. *Leaves* very large, bifarious, 2-pinnate ; pinnae usually 2-pair, 3-7-foliate, rachis terete, glabrous ; stipules connate, 7-1·5 in., adnate to the petiole and auricled at the base. *Leaflets* 4-9 by 1·5-3·5 in., terminal leaflet of each pinna usually largest, ovate, elliptic-lanceolate or oblong-lanceolate, acuminate, serrate, coriaceous when fully mature, glabrous, shining on both surfaces, pink when tender, turning yellow and ultimately red before falling ; lateral nerves 8-10 pairs, opposite, much arched ; tertiary nerves transverse, subparallel ; petiolules usually 2-4 in., sometimes up to 7 in. long, *Corymbs* pubescent or puberulous, coral red ; peduncles usually 2·5-4 in. long, leaf-opposed ; pedicels very short ; buds globose.

Flowers crowded, coral red, about '1 in. across. *Fruit* '25-3 in. diam., orange red, supported by the persistent calyx.

Fairly common in grass-lands and glades throughout the PROVINCE, ascending up to 2,500 ft. in the KHASI HILLS.

The stems are used as substitutes for bamboos in building temporary huts in forests where no bamboo grows.

Flrs. 5-8. Fr. 9-2.

4. *Leea macrophylla* Roxb. Vern. *Pharun-barne*, Khasi ; *Dholsamudra*, Beng.

A perennial herb with switchy annual shoots 3-5 ft. long which generally die back in March-April to be replaced by new ones in May-June ; stem deeply sulcate. *Leaves* usually up to 3 only, almost always simple, 9-20 by 8-16 in., ovate-cordate, acute, dentate-serrate, coriaceous, glabrous and dark-green above, greyish puberulous or pubescent beneath ; midrib sharply keeled ; lateral nerves about 9-12 on either half, usually opposite, almost straight, each giving off 1-6 branches terminating in teeth on the margin ; petiole 2-3·5 in. long, stout, channelled halfway from beneath with large adnate stipules. *Flowers* polygamous, white, small, males usually in small sessile or shortly peduncled corymbs from the base of the puberulous peduncle of the female corymbs which are 8-12 in. long. *Staminal tube* entire or nearly so. *Fruit* depressed-globose, '25-33 in. diam., black when ripe.

Only found so far in the KAMRUP and KHASI HILLS Districts, chiefly in the neighbourhood of Barnihat.

The ripe fruit is edible. The root is reported to be a remedy for ring-worm and guinea-worm and is also applied as poultice on obstinate sores and on sprains.

Fls. 8-10. Fr. 10-3.

5. *Leea trifoliata* Laws.

A weak herbaceous plant with swollen joints up to 3 ft. in height. *Leaves* usually* 3-foliolate ; petiole sheathed at the base, winged above. *Leaflets* 3-6 by 1-3 in., elliptic-oblong or obovate, rather abruptly acuminate, cuspidate serrate or serrulate, membranous, slightly pubescent along the nerves, especially when young ; main lateral nerves about 10 on either side of the midrib, slightly arched ; lateral petiolules '2-4 in. long, terminal '8-1·5 in. long. *Gynes* small. *Anthers* distinct. *Fruit* dry, black when ripe.

Foot of the KHASI HILLS in KAMRUP, NAGA HILLS.

Fls. 5-6. Fr. 7-8

6. *Leea crispa* Willd. Vern. *Gangma-chhangoppa*, *Mangkhrom*, Garo ; *Soh-phyrnou-nar*, Khasi ; *Ban-chalta*, Beng.

A gregarious undershurb, 3-4 ft. high, which grows annually from a perennial root-stock, easily recognised by crisped wings on the branches and leaf-rachis, the last two sulcate between the wings ; young parts pubescent. *Leaves* pinnately 3-5-foliolate ;

* Sometimes a pair of much smaller leaflets are seen about the middle of the petiole, e. g., my sheet No. 5449.

common petiole short, stout. *Leaflets* 4-9 by 1.5-3.5 in., elliptic, obovate, to ovate-oblong or oblong-lanceolate, acute or shortly acuminate, coarsely serrate, generally rounded at the base, coriaceous, subglabrous, turning red before dying; lateral nerves about 18 on either side of the midrib, straight, parallel, minutely strigose beneath; tertiary nerves very fine, transverse, parallel, glabrous; petiolules .3-.5 in. long. *Corymbs* shortly peduncled, 1-2 in. across. *Flowers* pale-yellow; pedicels short; bracts small, persistent. *Anthers* distinct. *Fruit* .3 in. across, broader than long, glabrous, steel-grey when ripe, 5-6-seeded.

Very common in grass-lands, especially in the Sal-bearing tracts of the PROVINCE and up to 4,000 ft. in the KHASI HILLS. It helps the regeneration of Sal by ousting grass and preparing the soil for germination of seed.

Fls. 7-8. Fr. 10-12.

7. *Leea aspera* Edgew. Vern. *Soh-phyrnou*, Khasi; *Rahakhani-gangma*, Garo.

An annual but semi-woody plant sometimes attaining 15-20 ft. in height, often tufted. *Stem* striated and with longitudinal grey streaks; pith large. *Leaves* usually 2-pinnate, sometimes 1 or 3-pinnate; rachis glabrous. *Leaflets* 3-6 by 2-3.5 in., elliptic, oblong or ovate, finely caudate, rounded or subcordate at the base, strongly and often cuspidately serrate, membranous or sub-coriaceous, punctate, harsh above, pubescent on the nerves beneath; lateral nerves 15-18 on either side of the midrib, mostly opposite, lowest pairs basal, almost straight, parallel, tertiary nerves very fine, close, parallel, lateral petiolules .3-.6 in. long. *Cymes* axillary, corymbose, 2-4 in. long; often trichotomously branched; branches compressed. *Flowers* .2 in. across, light-green, slightly scented; bracts small, persistent. *Calyx-teeth* acute. *Petals* lanceolate. *Berries* .3 in. across, depressed-globose, 5-seeded, slaty-green, turning black when fully ripe.

Fairly common in deciduous forests and grass-lands, especially in LOWER ASSAM and the HILLS up to 4,000 ft.

Fls. 6-8. Fr. 10-12.

8. *Leea umbraculifera* C. B. Clarke. Vern. *Ahina*, Ass. (Darr.); *Gach-gangma*, Ass. (Kam.); *Hupai-ura*, Sylh.; *Rakkibaing-assing*, Miri & Abor; *Pandausa-baphang*, Kach.; *Dieng-shong-wiang-synrang*, *Dieng-shong-rieng-masi*, *Dieng-song-wi-ang*, Khasi; *Choptipli*, *Soptipli*, *Nampiru-chin*, Mik.; *Demboranglang-changnc*, Duft.; *Thi-phak-Khrong-bol*, *Gangma-jachan*, Garo; *Asra-jola*, Mech.

A small tree attaining 50 ft. in height; stem fluted at base, often stilted on crown of thick aerial roots; bark grey or brown and somewhat rough outside, red inside. *Leaves* 2-3-pinnate; common petiole purple, amplexicaul at the base, rachis channelled, glabrous, purple at points of insertion of the pinnae. *Leaflets* 3-8 by .8-2 in., oblong-lanceolate or oblong, strongly serrate, caudate-acuminate, rounded or subacute at the base, coriaceous,

quite glabrous, shining underneath, variegated with red brown and green before falling; lateral nerves 10-15 on either side of the midrib, generally opposite, much arched, tertiary nerves very fine, transverse, parallel; petiolules .2-2 in. long, rather slender. *Inflorescence* 4-8 in. long, terminal or subterminal, corymbose with puberulous ultimately glabrescent branches; peduncles ordinarily up to 4 in. long; pedicels upto .1 in. long. *Flowers* greenish-white, .2-.25 in. across. *Calyx* green, turbinate, lobes 5, rounded, persistent. *Petals* light-green, .16 by .08 in. lanceolate, spreading or recurved. *Disk* fleshy, light yellow, urceolate. *Anthers* sessile, cohering by their lower end, introrse; connective white. *Fruit* .25-.3 in. across, depressed-globose, rather obscurely 3-6-lobed.

Common throughout the PROVINCE, especially in evergreen type of forest.

Wood reddish-brown, hard and compact, weighing about 48 lbs. per c. ft.; medullary rays some very broad, others finer, not very close, pores large but scanty; annual rings distinct, liable to crack but takes a good polish, and quite ornamental in radial section.

Fls. 7-11. Fr. 12-2.

9. *Leea sambucina* Willd. Vern. *Kukurathengia*, Ass. (Lakh. & Sib.); *Dibadiang-asung*, Miri; *Riu-khong-pieng*, Khasi. Also most of the names applied to *L. umbraculifera*.

A semi-herbaceous shrub up to 15 ft. in height and 3-4 in. in diam., at base. *Leaves* 2-3 pinnate, rachis stout, glabrous. *Leaflets* 3-8 by .8-3.5 in., oblong, oblong to ovate or elliptic-lanceolate, sharply acuminate, glabrous, coriaceous when mature; lateral nerves 7-12 on either half, arcuate, forked near the margin, raised beneath, tertiaries fine, lateral petiolules .2-.5 in. long, terminal up to 1.5 in. long. *Flowers* greenish white, .25-.3 in. across in much branched (often from near the base) compact puberulous, subterminal corymbs up to about 4 in. long; peduncles up to 2 in. long. *Petals* lanceolate-oblong, spreading; anthers cohering at the base. *Berry* depressed, globose, .25-.3 in. across, obscurely 3-6 lobed, 3-6 seeded.

Common in evergreen forests.

The ripe fruit is said to be edible. It is very apt to be mistaken for young stages of *L. umbraculifera* from which it differs by its habit, somewhat broader and fewer nerved leaflets, shorter and stouter peduncles, broader panicles and larger flower buds.

Flrs. rainy season. Fr. winter.

10. *Leea æquata* Linn. Vern. *Dieng-soh-phyrru-iong*, Khasi (Kam. side).

A semi-herbaceous plant 8-10 ft. high, easily distinguished from its congeners by its harsh feel and by the peltate glands on the undersurface of its leaves; young shoots hispid pubescent. *Leaves* 1-3-pinnate, usually 2-pinnate; rachis terete, hirsute. *Leaflets* 3-9 by 1-2.5 in., oblong-lanceolate or lanceolate, sharply serrate, caudate, acuminate, more or less rounded at the base, membranous, hispid with scattered grey hairs above, hirsute along the nerves and with scattered round brown peltate glands

beneath; lateral nerves 8-18 on either side of the midrib, slender, arched, tertiaries sub-parallel, invisible on the upper surface; lateral petiolules 15-5 in., terminal 1-15 in. long, hirsute. *Inflorescence* subterminal or leaf-opposed, 3-4 in. long and as broad, glandular-hairy; peduncle often branched from near the base. *Berries* depressed-globose, 25-3 in. diam., 3-6-seeded, turning red and finally black in ripening.

Apparently not very common. Foot of the KHASI HILLS on the KAMRUP side.

Fls. 6-7. Fr. 10-12.

11. *Leea bracteata* C. B. Clarke. Vern. *Kumtin-toi*, Lush.; *Lang-kurnu*, Khasi.

A shrub up to 16 ft. in height and 2-5 in. in diam. at base; stem often rooting from the internodes; young shoots rusty pubescent. *Leaves* pinnate or bipinnate; rachis more or less pubescent; common petiole sheathing at the base and winged from there for a length of 2-5-4 in. *Leaflets* 9-15 by 2-5-6 in., ovate, elliptic or oblong lanceolate, crenate-serrate, caudate acuminate, rounded or subacute at the base, membranous or chartaceous; glabrous and green above, pubescent and of a coppery-brown colour underneath; lateral nerves 15-20 on either half, mostly opposite, slightly arched, prominent beneath; tertiary nerves transverse, wavy, very fine; lateral petiolules 2-4 in. long, stout, pubescent. *Inflorescence* 3-4-5 in. long and about as broad, congested, with bright red pubescent branches and numerous ovate or lanceolate subpersistent bracts 2-6 in. long. *Berries* 3-4 in. diam., depressed-globose, 1-5-seeded, black when ripe.

KHASI, NAGA and LUSHAI HILLS up to 4,000 ft., generally in shady forests and ravines.

Wood fairly compact and heavy, resembling *L. umbraculifera* in structure.

Fls. 5-7. Fr. 10-12.

12. *Leea robusta* Roxb. Vern. *Koulkar*, Lushai.

A semi-herbaceous shrub up to 10 ft. in height; branches rusty-tomentose. *Leaves* 2-3-pinnate; rachis rusty-tomentose. *Leaflets* 8-12 by 2-5-3-5 in., lanceolate, or oblong-lanceolate, caudate-acuminate, finely serrate, rounded or subcordate at the base, membranous, glabrous but sub-rugose above, softly rusty-pubescent beneath; lateral nerves 14-18 on either half, generally opposite, slender, arched, tertiary nerves transverse, wavy, about 06 in. apart, parallel. *Peduncle* and branches of inflorescence rusty-villous, bracts deciduous, anthers slightly united in bud. *Flowers* green; staminal tube white. *Berries* about 33 in. across, purple-black when fully ripe; depressed, globose, 4-6 seeded.

KHASI HILLS, 3-4,000 ft., not very common.

Fls. 7-8. Fr. 10-12.

FAM. 43. STAPHYLEACEÆ.

Trees or shrubs. *Leaves* alternate or (in the case of our only genus *Turpinia*) opposite. *Flowers* 2-sexual, regular, paniced. *Calyx* imbricate, 5-partite, hypogynous. *Petals* 5, imbricate. *Disk* complete, lobed. *Stamens* 5, inserted outside the disk and opposite the calyx-lobes; anthers introrse. *Ovary* of three carpels, free or (in our genus) combined; ovules 2 or more in each carpel; styles 3, short. *Fruit* a berry or capsule; seeds one or many in each cell, albuminous; embryo straight.

1. TURPINIA Vent.

Trees or shrubs. *Leaves* opposite, imparipinnate, stipulate. *Leaflets* opposite, stipellate, serrulate, generally shining, often more or less oblique at the base. *Panicles* terminal, often running down to the axils of the upper leaves, sometimes wholly axillary. *Flowers* whitish. *Filaments* flattened; anthers small. *Ovary* sessile, 3-celled. *Fruit* a 3-lobed and 3-celled berry. *Seeds* angular; testa shining.

Middle-sized tree. Leaflets generally 7. Panicles large, mostly terminal. *Fruit* over 1 in. in diam.

Large shrub or small tree. Leaflets generally 5.

Panicles small, generally axillary. *Fruit* scarcely 5 in. in diam.

.. 1. *T. pomifera*.

.. 2. *T. nepalensis*.

1. *Turpinia pomifera* DC. Vern. *Pani-letku*, Ass. (Lakh.); *Bon-keseru*, Ass. (Sib.); *Gobar-khutla*, Ass. (Darr.); *Mota-amari*, Ass. (Kam.); *Tukku-assing*, Abor; *Sidumbulli-assing*, Miri; *Thekjoai*, *Thekjoy*, *Khrang-arong*, Mik; *Piyu-nekphi*, *Takre-changne*, Duff. *Dieng-iong*, *Dieng-soh-sang-kei*, *Dieng-soh-long-anthri*, Khasi; *Thaisram-phang*, Kach.; *Kothamari*, Garo (Dambu); *Bol-dikim*; *Kulamari*, *Kothamari*, *Gongmajaching*, Garo; *Kala-dingart*, Mech.

A rather handsome small or middle-sized tree, sometimes attaining as much as 9 ft. in girth, generally with a gregarious tendency; crown narrow and conical until mature. *Bark* grey or brown, fairly smooth on young trees, 12-25 in. thick, horizontally wrinkled and vertically furrowed, whitish or dun-brown inside with strands of deeper brown or amber. *Leaves* usually 10-20 in. long, opposite, imparipinnate, wholly glabrous; rachis terete; stipules interpetiolar, triangular, caducous. *Leaflets* generally 7, often 5, rarely 9 or 3, opposite, 3-8 by 1-3 in., oblong-elliptic or ovate, acuminate, serrulate, acute or slightly rounded and usually more or less oblique at the base, coriaceous, glossy green above, pale beneath; lateral nerves 6-8 on either half, much arched, tertiary nerves fine, irregularly reticulate;

lateral petiolules '1-4 in. long, terminal 1-2 in. long; stipels subulate, caducous. *Panicles* up to 12 in. or more in length when terminal, 3-6 in. long when axillary, corymbosely much branched; pedicels short. *Flowers* about '2 in. across, minutely bracteolate. *Calyx* lobes unequal, ovate or elliptic oblong, deciduous, ciliolate, '1-15 in., obovate-oblong or oblong; styles 3, more or less connate. *Fruit* nut-like, '7-15 in. across, globose. *Seeds* without aril; albumen fleshy; embryo straight.

Ubiquitous in evergreen types of plains forest throughout the province, especially in damp localities, ascending to 3,000 ft. in the hills.

The leaves are used for cattle fodder. Wood whitish, soft, even-grained, weighing 30-35 lbs. per cft.,—not used except as firewood but might be found suitable for carved toys and cooper's articles.

Flrs. 2-3. Fr. 4-5.

2. *Turpinia nepalensis* Wall. Vern. *Dieng-ja-rasi*. Synt., *Dieng-ja-arthri*. Khasi.

Generally only a shrub, scarcely exceeding 20 ft. in height; bark grey, corky outside, '15 in. thick; light-brown inside with streaks of lighter tissue. *Leaves* usually 5-12 in. long. *Leaflets* scarcely more than 5, 2-5 by '8-15 in., elliptic, ovate or oblong, caudate-acuminate, closely serrulate, coriaceous, glabrous, concolor on both surfaces, not so shining above as in *T. pomifera*; lateral nerves 4-7, arched, very slender; base always acute, often cuneate. *Inflorescence* generally axillary, 4-7 in. long. *Flowers* not seen. *Fruit* globose, up to '3 in across., succulent when ripe, sweetish.

Above 4,000 ft., in the KHASI HILLS and possibly also the MIKIR HILLS. Mawmluh near Cherrapunji, Kyelong Rock, Mawsynrang etc.

Fr. 10-12.

This is undoubtedly a distinct species. The leaves and fruit are quite different, also the flowering and fruiting seasons.

FAM. 44. ACERACEÆ.

Trees or erect shrubs. *Leaves* opposite, simple, undivided or lobed; stipules 0. *Flowers* regular, polygamous. *Sepals* and *petals* isomerous, the latter sometimes wanting. *Disk* generally complete and annular or 0. *Stamens* 4-10, inserted outside or upon, very rarely inside the disk; filaments free. *Ovary* of 2 carpels, each 1-2 ovuled. *Fruit* of two indehiscent samaras; *Seeds* exalbuminous.

1. ACER Linn.

Generally the characters of the Family. *Leaves* (in the Assam species) undivided or 3-7 lobed. *Flowers* in terminal or axillary racemes or corymb. *Calyx* usually 5-lobed, deciduous. *Petals*

as many as the calyx-lobes, sometimes 0. *Disk* thick, annular or cup-shaped, glabrous; margin lobed. *Stamens* generally 8, inserted on the disk; filaments dimorphous being usually longer in the male than in the hermaphrodite flowers. *Ovary* usually 2-lobed, 2-celled, laterally compressed; style deeply 2-fid; ovules 2 in each cell. *Fruit* a double samara, indehiscent; wings large, shaped more or less like the blade of a *khukri* (cultrate), membranous, thickened at the back; cotyledons irregularly folded.

Petiole usually exceeding 1 in. in length:—

Leaves pale beneath; cymes pubescent.

.. 1. *A. oblongum*.

Leaves silvery-white beneath; cymes glabrous.

.. 2. *A. niveum*.

Petiole usually less than 1 in. in length:—

Leaves green beneath; cymes glabrous.

.. 3. *A. laevigatum*.

1. *Acer oblongum* Wall. Vern. *Dieng-soh-khru*, Khasi; *Dieng-ialeh*, Synt.

A middle-sized deciduous tree, often irregularly buttressed at the base; branches lenticelled; bark greenish-grey or brown outside, with short raised horizontal bars and shallow longitudinally reticulate furrows peeling in irregular thick flakes in older trees, 2-4 in. thick, inside light pink, in very thin concentric layers. *Leaves* often ternate on young stems, 2.5-6 by 7-2 in., oblong or ovate-lanceolate, acuminate, entire, chartaceous, glaucous beneath; lateral nerves 6-8 pairs; base sub-acute or rounded. 3-nerved; petiole 7-4 in. long, slender, terete, coral-red or green. *Flowers* 5-merous in terminal or leaf-bearing lateral corymbose panicles, 3-5 in. long, pedicels and calyx hairy. *Sepals* and *petals* 1 in. long, linear-oblong. *Stamens* 8, exserted; filaments glabrous. *Ovary* hairy. *Fruit* glabrous; nuts more or less angular; wings 1 by 5 in., contracted at the base, divergent but often overlapping by the inner edges, closely veined.

The KHASI & JAINTIA and NORTH CACHAR HILLS between 2,000 and 4500 ft., not uncommon.

Wood light reddish-brown, moderately hard, close-grained, medullary rays fine: weighing 45 lbs. per cft., suitable for agricultural implements and for turning into cups and bowls.

Flrs. Rainy season (?) Fr. 12-2.

2. *Acer niveum* Bl. Vern. *Mota-bhe*, Ass. (Lakh); *Nabar*, Kuki.

A shade-enduring tree, often attaining very large size; bark brownish-grey, shallowly reticulately fissured, dun-brown inside, reddish-brown with yellow reticulations underneath the corky layer. *Leaves* opposite, sometimes ternate or alternate, 4-9 by 1.5-3 in., oblong or elliptic acuminate, quite entire, coriaceous, dark-green and glabrous above, glabrescent and silvery-grey beneath; lateral nerves about 8 on either half often with shorter intermediate ones, conspicuous underneath, tertiary nerves strongly reticulate; base acute or slightly rounded; petioles 1-3 in. long, slightly swollen at the upper extremity. *Flowers* small, in racemose glabrous corymbs. *Stamens* 6-8, glabrous.

Fruit glabrous; cells not angular; wings about 1 in. long, constricted near the base, divergent, much veined.

Only found in the LAKHIMPUR DISTRICT along the NAGA HILLS boundary, in the neighbourhood of Jeypur and in CACHAR on the Bhuban Hills.

3. *Acer lævigatum* Wall. Vern. *Dieng-than*, *Dieng-soh-tyrkhum*, *Dieng-tyrthia-iong*, Khasi; *Dieng-ja-ryngam*, *Dieng-soh-tang-hi*, Synt.; *Thing-khim*, Lush.

A middle-sized deciduous tree with dark greenish-grey bark on trunks and larger branches and smooth green bark on branchlets; inside creamy-white to pale-yellow, granular, speckled with brown spots, somewhat bitter in taste. *Leaves* 2-6 by 1-2 in., ovate or oblong-lanceolate, acuminate, serrulate when young, undulate, glabrous but often pilose along the mid-rib and with tufts of silky hairs in the axils of the nerves beneath, chartaceous, turning pink before falling; main lateral nerves 6-9 on either side of the midrib, arched; nervules very closely reticulate; petiole .25-.75 in. long, finely channelled above. *Racemes* 3-5 in. long, lax, with very slender ramifications. *Sepals* 5, ovate or lanceolate. *Petals* 5, clawed, white, about .12 in. long. *Stamens* 5-8, glabrous, longer than the petals. *Ovary* hairy. *Fruit* glabrous; nuts elliptical, almost terete, reticulate; wings .7-1 in. long, divergent, tinged with red until mature, back fairly straight.

KHASI & JAINTIA HILLS, 3-6000 ft. Cherrapunji, Sohrarim, Jawai, Shampung, etc. not common but with a gregarious tendency where it occurs.

Wood white, hard and close-grained, weighing about 43 lbs. per c. ft., capable of being used as planks and scantlings.

Flrs. 3-4. Fr. 8-10.

FAM. 45. SAPINDACEÆ.

Trees, shrubs or rarely climbing herbs. *Leaves* alternate, pinnate or rarely 1-3-foliate, (opposite and digitate in *Æsculus*), exstipulate. *Flowers* usually polygamous, generally more or less irregular. *Calyx* 4-5-lobed or of 4-5 sepals, usually imbricate, rarely valvate. *Petals* 4-5 or 0, often with scales or tufts of hairs at the base within. *Disk* annular or unilateral, often lobed, sometimes wanting in male flowers. *Stamens* 4-8, rarely 10, generally inserted inside the disk. *Ovary* 1-4, usually 3-celled, often 3-lobed; ovule generally 1, sometimes 2 in each cell. *Fruit* capsular or drupaceous, sometimes lobed. *Seeds* often arillate with a large hilum; albumen 0; cotyledons curved or convolute.

1. CARDIOSPERMUM Linn.

Cardiospermum Halicacabum Linn. Vern. *Kapalphuta*, Ass. ; *Thaimodo-dukha*, Kach. ; *Sib-jhul*, *Nayaphatki*, Beng.

A thin wiry climbing herb with sulcate branches. *Leaves* alternate, bi-ternate, 2-3 in. long, deltoid in outline. *Leaflets* 3-1 in. long, lobed or coarsely dentate, acuminate, membranous, more or less pubescent. *Flowers* very small, white, polygamodioecious in few flowered umbellate cymes. *Peduncles* 3-5 in. long, very slender, the lowest pair of branches opposite and developed as spiral tendrils. *Sepals* 4, in unequal pairs, each with a scale at or above the base. *Ovary* 4-celled, with an ascending ovule in each cell. *Capsule* 3-celled, trigonously pyriform, inflated, loculicidal. *Seeds* about 1 in. diam., globose, arillate at the base, exalbuminous.

Common in drier uplands in the PLAINS, also in the NORTH CACHAR HILLS, e.g., Maibong, Dautuhaja, etc.

The seeds and roots possess valuable medicinal properties.

Fls. and Fr. 4-12.

{2. ÆSCULUS Linn.

Æsculus punduana Wall. Vern. *Ikuhia*, *Raman-bih*, Ass. ; *Sartok-asing*, Abor ; *Ramon-asing*, Miri ; *Phaklang-jan-arong*, Mik. ; *Phrado-buphang*, Kach. ; *Dingari*, *Khangkher* or *khangkhir khola*,

Mech ; Rimot, Bol-rimmu, Garo ; Dieng-chhang or Dieng-sang-kenrop, Dieng-dula or dola, Khasi ; Ngraurau, Naga.

A small or middle-sized deciduous tree with spreading branches and scaly buds ; bark greyish, warty outside, .25 in. thick ; inside whitish, speckled with numerous brown dots, exuding watery sap when cut. *Leaves* opposite, exstipulate, digitate ; common petiole 7-12 in. long, terete, glabrescent. *Leaflets* up to 7, gradually smaller from the terminal, 5-15 by 2-5 in., oblanceolate, acuminate, finely serrulate, subcoriaceous, glabrous ; main lateral nerves 20-25 on either half, almost transverse to the midrib at the base, slightly arched at the outer extremity, tertiary nerves slender, transverse to the lateral nerves, sub-parallel ; base acute ; petiolules .2-.7 in. long, flattened above. *Flowers* irregular, white, .5-.6 in. long (excluding the stamens) in large terminal thyrsoid panicles of penduncled cymes. *Panicles* up to 24 in. long, dun-pubescent when young ; pedicels gradually shorter upward. *Calyx* .2-.3 in. tubular, lobes 5, imbricate, rounded at the apex, dun-canescens outside. *Petals* 4, rarely 5, white, unequal, clawed, externally pubescent, often with a yellow spot at the base. *Stamens* slender, usually 7, free, much exserted. *Disk* unilateral. *Ovary* 3-celled, cells with 2 superposed ovules ; style elongated, slender. *Fruit* a brown leathery rugose, ovoid or obovoid, apiculate, loculicidal capsule, 2-3 in. long ; valves 2-3 in each cell. *Seed* 1 in each cell, 1-2 in. long, brown, smooth with a very large oval hilum ; cotyledons thick, not separable.

Common along streams and ravines in the hills and their vicinity throughout the Province, ascending to 4,500 ft.

Wood white, soft, close-grained, weighing about 36 lbs. per c. ft., capable of being turned into cups, plates and vases and of being chiselled into toys, etc.

Fls. 1-2. Fr. 4-7.

3. ALLOPHYLUS Linn.

Shrubs or small trees. *Leaves* alternate, 1-3-foliolate, exstipulate. *Flowers* small, generally white, polygamo-dioecious, irregular in simple or branched racemes ; pedicels short ; buds globose. *Sepals* 4, in opposite pairs, outer pair small, inner cucullate, widely imbricate. *Petals* 4, very small or obsolete, usually with a shaggy scale above the claw. *Disk* unilateral, usually with 4 glands opposite the petals. *Stamens* 8, inserted on the receptacle inside the disk. *Ovary* usually 2-lobed and 2-celled, reduced merely to a pistillode in the male flowers ; styles 2, stigmatic on the inner face ; ovule one in each cell. *Fruit* indehiscent with 1-2 subglobose lobes. *Seeds* erect, usually with a short aril at the base ; embryo curved ; cotyledons plicate.

Leaves 1-foliolate ; racemes more or
less branched.
Leaves 3-foliolate ; racemes simple.

..
..

1. *A. Zeylanicus*.
2. *A. Cobbe*.

1. *Allophylus zeylanicus* Linn.

A large shrub or small tree with terete glabrous branches and whitish bark; young shoots pubescent. *Leaves* 1-foliolate, 2-12 by 1-6 in., oblong, ovate or obovate, acuminate, usually toothed or repand, generally subcoriaceous, glabrous, often with a pair of short processes at the upper extremity of the petiole which is .5-2.5 in. long. *Racemes* usually long-peduncled, very variable in length, generally with a few branches at the base. *Flower-buds* globose, .04-12 in. diam. *Fruit* globose, red when ripe.

Two varieties occur in Assam:—

1. *assamica*; leaves quite entire, glabrous; racemes short.
2. *grandifolia*; leaves large, obovate, toothed or repand-denticulate, submembranous; racemes 2-4 in. long.

Doyang Reserve, SIBSAGAR DIVISION, Margherita, LAKHIMPUR, Abdul Haq! Ghuttermukh, CACHAR-Præzer! NAGA HILLS, Watt!
Fls. 4-5. Fr 9-10.

2. *Allophylus Cobbe* Bl. Vern. *Arhik-bouna*, Lushai; *Chi-cehirum*, Tipp.

A shrub up to 15 ft. in height with grey lenticellate bark. *Leaves* 3-foliolate; common petiole 2.5-7 in. long, finely channelled or margined. *Leaflets* very variable, 3-10 by 1.5 in., elliptic, obovate or lanceolate, lateral oblique, generally serrate, acuminate, membranous, dark-green and almost glabrous above, paler and glabrescent to pubescent beneath; lateral nerves 10-12 on either half, slender, arched; base cuneate; lateral petiolules 1.5 in., terminal 3-1 in. long. *Flowers* white, about 1 in. across when expanded, clustered on narrow, usually simple, axillary, puberulous or pubescent racemes, 3-9 in. long; pedicels very short, slender. *Petals* cuneate, shaggy above the claw. *Drupels* .25 in. diam., globose, orange red, when ripe.

An exceedingly variable and widely distributed species of the forms mentioned by Hiern in F. B. I., the following may be separated within our area:—

- I. Racemes simple; leaflets lanceolate.
 Leaflets obscurely serrate, subentire, nearly glabrous; bracts small. .. *glaber*.
 Leaflets sharply and sometimes coarsely serrate.
 Petioles, under surface of leaves and inflorescence pubescent to tomentose; bracts linear exceeding the buds. .. *Aporetica*.
- II. Racemes branched, solitary. .. *Rheedii*.
- III. Racemes simple, usually 2 together, petals not declinate. .. *distachys*.

These forms are however connected by intermediate links.

Not uncommon in the DHANSIRI VALLEY, Lumding etc., in NOWGONG, also on the Northern slopes of the KHASI HILLS.

The fruit is edible when ripe and the roots possess astringent properties.

Fls. & Fr. apparently throughout the year.

The following may also be mentioned:—

A. longipes Radlk. Pflanzenreich. Heft 98. P. 592. A small tree. *Leaves* 3-foliolate; common petiole 1.5-4 in. long; leaflets 4.5-9 by 1.2-3 in.; lateral, somewhat smaller with shorter petiolules, narrow lanceolate, remotely serrulate, membranous, glabrous. *Racemes* 8-11.75 in. long.

not much branched ; peduncle long. *Buds* about .08 in. across. *Sepals* glabrous. *Petals* broad, elliptic, scale deeply 2-fid, shaggy ; ovary thinly hairy. *Loles* of fruit 3.4 in. long.

GARO HILLS, Tura—Mrs. Parry.

A. subfalcatus Radlk. Records of Botanical Survey of India Vol III—3 (1907). A shrub? *Leaves* 3 foliolate ; common petiole 2.3.5 in. long. *Leaflets* 3.5-9.3 in., elongate, lanceolate, acuminate often falcate, base of the lateral ones often unequal, remotely serrate-dentate, chartaceous, glabrous. *Racemes* not much branched, 1.7-6 in. long ; buds small. *Sepals* glabrescent. *Petals* cuneate ; disc puberulous. *Ovary* pilose. *Lobes* of fruit .4 in. long.

ASSAM, KHASI HILLS.

4. DITTELASMA Hk. f.

Dittelasma Rarak Hook. f. Vern. *Am-selenga*, Ass. (Sib.).

A middle-sized or small tree scarcely exceeding 50 ft. in height in Assam with grey leathery plain bark ; young parts softly tomentose. *Leaves* alternate, pinnate, 1.1.5 ft. long ; rachis tomentose when young, angled and ribbed. *Leaflets* (in Assam) 8 to 12, sub-opposite or alternate, 4-8 by 1.2.5 in., falcately lanceolate or oblong, acuminate or cuspidate acute, quite entire, subcoriaceous, more or less pubescent when young, afterwards glabrescent or glabrous, pale beneath ; main lateral nerves 20-25 on either half with one or more intermediate ones between them, tertiary nerves reticulate ; base oblique, cuneate ; petiolules .15-.25 in. long. *Flowers* pale, polygamo-monœcious, bracteate, in large terminal or axillary rusty pubescent, panicles. *Sepals* 5, oblong, somewhat unequal ; both sepals and petals tomentose outside. *Petals* oblong, each with a large hairy scale at the base, parallel to and nearly as long as the blade. *Disk* semicircular, glabrous. *Stamens* 8, equal ; filaments hairy, inserted inside the disk and around the base of the ovary. *Ovary* globose, 3-lobed, 3-celled, with one ovule in each cell. *Fruit* of 3 cocci, but usually only one develops to maturity and attains about 1 in. in diam., indehiscent, with a fleshy saponaceous pericarp. *Seed* globose, exarillate, exalbuminous ; testa horny ; cotyledons unequal.

Not common in the NORTH CACHAR and KHASI HILLS up to 3,000 ft., also in UPPER ASSAM, especially in the SIBSAGAR DISTRICT.

The fruit has the same properties as that of the soap-nut (*Sapindus Mukorossi* and other allied species).

Fls. 6-7. Fr. 10-11.

5. ERIOGLOSSUM Bl.

Erioglossum rubiginosum Bl. Syn. *E. edule*. Bl. Vern. *Abigran*, Garo.

A small tree with dark-grey warty bark .25 in. thick, which exfoliates in large pieces exposing a dark-brown or black surface ; inside reddish-brown, fibrous ; young parts rusty or golden tomentose. *Leaves* imparipinnate, 9-15 in. long, common petiole terete, velvety-tomentose. *Leaflets* 5-15, generally opposite or

subopposite, 4-10 by 1-3·5 in., oblong or elliptic, lateral more or less oblique, acuminate, entire, chartaceous, rusty-tomentose on both surfaces but glabrescent above; lateral nerves about 10 on either side of the midrib, arched, tertiary nerves reticulate; base unequal-sided; petiolules 1-2 in. long. *Inflorescence* 6-11 in. long of cymose clusters, borne or lax, usually paniced racemes, rusty-tomentose throughout; bracts linear, woolly. *Flowers* fragrant, brownish-white, irregular. *Calyx* 5 partite, segments about 15 in. long, two outermost smaller than others, 5 concave, imbricate in bud. *Petals* 4, slightly exceeding the calyx-lobes, obovate-oblong, clawed, each with a 2-lobed bearded scale. *Disk* 1-sided, lobed. *Filaments* 8, one forked, hairy; anthers 9. *Ovary* stipitate, 3-lobed; style declinate. *Fruit* of 3 drupels, black when also ripe.

Plains evergreen forests in the ASSAM VALLEY, not at all common.
The ripe fruit is eaten.
Fls. 3-4. Fr. 7-8.

6. CUPANIA Linn.

Trees or large shrubs. *Leaves* alternate, generally paripinnate; leaflets entire. *Flowers* small, polygamo-dicæous. in axillary or subterminal bracteolate panicles. *Sepals* 5-4, or sometimes united at the base, concave, in two series. *Petals* 5-4 or wanting, sometimes with scales at the base. *Disk* annular, fleshy, glabrous. *Stamens* 7-10, inserted within the disk. *Ovary* generally obovoid, 2-4-celled, with one ovule in each cell. *Fruit* capsular, usually loculicidal. *Seeds* globose or oblong, generally arillate, exalbuminous.

Middlesized tree. Flowers greenish.

Petals with two scales each.

Small tree. Flowers whitish. Petals often 0, without scales. .. 1. *C. Pentapetala*.

.. 2. *C. sumatrana*.

1. *Cupania pentapetala* W & A. Vern. *Koipura*, Sylh.

A fairly large tree. *Leaves* up to 12 in. in length; rachis not winged. *Leaflets* 4-8, sub-opposite or alternate, 4-8 by 1-2·5 in., ovate or oblong, bluntly acuminate, coriaceous, glabrous, shining; lateral nerves faint, slightly arched; base obtuse; petiolule 12-25 in. long. *Flowers* 5-merous, dull yellowish green, pubescent, about 15 in. diam., in racemes arranged in dense panicles. *Calyx* 5-cleft, lobes sub-valvate. *Petals* small with two glabrous incurved scales at the base. *Stamens* 7-8, exserted; filaments pubescent. *Disk* pubescent. *Ovary* 3-celled, pubescent; style short. *Capsule* stipitate, 4 in. across, pyriform, not lobed; seeds arillate.

SYLHET, Roxburgh

2. *Cupania sumatrana* Miq. Syn. *Mischocarpus pentapetalus* Radlk.

A small tree up to 40 ft. in height with a narrow crown ; branchlets reddish. *Leaves* up to 2 ft. in length ; rachis red. *Leaflets* up to 10, alternate or subopposite, 3-10 by 1·5-3 in., ovate or ovate-oblong, slightly acuminate, glabrous, chartaceous ; lateral nerves very faint, often with axillary glands, petiolules 1·5-3 in. *Flowers* whitish, 1 in. across, in panicles 6-12 in. long. *Calyx* and *Stamens* as in the preceding species. *Petals* small or wanting, without scales. *Capsule* 6-8 in. long, pyriform, ribbed, apiculate on 3-gonous stipes, red when ripe.

SYLHET, Gomez !

7. HARPULLIA Roxb.

Harpullia cupanoides Roxb. Vern. *Jong-kitil-thing*, Kuki ; *Harpulli*, Beng. (Chitt.).

A deciduous tree up to 50 ft. in height with a straight trunk, bark greyish-brown outside, more or less thickly covered with black lenticels, green beneath the corky layers, inside greenish-white to light brown, granular, with strands of brownish fibrous tissue, 2-2·5 in. broad ; branches ascending ; young parts rusty-velvety, hairs both simple and stellate. *Leaves* 6-8 in. long ; paripinnate or imparipinnate with a rudimentary terminal leaflet ; common petiole terete, rusty-pubescent. *Leaflets* 8-12, generally alternate, rarely sub-opposite, 3-9 by 1-2·5 in., ovate, elliptic or elliptic-oblong, membranous or thinly coriaceous, entire, acute, glabrous above, glabrous or minutely puberulous and glaucous beneath, always more or less puberulous along the midrib and nerves beneath ; main lateral nerves 10-16 on either half, slender, slightly arched ; base subacute or oblique with the upper half rounded or sometimes cuneate ; petiolules 2-3 in. long, rusty-velvety. *Flowers* about 3 in. long, pale-yellow, polygamous, in spreading pubescent panicles, 4-9 in. long from axils of existing or fallen leaves or extra axillary ; bracts 3-1·5 in. long, spathulate, acuminate ; bracteoles linear or subulate, tomentose ; pedicels short. *Calyx* usually 5-partite ; rusty-tomentose, lobes 2-2·5 in. long. *Petals* 5, about 6 in. long, oblong-lanceolate, clawed. *Stamens* 5 ; filaments shorter than the petals ; anthers oblong. *Disk* very small, hairy. *Male flowers* with villous pistillode. *Ovary* 2-lobed, 2-celled, hairy ; ovules usually 2 in each cell, pendulous. *Capsule* 1 by 1·5-2 in., compressed, transversely oblong, apiculate, shortly stipitate, inflated, pendulous, pale-yellow to bright-orange pubescent towards the base and often along the suture between the lobes. *Seeds* usually 1, 5-6 in. long, horizontal, obliquely ovoid-oblong, with a thick funicle and orange aril covering the base (?), hilum basal, testa dark brown, almost black ; cotyledons green ; radicle lateral ; albumen 0.

NORTH CACHAR HILLS, Mupa Valley, Panimur, etc.

Wood white, soft, apparently not suitable for use as timber, weighing about 42 lbs. per c. ft. pores with white deposit inside.

Fls. 2-3. Fr. 5-6.

According to Roxburgh the aril covers the whole seed except the apex. In my specimens the aril forms a disk-like cup at the base only, but these may not have been sufficiently mature.

8. LEPISANTHES Bl.

Lepisanthes burmanica Kurz.

An evergreen tree up to 25 ft. in height with a straight palm-like trunk; young shoots tomentose; bark fairly smooth, greyish-brown and with white blotches outside, leathery, reddish-brown inside. *Leaves* paripinnate, 2-3 ft. long; common petiole slightly channelled, pubescent. *Leaflets* 8-12, opposite or subopposite, 8-12 by 2·2-3 in., sometimes up to 14 by 4 in., elliptic or oblong-lanceolate, entire, acuminate, obtuse at the base, chartaceous, glabrous and dark-green above, puberulous along the midrib and nerves beneath, pinkish-white while very young; lateral nerves about 15 on either half, arched, prominent beneath; tertiary nerves reticulate; petiolules about 15 in. long, stout, puberulous. *Panicles* terminal or axillary, 12 in. or more in length, shaggy-tomentose, bearing numerous spike-like cyme-bearing racemes. *Flowers* pale-yellow, about 2 in. long, subsessile, mostly cymosely fascicled. *Sepals* 4-5, imbricate, orbicular, silky outside, glabrous inside. *Petals* 4, obovate or spatulate with a densely hairy scale above the claw. *Stamens* 8; filaments short, glabrous; anthers broad. *Disk* annular. *Ovary* densely woolly, 3 celled; ovules solitary in each, style short. *Fruit* drupaceous, about 3 in. diam., seed solitary; exalbuminous; cotyledons unequal.

Tippum near Jaipur, LAKHIMPUR, also in the Guma Reserve, GOALPARA; —not very common.

Wood white with wavy horny concentric bands; pores scanty but large; weight 36 lbs. per c. ft.

Fls. 5-6.

L. Listeri King ms.ex Radlk in Records of Botanical Survey Vol. III, P. 344.

A shrub? *Branchlet* terete; young parts somewhat harshly tomentose. *Leaves* with 4 pairs of leaflets, rachis striate, pubescent, 13-17 in. long or probably longer; petiolar portion 6-9 in. long. *Leaflets* subopposite, 6·5-13·5 by 2·5-6 in., upper usually larger, obovate-oblong to oblanceolate, shortly acuminate, narrowly obtuse at the base, thin, glabrous or puberulous on the midrib and nerves above, rough with minute harsh hairs beneath, nerves prominent on the under surface; lateral nerves many; petiolules stout, 3·5 in. long. *Racemes* supra-axillary, usually 2 or 3 together, 2-3·7 in. (sometimes about 7 in. if Burkill's sheet 3469 from Janakmukh, N. E. Frontier is this species), somewhat harshly tomentose at least when young. *Flowers* not seen. *Sepals* 5, ferruginous-tomentose; pedicels in fruit up to 4 in. long, articulate at the base. *Drupe* ellipsoid, about 1·7 in. by 1·3 in., with 3 compressed loculi, at first tomentose, less hairy with age, pericarp fleshy.

N. E. FRONTIER—Burkill! Duffla Hills—Lister!

Fr. 1.

L. assamica Radlk. Records of Bot. Survey Vol. III, P. 343.

A shrub? *Innovations* brown tomentose. *Leaves* paripinnate, 4-6 foliolate, rachis 12-14 in. long; leaflets subopposite, lanceolate-oblong, subcoriaceous; lateral nerves many, spreading, glabrous. *Racemes* axillary, fascicled, 1-3 in. long, densely dark-brown, pubescent; pedicels short, about 1 in.; buds subglobose up to about 2 in. across. *Sepals* 5, densely pubescent outside,

sericeous within. *Petals* 5, broadly spathulate, scales bilobed, fimbriate; disk glabrous. *Stamens* 11-12; pistillode 3 locular, 3-grooved, villous. *Female* flowers and fruits not known.

SOUTH LUSHAI HILLS near Lungleh—Gage, 3000-4000 ft.
Flrs. 4.

9. SCHLEICHERA Willd.

Schleichera trijuga Willd.

A medium sized to large branchy, deciduous tree. *Bark* light or dark grey, exfoliating in irregular plates; blaze hard, pink; young parts rusty tomentose. *Leaves* alternate, paripinnate, rachis up to 6 in. long. *Leaflets* 4-8, opposite, terminal pair largest, then gradually smaller to the lowest pair, 2-9 by 1-3.5 in. oblong or elliptic, entire, rounded, subacute or shortly acuminate at the apex; base usually unequal, glabrescent, dark green and coriaceous when mature, crimson then fresh green and pubescent along the nerves when young, nerves prominent beneath. *Flowers* small, polygamous, in pedicellate clusters on slender interrupted racemes 3-6 in. long, simple or often branched in male flowers, crowded at the ends of branches and axillary, extra axillary or borne on abbreviated branches; pedicels slender. *Calyx* minute, 4-6 lobed, lobes blunt. *Petals* 0. *Disk* annular, wavy. *Stamens* 5-8, longer than the calyx. *Ovary* hairy outside, flask-shaped, narrowed to a rigid style, 3-celled; stigma lobed. *Fruit* indehiscent, 8-1 in. long, smooth, ovoid and short pointed with dry and crustaceous rind. *Seed* enclosed in fleshy aril, smooth, brown.

Collected by Mr. R. N. De in GARO HILLS.

This is the only record we have in the herbarium of this well known tree from ASSAM.

The best lac is reared on this tree. The seeds yield an oil which is used for burning. The fleshy aril of the seeds is edible. The wood is heavy and durable.

Leafless about Feb-March for a very short time.

Flrs. 3 with new leaves. Fr. 8-9.

Seedlings trifoliate.

10. SAPINDUS Plum.

Sapindus Mukorossi Gaertn. Vern. *Ritha*, Ass. & Beng.; *Phenil*, *Arishta*, Sans.; *Manichal*, *Haitaguti*, Miri; *Haithal-bang*, *Phuwathai*, Cach.; *Hinghi*, Kuki; *Dieng-spieng-rah*, Synt.; *Thi-dak-dak-arong*, Mik.

A small deciduous tree up to 40 ft. in height with a broad globose crown; bark dark-greenish-brown, fairly smooth, with many vertical lines of lenticels and fine fissures, 12 in. thick, inside greenish-white and very faintly speckled. *Leaves* 12-20 in. long, paripinnate; common petiole very narrowly bordered, glabrous. *Leaflets* 10-20, generally alternate, often subopposite or even opposite, 3.5-6 by 1-2 in., gradually smaller towards the apex of the rachis, lanceolate or oblong, entire, acuminate, coriaceous, glabrous, turning yellow before falling; main lateral nerves

12-25 on either half with one or two intermediate ones between, much arched, generally with a pit at the axil; base more or less oblique; petiolules 1-3 in. long. *Inflorescence* a compound terminal panicle, 12 in. or more in length with pubescent branches. *Flowers* about 1 in. across, polygamous. *Calyx-lobes* 4-5, somewhat unequal, ciliate. *Petals* 5, each with a woolly scale on either side above the claw. *Stamens* 8, inserted at the centre of the annular disk; filaments woolly; anthers versatile, exserted. *Ovary* 3-cornered, normally 3-celled, glabrous; style terminal; ovule solitary. *Fruit* a globose fleshy 1-seeded drupe, 7-1 in. across; pericarp and endocarp saponaceous, wrinkled and somewhat translucent when dry; seed 3-5 in. diam., globose, black, loose in dry fruit, testa crustaceous; albumen 0.

Cultivated in villages especially in the hills, and very often found as an escape in deciduous forests.

The wood weighs about 44 lbs. per c. ft., light-yellow, compact, close grained, but is not used as timber. The saponaceous covering of the fruit is a very good substitute for washing soap and is much used. The leaves are eaten by cattle.

Flrs. 5-6. Fr. 10-1.

11. APHANIA Bl.

Shrubs or small trees. *Leaves* alternate, paripinnate or unifoliate; leaflets entire. *Flowers* polygamous, small, in large terminal or axillary panicles or racemes. *Calyx* 4-6-lobed, usually cup-shaped; lobes imbricate, petaloid. *Petals* 4-6, small. *Disk* complete, slightly lobed. *Stamens* 5-8, rarely fewer, inserted within the disk. *Ovary* usually 2-celled; style bifid; ovules solitary. *Fruit* fleshy, smooth, deeply 2-lobed. *Seed* exarillate; cotyledons thick.

Leaves usually pinnate, leaflets distant.

.. 1. *A. rubra*.

Leaves unifoliate, generally crowded at the ends of branches.

.. 2. *A. Danura*.

1. *Aphania rubra* Radlk. Syn. *Sapindus attenuatus* Wall. Vern. *Tang-ting*, *Bon-gadhi*, Ass. (Lakh.); *Tiktiki*, Ass. (Sib.); *Maiki-Bandardina*, Ass. (Darr.); *Hekokeko*, Ass. (Kam.); *Lal-koipura*, Beng. (Sylh.); *Thai-khrok*, Mech; *Dieng-soh-jimmang*, Khasi; *Dodekhi-thong*, Garo.

Usually a shrub attaining 12 ft., sometimes with a subscandent habit, rarely a small tree up to 20 ft. in height, branches verrucose, often with minute vertical fissures. *Leaves* alternate, crowded at the ends of branches; leaflets 8-10, mostly subopposite, very variable in shape and size, generally 5-12 by 1.5-4.5 in., ovate, elliptic-oblong or ovate to oblong lanceolate, acuminate, entire, sub-coriaceous, glabrous; main lateral nerves 10-15 on either half, generally with a shorter intermediate one between, arched, tertiary nerves reticulate; base rounded or slightly cuneate, petiolules 3-5 in. long, swollen at the base. *Flowers* about 15 in. across, brick-red, glabrous, in large terminal or lateral, puberu-

lous or glabrate panicles. *Calyx* lobes 4-5, greenish outside, unequal, ciliolate. *Petals* 4-5, as long as the sepals, sometimes with scale at the base. *Stamens* 6-8; filaments 0 or very short. *Ovary* 2-lobed. *Fruit* about .7 in. long, 1-2-lobed, ellipsoidal, red while ripening, purple and soft when fully ripe.

Found throughout the Province chiefly in evergreen types of forests.

Wood moderately hard and tough and used as tool-handles. The ripe fruit is eaten.

Flowers 11-1. Fr. 3-4.

2. *Aphania Danura* Radlk. Syn. *Sapindus Danura* Voigt. Vern. *Danura*, *Ambriuj*, *Nunchha*, Beng.

An evergreen shrub or small tree. *Leaves* 1-foliolate, often so crowded at the ends of the branches as to appear verticillate, 4-12 by 1-5 in., obovate-elliptic, oblong or lanceolate, acute or very shortly acuminate, entire, coriaceous, glabrous and shining on both surfaces, gradually narrowed to a rounded or subcordate base; lateral nerves 12-16 on either side of the midrib with shorter intermediate ones; petiole .08-.2 in. long, stout. *Flowers* small, yellowish-pink at the tips, in terminal panicles up to 12 in. long. *Sepals* 5, orbicular, unequal. *Petals* 5, each with a woolly scale at the base. *Stamens* 6-8; filaments short; anthers obtuse. *Disk* crenulate, glabrous. *Ovary* glabrous, 2-3-lobed. *Fruit* of 1-3 drupels, shortly stipitate, ellipsoidal, .3-.5 in. long, turning orange-red to blackish in ripening.

SYLHET and CACHAR and possibly also GOALPARA.

Fls. 2-4. Fr. 5-6.

12. XEROSPERMUM Bl.

***Xerospermum Noronhianum* Bl.** Vern. *Bura*, Beng. (Cach.); *Buru-buphang*, Kach.; *Khoirao*, Naga; *Dieng-soh-moni-ar-shree*, Khasi; *Shanpi*, *Khuranchi*, Garo.

A middle-sized evergreen tree with a dense oval crown; young shoots puberulous. *Bark* dark-brown outside, uneven with warts, red with green streaks underneath the thin corky layer, reddish brown inside, fibrous, brittle. *Leaves* alternate, paripinnate, exstipulate; leaflets generally 4, rarely 2, more rarely 1, 3-6 by .8-1.5 in., elliptic to oblong lanceolate, acuminate, quite entire, coriaceous, glabrous, shining on both surfaces; lateral nerves 10-12 on either half, slender, arched; tertiary nerves closely reticulate; base cuneate; petiolules .15-.25 in. long. *Flowers* small, light yellow or greenish in sub-simple fascicled axillary racemes of varying lengths up to 4 in.; pedicels up to .1 in. long. *Sepals* 4, imbricate, in 2 series, outer smaller, ciliate. *Petals* 4, ciliate without basal scales. *Disk* annular, glabrous. *Stamens* generally 8, inserted within the disk. *Ovary* didymous, 2-celled; ovule solitary, ascending. *Fruit* yellow, usually 1-lobed; lobes about 1 by .8 in., ellipsoid, muricated with low pyramidal

tubercles ; seed exarillate ; testa pilose ; cotyledons large, superposed.

Evergreen forests of UPPER ASSAM and the SURMA VALLEY, also in the HILL DISTRICTS up to 3,000 ft.,—not common. The wood appears to be hard, tough and heavy but coarse-grained.

Fls. 4-5. Fr. 11-3.

13. NEPHELIUM Linn.

Nephelium Longana Camb. Vern. *Naga-lichi*, Ass. (Lakh.) ; *Tokra*, *Kath-lechi*, *Mirgach*, Ass. (Nowg.) ; *Tagong-asing*, Abor ; *Asri-phang*, *Asuri-baphang*, Kach. ; *Marli-arong*, *Mirchesu*, Mik. ; *Marli-thing*, Kuki ; *Dieng-loba*, Khasi ; *Samphal-bol*, Garo ; *Eye-ball tree*, Eng.

A middle-sized evergreen tree up to 50 ft. in height, buttressed at base. *Bark* dark-grey and rough outside, reddish-brown and fibrous inside with fine concentric bands of whitish tissue. *Leaves* alternate ; common petiole terete. *Leaflets* 4-10, opposite or sub-opposite, rarely alternate, 2-10 by '6-2'5 in., elliptic, ovate or oblong-lanceolate, acute or acuminate, entire, subcoriaceous, glabrous and shining above, glaucous and generally soft beneath, red when young ; lateral nerves 12-20 on either half, tertiary nerves reticulate ; base more or less oblique ; petiolules '2-3 in. long, margined. *Flowers* polygamous, pale-yellow or dull-white, somewhat dimorphic, mostly in cymose clusters on the branches of terminal pubescent panicles, 6-12 in. long ; pedicels stout, buds globose. *Calyx* 5-6-lobed, lobes imbricate in bud, velvety tomentose on both sides. *Petals* generally 5, as long as the calyx-lobes, spathulate, pubescent. *Disk* tomentose. *Stamens* 6-10 ; filaments pubescent, longer in the male than in the female or hermaphrodite flowers. *Ovary* 2-3-lobed. *Fruit* '6-8 in. diam., globose, tubercled, purplish-red when ripe ; aril complete, thin, subacid.

Fairly common in evergreen types of forests in UPPER ASSAM and in the HILL DISTRICTS, ascending to 3,500 ft. in GARO HILLS, cultivated in most parts of India.

Wood close-grained, moderately hard, of a reddish colour, weighing about 55 lbs. per c. ft. It is used for posts and agricultural implements. The aril of the fruit is eaten.

Fls. 4-5. Fr. 7-9.

Nephelium Lit-chi Camb. Vern. *Lesi*, *Lisi*, Ass. ; *Nichu*, Beng.—is very closely allied to the above species. It has been successfully cultivated in some parts of Assam, e.g., Sibsagar, Dibrugarh and Gauhati. *Calyx* nearly truncate. *Petals* 0. *Disk* glabrous. *Fruit* about 1 in. long, tubercled, ovoid, ripening in May-June. Wood harder and heavier than of *N. Longana*.

Dodonæa viscosa Jacq. A stiff evergreen resinous shrub. *Leaves* alternate, exstipulate, subsessile, 1'5-3 by '2-1 in., oblanceolate, coriaceous, shining above. *Flowers* polygamous, inconspicuous, yellowish green, '2 in. across in short terminal panicles. *Calyx* 5 lobed ; lobes about '1 in. long. *Petals* 0. *Stamens* 8 ; disk inconspicuous. *Ovary* 3-4 celled. *Fruit* a compressed capsule, '5 in. long, membranous, 2-4 winged and septicidally 2-4 valved.

Sometimes grown in gardens e.g. Shillong.

FAM. 46. SABIACEÆ.

Climbing or erect shrubs or trees. *Leaves* alternate, exstipulate, simple or imparipinnate. *Flowers* small, 1-2 sexual, generally panicled. *Calyx* 4-5 cleft; lobes imbricate. *Petals* 4-5, imbricate, sometimes unequal. *Stamens* 4-5, inserted at the base of and opposite to the petals, all or two only perfect. *Disk* small, annular. *Ovary* 2-3 celled, compressed; ovules 1-2 in each cell; styles 1-2, free or connate. Fruit a drupe or of 1-2 dry carpels; seeds with a broad hilum; albumen 0.

Climbers. Petals and stamens equal, the latter all fertile .. 1. *Sabia*.
 Trees or large erect shrubs. Petals and stamens unequal.
 Only two stamens fertile. ... 2. *Meliosma*.

1. SABIA Coleb.

Scandent shrubs. *Leaves* simple, quite entire. *Flowers* usually 2-sexual, solitary or in cymes or panicles, each supported by a pair of opposite bracts. *Calyx* of 4-5 equal lobes. *Petals* 4-5, equal, generally green or purplish, with translucent veins. *Stamens* 4-5, all fertile. *Disk* annular, 4-5 lobed. Carpels generally 2; styles 2, terminal in flower, more or less cohering; ovules 2 in each carpel. *Fruit* of 1 or two dry and gibbous carpels 1-seeded, each with the remains of the styles which become sub-basal in fruit; seed reniform.

- I. Cymes simple, 3-5-flowered. Flowers greenish purple. Stamens equal. .. 1. *S. purpurea*.
- II. Cymes dichotomous, 7-11 flowered. Flowers yellowish, Stamens unequal. .. 2. *S. parviflora*.
- III. Cymes many flowered :—
 - A. Leaves glaucous beneath; flowers greenish-white :—
 - Panicles from leaf axils or supra-axillary; cymes peduncled, corymbosely arranged. .. 3. *S. lanceolata*.
 - B. Leaves green beneath; flowers yellowish :—
 - Panicles racemiform, rachis and its branches glabrous. .. 4. *S. limoniacea*.
 - Panicles much branched, rachis and its branches pilose. .. 5. *S. paniculata*.

1. *Sabia purpurea* Hk. f. & Th. Vern. *Jermi-neirang-chhai*, *Dieng-jermei*, Khasi.

A small straggling and rather bushy climber; branchlets green or greenish-purple; bark yellow inside. *Leaves* generally

2-3 by '3-1 in., but about twice this size on flowerless branches, oblong or lanceolate, long acuminate, softly and thinly coriaceous, puberulous when very young, otherwise glabrous, somewhat pale but shining beneath; main lateral nerves 3-4 on either half, slender, straggling with three or four intermediate nerves between them, much anastomosing; base generally rounded; petiole '2-5 in. long. *Peduncles* axillary, shorter than the leaves, filiform, irregularly branched, 3-5 flowered; pedicels '5-6 in. long. *Sepals* about '06 in. long, ovate. *Petals* nearly '16 in. long, oblong-lanceolate, purplish-brown, 5-nerved, tips often reflexed. *Filaments* subulate. *Drupe*s generally solitary, '2-3 in. across., orbicular, compressed, rugose, blue when fully ripe, with the style on one side a little above the calyx.

Fairly common in the KHASI HILLS, 4-6000 ft.

Flrs. 3-4. Fr. 6-7.

2. *Sabia parviflora* Wall.

A climbing shrub somewhat more woody and more rigid than the foregoing species and in some respects intermediate between it and the next species; young parts thinly pubescent. *Leaves* 2-4 by '7-1'3 in., ovate-oblong or ovate-lanceolate, with wavy margins, acuminate, coriaceous, glabrous, somewhat pale beneath, midrib stout; lateral nerves about 10 on either half, almost horizontal, joined by two lines of arched intramarginal veins far within the margin; base rounded; petiole '2-4 in. long, slightly puberulous or glabrous. *Cymes* dichotomous, 7-11 flowered; peduncles 1-1'5 in.; pedicels about '2 in. long. *Flowers* minute. *Sepals* ciliate. *Petals* oblong, 5-nerved. *Filaments* ligulate, unequal. *Drupe*s 1-2 together, '2-4 in. across, compressed; stone sub-reniform, prominently pitted and ridged on the margin.

KHASI HILLS, 3250 ft., Baipani Forest; 4-5000 ft., Mann. Not common.

Flrs. 4-5 (?). Fr. 7-8.

3. *Sabia lanceolata* Colebr. Vern. *Miri*, *Mandri*, Garo; *Samtamch*, Khasi.

A climbing shrub; bark black, yellowish inside. *Leaves* 3-7 by 1-2 in., bifarious, oblong-lanceolate or oblong, caudate acuminate, acute or rounded at the base, subcoriaceous or membranous, shining above, glaucous beneath; main lateral nerves 8-12 on either half, generally almost horizontal, joined by an intermarginal nerve well within the margin; petiole '2-4 in. long. *Panicles* peduncled bearing corymbosely arranged, peduncled cymes; peduncles axillary or supra-axillary; 1'5-2 in. long, slender, glabrous; rachis of panicles puberulous or glabrate; pedicels about '15 in. long, slender. *Flowers* greenish-white, sweet-scented. *Sepals* broadly ovate. *Petals* '15 in. long, ovate-acuminate, imbricate in bud. *Filaments* shorter than the petals, broadly

winged. *Fruit* generally of compressed sub-pyriform ; drupels '6-7 in. long, blue when ripe.

Plains of the BRAHMAPUTRA VALLEY also the KHASI and GARO HILLS up to 6,000 ft. Fairly common.

The leaves are used by the Garos for fomenting in cases of swellings and pain on the ankle or wrist.

Flrs. 11-12. Fr. 3-4.

4. *Sabia limoniacea* Wall.

A large climber ; bark blackish smooth and shining, yellow inside. *Leaves* 3-8 by 1.25-3.25 in., oblong to ovate-lanceolate, elliptic or oblong, acute or acuminate, thickly coriaceous, dark-green above, somewhat pale and often pinkish underneath, turning yellow when old ; main lateral nerves 5-6 on either side of the midrib, much arched, tertiary nerves reticulate and very prominent beneath ; base rounded or subacute ; petiole '6-1 in. long, channelled. *Panicles* axillary or supra-axillary, 3-5 in. long, racemiform, reddish, quite glabrous, with persistent bud-scales at the base ; pedicels '1-1.2 in. *Flowers* '1-1.2 in. across., greenish-yellow. *Calyx* lobes orbicular or broadly ovate. *Petals* '1 in. long, ovate or obovate, 5-nerved. *Stamens* included. *Fruit* of one or two drupels, each about '5 in. across, much compressed, red when ripe.

Throughout the plains of both VALLEYS, also up to 3,000 ft. in the HILLS, generally in evergreen types of forest.

Flrs. 12-2. Fr. 2-4.

5. *Sabia paniculata* Edgew.

A large evergreen climber ; stem dark-grey. *Leaves* 3-8 by 1.5-3 in., oblong-lanceolate, acuminate, coriaceous, dark-green and shining above, pale beneath ; main lateral nerves 6-8 on either half, much arched, tertiary nerves strongly reticulate ; base generally rounded ; petioles '3-6 in. long, shallowly channelled. *Flowers* yellow, inodorous, '1.5-2 in. across, in large lateral often leaf-bearing panicles ; ramifications and pedicels slender, red, pilose. *Sepals* elliptic, densely hairy outside. *Petals* about '1 in. long, oblong, 3-5 nerved, glabrous. *Filaments* ligulate. *Fruit* usually of a solitary drupel, '3 in. across., orbicular, compressed.

Along the foot of the Himalayas in NORTH KAMRUP, generally affecting shady and swampy localities.

Flrs. 1-2. Fr. 5-6.

Sabia ? sp. A large woody climber. *Leaves* 5-8 by 2-3 in. elliptic-oblong or oblong, abruptly short acuminate, coriaceous, glabrous, lateral nerves 6-8, much arched and anastomosing within the margin ; petiole swollen at the top, '4-8 in. long. *Flowers* not seen. *Cymes* few flowered, not peduncled ; pedicels puberulous, stout, '2 in. long. *Drupe* usually solitary, about '4 in. long.

Sheet No. 3793. Materials incomplete for identification.

Charduar—DARRANG.

Fr. 4.

2. MELIOSMA Bl.

Trees or shrubs, usually with hairy extremities. *Leaves* simple, or imparipinnate. *Flowers* small in large terminal or lateral thyrsoid panicles. *Sepals* and *petals* 4-5, unequal. *Stamens* usually 5, two fertile and adnate to the smaller petals, the rest without anthers; anther cells of the fertile stamens globose, attached to a large flat connective. *Disk* 4-5 toothed, cup-shaped, membranous. *Ovary* sessile, usually 2-celled; ovules 2 in each cell; style 1, subulate. *Fruit* a drupe, obliquely globose; endocarp bony. *Seed* solitary; cotyledons folded.

I. Leaves simple:—

Mature leaves glabrous; fruit pyriform, nearly ½ in. long.

.. 1. *M. Mannii*.

Mature leaves more or less puberulous beneath; fruit globose, about ½ in. across.

.. 2. *M. simplicifolia*.

II. Leaves imparipinnate; leaflets more or less pubescent; fruit globose, not exceeding ½ in. in diam:—

A. Leaflets distantly serrate:—

Leaflets 7-13.

.. 3. *M. Wallicfii*.

Leaflets 13-25.

.. 4. *M. pinnata*.

B. Leaflets quite entire, 11-15.

.. 5. *M. Arnottiana*.

1. *Meliosma Mannii* Lace.

A small tree; branchlets and ramifications of inflorescence covered with oblong lenticels. *Leaves* 2½-5 in. long, oblong or oblanceolate, distantly serrate-toothed or entire, rounded or somewhat acute at the apex, coriaceous, glabrous, shining above; lateral nerves 8-10 on either half, oblique, slightly arched, with tufts of hair-like scales at the axils, tertiary nerves finely reticulate; base cuneate; petiole ¾ in. long, swollen at the base. *Inflorescence* terminal, 8-10 in. long and as broad, dense-flowered, puberulous, lower part leafy. *Flowers* white, about ½ in. across on pedicels ⅕-⅙ in. long. *Sepals* generally 4, unequal, minutely ciliate. *Petals* 5, the three outer orbicular, concave, about ⅛ in. long. *Fruit* a pyriform drupe, ¾ in. long, scarlet when fully ripe, 1-celled, 1-seeded; pericarp fleshy, smooth; endocarp rugose and with a median ridge; cotyledons fleshy, oily.

KHASI HILLS, very rare. Distribution:— UPPER BURMA.

Flrs. (?) Fr. 1-2.

2. *Meliosma simplicifolia* Roxb. Vern. *Thowthowa*, Ass.; (Sibs); *Larubandha*, Ass. (Lakh.); *Pichola*, Ass.; (Darr.); *Sankonaro*, Ass. (Darr.); *Hengunia*, Ass. (Nowg.); *Phoko*, *Dhapapatia*, Ass. (Kam.); *Gurban-asing*, Miri & Abor; *Nitak-asing*; Miri; *Phaglan-jan-arong*, Mik.; *Dieng-lyng-krong*, *Dieng-la-pia*, *Dieng-nong-krow*, Khasi; *Nah-pui*, *Thing-erkum*, Kuki; *Lai-doibru*,

(or Dibru?), Mech; *Borsiring*, *Thaukhu-khokhra*, *Babari-chi*, *Samnabat*, Garo; *Bon-khoklu*, Cach.; *Koaso*, Naga.

A small tree, almost evergreen; bark greenish-grey outside, pink inside with very fine reticulating veins of deeper red, turning to reddish tan-brown after exposure, '3-5 in. thick, fibrous; exuding a watery juice from cuts; branchlets pubescent or puberulous. *Leaves* 5-15 by 1.5-6 in., oblanceolate or obovate-oblong, shortly acuminate or rounded at the apex, entire or distantly serrate-toothed, chartaceous or subcoriaceous, glabrous above, puberulous or glabrescent beneath; main lateral nerves 14-22 on either half, oblique but nearly straight, joining at the extremities to form a more or less continuous scalloped intermarginal vein; base very acutely cuneate; petiole 1-1.5 in. long, margined, swollen at the base, pubescent or glabrate. *Panicles* as long as or sometimes longer than the leaves, terminal with lower branches often from the axils of the upper leaves, pubescent. *Flowers* white, turning to pale-yellow, sessile or subsessile, scarcely .1 in. across., buds globose. *Sepals* ciliate. *Petals* 3, outer large, orbicular, 2 inner scale-like, bifid. *Drupe* about .2 in. across., globose; endocarp keeled and reticulate, rugose.

Common throughout the province, ascending to 3,000 ft. in the Hills.

Wood light reddish brown, moderately hard, pores evenly distributed, medullary rays numerous, moderately broad, weight about 33 lbs per c. ft.

Flrs. 1-5. Fr. 3-6.

3. *Meliosma Wallichii* Planch. Vern. *Dieng-sngit*, Khasi; *Dieng-chidit*, *Dieng-sniat*, *Dieng-la-myrsiang*, Syat.

A middle-sized tree up to 60 ft. in height and nearly 5 ft. in girth; branchlets rusty puberulous; older branches dotted with raised lenticels; bark dark-grey or greyish-brown, often with horizontal wrinkles, fibrous, inside white, on large trees in alternate broad radial bands of white and pink turning to tan-brown on exposer. *Leaves* imparipinnate, about a foot long, rachis terete, rusty-tomentose. *Leaflets* 5-13, opposite or subopposite, 3-7 by 1-2 in., ovate, obovate-oblong or oblong, acuminate, distantly cuspidate-serrate or on very old trees entire, subcoriaceous, glabrous and often with a grey metallic lustre above, rusty-tomentose beneath; lateral nerves 8-12 on either half, slanting and much arched; base rounded, more or less oblique; petiolules .2-.7 in. long. *Panicles* terminal, much branched, rusty-tomentose. *Flowers* very small, shortly pedicelled. *Sepals* orbicular-ovate. *Petals* sub-valvate. *Drupe* globose, about .2 in. across., reddish when ripe.

KHASI & JAINTIA HILLS 2500-6000 ft.

Wood very light, soft, spongy, light brown, medullary rays broad with finer ones in between, pores large, handsome on radial section with conspicuous silver grain liable to crack.

Flrs. rainy season. Fr. cold season.

4. *Meliosma pinnata* Roxb. Vern. *Hengnua* or *Hengunia*, *Banpasola*, *Mamoi*, Ass., *Dermi-asing*, *Miri*; *Nammu-Changne*, Duff.; *Toiram*, Kuki; *Dieng-krot*, *Dieng-soh-naior*, Khasi; *Bolnichik*, *Bolandime*, *Gapenda*, Garo.

Usually a small tree up to 35 ft. in height but occasionally grows up to 50 ft. *Bark* grey or brownish outside, dark-green underneath the cuticle, inside red, oxidising to brown after exposure. *Leaves* imparipinnate, 9-18 in. long; rachis terete, more or less puberulous. *Leaflets* 11-25, opposite or subopposite, 3-8 by 7-15 in., oblong-lanceolate, long-acuminate, usually distantly cuspidate-serrate, subcoriaceous, glabrous above, more or less pubescent beneath, especially along the reddish midrib and nerves, brownish-red when young; lateral nerves about 15 on either half, much arched, tertiary nerves closely reticulate; base acute or cuneate; petiolule 1-2 in. long, pubescent. *Panicles* terminal, 1 ft. or more in length with spreading branches. *Flowers* white, minute, sessile or shortly pedicelled; *Sepals* broadly or suborbicular, ovate, ciliate. *Petals* glabrous. *Drupe* globose, about 2 in. across.

Common throughout the PLAINS DISTRICTS of both VALLEYS and up to 3000 ft. in the HILLS.

The wood is light, porous and brittle, and of no timber value. The young leaves are eaten by the Miris cooked with fish.

Flrs. 4-6. Fr. 8-9.

5. *Meliosma Arnottiana* Wight?

A tree up to 40 ft. in height; branchlets rusty velvety tomentose. *Leaves* 6-10 in. long; common petiole and petiolules rusty pubescent. *Leaflets* 11-15, opposite or subopposite, 2-4 by 7-15 in., ovate to oblong lanceolate, caudate-acuminate, quite entire, chartaceous, glabrous above, rusty pubescent beneath; lateral nerves 8-10 on either half, oblique, slightly arched with a tuft of bristles at the axils; tertiary nerves closely reticulate; base rounded or subacute; petiolules 2-5 in. long. *Panicles* terminal, about a foot long, much-branched, ramifications rusty pubescent. *Flowers* minute, sessile or very shortly pedicelled. *Sepals* ovate, puberulous, ciliolate. *Petals* subvalvate. *Drupe* globose, about 15 in. across.

Barapani in the KHASI HILLS,—rare.

Flowers in our specimens are much smaller than in the type.

Flrs. 5-6. Fr. 7-8.

FAM. 47. ANACARDIACEÆ.

Trees or erect shrubs, the latter very rarely scandent, generally with a acrid milky or resinous juice. *Leaves* alternate (in all the species described here), simple, trifoliolate or imparipinnate, exstipulate. *Inflorescence* generally a terminal panicle. *Flowers* small, mostly regular, unisexual and polygamous or bisexual. *Calyx* 3-5-partite. *Petals* free, as many as the calyx-divisions and alternating with them, imbricate or valvate in bud, sometimes accrescent, rarely 0. *Disk* cup-shaped or annular. *Stamens* usually as many as the petals, rarely twice as many, inserted under or on the disk, sometimes not all fertile. *Ovary* usually superior and 1-celled; styles 1-4; ovule solitary in each cell, pendulous. *Fruit* a drupe; seed exalbuminous; cotyledons plano-convex.

1. RHUS Linn.

Trees or shrubs with resinous or acrid juice. *Leaves* 3-foliolate or pinnate, rarely simple. *Flowers* small, polygamous, paniced. *Calyx-limbs* 4-6; petals 4-6, imbricate. *Disk* fleshy, annular. *Stamens* 4-10, inserted at the base of the disk, often lobed. *Ovary* sessile, 1-celled; styles 3. *Drupe* dry, with a pendulous seed.

* Assam species.

I. Leaflets pubescent or tomentose beneath :—

Petiole winged, densely pubescent.

Leaflets 4-6 pairs. ..

1. *R. semialata*.

Petiole not winged, slightly

pubescent. Leaflets 5-12 pairs. ..

2. *R. khasiana*.

Petiole not winged, glabrous or

nearly so. Flowers pedicelled. ..

3. *R. insignis*.

II. Leaflets glabrous beneath ;—

Panicles slender, glabrous or

nearly so. Flowers pedicelled. ..

4. *R. succedanea*.

Panicles stout, pubescent. ..

5. *R. Griffithii*

1. **Rhus semialata** Murr. Vern. *Naga-tenga*, Ass.; *Soh-ma*, *Dieng-soh-ma*, *Dieng-soh-sma*, Khasi; *Dieng-sa-ma*, Synt.; *Khetma*, *Khitma*, Garo; *Gimbao*, Kach.; *Khokma-thing*, Kuki; *Bhakhimlo*, Nep.

A small deciduous tree somewhat gregarious in habit, young parts and inflorescence covered with dark-grey pubescence; bark ashy-grey, warty, dull greenish-white inside. *Leaves* imparipinnate, over a foot long; common petiole usually winged between upper leaflets. *Leaflets* 4-6 pairs, opposite, lateral sessile, 2-4 by 1-2 in., elliptic ovate or oblong-lanceolate, acuminate, deeply crenate or dentate, membranous, pubescent along the midrib, otherwise glabrous above, densely grey-tomentose beneath; main lateral nerves 10-15 on either half, parallel, almost transverse; base rounded, oblique. *Panicles* terminal, 6-8 in. long, conical, dense-flowered. *Flowers* 1 in. across, whitish or pale-green; pedicels minute. *Sepals* small, ovate, pubescent. *Petals* oblong, ciliate, much exceeding the sepals. *Drupe* 15-2 in. across, sub-globose, compressed, pink when mature.

Common in the KHASI HILLS above 2,500 ft., also found along the foot of the Himalayas e.g., Dulong-mukh, Khalingduar, etc.

The ripe fruit has a sharp acid taste and is much eaten by the Nepalese. It is also used as a substitute for rennet in preparing curds. It is said to be a remedy for colic.

Fls. 5-9. Fr. 9-4.

2. **Rhus khasiana** Hk. f.

A middle-sized tree up to 45 ft. in height; bark 7 in. thick, greyish-brown and rough outside, split into oblong plates, red below the outer dead layers, inside finely fibrous, light red, mottled with white streaks. *Leaves* pinnate, 12-18 in. long; common petiole slender, minutely grey-puberulous, glabrescent. *Leaflets* 5-12 pairs, often alternate, 3-5 by 6-17 in., lanceolate, sharply serrate or sub-entire, acuminate, membranous, glaucous and hairy along the midrib and nerves beneath; lateral nerves about 15 on either side of the midrib, very slender, slightly arched; base obliquely cuneate; petiolules about 2 in. long. *Panicles* terminal, rather lax. *Drupe* 3 in. across, orbicular-ovate, compressed, pedicelled; epicarp papery; endocarp fibrous.

KHASI HILLS. not common.

3. *Rhus insignis* Hk. f.

A handsome tree up to 30 ft. in height; branchlets stout, with rusty-villous tips. *Leaves* 12-20 in. long; common petiole terete but slightly angled towards the base, glabrous, speckled with lenticels. *Leaflets* 7-11, 3-9 by 1·7-3·5 in., ovate, oblong or lanceolate, abruptly or tapering acuminate, entire, sub-coriaceous, glabrous and shining above, softly rusty-tomentose beneath; lateral nerves 20-30 on either half, parallel, slightly arched, tertiary nerves strong; base unequally rounded, sometimes cordate; petiolules 15-25 in. long, glabrous. *Panicles* axillary, shorter than the leaves, lax, long-peduncled, rachis and ramifications lenticelled, glabrous. *Flowers* 1 in. across. *Petals* with a stout midrib. *Drupe* globose, 3 in. across; epicarp thin, dry; endocarp waxy; stone crustaceous.

KHASI HILLS, not common,—Nartiang, Jowai Sub-Division—Distribution—Sikkim.

Fls. 5-6. Fr. 7-10.

4. *Rhus succedanea* Linn. Vern. *Dieng-kean* or *-kain*, *Ka-kain*, Khasi; *Dieng-suit*, Synt. (Nartiang); *Thing-hran*, Kuki; *Bol-micheng*, *Bol-khat-thi*, Garo.

A middle-sized deciduous tree up to 50 ft. in height. *Bark* 1-15 in. thick, dark-grey and rough outside, split with vertical reticulate fissures and exfoliating in irregular flakes, white to very light brown inside, faintly mottled with strands of darker brown fibres,—on young parts plain and with horizontal lines or lenticels. *Branchlets* usually glabrous. *Leaves* imparipinnate, crowded at the ends of branches; common petiole swollen at the base, terete, glabrous. *Leaflets* 3-6 pairs, opposite, 2-6 by 7-2 in., ovate to lanceolate or oblong, long-acuminate, entire, thinly coriaceous, usually quite glabrous, pinkish brown when very young, turning red before falling; main lateral nerves 12-25 on either half, straight, almost transverse, often alternating with shorter intermediate ones; base acute or rounded, more or less oblique; petiolules 2-4 in. long, slender or fairly stout. *Panicles* axillary, 5-10 in. long, with slender and drooping branches, usually glabrous. *Flowers* greenish yellow, scarcely 1 in. in diam. *Sepals* ovate, obtuse. *Petals* much larger, oblong. *Disk* 5-lobed. *Drupe* 25-3 in. in diam., orbicular-compressed, rugose, glabrous, shining yellow or tan-brown; epicarp thin, bursting irregularly; mesocarp fibrous; stone compressed, hard, surrounded with a thick coating of wax.

Fairly common throughout the province, specially in the hills and their neighbourhood.

Wood greyish white, twining brown with age, heartwood small, yellow. In this province the wood is heavier (44·6 lbs. per c. ft), harder and tougher than given in Gamble's Timber Manual in respect of W. Himalayan specimens and seems to be suitable at least for agricultural implements. The wax of the

seeds is made into candles in Japan where the tree is also tapped for the famous lacquer varnish. The juice is corrosive.

Fls. 3-4. Fr. 1-5.

5. *Rhus Griffithii* Hk. f. Vern. Darmi-asing, Miri, also the names usually given to the foregoing species.

A smaller tree with a more open crown than *R. Succedanea*. *Bark* 25 in. thick, greyish-brown, lenticelled, otherwise plain, inside light-red, mottled with specks of deeper red, exuding a brown gum from cuts. *Leaves* imparipinnate, crowded at the ends of branches, 1-2 ft. long, quite glabrous; common petiole terete red. *Leaflets* 4-10 by 1-3.5 in., oblong, ovate or elliptic-lanceolate, acuminate, often abruptly, quite entire, coriaceous, more or less shining when mature; midrib red; lateral nerves 16-20 on either half, strong, parallel; base cuneate; petiolules stout. *Panicles* axillary, 5-6 in. long, branches pubescent, glabrate in fruit. *Flowers* 1 in. in diam., sessile or shortly pedicelled. *Sepals* ovate, pubescent. *Petals* linear-oblong. *Stamens* exserted. *Disk* lobed. *Drupe* about 25 in. across, orbicular or obliquely ovate, compressed; epicarp thin; stone surrounded with wax.

Fairly common in UPPER ASSAM and the HILLS.

The wood is of the same quality as of the preceding species. The young leaves are used as a vegetable by Miris and Abors.

Fls. 3-5. Fr. 7-10.

2. SEMECARPUS Linn. f.

Tree generally with acrid juice. *Leaves* alternate, simple, entire, coriaceous. *Flowers* polygamous or dioecious, generally in terminal panicles. *Calyx* 5-6-fid, segments deciduous. *Petals* 5-6, imbricate, usually much exceeding the sepals. *Disk* broad, annular. *Stamens* 5-6, inserted outside and below the disk, imperfect in the female flowers. *Ovary* 1-celled; styles 3. *Drupe* fleshy, oblong, more or less obliquely seated on a fleshy receptacle formed of the accrescent calyx-tube and the disk; pericarp filled with an acrid juice. *Seed* pendulous; testa coriaceous; cotyledons plano-convex; radicle superior.

Leaves pubescent beneath. Flowers 2-3 in. across; drupe obliquely oblong. ..

.. 1. *S. Anacardium*.

Leaves glabrous beneath. Flowers scarcely 1 in. across; drupe transversely oblong. ..

.. 2. *S. Prainii*.

1. *Semecarpus Anacardium* Linn. f. Vern. Bhela, Bhala, Beng. & Ass.; Bar-bhola, Ass. (Nowg.); Bhaola, Bhala, Bhelawa, Mech; Bol-agal, Bareri, Babari, Garo, Barla-arong. Mik.; Dieng-soh-bhala. Khasi; Pursho-bhola, Nep. Bhallataka, arushkara, Sans. The marking nut tree.

A moderate-sized deciduous tree; young parts and inflorescence pale velvety tomentose. *Bark* dark-brown to blackish-grey

outside, rough, split vertically, light-red inside, .3-.5 in. thick, exuding an acrid milky juice. *Leaves* alternate, simple, crowded at the extremities of branches, 8-24 by 4-14 in., obovate or elliptic oblong, sometimes pandurate, generally rounded at the tip, sometimes subacute, entire, thinly coriaceous, harsh with short scattered bristles, but glabrate with age, and dark green above, brownish-grey and tomentose beneath, specially along the nerves; midrib very stout; lateral nerves 16-24 on either half, prominent beneath, straight or slightly arched; base sub-acute or rounded, sometimes abruptly cordate; petiole 1-2 in. long, very stout, flattened above. *Panicles* terminal, lower branches often from upper leaf axils. *Flowers* .2-.3 in. across, sessile, in fascicles on the branches of the panicles; bracts lanceolate or subulate. *Calyx* obconic, 5-cleft, densely buff-velvety outside. *Petals* greenish-yellow, about .15 in. long or lanceolate, pubescent outside, glabrous within. *Disk* shaggy. *Filaments* subulate. *Styles* densely hairy. *Drupe* 1 in. long, somewhat obliquely oblong-ovoid, usually of the shape of a miniature mango, compressed, shining, black when ripe, seated on an orange coloured, fleshy receptacle formed of the disk, the base of the calyx and the extremity of the stalk.

Fairly common in deciduous forests in the BRAHMAPUTRA VALLEY and up to 2,000 ft. in the HILLS.

Wood soft and light, not used as timber. The cup of the ripe fruit is eaten raw, dried or roasted. The pericarp of the fruit contains an acrid juice which is used as marking ink, and in medicine.

Fls. 7-9 with new leaves. Fr. 12-3.

Somewhat rare in UPPER ASSAM and the SURMA VALLEY.

2. *Semecarpus Prainii* King Journ. Ass. Soc. Beng. 65 (1897), 511. Syn. *S. heterophyllus* Hk. f.

A large tree with rough brown bark and glabrous branchlets. *Leaves* 5-12 by 1.5-4 in., oblanceolate, abruptly obtusely acuminate, quite entire, coriaceous, dark-green and shining above, buff-grey and rather strongly reticulate beneath, quite glabrous on both surfaces; lateral nerves 15-20 on either half, abruptly arched near the margin, otherwise straight, tertiary nerves transverse to the secondary nerves; base very gradually narrowed to the petiole; petiole .7-1.5 in., slightly swollen at the base and depressed above. *Panicles* terminal, exceeding the leaves, branched down to the base with thinly pubescent branches. *Flowers* dioecious; bracts subulate. *Males* about .1 in. across, sessile in clusters of 3-8; buds globose; calyx pubescent, segments ovate or ovate-oblong, ciliolate. *Petals* elliptic to suborbicular, glabrous. *Female* flowers not seen. *Drupe* .5 in. long, broader than long; receptacle .3 in. long, obconic.

Very rare. Patharia Reserve, SYLHET (B. C. Sen Gupta) Dist. Java, Sumatra.

Fls. 3-4.

3. MANGIFERA Linn.

Evergreen trees, all parts more or less aromatic. *Leaves* alternate, simple, petiolate, coriaceous. *Flowers* small, polygamous in terminal panicles; bracts deciduous. *Calyx-segments* 4-5, imbricate, deciduous. *Petals* 4-5, imbricate with thickened longitudinal nerves. *Stamens* 4-5, inserted between the lobes of the fleshy disk, usually one only perfect and much larger than the others. *Ovary* sessile, 1-celled, oblique; style lateral, simple; ovule 1, pendulous from a basal funicle. *Drupe* large, fleshy; stone fibrous, more or less compressed; cotyledons fleshy, plano-convex, often unequal.

Leaves oblong-lanceolate, thickly coriaceous, lateral nerves nearly transverse:—

- | | | |

1. *Mangifera indica* Linn. Vern. *Am*, *Ass.* & *Beng.*; *Keidi-asing*, *Miri*; *Thekachu*, *Garó*; *Tharbi-arong*, *Mik.*; *Dieng-soh-pien*, *Dieng-thlai-nar*, *Khasi*; *Thaiguja-baphang*, *Kach.*; *Tagung-changne*, *Duff.*; *haidai*, *Tipp.*; *Amra*, *rasala*, *madhuduta*, *Sans.* The mango tree.

A large evergreen tree with rough thick dry-grey fibrous bark. *Leaves* crowded at the ends of branches 4·5-12 by 1·5-4 in., oblong or obovate-lanceolate, bluntly acuminate, entire but often with wavy margins, coriaceous, glabrous, mature, dark glossy green, pinkish when very young, turning yellow before falling; main lateral nerves strong, about 20 on either half, often with a few intermediate ones, arched, vanishing at the margins; base acute; petiole 1-2·5 in. long, swollen at the base. *Panicles* about 12 in. long, conical in outline, pubescent throughout; bracts elliptic, concave, deciduous. *Flowers* about .15 in. across, greenish-yellow, scented, male and bi-sexual on the same panicle. *Calyx* 4-5-partite; segments imbricate, ovate, concave, pubescent outside, deciduous. *Petals* 4-5, imbricate, much longer than the calyx-segments, ovate, pale-yellow with 3-5 longitudinal ridges. *Disk* fleshy. *Stamens* 4-5, inserted on the disk, only one perfect and much larger than the rest; filaments of fertile stamens subulate, others filiform. *Ovary* sessile, obliquely seated, ovoid, glabrous; ovule solitary; style sub-lateral, declining towards the fertile stamen. *Drupe* 2-4-up to 8 in. or more in cultivated forms—long, ovoid or globose, laterally compressed with a 'nose' on the ventral side near the tip indicating the position of the style, fleshy, generally yellow when ripe; mesocarp more or less stringy, aromatic, sharply acid to sweet when ripe; stone compressed, longitudinally furrowed, fibrous.

Cultivated throughout the province, also undoubtedly indigenous in the evergreen tracts of both valleys.

The wood is grey light and coarse-grained but does not warp or split much. It is therefore found fit for planks and packing cases. Weight about 40 lbs, per c. ft. The ripe fruit so much prized in other provinces, is however of little value in Assam owing to attacks of insects of various kinds.

Fls. 2-3. Fr. 5-7.

2. *Mangifera sylvatica* Roxb. Vern. *Bon-am*, Ass.; *Lakshmi-am*, Sylh. & Cach.; *Haibamin*, Tipp.; *Chuchi-am*, Nep.

A lofty evergreen tree with a dense globose crown. *Bark* brownish-grey; inside greenish yellow, the inner layers exuding a white gum. *Leaves* scarcely distinguishable from those of the mango tree, excepting that they are as a rule proportionately narrower and longer-petioled; main lateral nerves up to 25 on either half. *Panicles* much larger and with ascending slender glabrous ramifications. *Flowers* pinkish-white, on glabrous pedicels. *Calyx* 5-lobed, very small. *Petals* 5, oblong, twistedly imbricate. *Disk* slightly grooved, villous. *Stamen* solitary, inserted in the cavity of the disk. *Ovary* obliquely oval; style subulate. *Drupe* 3-4 in. long, ovate, obliquely tapering acuminate so as to be often hooked, very slightly compressed; stone less firm, less fibrous and less furrowed than of the mango; embryo ascending, radicle turned upward along the edges of the cotyledons.

Sporadic in the evergreen forests of UPPER ASSAM and the SURMA VALLEY.

The unripe fruit is more pleasantly aromatic than the mango and is very suitable to be made into tarts, pickles and jellies but the ripe fruit is very inferior. The timber is of the same quality as that of the mango tree, but has been found unsuitable for tea-boxes.

Fls. 9-10. Fr. 1-3.

3. *Mangifera andamanica* King in Journ. As. Soc. Beng. 65 (1897), 470.

Apparently only a small or middle-sized tree. *Bark* dark-brown, not so rough as of the other two species. *Leaves* 3-9 by 1-3.5 in., obovate, obtuse or bluntly acuminate, entire, thinly coriaceous, quite glabrous, concolor and shining on both surfaces; lateral nerves 10-12 on either half, not so strong as in the other two species, very oblique, somewhat straggling, tertiary nerves conspicuously reticulate. *Panicles* shortly peduncled. *Flowers* tetramerous, pedicelled. *Drupe* 1.5-2.5 by 1-1.5 in., oval blunt, compressed; pulp thin; stone large, rugose, finely tomentose.

Extremely rare, only once found by the writer at the foot of the Mikir hills near Barpathar, SIBSAGAR.

Fls. 9-10. Fr. 1-2.

4. HOLIGARNA Lam.

Holigarna longifolia Roxb. Vern. *Jhawa*, Sylh.; *Phol-hoi* or *Pholoi-kung*, Tipp.; *Hlang-phalaru*, Kuki; *Bonsu-buphang*, Kach.; *Kherai*, Manip.; *Ng-gai*, Naga; *Katebel*, Lush.

A lofty tree up to 100 ft. in height, with spreading branches, widely buttressed at the base; buds densely silky pilose. *Bark* grey outside, white or light red inside, exuding a caustic milky juice which turns black after exposure. *Leaves* densely crowded at the ends of the branchlets, 12-24 by 3-5.5 in., cuneiform-oblong, thin, coriaceous, abruptly acuminate, usually entire, glabrous, glaucous beneath; midrib stout; lateral nerves about 25 on either half, straight but suddenly up-turned at the extremity, sometimes ending in few coarse teeth; petiole .2-.3 in. long, usually with 2-4 incurved spurs .5-1 in. long. *Flowers* small, bracteate, polygamo-dioecious, 5-merous, dull-white, rusty tomentose, in axillary panicles 7-15 in. long with spreading branches; bracts linear; pedicels very short, elongating in fruit. *Calyx* rather sharply pentagonous, rusty tomentose, lobes minute. *Petals* 5, almost free, spreading, oblong, hairy. *Filaments* 5, shorter than the petals, much shorter in the female flowers, on the edge of the disk. *Disk* lining the calyx-tube in male flowers. *Ovary* inferior, compressed, hairy; styles 3, recurved; ovule solitary, pendulous. *Drupe* enclosed by the calyx-tube, about 1 in. long, ovate-oblong, slightly compressed; mesocarp with large cells filled with an acrid juice; cotyledons equal.

Fairly common in the evergreen forests of CACHAR and south-eastern part of SYLHET.

Wood light-grey, soft, very light, weighing about 25 lbs. per c. ft.

The acrid juice is used as a Varnish.

Fls. 12-1. Fr. 5-6.

Var. *Helfri* Hk. f. (sp). Young shoots pubescent. *Drupe* exposed at the top. Our form appears to be intermediate between *H. longifolia* Roxb and *H. Helfri* Hk. f. I am inclined to regard this as a variety of *H. longifolia*.
Katakhall reserve, CACHAR.

5. DRIMYCARPUS Hk. f.

Drimycarpus racemosus Hk. f. Vern. *Amsia*, Ass. (Lakh.); *Am-selenga*, Ass. (Darr.); *Dieng-borrah*, *Dieng-kain*, Khasi (Cherra-side); *Dieng-soh-rany*, *Dieng-kabra*, Synt.; *Babari*, Garo (Tura); *Khati*, Garo (Damra); *Bol-thekachu*, i. e., wild mango, Garo (Dambu); *Bombal* (Lush.)

A fairly large tree up to 80 ft. in height and 7 ft. in girth. *Bark* corky, rather rough, grey outside, reddish-brown inside, granular, exuding from the inner layers a thin watery acrid sap which turns black after exposure. *Leaves* somewhat resembling those of the mango tree, 4-10 by 1.5-2.5 in., oblong-lanceolate or oblanceolate, abruptly acuminate, quite entire, coriaceous, glabrous, shining above, glaucous beneath; lateral nerves 18-24 on either

half of the midrib, very prominent and shining beneath, slightly arched; tertiary nerves reticulate; base cuneate; petiole '5-'7 in. long, stout, channelled above, not spurred. *Flowers* white, about '1 in. across; males sessile, females on slender puberulous pedicels, in axillary, fascicled, pubescent, racemose panicles, often below the leaves and usually shorter than them. *Calyx* superior; lobes 5, oblong-acute, imbricate. *Petals* 5, orbicular or ovate, imbricate. *Stamens* 5; filaments short, inserted at the base of the annular disk. *Ovary* inferior, 1-celled, 1-ovuled; style 1. *Drupe* about 1 by '6 in., transversely oblong or ovoid, surmounted by the remains of the calyx, dark glossy green with minute yellowish dots while young, red when fully ripe. *Cotyledons* equal, plano-convex.

In shady places, often along streams, throughout the PROVINCE and up to 4,000 ft. in the HILLS.

Wood yellowish grey, but liable to be discoloured, close-grained, moderately hard, medullary rays fine, joined by very fine transverse lines. Said to be used for canoes and planking. According to Gamble it is the wood most employed for boats in Chittagong.

Fls. 9-11. Fr. 11-4.

6. LANNEA A. Rich.

(Odina Roxb).

Lannea grandis A. Rich. Syn. *Odina* Wodier Roxb. Sans. *Jingni*. Vern. *Jia*, Ass., Beng., & Mech., *Jiyal*, Beng. (Sylh.); *Kai-engla*, *Khai-engla*, Sylh. (perhaps wrongly); *Adalia Poma*, *Madabai* or *Mandamai*, Cach.; *Dieng-thang*, *Dieng-soh-knurnot* (Burnihat), *Dieng-sur*, *Dieng-khang*, *Dieng-pasoh-pier* (Shella), *Dieng-tang-leng*, *Soh-lapeit-synrang*, Khasi; *Dume*, *Dome*, *Bol-chigamba*, *Bol-agru*, Garo; *Thing-khoi-nath*, Kuki; *Toi-sing-taite*, Tipp.; *Jika*, *Jiga*, Jharua; *Hulurhe*, Nep.; *Tiji-arong*, Mik.

A small to middle sized deciduous tree with thick branchlets. *Bark* thick, grey or greyish black, smooth and slightly wrinkled when young, afterwards rough and fissured, exfoliating in thin round plates, exposing a greyish or pinkish-white surface; blaze red, streaked with irregular white or pink streaks, fibrous. *Young parts* and inflorescence deciduous stellate-pubescent or almost tomentose. *Leaves* crowded at the ends of branches, alternate, 12-18 in. long, imparipinnate; common petiole terete. *Leaflets* 5-11, opposite, shortly petiolulate or nearly sessile, 3-6 by 2-3½ in., ovate, elliptic or lanceolate, acuminate; base often oblique, rather membranous, often slightly puberulous when young, glabrous with age; lateral nerves 6-10—sometimes more, on either side of mid-rib, petiolule upto '1 in. *Flowers* small, '15-'12 in. across, yellowish-green, usually diœcious, rarely monœcious, 4-rarely 5-merous, fascicled on the branches of slender racemes, which are crowded at the ends of branches; *males* usually longer and compound, *females* usually simple, elongating in fruit.

Calyx imbricate in bud, persistent in female flowers, ovate, ciliate. *Petals* about twice the calyx lobes or longer, '1-12 in. long, usually purplish in the middle, imbricate in bud, spreading, oblong, acute in the male flowers, longer and obtuse in female flowers. *Disc* annular, 8-lobed. *Male flowers* :—stamens usually 8, rarely 10 (?) inserted on the margin of the disc; pistillode 4-rarely 5-cleft. *Female flowers* :—staminodes small; ovary 4-6 lobed, 1-celled; styles 3-6 short; stigma papillose; ovule solitary, pendulous from the apex. *Drupe* upto '6 in. long, usually red when ripe, seated on the somewhat enlarged calyx, curved, oblong, laterally somewhat compressed; stone large, pitted,

Common throughout the Province, specially in deciduous types of forests, but not recorded from the N. E. FRONTIER DISTRICT, ascending to 3000 ft. in the hills.

Sapwood white, soft and perishable. Heartwood red when fresh cut turning to reddish brown after exposure, much prized in Sylhet for posts. Weight 50-60 lbs. per c. ft. A useful gum can be obtained by making cuts in the sapwood. The leaves are greedily eaten by cattle and elephants are fond of the young shoots. The tree can be most easily propagated by cuttings of all sizes, and live house-posts are a very common sight in Bengal villages.

Fls. 3-4 Fr. 4-6. New leaves 5-6. Leaves turn yellow before falling.

7. TAPIRIA Juss.

Tapiria hirsuta Hk. f. Vern. *Dhindau-baguri lata*, Ass. (Darr.); *Midi-takkir*, Miri & Abor; *Du-cheng-brup*, Garo; *Hang-Ding*, Mik.; *Chutti-lara*, Nep.

A fairly heavy scandent shrub, hirsute or villous throughout. *Bark* black on mature stems, peeling off in strips exposing a brown surface, greenish brown inside. *Leaves* imparipinnate, 8-15 in. long; common petiole terete, villous. *Leaflets* 11-15, lateral opposite, 1-4 by '5-1'5 in., ovate oblong or lanceolate, acuminate, distantly crenulate-serrate, membranous, tomentose hirsute or strigose, more densely on the under surface; lateral nerves 6-9 on either half, slender, evenly arched; base rounded or subcordate, more or less oblique; petiolules '1-2 in. long. *Panicles* axillary or sub-terminal, 5-12 in. long with spreading ramifications. *Flowers* polygamous, very small, white, sweet scented; pedicels capillary, '05-15 in. long, nearly glabrous. *Calyx* 5-lobed, persistent, lobes ovate. *Petals* 5, oblong or elliptic oblong, imbricate. *Disk* yellow, 5-lobed. *Stamens* 10, inserted at the base of the disk; anthers globose. *Ovary* 5-lobed, each lobe with a style, but 1-celled and 1 ovuled. *Drupe* about '3 by '25 in., obliquely oblong, black when ripe with a subacid aromatic flesh; stone rugose; crustaceous.

Throughout the PROVINCE ascending to 4,000 ft. in the Hills, generally in scrub forest and on old jhums.

The Mikirs eat the leaves as a vegetable. The ripe fruit is eaten. The Garos use the juice of the plant to dress cuts and other wounds probably as an antiseptic.

Fls. 1-3. Fr. 4-5.

8. SPONDIAS Linn.

Glabrous trees. *Leaves* imparipinnate, usually crowded at the ends of the branchlets; leaflets opposite or subopposite. *Flowers* small, polygamous, generally in large terminal panicles. *Calyx* inferior, small, 4-6-fid; lobes slightly imbricate. *Petals* 4-6, subvalvate, spreading. *Disk* cup-shaped, thick, slightly lobed. *Stamens* 8-10, inserted beneath the disk. *Ovary* superior, 4-6-celled, each cell with a solitary pendulous ovule; styles 4-6, conniving or erect. *Drupe* large, fleshy, terete with a 1-6-celled hard stone; cotyledons elongate, radicle superior.

Leaflets broad, abruptly acuminate, always entire with a strong intramarginal nerve. Flowers congested, subsessile. *Drupe* 1.5-2 in. long.

Leaflets narrow, tapering acuminate, serrate on young shoots, with no intramarginal nerves. Flowers scattered on long filiform pedicels. *Drupe* scarcely exceeding 1 in. in length.

.. 1. *S. mangifera*.

.. 2. *S. axillaris*.

1. *Spondias mangifera* willd. Sans. *Amrataka*. Vern. *Amor*, *Amora*, *Amratenga*, Ass., *Amra*, Beng. *Dergi-asing*, Miri & Abor; *Thaisudi-phang*, Kach.; *Suming-* or *Chiming-arong*, Mik.; *Dieng-soh-pair* (*pyjer* or *-pier*) *Dieng-soh-pair-kanthai*; Khasi; *Ambri-thong*, *Ambi-thong*, *Thong-rong*, Garo; *Tamxen*, Naga; *Heining*, Manip.; *Tai-to-thing*, *Toito*, Kuki.

A middle-sized tree with a pleasant aromatic smell. *Bark* brown or grey, plain but often with horizontal wrinkles and light vertical fissures, soft; inside reddish-brown with vertical streaks of lighter colour, .25-.3 in. apart. *Leaves* 1-1.5 ft. long; common petiole terete, slender. *Leaflets* 9-13, 2-9 by 1-4 in., elliptic-oblong, always quite entire, abruptly long acuminate, membranous, shining, lateral more or less oblique, turning yellow before falling; lateral nerves 10-30 on either half, straight, parallel; nearly transverse, joined by a strong intramarginal nerve; petiolules about .2 in. long. *Flowers* ploygamous, .2 in. across, scented, subsessile, in spreading terminal panicles. *Calyx* salver-shaped with 5-6 acute lobes which are deciduous. *Petals* as many as calyx-lobes, greenish-white, about .1 in. long, ovate-oblong, acute, glabrous. *Disk* broad, fleshy, usually 5-lobed. *Stamens* twice the number of petals; filaments short, subulate; anthers versatile. *Ovary* of 4-6 carpels which are free above, each with a short conniving style. *Drupe* 1.5-2 in. long, ovoid or oblong, greenish-yellow when ripe; pulp soft, acid, aromatic; stone semi-woody, fibrous with many cavities outside, 1-5 celled, cells opening by cavities through the top of the stone; seeds 1-5 of which, however, not more than 1-3 are perfect.

Throughout the plains in both the VALLEYS and up to 3,000 ft. in the HILLS, generally affecting deciduous forests or open spots.

Wood soft, light-grey, very porous, weighing about 26 lbs. per c. ft., of no use. The tree is often attacked by insects and from the holes made by

them a gum exudes which is insoluble in water. The fruit is eaten when ripe, also pickled or made into curries when green and tender. The aromatic flower-buds also make a very agreeable curry. The trees can be very easily propagated from cuttings.

Leafless 12-3. Fls. 3-5. fr. 11-2.

2. *Spondias axillaris* Roxb. Vern. *Khamoli-sali*, *Khamoli-mola*, Ass. (Sibs.); *Hamoi-tenga*, Ass. (Darr.); *Belam-asing*, Abor & Miri; *Belam-changne*, Duff.; *Theseli-arong*, Mik.; *Aming-gok*, *Amung-gok*, *Agimmok*, Garo; *Dieng-salaat*, Synt.; *Nihor*, Jharua (Dalu, Garo Hills); *Lobshi*, Nöp.

Usually a small evergreen tree attaining in favourable localities about 80 ft. in height and 7 ft. in. girth, with thin horizontal branches. *Bark* on branches and young plants greenish-brown, plain and shining but with large warts; on old stems dark-grey to black, reticulately fissured and splitting in thin long strips; inside light-red in thin concentric plates. *Leaves* 12-18 in. long; common petiole terete, slender. *Leaflets* 7-17, generally opposite, 2-4 by 7-1.5 in., ovate, lanceolate or oblong-lanceolate, caudate or acuminate; base cuneate to rounded, oblique on the leaflets,—from distantly but deeply serrate on young plants, to subentire on mature trees, membranous, puberulous on the nerves and along the margin when young, glabrous with age except for tufts of hair on the axils of nerves beneath, undersurface pale; main lateral nerves 10-12 on either half, joined by an intramarginal nerve, tertiary nerves very fine, closely reticulate; petiolules slender, slightly channelled, lateral —1.2 in., terminal 5.8 in. long. *Flowers* polygamous, pentamerous, greenish-white. **MALE FLOWERS**—15 in. across in panicles 3-6 in. long, usually crowded towards the base of the shoots, axillary and extra-axillary, panicle branches slender; pedicels up to 1 in. long, filiform. *Calyx* cup-shaped, lobes elliptic or ovate, ciliate. *Petals* elliptic. *Stamens* 10; filaments slightly subulate, short; anthers large, oblong; disk rather obscure, pistillode 0. **HERMAPHRODITE or FERTILE FLOWERS**—25 in. across, solitary on stout peduncles up to 6 in. long or on short few flowered racemes; pedicels up to 2.5 in. long. *Stamens* 10; disk annular, 10 lobed. *Ovary* 5 celled with 5 erect styles. *Drupe* 1.1-2 by .8 in., oblong, yellow when ripe, flesh fibrous, white when ripe, very acid, stone .6-.8 by .3-.5 in., horny, shallow-pitted all over and with 5 prominent depressions at the top, 5 celled; seeds with membranous testa and oily cotyledons.

Common in all submontane tracts and up to 4,000 ft. in the HILLS, though somewhat rare in the Sadar Sub-Division of the KHASI HILLS. Very common in some parts of the GARO, JAINTIA and NORTH CACHAR HILLS.

It appears from King and Prain's description in *Annals of Royal Botanic Garden, Calcutta*—Vol. IX. P. 25, that the plants examined by them bore no male flowers, and the plants raised from seeds in the Botanic Gardens bore only hermaphrodite flowers. The forms producing male flowers should be further examined in the field for correlated difference.

The wood is greyish-white, soft and light, not of much use. The inner bark is chewed by most hill-people and certain classes of Assamese as a substitute for Areca-nut. The ripe fruit is eaten.

Fls. 2-4. Fr. 7-12.

FAM 48. MORINGACEÆ.

Deciduous trees with corky bark and soft spongy wood. *Leaves* alternate, imparipinnate, twice or thrice compound; leaflets opposite, entire; stipules 0. *Flowers* 2-sexual, irregular, whitish or pinkish, in axillary and terminal panicles. *Calyx* cup-shaped; segments 5, petaloid. *Petals* unequal, erect, spreading. *Disk* thin, lining the calyx tube. *Perfect stamens* 5, opposite the petals, alternating with 5 antherless filaments, all inserted on the edge on the disk and all declinate; anthers 1-celled. *Ovary* stalked, lanceolate, 1-celled; ovules numerous on parietal placentas; style slender. *Fruit* a pod-like capsule, rostrate, 3-angled, 3-valved. *Seeds* many, usually winged; albumen 0.

MORINGA Lamk.

Moringa pterygosperma Gaertn. Vern. *Saijna*, *Sohjna*, Beng. & Hind., *Sajina*, Ass.

A middle-sized tree with thick corky bark, the inner layers exuding a red resinous gum; roots pungent. *Leaves* 1-2.5 ft. long, usually 3-pinnate; petiole sheathing at the base; pinnæ 4-6 pairs, opposite; pinnae 6-9 pairs, opposite, the uppermost pair 1-foliolate, a hairy gland between each pair of pinnæ and pinnulae. *Leaflets* 4-8 in. long, ovate or elliptic, entire, membranous, pale beneath; veins invisible. *Flowers* 1 in. across, strongly honey-scented. *Sepals* petaloid, linear-lanceolate, reflexed. *Petals* linear-spathulate, white but with yellow dots above near the base. *Filaments* villous. *Ovary* hairy. *Capsule* 9-20 by 6-8 in., 3-gonous, longitudinally ribbed, slightly constricted between the seeds. *Seeds* 3-gonous, winged along the corners, about 1 in. long including the wings.

Planted in homesteads and almost universally in coolie lines in tea gardens of both VALLEYS chiefly for the fruits which are used as a vegetable. The tender leaves and flowers are also eaten; cooked. The pungent roots, bark and gum are used medicinally. Wood very soft and very porous, absolutely useless.

Fls. 1-3. Fr. 3-5.

FLORA OF ASSAM

BY

U. N. KANJILAL, F.L.S.,

Late Extra Deputy Conservator of Forests, Assam.

P. C. KANJILAL, I.F.S.,

Deputy Conservator of Forests, U. P.

AND

A. DAS, I.F.S. (Retd.), F.L.S.

VOL. II.

CONNARACEÆ TO CORNACEÆ.

AMERICAN ALPINE CLUB LIBRARY
710 10th ST S.W. SEATTLE 15

Published under the authority of the Government of Assam.

Printed by Lakshminarayan Nath
PRABASI PRESS
120-2, Upper Circular Road, Calcutta.

PREFACE.

The original draft of this Volume (*Calycifloræ*) was completed in 1932 by Mr. P. C. Kanjilal, B.Sc., I.F.S., of the United Provinces. Considerable time has elapsed before this Volume could be taken in hands for publication. During this period many species have been discovered and described and a number of alterations have been made in the nomenclature.

I lost touch with the publication of the Volumes of the "Flora of Assam" since my retirement in December, 1934.

I have now been asked to take up the work of editing and publishing all the remaining Volumes of the "Flora." The task is arduous, specially so, as I am not afforded facilities to consult the herbarium and library of the Royal Botanic Garden, Sibpur. It is impossible to do justice to a work of this nature without facilities for ready reference.

I have since described as many as 40 species, which have been embodied in this work in small types, and in many cases it has not been practicable to include them in the keys without seriously interfering with the progress of printing work.

The following species have appeared in the body of this Volume in their old nomenclature which could not be altered in time:—

CORRECT MODERN NAME.

NAME USED IN THIS VOLUME.

Santaloides caudatum (Planch)

O. Kuntze.

Rourea caudata Planch.

Indigofera glabra Linn.

I. pentaphylla Linn.

Pongamia pinnata (Linn) Therr.

P. glabra Vent.

Delonix regia Raf.

Poinciana regia Boj.

Prunus Puddum Roxb.

P. cerasoides Don.

CORRECT MODERN NAME.	NAME USED IN THIS VOLUME.
<i>Sorbus cuspidata</i> Hedl.	<i>Pyrus cuspidata</i> Bertol.
<i>Bergenia ligulata</i> (Wall) Engl.	<i>Saxifraga ligulata</i> Wall.
<i>Carallia brachiata</i> (Lour) Therr.	<i>C. integerrima</i> DC.= <i>C. lucida</i> Kurz.
<i>Terminalia tomentosa</i> W. & A.	<i>T. tomentosa</i> Bedd. Var. <i>typica</i> .
<i>Eugenia cumini</i> (Linn) Druce.	<i>E. jambolana</i> Lam.
<i>Psidium Guajava</i> Linn.	<i>P. Guyava</i> Linn.
<i>Rotala indica</i> Kæhne.	<i>Ammannia peploides</i> Spreng.
<i>Rotala rotundifolia</i> Kæhne.	<i>Ammannia rotundifolia</i> Ham.
<i>Epilobium trichoneurum</i> Hausk.	<i>E. Hookeri</i> C. B. Clarke.
<i>Woodfordia floribunda</i> Salisb.	<i>W. fruticosa</i> Kurz.
<i>Mollugo pentaphylla</i> Linn.	<i>M. stricta</i> Linn.
<i>Mollugo lotoides</i> O. Kuntze.	<i>M. hirta</i> Thunb.
<i>Mollugo oppositifolia</i> Linn.	<i>M. Spergula</i> Linn.
<i>Centella asiatica</i>	<i>Hydrocotyle asiatica</i> Linn.
<i>Hydrocotyle sibthoropioides</i> Lam.	<i>H. rotundifolia</i> Roxb.

Some species have been described and put in the addenda as otherwise the publication of this Volume would have been unusually delayed.

I must first gratefully acknowledge the valued assistance of Mr. R. N. De, B.Sc., I.F.S., Forest Botanist, Assam, in his careful reading of the proof and hearty co-operation in every direction.

I am personally indebted to Dr. K. Biswas, M.A., D.Sc., F.R.S.E., and Mr. V. Narayanswami of Royal Botanic Garden, Calcutta, for their ungrudging help in all possible directions.

My grateful acknowledgments are also due to Mr. C. E. C. Fischer of Kew Gardens, for material assistance in revising the nomenclature and incorporating new records and new species from Assam, in this Volume.

It has not been possible to avoid printers' mistakes in spite of repeated proof-reading.

A. DAS.

SHILLONG,
10th February, 1938.

INTRODUCTION.

The materials for this Volume of the "Flora of Assam" were mainly collected by the late Rai Bahadur U. N. Kanjilal, F.L.S. His son, Mr. P. C. Kanjilal, I.F.S., of the United Provinces who was deputed to Assam to act as Botanical Forest Officer wrote the manuscript of this volume and revised his father's descriptions. His successor in office, Mr. A. Das, I.F.S., now retired, described and added some more species.

It is unfortunate that none of these officers are now in service in Assam and to my predecessor, Dr. N. L. Bor, I.F.S., and me as Botanical Forest Officer, has fallen the task of publication of the remaining parts of the "Flora of Assam." I have used my pen freely in correcting all mistakes that have caught my eye and I have been very ably assisted in proof-reading by my Botanical Assistant, Babu Banka Bihari Syam to whom my thanks are due. Every endeavour has been made to eliminate mistakes and it is hoped that some measure of success has been achieved.

R. N. DE, I.F.S.

Botanical Forest Officer, Assam.

SHILLONG,

14th February, 1938.

FLORA OF ASSAM

CALYCIFLORÆ.

FAM. 49. CONNARACEÆ.

Mostly woody climbers, rarely erect shrubs, more rarely trees. *Leaves* alternate, imparipinnate or 1-3-foliolate, exstipulate; leaflets quite entire. *Flowers* usually 2-sexual and regular, 5-merous, in racemes or panicles. *Calyx* imbricate or valvate, usually persistent. *Petals* narrow, free or nearly so. *Disk* obsolete. *Stamens* 10, 5 against and 5 between the petals, the former usually shorter and imperfect; filaments generally connate at the base. *Carpels* 5, each usually with 2 collateral ovules, usually only one carpel developing into fruit. *Fruit* of one, rarely 2, 1-seeded 2-valved follicular capsules; seed 1, often arillate, exalbuminous; radicle superior.

Calyx accrescent, lobes orbicular. Follicle sessile.	1. Rourea.
Calyx not accrescent, lobes elongate. Follicle stipitate.	2. Connarus.

1. ROUREA Abul.

Leaves imparipinnate; leaflets sub-opposite or alternate. *Flowers* small in axillary panicles. *Sepals* 5, orbicular, imbricate, much enlarged in fruit. *Petals* 5, usually oblong. *Carpels* 5, only 1 perfect. *Capsule* sessile, curved or crescent-shaped; seed solitary, erect, arillate, exalbuminous.

Leaflets subcoriaceous, sepals not ciliate, much shorter than the petals; follicle usually much curved.	1. <i>R. commutata.</i>
Leaflets chartaceous. Sepals slightly ciliate, about as long as the petals; follicle slightly curved and obliquely oblong.	2. <i>R. caudata.</i>

1. *Rourea commutata* Planch.

A large glabrous evergreen scandent shrub. *Leaves* 8-12 in. long; common petiole stout, terete. *Leaflets* usually 5-9, rarely up to 13, more or less alternate, 3-7 by .8-2.5 in., oblong to ovate lanceolate, more or less rounded or subacute at the base, abruptly acuminate with a blunt tail, subcoriaceous, shining on both surfaces; main lateral nerves 3-5 on either half, anastomosing near the margin and with many shorter intermediate ones, the lower two much arched and extended up to the middle of the leaflet often even beyond; petiolules .1-.2 in. long, stout. *Flowers* white, small, in much branched axillary panicles. *Sepals* about .08 in. long, orbicular or slightly ovate. *Petals* about 1.5 in. long, obovate-oblong. *Styles* recurved, longer than the petals. *Follicles* about 1 in. long, oblique, curved and tapering to a point, opening by the inner suture; seed about .7 in. long, oblong, completely enveloped by a bright red aril.

Occurs in evergreen forests of the LAKHIMPUR and SIBSAGAR DISTRICTS, also in the KHASI HILLS.

The aril of the ripe fruit is eaten.

Flrs. 5-6. Fr. 7-8.

2. *Rourea caudata* Planch.

A woody climber very similar in appearance to the foregoing species. *Common petiole* more slender; leaflets thinner, slightly smaller, with a longer tail; main lateral nerves up to about 8 on either half. *Panicles* axillary, fascicled, 2-5 in. long; pedicels capillary, .2-.3 in. long. *Sepals* about .15 in. long, ovate-oblong, ciliate, enveloping the petals. *Style* much exceeding the petals. *Follicle* somewhat smaller, obliquely oblong, only slightly curved, clasped at the base and for about a third of its length by the accrescent calyx.

KHASI and JAINTIA HILLS, e.g., near Mynso, also NOWGONG, SIBSAGAR and the DUFFLA HILLS.

Flrs. 9-11. Fr. 12-2.

2. CONNARUS Linn.

Connarus paniculatus Roxb. Vern. *Makoi-lata*, Ass., *Kobelahu*, *The-phlop-phlop*, *Rikang-tomdak*, Mik.; *Hlu-plu*, *Met-puk*, *Lushai*.

A large woody climber. *Bark* rough, dark-brown or black, yellowish to reddish inside according to age. *Leaves* imparipinnate; rachis $\cdot 3\cdot 7\cdot 5$ in. long, terete. *Leaflets* 3-7, usually 5, 3-8 by 1-2-5 in., elliptic lanceolate or oblong, bluntly short-acuminate, quite entire, thinly coriaceous, perfectly glabrous and shining, subacute or slightly rounded at base; main lateral nerves 5-7 on either half, very oblique and much arched, slender; petiolules $\cdot 2\cdot 3$ in. long, very stout. *Flowers* white, $\cdot 2\cdot 3$ in. long, cymosely arranged on the branches of rusty pubescent, mostly terminal panicles 5-12 in. long; pedicels up to $\cdot 1$ in. long; bracts minute. *Calyx* lobes $\cdot 5$ in. long, imbricate, oblong, thick and persistent but not accrescent in fruit, pubescent outside. *Petals* twice as long as the calyx, linear oblong, narrowed towards the base, membranous, nearly glabrous, dull-white. *Stamens* 10, alternately much shorter and sterile; filaments pubescent. *Carpels* 5, 4 imperfect, the 5th with a slender style, villous. *Follicles* 1-2-1-5 by $\cdot 6\cdot 8$ in., inflated, slightly compressed, on a thick stipe and supported by the persistent calyx, shining and obliquely striated outside; valves more or less pubescent inside. *Seed* black, $\cdot 7\cdot 9$ by $\cdot 5\cdot 6$ in., much compressed; aril small, reaching about a quarter of the length of the seed, with a crenate margin; cotyledone oily.

Fairly common throughout the plains and up to 4,000 ft., in the HILLS, generally in evergreen types of forest.

The oil of the seeds may be found suitable for soap-making.

Flrs. 2-4. Fr. 3-5.

FAM. 50. LEGUMINOSÆ.

Trees, shrubs or herbs. *Leaves* alternate, usually compound, stipulate. *Flowers* 2-sexual, regular or irregular, bracteate, arranged singly or in heads, on simple racemes or panicles of racemes, rarely in single heads. *Sepals* 5, usually connate, often 2-lipped, rarely free, odd lobe usually anterior. *Petals* 5, rarely the 5th suppressed, free, but usually combined when the flowers are in heads. *Stamens*

normally 10, sometimes fewer by suppression or indefinite when the flowers are in heads; filaments free or variously combined; anthers 2-celled with longitudinal dehiscence. *Ovary* free, often stipitate; carpel solitary; ovules on the ventral suture of the carpel. *Fruit* a legume (pod), usually dehiscent along one or both sutures. *Seeds* flat or more or less compressed, generally exalbuminous; testa horny or coriaceous.

This very large and important Family is divided into three Sub-Families :—

Flowers irregular. Petals unequal, free, imbricate; stamens up to 10 :—

Stamens diadelphous, less frequently free or monadelphous; calyx gamosepalous; petals descending, imbricate (posterior petal outermost) usually largest ..

1. Papilionatæ.

Stamens free; calyx divided to or nearly to the base; petals ascending, imbricate (posterior petal innermost)... ..

2. Cæsalpinioidæ.

Flowers regular. Petals equal, more or less connate, valvate; stamens usually indefinite.

3. Mimosoidæ.

Sub-family I. PAPILIONATÆ. (Leguminosæ)

Herbs, shrubs or trees. *Leaves* usually pinnate, less commonly digitate, rarely simple; leaflets often stipellate. *Flowers* 2-sexual, irregular and of the characteristic papilionaceous type, as described below. *Calyx* gamosepalous, 2-lipped. *Corolla* of 5-imbricate petals, which are more or less clawed, the two innermost (which are also anterior) similar, free or connate into a more or less boat-shaped sheath encasing the ovary; these are called *keel* petals. The next two petals are immediately outside the keel, also similar and are called the *wings*. The fifth is the outermost or odd petal called the *standard*, which is posterior in position and generally broader than the others and reflexed. *Stamens* generally 10, diadelphous, sometimes monadelphous, rarely all free, inserted with the petals on the calyx-tube; anthers often versatile. *Pod* dry, generally dehiscent, sometimes indehiscent. *Seeds* exalbuminous or albuminous.

Artificial key to the Papilionatæ.

- Tribe I. **PODALYRIÆ**. Stamens free. Pod dehiscent, leaves digitate :—
 A shrub; stipules connate. .. 1. *Piptanthus*.
- Tribe II. **GENISTEÆ**. Herbs or shrubs. Leaves simple or digitately trifoliate; leaflets entire; stamens monadelphous; pod dehiscent, not jointed :—
 Pods flattened. A shrub. .. 2. *Priotropis*.
 Pods turgid. Herbs or under-shrubs. .. 3. *Crotalaria*.
- Tribe III. **TRIFOLIÆ**. Herbs; leaves 3 foliolate; leaflets toothed :—
 Flowers blue; petals early deciduous; a trailing herb. .. *Parochetus*.
- Tribe IV. **GATEGEÆ**. Herbs or shrubs, sometimes climbing; leaves imparipinnate; leaflets usually entire; stamens usually diadelphous; pod dehiscent, not jointed; stipellæ usually absent :—
 I. Hairs fixed by the middle; anthers apiculate. .. 4. *Indigofera*.
 II. Hairs basifixed; anthers obtuse :—
 A. Pods flattened, continuous; leaves imparipinnate :—
 Pods tardily dehiscent; shrubs or climbers. .. 5. *Millettia*.
 Pods soon dehiscing .. 6. *Tephrosia*.
 B. Pods long, slender, septate; leaves usually paripinnate; inflorescence axillary. .. 7. *Sesbania*.
- Tribe V. **HEDYSAREÆ**. Herbs or shrubs, sometimes climbing; leaves usually imparipinnate, (exc. *Smithia*) rarely 1-foliolate; stamens diadelphous or monadelphous; pod jointed or 1-seeded :—
 I. Leaflets not stipellate :—
 A. Stamens in bundles of 9 & 1; ovule solitary. .. 8. *Lespedeza*.
 B. Stamens in bundles or 5+5 :—
 Joints of pod folded inside calyx. .. 9. *Smithia*.
 Pod straight, exserted. .. 10. *Æschynomene*.
 II. Leaflets stipellate :—
 A. Pods twisted up inside the calyx. .. 11. *Uraria*.

- B. Pods not twisted up inside the calyx. 12. *Desmodium*.

Tribe VI. *VICIEÆ*. Climbers or low herbs; leaves paripinnate, ending in a bristle or tendril; stamens diadelphous or monadelphous by abortion; pod not jointed, dehiscent :—
 Stamens 9, (the posterior absent); a climber. 13. *Abrus*.

Tribe VII. *PHASEOLEÆ*. Usually climbers, rarely trees or erect shrubs; leaves pinnately 3-foliolate (digitate in *Flemingia*), stipellate—or exstipellate and then gland-dotted; pods not jointed, dehiscent; stamens 1-2 adelphous :—

I. Leaves not gland-dotted :—

A. Nodes of raceme not tumid; petals about equal in length; style not bearded :—

1. Stamens diadelphous, all fertile; stipules and bracts persistent :—
 Style filiform. Calyx teeth distinct. 14. *Shuteria*.

Style flattened upwards. Calyx truncate. 15. *Dumasia*.

2. Stamens monadelphous, alternately sterile and short; stipules and bracts minute, caducous. 16. *Teramnus*.

B. Racemes tumid at the nodes; style not bearded :—

1. Petals very unequal :—
 Climbers; keel exceeding the wings and the standard. 17. *Mucuna*.

Trees or undershrubs; standard exceeding the keel. 18. *Erythrina*.

2. Petals about equal in length :—

a. Stamens diadelphous :—

- i. Pods not winged, 1-seeded, dehiscent at the 1-seeded tip only :—

- Flowers large,
showy, usually
in racemes. . . 19. *Butea*.
Flowers small,
usually
panicked. A
sinistorse
climber. . . 20. *Spatholobus*.
- ii. Pod winged,
many seeded,
tardily dehiscent. 21. *Mastersia*.
- b. Stamens monadelphous :—
Upper lip of
calyx projecting;
lobes connate. . . 22. *Canavalia*.
Calyx teeth sub-
equal, upper con-
nate :—
Pod oblong, tur-
gid, 1-2 seeded. 23. *Dioclea*.
Pod linear, flat,
many seeded. . . 24. *Pueraria*.
- C. Racemes usually tumid at
the nodes; style bearded :—
1. Stigma oblique :—
- a. Keel spirally beaked :—
Keel forming com-
plete spiral; pod
more or less com-
pressed. . . 25. *Phaseolus*.
Keel beaked but
not forming a
spiral; pod sub-
terete. . . 26. *Dysolobium*.
- b. Keel incurved, some-
times slightly twist-
ed. . . 27. *Vigna*.
2. Stigma terminal :—
Petals about equal in
length. . . 28. *Dolichos*.
Petals very unequal
in length; flowers
showy. . . 29. *Clitoria*.
- II. Leaves gland dotted; stipellæ
often abortive; nodes or
racemes not tumid :—
- A. Ovules 1-2; pod not de-
pressed between the seeds :—

Leaves digitately 3-foliate or 1-foliolate. Pod turgid. Erect or prostrate under-shrubs. .. 30. *Flemingia*.

Leaves 1 foliolate; pod flattened. Erect under-shrub. .. 31. *Eriosema*.

B. Ovules 3 or more :—

1. Pod without depressed lines between the seeds. .. 32. *Dunbaria*.

2. Pod with depressed lines between each seed :—
Seed with a large grooved strophiole. .. 33. *Atylosia*.

Seed without strophiole. .. 34. *Cajanus*.

Tribe VIII. *DALBERGIEÆ*. Trees or shrubs, sometimes scandent; leaves imparipinnate; stamens 1-2 adelphous; pod indehiscent :—

Leaflets alternate. .. 35. *Dalbergia*.

Leaflets opposite :—

Pods thick, almost woody, not winged. .. 36. *Pongamia*.

Pods thin, firm, winged down one or both sutures. .. 37. *Derris*.

Tribe IX. *SOPHOREÆ*. Shrubs or trees; leaves imparipinnate, rarely simple; stamens free :—

A. Leaves simple. Bract and bracteoles large, opposite, persistent. .. 38. *Dalhousiea*.

B. Leaves odd pinnate; bracts or bracteoles small :—

Pod moniliform; stigma terminal. .. 39. *Sophora*.

Pod turgid, dehiscent; stigma oblique. .. 40. *Ormosia*.

1. *PIPTANTHUS* D. Don.

Piptanthus nepalensis D. Don.

A shrub 8 to 12 ft. high, somewhat gregarious in habit. Branches green, angled or with vertical ridges and annulate with scars of fallen stipules; young shoots silky. *Leaves* digitately 3-foliolate; common petiole .7-1.5 in. long; stipules connate, opposite the petioles .2-.3 in. long, broadly

triangular, pubescent, drying brownish-grey. *Leaflets* sessile, 1.4 by .3-1 in., lanceolate or narrow elliptic, acuminate, entire, dark-green above, pale beneath and adpressed, grey pubescent when young, soon glabrate; midrib prominent beneath; main lateral nerves 8-12 on either half, faint. *Flowers* yellow, about 1.25 in. long, in short compact hairy racemes, 4-5 in. long; peduncles triquetrous; pedicels .5-.7 in. long; bracts ternate, tomentose. *Calyx* about .5 in long, campanulate, tomentose outside, deciduous from the base. *Petals* bright yellow, all clawed, 1 in. long including the claw which is about .5 in. long; standard erect, blade orbicular, notched, margins reflexed; wings obovate about as long as the blunt slightly incurved keel. *Stamens* 10, free, equal or subequal; anthers uniform. *Ovary* linear, hairy. *Pod* 3-5 by .4-.5 in., flat, continuous within, narrowed at both ends, stipe .8-1 in long. *Seeds* 3-10.

KHASI HILLS—Shillong-Jawai Road, *Prain*,—Laitlongkot, Manipur-Watt. Deserves a place in gardens for the beautiful golden-yellow flowers.

Flrs. 3-5. Fr. 9-11.

2. PRIOTROPIS W. & A.

Priotropis cytisoides W. & A. Vern. *Dieng-sha-ratoth*, *Dieng-sha-ratoth-balih*, Synt.; *Dieng-sia-kurie* or *chakuriaio*, *Dieng-toh-tari*, Khasi.

A shrub usually 6-8 ft. high, somewhat bushy in habit; branchlets, petioles and inflorescence adpressedly grey silky. *Leaves* 2-5 in. long; common petiole .5-1.5 in. long, slender, slightly channelled; stipules very short, subulate, deciduous. *Leaflets* 3, .5-2.5 by .4-1 in., oblong elliptic to lanceolate, acute at both ends; apex mucronate, entire, membranous, glabrous except along the midrib above, minutely adpressed silky beneath; midrib rounded; main lateral nerves about 8-10 on either side of the midrib, anastomosing near the margin; petiolules .05-.1 in. long; stipules minute and setaceous or 0. *Racemes* leaf-opposed or terminal, 3-5 in. long, shortly stalked, densely 10-50 flowered; pedicels about .25 in. long. *Calyx* campanulate, hairy outside, supported by a pair of bracteoles; teeth subequal. *Corolla* much exserted, pale-yellow, turning at least the standards and

wings purplish brown; standard orbicular or broad-obovate, mucronate, about .5 in. across, abruptly reflexed from the claw with two gland-like swellings at the junction of the claw, which is concave and densely silky within except at the base; wings .3 in., obliquely oblong-ovate or obovate; keel with a long pointed ascending beak exceeding the wings, clawed, ciliate towards the base; all petals finely purple veined. *Stamens* monadelphous; anthers dimorphous, 5 with small rounded and 5 with large oblong anthers. *Ovary* stalked and usually bearded along the ventral surface; style long, abruptly bent, bearded towards the top on the inner side; stigma roundish. *Pods* stalked, 1.1-1.5 by .4-.5 in., obliquely obovate-oblong, flat but somewhat turgid, tipped by the remains of the style, continuous inside, finely veined, minutely adpressed hairy; seeds 2-8, reniform, flattish, tan-brown when mature, on long slender straight funicles.

KHASI and JAINTIA HILLS 3,600 ft. in glades and grasslands; also along the waterless belt along the foot of the Himalayas in GOALPARA and KAMRUP.

Flrs. 4-8. Fr. 8-10.

3. CROTALARIA Linn.

Herbs and shrubs. *Leaves* simple or 3-foliolate, rarely 3-7 foliolate (in a few South Indian species). *Flowers* yellow, blue or purplish, in terminal or leaf opposed lax racemes. *Calyx tube* short; teeth subequal or connate and 2-lipped. *Corolla* exserted or equalling the calyx; standard generally orbicular, clawed; wings narrower and shorter; keel as long as the wings but broader, connate, much incurved, sharply beaked. *Stamens* monadelphous, forming a sheath of nine filaments open in front; anthers alternately versatile and basifixed. *Ovary* linear, sessile or stipitate, usually many-ovuled; style long, abruptly incurved at the base, bearded; stigma minute, oblique. *Pod* straight, linear or oblong, continuous within, turgid; seeds usually with a long funicle.

I. Leaves simple :—

A. Low herbaceous plants :—

.1. Corolla yellow :—

Leaves oblong, up to 1 in. in length; stipules minute, not decurrent; pod .25 in. long. ..

1. *C. humifusa*.

Leaves obovate, up to 2 in. in length; stipules decurrent; pod 1 in. long. 2. *C. ferruginea*.

Leaves oblong, up to 3 in. in length; stipules persistent, not decurrent; pod 1·2 in. long. .. 3. *C. mysorensis*.

2. Corolla light blue :—

Leaves linear obovate, up to 6 in. in length; stipules minute, not decurrent; Pod ·7 in. long. .. 4. *C. sessiliflora*.

B. Middle sized perennials :—

1. Corolla yellow :—

Branches winged with decurrent stipules; racemes lateral; pod stalked. 5. *C. alata*.

Branches tetragonous; racemes terminal and lateral; pod shortly stalked. 6. *C. tetragona*.

Branches terete, sulcate; racemes terminal and lateral; pod sessile. 7. *C. juncea*.

2. Corolla blue :—

Branches terete; racemes terminal; pod sessile. 8. *C. occulta*.

C. Generally large perennials or under-shrubs :—

Flowers in terminal heads; corolla blue; pod sessile. .. 9. *C. capitata*.

Flowers in terminal racemes; pod stalked :—

Bracts persistent; stipules leafy, persistent. 10. *C. sericea*.

Bracts minute, subpersistent; stipules minute, caducous. .. 11. *C. assamica*.

II. Leaves 3-foliolate. Racemes terminal and lateral; corolla yellow :—

Pod tetragonous, sessile, silky, 2-seeded. 12. *C. trifoliatrum*.

Pod cylindrical, stalked, glabrous, 20-30 seeded. 13. *C. striata*.

1. *Crotalaria humifusa* Grah.

A much-branched slender herb clothed with dun-brown silky hairs. *Leaves* simple, nearly sessile, up to 1 in. in length, oblong, symmetrical, membranous, glaucous beneath; stipules minute, subulate. *Racemes* leaf-opposed, 1·5-3 in. long, arched, 3-6 flowered; bracts minute. *Calyx* long-

toothed, concealing the small yellow corolla. *Pod* stalked, .2-.3 in. long, oblong, glabrous, 6-8 seeded.

In grass lands up to 5000 ft. in the KHASI HILLS.

2. *Crotalaria ferruginea* Garh.

A much branched fairly robust herb; branches conspicuously winged with persistent decurrent stipules, velvety or shaggy. *Leaves* simple, subsessile, 1-2 by .7-1 in., obovate-oblong, obtuse or rounded at the apex; stipules decurrent, persistent. *Racemes* leaf-opposed, 3-6 in. long, long-peduncled, laxly 2-8 flowered; bracts persistent. *Calyx* about .5 in. long, velvety. *Corolla* yellow, more or less included. *Pod* about 1 in. long, linear-oblong, glabrous, 20-30 seeded.

Fairly common in some parts of the plains of UPPER ASSAM. Var. *pilosissima* Benth.—has larger leaves and flowers and is more densely silky; found in the KHASI HILLS, 3-5000 ft.

3. *Crotalaria mysorensis* Roth. Vern. *Lao-soh-mynkhar*, *Khasi*.

A densely silky diffuse herb, 1-2 ft. high. *Leaves* simple, 1-3 in. long, oblong-elliptic or elliptic ovate, rounded at both ends, membranous, gland dotted, sparsely covered with long patent hairs; petiole very short; stipules .2-.3 in. long, lanceolate, not decurrent. *Racemes* terminal or sub-terminal, 4-9 in. long, long peduncled, 6-9 flowered. *Calyx* about .5 in. long, clothed with long silky hairs. *Corolla* yellow, hardly exserted. *Pod* about 1 in. long, oblong, glabrous, 20-30 seeded.

Grass-lands, specially in the HILLS; e.g., Nongston, KHASI HILLS, up to 5000 ft.

Flrs. rainy season. Fr. autumn.

4. *Crotalaria sessiliflora* Linn.

A robust perennial herb up to 7 ft. in height with ascending strigose branches. *Leaves* simple, 2-6 by .5-.8 in., linear-lanceolate, narrowed at both ends, subcoriaceous, somewhat scabrid and sparsely hirsute above, thinly silky pilose underneath; petiole .1 in. long or less; stipules setaceous, minute. *Flowers* in racemes up to 9 in. in

length or solitary from axils of leaves, deflexed, or shortly petioled; bracts and bracteoles persistent. *Calyx* about .5 in. long, deeply divided; lobes unequal, densely silky, accrescent in fruit. *Corolla* bluish-white, not exserted. *Pod* about .7 in. long, oblong, glabrous, 10-15 seeded.

Along water-courses or margins of swamps in the KHASI HILLS, specially in the Jowai Sub-Division.

Flrs. 8-9. Fr. 10-11.

5. *Crotalaria alata* Ham.

A suberect undershrub about 2 ft. high. *Leaves* simple, 1-3 in. long, obovate or ovate-oblong; apex rounded or acute, mucronate, entire, membranous, silky pubescent beneath; base often unequal; petiole very short; stipules decurrent along the internodes and ending as stiff pointed triangular flaps below the leaves. *Racemes* leaf-opposed, 2-3 flowered; peduncle long, often leafy; bracts small, persistent. *Calyx* about .4 in. long, silky, bracteolate. *Corolla* pale yellow, included. *Pod* stalked, 1.2-1.8 in. long, linear-oblong, narrowed into a stalk at base, glabrous, 30-40 seeded.

Grass-lands in UPPER ASSAM and KHASI HILLS up to 5,500 ft.

Flrs. and Fr. 12-2.

6. *Crotalaria tetragona* Roxb.

A shrub up to 6 ft. in height with 4-gonous stem and sulcate silky branches. *Leaves* 4-12 by .5-1 in., linear or lanceolate very gradually narrowed to the cuspidate tip, membranous or subcoriaceous, green and thinly pilose above, pale and densely silky pilose beneath; lateral nerves very oblique; petiole stout, .1-.15 in. long; stipules minute, setaceous or 0. *Racemes* simple, mostly terminal, 6-10 in. long, laxly 4-10 flowered; bracts setaceous, flowers handsome, lemon yellow; pedicels up to .5 in. long. *Calyx* about .7-1 in. long, densely brown-velvety; teeth very long, breaking off in the pod. *Corolla* glabrous, slightly exserted. *Pod* subsessile, 1-2 in. long, .4-.5 in. diam., oblong, persistently brown-velvety. *Seeds* 12-20, about .15 in. long, glossy dark-brown.

Grass-lands in the plains and lower hills in the drier parts of the PROVINCE.

Flrs. 9-10. Fr. 11-12.

7. Crotalaria juncea Linn. Vern. *San.* Hind. & Beng. (-Sunn); *Ausa*, Ass.

A shrub 5 or 6 ft. high, somewhat resembling the foregoing species with ascending terete but sulcate stiff and slender silky branches. *Leaves* 1·5-3·5 in. long, linear to obovate-oblong, obtuse or subacute, subcoriaceous, covered with silky hairs on both surfaces; petiole very short; stipules minute or 0. *Racemes* simple, mostly terminal up to 12 in. long, laxly 10-20 flowered; bracts minute. *Calyx* about 1 in. long, brown-velvety. *Corolla* bright yellow, glabrous, slightly exserted. *Pod* 1-1·3 in. long and about ·4 in. across, rusty-velvety. *Seeds* 10-15, brown.

Cultivated for its fibre in SYLHET and GOALPARA in ASSAM and almost universally in the plains of other provinces.

Flrs. 12-1. Fr. 2-3.

8. Crotalaria occulta Grah.

A small undershrub 2-3 ft. high having the general look of a stunted *C. sessiliflora*, with ascending branches and adpressed silky hairs. *Leaves* simple, 1·5-3 by ·3-·7 in., cuneately obovate or oblanceolate, subcoriaceous, substrigose and sometimes sparsely pilose along the midrib above, glaucous and more or less densely grey-silky beneath; petiole scarcely ·1 in. long; stipules minute, setaceous. *Racemes* terminal, peduncled, 3-7 in. long, 6-20 flowered; bracts minute. *Flowers* delightfully scented like violets. *Calyx* ·5-·6 in. long, densely brown silky. *Corolla* sky-blue, with darker blue or purple veins, glabrous, as long as or slightly exceeding the calyx. *Pod* about 1 in. long, ·25 in. broad, glabrous. *Seeds* 10-15, about ·07 in. long, kidney-shaped, glossy-brown.

Grass-lands in the hills up to 5,500 ft. Well worth cultivating in gardens for the sake of its scented flowers.

Flrs. 8-9. Fr. 9-10.

9. *Crotalaria capitata* Benth.

A bushy cæspitose shrub; stems scarcely branched. *Leaves* simple, 1-1·5 in. long, obovate or oblanceolate, subacute or rounded at the tip, subcoriaceous, green and glabrate above, silky beneath; stipules 0. *Flowers* violet blue in terminal heads or congested racemes of 6-20 flowers; bracts and bracteoles small, persistent. *Calyx* ·5 in. long, densely brown-silky. *Pod* sessile, glabrous, not exceeding the calyx.

KHASI HILLS, 5-6,000 ft.

Flrs. 8-9. Fr. 9-11.

10. *Crotalaria sericea* Retz. Vern. *Jhumjhum*, Beng.; *Atasi*, Sans.

A shrub 5-7 ft. high; branches striated, sometimes sharply tetragonous, subglabrous or clothed with short silky hairs. *Leaves* simple, 3-6 by 1·7-3 in., obovate-oblong to oblanceolate, subcoriaceous but soft, glabrous or very minutely pubescent above, finely silky beneath; lateral nerves 7-9 on either half, oblique; base cuneate; petiole ·2-·4 in. long; stipules falcate or deltoid, leafy, persistent. *Racemes* generally terminal, up to a foot long, 20-40 flowered; peduncles stout, angled; bracts ovate, foliaceous or sometimes setaceous. *Calyx* about ·5 in. long with subulate teeth, subglabrous. *Corolla* much exserted, yellow or purplish. *Pod* 2 in. long, nearly ·5 in. diam., thinly silky. *Seeds* 20-40, kidney-shaped, imbricating, in two rows.

Grass-lands in swampy localities in GOALPARA, possibly throughout LOWER ASSAM.

Flrs. and Fr. 10-3.

11. *Crotalaria assamica* Benth.

A shrub resembling the foregoing species in general appearance; branches stout, finely striated, silky. *Leaves* 2-5 by ·5-1·2 in., oblanceolate-oblong; apex obtuse or subacute, mucronate, thinly coriaceous, glabrous, but somewhat rugose above, very finely silky underneath; base cuneate; petiole ·1-·2 in. long. *Racemes* terminal, about a foot long, 20-30 flowered; bracts and bracteoles minute. *Calyx* ·5-·65 in.

long, pubescent with lanceolate teeth. *Corolla* .7-.9 in. long, golden yellow. *Pod* about 2 in. long and .65 in. across, above the middle, oblanceolate in outline, glabrous, distinctly stalked, many-seeded.

Plains of ASSAM and flats in the Jowai Sub-Division, KHASI HILLS.

Flrs. and Fr. cold season.

12. *Crotalaria trifoliastrum* Willd.

A perennial plant 2-3 ft. high, with numerous downy ascending branches. *Leaves* 3-foliolate; common petiole 1-1.2 in. long; stipules minute, setaceous. *Leaflets* .5-1 in. long, obovate-oblong, obtuse or emarginate, membranous, glabrous above, silky beneath. *Racemes* terminal and lateral up to 6 in. in length, 12-40 flowered; bracts minute. *Calyx* .12 in. long with linear teeth, silky. *Corolla* about .25 in. long, yellow, glabrous. *Pod* about .15 in. long, quadrangular, thinly silky, 2-seeded.

Believed to occur in the plains of both VALLEYS.

13. *Crotalaria striata* DC. Vern. *Ghantakaran*, Ass. (Upp. Ass.); *Jhunjhunia*, Ass. (Kam.).

A low shrub 2-4 ft. high, somewhat gregarious in habit; branches sulcate, obscurely silky. *Leaves* 3-foliolate; common petiole 2-3 in. long, slender; stipules minute, deciduous. *Leaflets* 1.5-4 in. long, obovate-oblong, obtuse or acute, membranous, green and glabrous above, pale and obscurely silky beneath; petiolules .1-.15 in. long. *Racemes* terminal and lateral, 6-12 in. long, 20-50 flowered; bracts subulate, up to .2 in. long, caducous. *Calyx* .25 in. long; teeth as long as the tube. *Corolla* about .5 in. long, yellow, striped with red, glabrous. *Pod* 1.5-2 in. long, about .25 in. across, cylindrical, glabrous. *Seeds* 20-30, about .1 in. long, kidney-shaped, tan-brown, shining.

Common and gregarious in dry gravelly or sandy beds of streams in the plains, specially in UPPER ASSAM.

The stem is capable of yielding fibre similar to the 'Sun' fibre (*Crotalaria juncea*).

Flrs. and Fr. 10-12.

PAROCHETUS Hamilt.**Parochetus communis** Hamilt.

A slender creeping herb with tufted runners. *Leaves* digitately 3-foliolate; petiole usually 2-3 in. long, filiform. *Leaflets* 3, subsessile, .5 by .5 in., broadly obovate-obtriangular or obcordate, slightly emarginate at the apex, mucronate, membranous, green and glabrous above, grey-silky beneath, ciliate. *Peduncles* 3-4 in. long, 1-2 flowered, filiform, with a pair of lanceolate bracts about an inch below the flowers, hairy above the bracts. *Calyx-tube* .25 in. long, deep, campanulate, reddish-brown, hairy outside; teeth lanceolate. *Corolla* .6-.8 in. long, blue with reddish veins; standard obovate, clawed, wings and keel much shorter than the standard. *Stamens* 2-adelphous; anthers uniform. *Style* elongated, glabrous, suddenly incurved above the base. *Pod* about 1 in. long, linear, straight, glabrous, continuous within.

Trailing on road-sides and forest paths above 4,000 ft. in the HILLS, conspicuous for its beautiful flowers. When not in flower bearing a superficial resemblance to an *Oxalis*.

Flrs. 9-10. Fr. 10-11.

4. INDIGOFERA Linn.

Herbs, undershrubs or shrubs with laterally attached hairs, occasionally intermixed with basifixed hairs. *Leaves* imparipinnate, rarely 1-foliolate or digitately 3-foliolate; leaflets usually opposite; stipules small; stipels setaceous, minute, caducous or 0. *Flowers* in axillary racemes. *Calyx* campanulate; teeth minute, subequal or the lowest longest. *Petals* purple or pink, caducous; standard ovate, obovate or orbicular, sessile or clawed; wings oblong; keel spurred on each side near the base, often slightly adnate to the wings. *Stamens* all fertile, 2-adelphous, 9 forming a sheath behind the keel, the tenth free and opposite the standard; anthers uniform, connective apiculate. *Ovary* sessile, usually many ovuled; style short, incurved, beardless; stigma capitate, usually penicillate. *Pod* usually linear-cylindrical, straight or curved, turgid, muricated, septate between the seeds. *Seeds* globose or cylindrical, often truncate.

I. Leaves imparipinnate :—**A. Flowers in racemes :—****1. Pods straight :—****a. Leaflets more than 7 not glandular hairy, mostly shrubby :—****i. Bracts 0; racemes lax flrd.; leaflets 13-19, pod 6-8 seeded, turgid, 1-1.5 in. long. . .****1. *I. leptostachya*.**

- ii. Bracts minute, shorter than the calyx; racemes many fld.; pod very long (for the genus) 2·5-3 in.—15-20 seeded, beaked. .. 2. *I. galegoides*.
- iii. Bracts exceeding the buds :—
 * Flowers mostly over ·3 in. long :—
 Racemes many fld., dense; bracts lanceolate; leaflets 11-17. Pod 1·1·5 in. long, 6-10 seeded. .. 3. *I. atropurpurea*.
 Racemes many fld.; bracts boat-shaped; leaflets 13-21, large, usually over ·6 in. long, obovate oblong. Pod 1·1·5 in. long, 8-12 seeded with broad sutures. .. 4. *I. pulchella*.
 Racemes 15-25 fld.; bracts lanceolate; leaflets 15-51, small, under ·6 in. long, narrow-oblong. Pod 1·1·5 in. long, 8-12 seeded with very broad sutures. 5. *I. Dosua*.
 * * Flowers mostly small, about ·25 in.; racemes many fld.; leaflets 9-15. Pod 6-8 seeded with broad sutures. .. 6. *I. nigrescens*.
- b. Leaflets 7-9, glandular hairy :—
 Racemes 6-12 fld. Pod 10-12 seeded. A cæspitose undershrub. .. 7. *I. viscosa*.
- c. Leaflets 3-5; racemes few fld.; undershrubs or subherbaceous plants :—
 Racemes 2-4 fld.; leaflets 5; pod 8-12 seeded. .. *I. pentaphylla*.
 Racemes 6-12 fld.; leaflets 3; pod 6-8 seeded with bordered sutures. .. *I. trifoliata*.
 Racemes 6-12 fld., leaflets 3; pod tetragonous, 6-10 seeded. .. 8. *I. trita*.
2. Pod subfalcate, slightly compressed, 2-4 seeded :—
 Racemes 10-20 fld.; flowers small; bracts exceeding the calyx; leaflets 5-15. Undershrub. 9. *I. Anil*.
- B. Flowers in 10-20 fld. heads :—
 Leaflets 7-11. Pod cylindrical-2 seeded. Herbaceous. .. *I. enneaphylla*.

II. Leaves simple. Annuals :—

Flowers in 6-10 fld. racemes; pod 1 seeded.	<i>I. linifolia.</i>
Flowers in 4-8 fld. heads; pod 2 seeded.	<i>I. cordifolia.</i>

1. Indigofera leptostachya DC.

A shrub up to 10 ft. in height with slender twiggy branches and silky young shoots. *Leaves* 3-4 in. long, imparipinnate. *Leaflets* 13-19, opposite, .5-1 in. long, oblanceolate or oblong, green above, glaucous beneath, glabrescent; stipels minute. *Racemes* up to 3 in. in length, long-peduncled; bracts 0. *Calyx* about .1 in. long, brown silky; teeth deltoid. *Corolla* .25-.35 in. long, pale red, canescent outside. *Pod* 1-1.5 in. long, 8 seeded, straight, turgid, glabrous, with narrow sutures.

In grass-lands in the KHASI HILLS, above 5,000 ft.

2. Indigofera galeoides DC.

A tall shrub about 12 ft. high with twiggy branches, thinly covered with adpressed hairs. *Leaves* imparipinnate, 6-12 in. long, petioled. *Leaflets* 11-15, opposite, .4-2 in. in length, oblong or obovate-oblong, mucronate, membranous, green above, glaucous and with very short adpressed hairs beneath; stipels minute. *Racemes* 2-3 in. long, dense-flowered; bracts minute. *Calyx* very small, canescent; teeth deltoid. *Corolla* pale-red, .3-.5 in. long, canescent outside. *Pod* 2.5-3 in. long, 15-20 seeded, straight, cylindrical, beaked, glabrous.

KHASI HILLS, 5000 ft., generally in shady localities.

Flrs. 6-7.

Indigofera Gerardiana Wall. Var. heterantha F. B. I.**I. heterantha Wall.**

A deciduous shrub usually up to 5 ft., but sometimes larger with white canescent branchlets. *Leaves* 1-4 in. long, short petioled; stipules setaceous. *Leaflets* 9-31, .2-.65 in., obovate or oblong-obovate, obtuse or retuse, mucronate, clothed on both sides with adpressed white hairs, pale grey beneath; stipellæ minute. *Racemes* 1-3 in. long, densely adpressed hairy; pedicels very short; bracts minute, shorter than the calyx. *Flowers* .3-.5 in., pale red or purple. *Calyx* hairy, standard and keel pubescent outside, specially towards the top. *Pod* 1-1.5 in. long, cylindrical, glabrous.

May be found in KHASI and JAINTIA HILLS between 4000 and 5000 ft.

Flrs. 5-6. Fr. 9-10.

3. *Indigofera atropurpurea* Ham.

A large shrub with twiggy branches, nearly glabrous. *Leaves* imparipinnate, up to 9 in. in length; petiole .5-2 in. long. *Leaflets* opposite, 11-17, .5-1.5 in. long, oblong or obovate or obovate-oblong, obtuse, mucronate, membranous, green above, thinly hairy or glabrescent and paler beneath, shortly stalked. *Racemes* 4-6 in. in flowers, lengthening to 9 in. in fruit, dense towards the apex; bracts about .12 in. long, subpersistent, lanceolate, acuminate, exceeding the subtended buds; pedicels short. *Flowers* .3-.4 in. long. *Calyx* about .1 in. long, obliquely campanulate with scattered white hairs outside. *Corolla* .25-.3 in. long, deep pink or dark-purplish. *Pod* 1-1.5 in. long, 6-10 seeded, slightly compressed, turgid, not narrowed into a beak.

KHASI and GARO HILLS, up to 4000 ft.

Flrs. 5-7. Fr. cold weather.

4. *Indigofera pulchella* Roxb. Vern. *Sam-nabat*, Garo.

A shrub 10-12 ft. high; stem sulcate, dark-grey, often attaining 1 in. in diam. at the base. *Leaves* imparipinnate, 3-6 in. long, shortly petioled. *Leaflets* 13-21, opposite, .6-1.5 by .3-.5 in., obovate-oblong, subcoriaceous, pale-green above, glaucous beneath with adpressed hairs on both surfaces; stipels minute or 0. *Racemes* 1-4 in. long, short peduncled, moderately compact; bracts boat-shaped and with a cusp, longer than the subtended buds; pedicels short. *Calyx* about .1 in. long, oblique, canescent; teeth short. *Corolla* .5-.8 in. long, bright red or rose-coloured; standard nearly .3 in. broad, reflexed. *Pod* 1.2-1.7 in. long, 12-seeded, straight, turgid, glabrous; sutures broad.

KHASI HILLS up to 5,000 ft. Also Rongrengiri in the GARO HILLS, 2,000 ft.

Flrs. 3-4. Fr. 8-10.

5. *Indigofera Dosua* Ham. Vern. *Dieng-sha-rato*h, Synt.

A densely grey pubescent low woody shrub. *Leaves* subsessile, 1-4 in. long; stipules setaceous. *Leaflets* 21-31, usually opposite, .25-.5 in. long, linear-oblong to elliptic-oblong, mucronate, membranous, dull-green above, glaucous beneath, densely grey or brown pubescent; stipels 0. *Racemes* 1.5-3 in. long, peduncled, densely many flowered; bracts .2-.25 in. long, narrow, lanceolate, cuspidate, silky, exceeding the buds; pedicels very short. *Calyx* about .1 in. long, densely hairy; teeth subulate. *Corolla* pink purple, .3-.5 in. long, glabrous. *Pod* 1-1.7 in. long, 8-12 seeded, straight, terete, glabrescent; sutures very broad, shortly beaked.

KHASI, GARO and MIKIR HILLS up to 6000 ft., fairly common in grass-lands.

Var. *tomentosa* also occurs in the same localities, which has longer leaves, longer and more numerous leaflets, larger racemes and more velvety bracts with a longer cusp.

Flrs. 6-7. Fr. 8-9.

6. *Indigofera nigrescens* Kurz. Vern. Dieng-soh-brah, Khasi.

A shrub 5-6 ft. high with dark-brown branches. *Leaves* 4-6 in. long; rachis slender. *Leaflets* 9-15, opposite, .6-1 by .25-.4 in., obovate or elliptic, shortly petioluled, mucronate and often emarginate at the tip, membranous, dark-green and nearly glabrous above, bluish-glaucous and with scattered bristles beneath. *Racemes* 4-5 in. long, peduncled; rachis stout, pubescent. *Flowers* numerous, uniformly dense, about .25 in. long, drooping, very shortly pedicelled bracts linear lanceolate, long pointed with setaceous margins about .1 in. long. *Calyx* about .12 in. long, pubescent with fugaceous black or dark brown hairs outside; teeth minute, deltoid. *Pod* .8-1 in. long, drooping, straight, terete, thin-walled, 6-8 seeded, at first covered with black or dark-brown hairs, but soon glabrescent; sutures not thickened; seeds sub-globose, smooth.

KHASI HILLS 4,500 ft. e.g., Riat khwang, Nongstoin etc., chiefly in grass-lands.

Flrs. 9-10. Fr. 10-11.

7. *Indigofera viscosa* Lamk.

A much-branched cæspitose undershrub up to 3 ft. in height, densely viscous throughout. *Leaves* pinnately 7-9-foliolate, up to 1·5 in. in length; leaflets opposite, membranous, glaucous and with persistent adpressed bristly hairs beneath; stipules minute. *Racemes* 6-12-flowered, about 1 in. long; flowers red. *Pod* ·75-1 in. long, 10-12 seeded, straight, faintly torulose.

Plains of both valleys.

Indigofera pentaphylla Linn.

A densely cæspitose annual with a few slender but stiff branches. *Leaves* pinnately 5-foliolate, up to about 1 in. in length; leaflets 5, opposite, obovate, membranous, glaucous beneath; stipules setaceous, persistent. *Flowers* red in short 2-4-flowered racemes. *Pod* ·5-·75 in. long, 8-12 seeded, straight and cylindrical, turgid.

Grass-lands in the plains.

Indigofera trifoliata Linn.

A much-branched perennial, usually trailing, up to 2 ft. in height. *Leaves* pinnately and subdigitately 3-foliolate; stipules minute; leaflets ·5-1 in. long, oblanceolate, ashy green above, glaucous and with black dots beneath. *Racemes* 6-12 flowered, sessile, congested. *Calyx* very small. *Corolla* about ·15 in. long, red, much exserted. *Pod* ·5-·6 in. long, 6-8 seeded, straight, deflexed, with acutely keeled sutures.

In grass-lands in the plains.

8. *Indigofera trita* Linn. fil.

An undershrub 2-3 ft. high, with slender stiff branches. *Leaves* pinnately 3-foliolate; leaflets obovate, membranous, thinly clothed with adpressed grey hairs, the terminal one stalked and up to 1·5 in. in length; stipules ·1 in. long, setaceous. *Racemes* 1-2 in. long, 6-12 flowered, much congested, often forming a terminal panicle above the uppermost leaves. *Calyx* ·12-·25 in. long, white, canescent; teeth setaceous. *Corolla* purplish, ·15-·5 in. long. *Pod* ·75-1·2 in. long, 6-10 seeded, tetragonous, obtusely keeled, glabrescent.

In grass-lands in the plains, also up to 5,500 ft. in the KHASI HILLS, e.g., Byntar.

Flrs. 9-10.

9. *Indigofera Anil* Linn.

A low undershrub up to about 4 ft. in height; stem canescent, sulcate. *Leaves* 2-3 in. long, petioled. *Leaflets* 5-15, opposite, .4-.8 in. long, obovate-oblong, shortly cuspidate, sub-coriaceous, glabrous above, adpressedly grey hairy beneath, very shortly petioluled. *Racemes* 1-1.5 in. long, peduncled, 10-20 flowered; bracts subulate, about .1 in. long. *Calyx* about .04 in. long; teeth deltoid. *Corolla* pale-orange, about .12 in. long, silky. *Pod* .3-.6 in. long, 2-4 seeded, subfalcate, slightly compressed, recurved, turgid, at first adpressed pubescent, ultimately glabrescent, upper suture broadly keeled, shortly beaked.

Near Ahotguri, Majuli Island, SIBSAGAR DISTRICT, possibly in similar other localities in the plains.

Flrs. 10-11. Fr. 11-12.

Indigofera enneaphylla Linn.

A densely cæspitose much branched trailing annual or biennial up to 18 in. in length. *Leaves* imparipinnate, 1-1.5 in. long; leaflets 7-11, alternate, oblanceolate, subcoriaceous, terminal, sessile; stipules minute. *Flowers* in dense heads of 12-20. *Calyx* .1-.15 in. long with long setaceous teeth, slightly shorter than the corolla. *Pod* .1-.15 in. long, 2-seeded, cylindrical, thinly hoary.

Believed to occur in the plains of both valleys.

Indigofera linifolia Retz. Vern. *Bhangra*, Beng.

A much branched cæspitose annual or perennial, silvery-hoary throughout, up to a foot in height. *Leaves* simple, .5-1 in. long, linear to obovate, mucronate; petiole very short; stipules minute. *Flowers* white or bright-red, in 6-12 flowered dense racemes. *Calyx* small. *Corolla* .15-.25 in., standard spurred, long. *Pod* 1-seeded, minute, globose, mucronate.

Apparently very common in grass-lands in the plains of both valleys.

Indigofera cordifolia Heyne.

A diffuse herbaceous annual of dwarfish habit. *Leaves* simple, .5-.75 in. long, ovate-cordate, mucronate, thinly pubescent above, more densely beneath; stipules minute. *Flowers* bright-red but hidden inside the long-toothed downy calyx, in 4-8 flowered sessile heads. *Pod* .25 in. long, pubescent, usually 2-seeded.

Inconspicuous but common in grass-lands in the plains.

Cicer arietinum Linn. Vern. *But-mah*, Ass.; *Chhola*, *But-kalai*, Beng.; Gram or horse gram, Eng.

A viscous annual herb. *Leaves* usually imparipinnate; stipules

large. *Leaflets* many, rigid, deeply toothed, strongly veined; stipels 0. *Flowers* bluish-purple, axillary, solitary. *Calyx-tube* oblique; teeth unequal. *Corolla* exserted; standard broad. *Stamens* diadelphous (9+1). *Staminal* tube with an oblique mouth. *Style* beardless, persistent. *Pod* sessile, turgid, 2-seeded. *Seeds* beaked and with a slender funicle; cotyledons yellow.

Much cultivated in Upper India and to a certain extent in GOALPARA, KAMRUP and DARRANG.

Lens esculenta Mœnch. Vern. *Masur*, Hind & Beng.

A small erect softly pubescent herb. *Leaflets* 4-6 pairs; small, sessile, lanceolate, entire, rachis ending in a bristle; stipules semi-sagittate; stipels 0. *Racemes* 2-4 fld. *Flowers* pale blue or purple. *Calyx* teeth sub-equal, linear, silky. *Corolla* a little exserted; style bearded. *Pod* compressed, about .5 in. long, rhomboid-oblong. *Seeds* compressed of the shape of double convex lens, grey with minute spots, not beaked; cotyledons red.

This useful pulse is very successfully cultivated as a cold weather crop in GOALPARA, KAMRUP and DARRANG by immigrants from NORTHERN and EASTERN BENGAL.

Lathyrus sativus Linn. Vern. *Khesari*, *Teora*, Beng. & Ass.

An annual subscandent herb with hollow winged stems. *Leaves* paripinnate, the rachis ending in a tendril or bristle; petiole winged; stipules lanceolate, entire, auricled. *Leaflets* 2 or 4, 1.2-5 by .1-5 in., lanceolate. *Calyx* campanulate; teeth long, lanceolate. *Corolla* .5-.7 in. long, bright blue or white; standard broad, finely veined; keel short. *Staminal* tube truncate. *Style* flattened at the tip, bearded. *Pod* 4-5 seeded, glabrous, compressed; dorsal suture with a narrow spreading wing on either side. *Seeds* faceted, spotted.

A useful pulse cultivated as a *rabi* crop in the BRAHMAPUTRA VALLEY up to DARRANG.

5. MILLETTIA Wt. & Arn.

Trees or shrubs, the latter usually climbing. *Leaves* imparipinnate; leaflets opposite. *Racemes* simple and axillary, often fascicled or paniced and terminal. *Calyx* campanulate, shortly toothed or truncate. *Petals* much exserted, long-clawed. *Stamens* diadelphous, but the vexillary filament is sometimes connate from the middle; anthers uniform, basifixed. *Ovary* sessile, linear, few-ovuled; style filiform, incurved, glabrous; stigma capitate. *Pod* linear or oblong, flat or turgid, few-seeded, tardily dehiscent.

I. Trees or erect shrubs; standard not auricled.

Pod usually compressed :—

Leaflets 15-21, pubescent beneath;
stamens monadelphous. Pod pube-
scent, not broad, sutures not
thickened.

1. *M. pulchra*.

- Leaflets 9-11, glabrescent beneath; stamens diadelphous. Pod with prominent warts, sutures thickened and winged. 2. *M. Prainii*.
 Leaflets 5-7, glabrescent beneath; stamens diadelphous. Pod smooth, broad, sutures not thickened. .. 3. *M. Piscidia*.
- II. Climbers; standard not auricled; pod not compressed, usually constricted between seeds when more than one seeded :—
 Leaflets 11-17, brown pubescent beneath; stipules 0; standard glabrous on the back. 4. *M. pachycarpa*.
 Leaflets 5-7, glabrescent beneath, stipellate; standard densely silky. .. 5. *M. cinerea*.
- III. Climbers; standard auricled. Pod compressed :—
 Leaflets 7-9, long caudate; stipules and stipels falling off early; pod less than 1 in. broad, thin, minutely pubescent, sutures not prominently thickened, valves not woody. 6. *M. caudata*.
 Leaflets 7-9, shortly acuminate; bases of stipules persisting and prominent on the branches; stipels persistent. Pod 1-1.5 in. broad, velvety tomentose, thickened at the sutures, valves woody. 7. *M. auriculata*.

1. *Millettia pulchra* Benth. Vern. *Dieng-shakuriao*, *Dieng-tiw-khmat*, *Taw-tynneng*, *Sa-long-teu*, Khasi.

An erect shrub or a small tree 25-30 ft. high; young parts densely rusty pubescent; branchlets glabrous, more or less sulcate, lenticelled; bark thin, dark-grey outside, dull-white inside. *Leaves* 5-9 in. long; rachis sulcate, finely adpressed pubescent; stipules ligulate, .1-.15 in. long, densely pubescent. *Leaflets* 15-21, .9-3 by .3-.8 in., narrow-elliptic or oblong, tapering acuminate, margins slightly recurved, thinly chartaceous, dark-green and glabrous above, adpressedly silky pubescent and bluish-grey beneath; lateral nerves about 7 on either half, much arched, very slender; petiolules .1-.15 in. long; stipels bristle-like, scarcely .1 in. long. *Racemes* axillary, simple, 5-8 in. long; bracts minute; flowers purple or nearly so, fascicled on slender pedicels, .1-.6 in. long. *Calyx* as long as pedicel, shortly toothed or almost truncate, adpressed pubescent outside.

Corolla about .5 in. long; standard pubescent outside along the nerves when young or glabrous, generally with a green centre, not spurred. *Ovary* silky pubescent. *Pod* 2.4 by .5-.6 in., minutely adpressed hairy, generally 2-3 seeded. *Seeds* suborbicular, .25 in. across, reddish-brown.

KHASI HILLS, 3-4,500 ft., e.g., Cherrapunji, Tyrna, Puriem, Gunner falls etc.

The wood is very tough and is fit for tool handles and agricultural implements.

Flrs. 4-6, sometimes in December.* Fr. 9-10.

The form with larger leaflets may be a separate variety but they are connected by intermediate characters with the forms with small leaflets.

2. *Millettia Prainii* Dun. Journ. Linn. Soc. Vol. XLI., 1912.

A small or middle-sized tree up to 40 ft. in height and 4.5 ft. in girth with a short trunk and spreading crown, having a tendency to be gregarious; bark dark-greenish grey and lenticelled outside both in horizontal and vertical short bar; blaze cream coloured inside, green underneath the corky layer; young parts pubescent. *Leaves* 6-10 in. long; rachis terete, glabrous; stipules minute. *Leaflets* up to 11, 2.4 by .7-1.5 in., elliptic-lanceolate or oblanceolate, tapering acuminate, oblique at the base, chartaceous, minutely adpressed silky when young, glabrescent with age, pale or subglaucous beneath; lateral nerves 7 or 8 on either side of the midrib, slender, arched; petiolules .2-.25 in. long, terete, glabrous. *Racemes* simple, axillary, 4-6 in. long; flowers generally in fascicles of two, about .5 in. long. *Calyx* about .1 in. long, deeply cup-shaped, somewhat oblique, dark-brown and slightly pubescent outside, glabrous inside; teeth minute, deltoid. *Petals* purplish-white; standard orbicular with numerous fine purple lines at the base; wings and keel of a somewhat deeper purple. *Stamens* diadelphous; filaments glabrous, shining. *Ovary* covered with dark-brown bristles; style glabrous. *Pod* 3.4 by .6-.8 in., 2-3 seeded, with prominent scattered warts; both sutures

* This may be a variety different from the type described above, but the materials at hand are insufficient to enable me to separate them.

thickened and winged. *Seeds* about .5 by .3 in., compressed, smooth, reddish or chocolate.

Found along the right bank of the Monas (Dist. GOALPARA), also along the Tura-Dalu Road in the GARO HILLS.

Wood yellowish, hard, in alternate bands of light and dark tissue, not liable to split or warp, weighing about 55 lbs. per c. ft.

Flrs. 3-4. Fr. 6-9.

3. *Millettia Piscidia* Wight. Vern. *Dieng-soh-lynthein*, Khasi; *Mohal*, Sylh.

A small or middle-sized tree in general appearance much resembling the litchi. *Bark* plain, greenish-grey to dun-brown; blaze pale granular. *Leaves* somewhat approximate at the ends of the branchlets; stipules minute, caducous. *Leaflets* 5-7, but sometimes only three; lateral generally opposite, extipellate, 2-4 by .7-1.2 in., ovate-oblong, bluntly caudate, thinly coriaceous, quite glabrous, green on both surfaces or subglaucous beneath; main lateral nerves 6-8 on either half, arched, very slender; petiolules about .15 in. long. *Racemes* simple, lax-flowered; pedicels .25-.35 in. long, capillary, ebracteate. *Calyx* membranous, thinly silky or almost glabrous. *Corolla* white, .5-.6 in. long; standard glabrous. *Stamens* diadelphous. *Pods* 3-7 by .8-1.3 in., narrowed at both ends, coriaceous, smooth but faintly reticulate at the faces, early-dehiscent, 2-4 seeded. *Seeds* laterally oblong. .7 by .5 in., with a horny smooth brown testa.

Along the southern foot of the KHASI HILLS, e.g., Tyrna, Shella, banks of the Loobah Lake, etc., generally in shady ravines.

Flrs. Rainy season. Fr. Cold weather.

4. *Millettia pachycarpa* Benth. Vern. *Bokoa-bih*, *Bokol-bih*, Ass.; *Holosi*, Ass.; (Darr.); *Mak-khal*, Garo; *Ru-gojao*, Kach.; *Arru*, Kuki, *Khariu*, Khasi.

A large climber; branches terete; shoots, rachis, petiolule and inflorescence brown velvety. *Leaves* 9-15 in. long, deciduous; stipules deltoid, early deciduous. *Leaflets* exstipellate, 11-13, 2.3-8 by 1-3 in., terminal obovate, lateral oblong-lanceolate to oblanceolate, chartaceous, abruptly acuminate, glabrous above, brown tomentose beneath; lateral

nerves 10-14 on either half, very oblique, nearly straight; base cuneate; petiolules $\cdot 15\text{--}\cdot 25$ in. long. *Racemes* 5-9 in. long, somewhat densely flowered, axillary or forming terminal panicles. *Flowers* about 1 in. long, in fascicles at the nodes, sometimes from a short peduncle; pedicels stout, $\cdot 2\text{--}\cdot 25$ in. long; bracts and bracteoles small. *Calyx* $\cdot 2\text{--}\cdot 25$ in. long, bowl-shaped, brown-tomentose; teeth minute. *Corolla* $\cdot 7\text{--}\cdot 9$ in. long, light-mauve; standard glabrous on the back, not auricled. *Stamens* monadelphous. *Pod* 4-5 in. long, 1 in. or more broad, 1-3 seeded, woody, rugose, glabrous, often indented between the seeds.

GARO and KHASI HILLS and their neighbourhood up to 4,000 ft. The roots are used to poison fish.

Flrs. 3-4.

5. *Millettia cinerea* Benth. Vern *Mei-Blei*, *Jarmeisoh-lynkai*, *Mei-khari-jendru*, Khasi; *Jermi-sna-jalong*, Synt.

A fairly large woody climber with a bushy habit; young branches pubescent; bark exuding a reddish gum. *Leaves* deciduous about a foot long; common petiole channelled, swollen at the base; stipules subulate up to $\cdot 2$ in. long. *Leaflets* generally 5, 2-5 by 1-2 in., obovate-oblong or elliptic, abruptly bluntly acuminate, membranous or chartaceous, pubescent beneath when young, soon glabrescent; lateral nerves 7-9 on either half, oblique, more or less arched; petiolules about $\cdot 15$ in. long, stout; stipels setaceous, as long as the petiolules. *Racemes* generally in terminal, silky, pubescent panicles, 4-9 in. long; flowers about $\cdot 7$ in. long; pedicels up to $\cdot 25$ in. long; bracts and bracteoles subulate, caducous. *Calyx* about $\cdot 15$ in. long, densely silky; teeth short. *Corolla* reddish, $\cdot 5\text{--}\cdot 6$ in. long, grey-silky; standard densely silky on the back, not auricled. *Stamens* diadelphous. *Ovary* densely shaggy with white hairs; style glabrous, curled upward. *Pod* conspicuously torulose, generally 1-3 seeded, but sometimes as many as 8-seeded; joints globose, about 1 in. across, velvety, specially when young.

Throughout the plains of ASSAM and up to 5000 ft. in the GARO and KHASI HILLS.

Flrs. 5. Fr. 9-12.

6. *Millettia caudata* Baker.

An erect or straggling shrub about 15 ft. high; branches thin, glabrous, sparsely lenticelled. *Leaves* 12-15 in. long; common petiole slender, glabrous. *Leaflets* 5-9, 4-9 by 1.5-2.7 in., oblong-elliptic to oblong-lanceolate or oblanceolate, long-acuminate, thinly chartaceous, glabrous and bright green above, glaucous beneath; lateral nerves about a dozen on either half, slender, arched; petiolules .2-.35 in. long; stipels minute, caducous. *Racemes* axillary, 4-6 in. long, rather lax-flowered; pedicels short. *Calyx* about .12 in. long, silky; margin wavy or indistinctly toothed. *Corolla* .3-.4 in. long, densely silky; standard auricled. *Stamens* 2-adelphous. *Pod* 3-5 by .6-.75 in., straight, rigidly coriaceous or semi-woody, minutely adpressed pubescent, dehiscent, obliquely jointed, 3-5 seeded.

KHASI HILLS up to 3,000 ft.; also plains of SYLHET and UPPER ASSAM (down to Tezpur).

Flrs. 5-7. Fr. 12-3.

7. *Millettia auriculata* Baker. Vern. *Hololokha*, *Bologlokha*, Mech; *Gurari*, *Gauj*, Hind.

A woody climber distinctly gregarious in habit; young shoots fleshy, finely silky-tomentose. *Leaves* 1-2 ft. long, crowded at the ends of branchlets; common petiole terete, swollen at the base; stipules large, silky outside, basal portion usually persistent and prominent on the branches. *Leaflets* 7-9, 3-8 by 2-4 in., obovate-oblong or elliptic, bluntly and often abruptly acuminate, chartaceous, densely grey silky when young, afterwards glabrescent and green above, pale and minutely pubescent beneath; lateral nerves 10-14 on either half, oblique, nearly straight; base cuneate or rounded; lateral petiolules .2 in. long; stipels minute, setaceous. *Racemes* axillary, always simple, 4-9 in. long. *Flowers* dull-white, shortly pedicelled, fascicled on the rachis. *Calyx* .1-.12 in. long, broadly campanulate, shortly toothed, densely brown silky. *Corolla* about .3 in. long, silky all over; standard auricled. *Stamens* monadelphous; the tube being slightly split in front. *Style* filiform, glabrous, incurved; ovary hairy. *Pod* 4-7 by 1-1.5 in., straight,

strap-shaped and hard, permanently brown velvety, with very thick sutures, tardily dehiscent, 2-4 seeded.

In nearly all sal areas in the PROVINCE, chiefly in grassy blanks. Very common in the drier parts of the GOALPARA Sal forests.*

The leaves are used as fodder and the root to kill fish.

Flrs. 4-6. Fr. 11-2.

Millettia fruticosa Benth. Closely resembles the last species, differing by having more numerous (9-11) leaflets, subsessile reddish flowers in shorter axillary racemes and also in terminal panicles and nearly glabrous mature pods.

Said to occur in Assam, but no specimens are available.

Wisteria chinensis Sieb & Zucc.

A large climbing shrub; bark darkish brown. *Leaves* alternate, paripinnate, 5-6 in. long. *Leaflets* ovate, acuminate, entire; nerves hairy. *Flowers* bluish, about .9 in. long, in 5-7 in. long villous terminal racemes from the ends of branchlets; pedicels about .9 in. long, hairy. *Calyx* distinctly lobed; lobes often acute. *Pods* thin, coriaceous, dehiscent (Brandis).

KHASI & JAINTIA HILLS (No. 9906) Shillong 5000 ft.

Flrs. 3.

6. TEPHROSIA Pers.

Herbs or undershrubs. *Leaves* imparipinnate; stipules setaceous, usually persistent. *Leaflets* few or many, opposite, usually obliquely parallel nerved; stipels 0 or minute. *Racemes* leaf-opposed or terminal or flowers axillary, solitary or in pairs. *Calyx* campanulate; teeth distinct. *Petals* clawed; standard suborbicular; wings slightly adnate to the incurved (but not beaked) keel. *Stamens* diadelphous; anthers obtuse. *Ovary* sessile, many-ovuled; style incurved, filiform or flattened, glabrous or villous; stigma often penicillate. *Pod* flattened, continuous or more or less septate between the seeds. *Seeds* ovate; strophiole 0 or small.

Shrub 6-10 ft. high. Branches angled or grooved. Leaflets 1.5-2.5 in. long, ligulate, acute. Flowers large, white.

1. *T. candida*.

Perennial herb, 1-2 ft. high. Branches terete.

Leaflets hardly 1 in. long, obovate, obtuse.

Flowers small, purplish.

2. *T. purpurea*.

* It is sometimes reduced to a semierect shrub in the dense shade of the forest.

1. *Tephrosia candida* DC. Vern. *Bilakshani* or *Bilokhoni*, Ass.; *Bangali-dadigdiga*, Ass. (Kam.); *Mith-phang*, Cach.; *Samendu*, *Bolmendu*, Garo; *Dieng-toh*, Khasi; *Nathri*, Jharua; *Balasar*, Mech.; *Bangara*, Beng. (Sylh.).

A shrub 6-10 ft. high with a gregarious tendency; branches angled or grooved, densely grey-silky. *Leaves* 5-10 in. long; rachis grey-silky. *Leaflets* 15-29, 1·5-2·5 by ·3·5 in., narrowly oblong to obovate-oblong or ligulate, quite entire, minutely mucronate, subcoriaceous, dark-green and subglabrous above, pale and densely adpressed silky beneath; lateral nerves numerous, slender, oblique, straight, almost concealed by the dense silky hairs beneath; base acute; stipules ·2·25 in. long, deltoid-acuminate, hairy. *Racemes* simple, 6-9 in. long, terminal with often a few shorter ones from the axils of the upper leaves; rachis stout, angled or sulcate. *Flowers* creamy-white in fascicles of 2-4; pedicels ·3·8 in. long, filiform, silky, slightly thickening in fruit. *Calyx* ·15·2 in. long, broadly campanulate, somewhat oblique; teeth short, unequal, silky. *Corolla* ·7·1 in. long; standard obovate, densely silky outside. *Style* flattened, silky. *Pod* 3-4 by ·3 in., 10-12 seeded, continuous, densely covered with adpressed brown silky hairs, usually tipped with persistent style. *Seeds* brownish, transversely oblong, compressed, ·15 by ·12 in., with a white strophiole.

Throughout the province, generally in low lying grass-lands ascending to 3,000 ft. in the MIKIR, GARO and KHASI HILLS.

Often grown in tea-gardens as a fertiliser in newly planted plots, and also as a nurse for seedlings in forest plantations and in gardens for ornament.

Flrs. 8-10. Fr. 11-12.

2. *Tephrosia purpurea* Pers. Vern.; *Ban-nil*, Beng.; *Saraphunka*, Sans.

A suberect diffuse perennial; branchlets terete, glabrescent, often more or less zigzag; young parts silky. *Leaves* 2-6 in. long; stipules filiform, subulate, generally ascending. *Leaflets* 7-21, ·3·1 by ·1·6 in., obovate, rounded or emarginate, shortly mucronate, cuneate at the base, glabrescent above, adpressedly hairy beneath; lateral nerves very oblique, slender, straight, purplish. *Racemes* 3-6 in. long, lax-flowered, often leaf-opposed; bracts 3-furcate, setaceous.

Calyx .1-.15 in. long, strigose outside, with sharp-pointed teeth. *Corolla* .25-.3 in. long, purple; standard .15 in. broad. *Style* flattened, subglabrous. *Pod* 1-1.5 by .15 in., straight, thinly pubescent, 4-6 (10?) seeded. *Seeds* greenish-grey, smooth, speckled.

Fairly common in dry grass-lands and road-sides.

Flrs. Rainy season. Fr. 12-1.

Robinia pseud-acacia Linn.

A tree; young parts pubescent. *Leaves* imparipinnate; leaflets usually 6 pairs, elliptic, membranous, obtuse. *Flowers* in axillary racemes.

N. American species. Cultivated in Lake Garden Shillong, 4,500 ft.

Flrs. 4.

7. SESBANIA Pers.

Sesbania ægyptiaca Pers. Vern.; *Jayanti*, Sans.; Beng., and Ass.

A quick-growing soft-wooded short-lived shrub, 10-15 ft. high with short terete branches. *Leaves* paripinnate, 3-6 in. long; stipules lanceolate, deciduous. *Leaflets* 8-20 pairs, .6-1 by .1-.2 in., linear-oblong, membranous, glabrous, pale-green, minutely petioluled. *Racemes* axillary, 3-6 in. long, 6-10 flowered; pedicels .15-.2 in. long. *Calyx* .2 in. long, campanulate, membranous, glabrous, short-toothed. *Petals* subequal, long-clawed, pale-yellow or standard often with purple spots, maroon or deep purple. *Stamens* 2-adelphous. *Ovary* stalked, many-ovuled; style filiform, incurved, glabrous. *Pod* 6-9 in. long by .15 in. across, torulose, flexible, twisted, 20-30 seeded, dehiscent, septate between the seeds.

Cultivated as a fertilizer and for shelter in young plantations, sometimes found wild as escapes.

The leaves are used as poultices over rheumatic and other swellings. An ointment prepared from the seeds is used for itches and other skin diseases. The fibre of the bark is used for ropes and the leaves and tender branches for cattle-fodder.

Flrs. 8-9. Fr. Cold season.

8. LESPEDEZA Mich.

Herbs or undershrubs. *Leaves* pinnately 3-foliate, stipulate; leaflets without stipels. *Flowers* axillary, fascicled

or racemed. *Calyx-tube* campanulate; teeth long. *Corolla* exserted; standard broad. *Stamens* diadelphous (9+1). *Ovary* sessile or stipitate, 1-ovuled; style long, incurved, often persistent; stigma minute. *Pod* small, oblong, compressed, indehiscent, 1-seeded, reticulately veined.

Leaflets thinly grey pubescent beneath :—

Keel obtuse, not much incurved. Petiole 1.1-5 in. long. Leaflets up to 2 in. in length. Pod .25 in. long, downy. ..

1. *L. elliptica*.

Keel acute, much incurved. Leaflets generally below 1 in. in length :—

Petiole not exceeding .7 in. in length.

Pod about .5 in. long with dense spreading hairs.

2. *L. stenocarpa*.

Petiole up to .25 in. long, densely pubescent.

3. *L. eriocarpa*.

Leaflets silvery, canescent beneath, up to 2 in. in length. Keel acute and incurved. Pod scarcely .25 in. long, glabrescent. ..

4. *L. Thomsoni*.

1. *Lespedeza elliptica* Benth.

A shrub 6-10 ft. high; branches obscurely sulcate, finely grey-pubescent. *Leaves* 2-4 in. long; petiole 1.1-7 in. long, slender, pubescent. *Leaflets* .7-2.2 by .4-1.2 in., obovate-cuneate, obtuse, subcoriaceous, green and minutely canescent above when young, afterwards glabrescent, grey and more or less densely adpressed pubescent beneath; midrib shaggy beneath; petiolules .1-2 in. long. *Racemes* 1.5-4 in. long, peduncled; rachis and the short pedicels hairy; bracts and bracteoles ovate-lanceolate, .05-.1 in. long, hairy. *Calyx* .2-.25 in. long, grey-canescant; teeth linear, twice as long as the tube. *Corolla* deep red, .3-.4 in. long. *Pod* about .25 in. long, oblong, stalked, downy.

KHASI HILLS. Fairly common in the neighbourhood of Myrong such as Nongbri, Byntar, etc.

Flrs. 9-10. Fr. 12-1.

2. *Lespedeza stenocarpa* Maxim. Syn. *L. macrostyla* Baker (in part).

An undershrub 3-5 ft. high with densely grey-pubescent branches. *Leaves* .7-1.5 in. long; petiole .5-.7 in. long. *Leaflets* .5-.8 by .4-.6 in., obovate-cuneate, often emarginate,

rigidly subcoriaceous, glabrescent and rather strongly veined above, generally persistently white-silky beneath. *Racemes* short, dense-flowered, silky; buds hidden by silky bracts; pedicels $\cdot 1\cdot 2$ in. long. *Calyx* about $\cdot 1$ in. long; teeth longer than the tube. *Corolla* $\cdot 4\cdot 6$ in. long, deep rose; keel acute, much incurved. *Pod* about 1 in. long, shortly stalked, narrow-oblong, gradually tapering to the base of the persistent hairy style.

Up to 3000 ft. in the KHASI HILLS and possibly the MIKIR and other hills.

Flrs. 8-9. Fr. 12-2.

3. *Lespedeza eriocarpa* DC.

A much-branched undershrub 3-5 ft. high; branches slender, angular, furrowed, silky. *Leaves* $\cdot 5\cdot 2\cdot 5$ in. long, gradually smaller towards the extremities of the branches; petiole $\cdot 1\cdot 1$ in. long, channelled, adpressed silky; stipules $\cdot 1\cdot 3$ in. long. *Leaflets* $\cdot 2\cdot 1\cdot 2$ by $\cdot 07\cdot 7$ in., obovate-cuneate, mucronate, subcoriaceous, glabrous and strongly veined above, grey canescent beneath; petiolules short, densely adpressed pubescent. *Racemes* 2-3 in. long, peduncled, rather lax; pedicels $\cdot 15\cdot 3$ in. long, very slender, pubescent; bracts setaceous. *Calyx* $\cdot 2$ in. long, densely hairy; teeth linear, about twice as long as the tube. *Corolla* rosy-red, $\cdot 4\cdot 5$ in. long; keel incurved. *Pod* about $\cdot 25$ in. long, densely pubescent, shortly stalked; style pubescent at the base.

Grass-lands in the KHASI HILLS, 5-6000 ft.

Flrs. 9-11. Fr. 12-2.

4. *Lespedeza Thomsoni* Benth. Vern. *Ja Langkrem, Dieng-lalih*, Khasi.

A shrub up to 10 ft. in height; branches sulcate, silky. *Leaves* $\cdot 5\cdot 4$ in. long, gradually smaller towards the ends of the branches; petiole 1-2 in. long, angled or somewhat flattened, white canescent; stipules $\cdot 15\cdot 2$ in. long, subulate. *Leaflets* $\cdot 4\cdot 2$ by $\cdot 1\cdot 1$ in., oblong or elliptic, mucronate, subcoriaceous, dark-green, glabrous and elegantly veined above, densely silvery canescent beneath; petiolules short. *Racemes* 1-4 in. long, peduncled, congested, crowded at the extremities

of the branches to form false terminal panicles; pedicels .3-.5 in. long, slender, pubescent; bracts slightly longer than the pedicels, linear, terminating in a long bristle. *Calyx* .1-.15 in. long, obconic; teeth lanceolate, as long as the tube. *Corolla* deep purple, fading to bright rosy, .3-.35 in. long, subsessile, obovate or suborbicular, compressed, delicately veined, glabrescent; valves subcoriaceous; style beardless.

KHASI HILLS, 5-6000 ft., common round Shillong; also Sohiong, Nongbri, etc.

Flrs. 8-9. Fr. 10-11.

9. SMITHIA Ait.

Herbs or undershrubs. *Leaves* usually paripinnate, the rachis then ending in a bristle; stipules scarious, persistent, generally appendaged. *Leaflets* small, sensitive, exstipellate. *Flowers* yellow, rarely bluish, generally in simple or compound racemes which are often unilateral; bracts and bracteoles scarious, persistent. *Calyx* deeply 2-lipped, the lower lip usually lobed. *Corolla* exserted; standard suborbicular with a cuneate base; wings clawed and auricled; keel-petals obtuse, incurved, clawed. *Stamens* diadelphous in two bundles of 5 each. *Ovary* many ovuled; style filiform. *Pod* of 1-seeded, orbicular, joints folded together inside the calyx. *Seeds* reniform, without a strophiole.

Racemes not paniced. Calyx rigid with simple parallel veins :—

Leaflets 2-10 pairs, bristly only along the midrib; pod 4-6 jointed. 1. *S. sensitiva*.

Racemes paniced. Calyx membranous with reticulate veins :—

Leaflets 10-12 pairs, without bristles; pod 20-25 jointed. 2. *S. grandis*.

1. *Smithia sensitiva* Ait.

A much branched semi-woody weedy plant about 2 ft. high; stem not bristly. *Leaves* .3-1 in. long; rachis bristly. *Leaflets* generally 4-12, rarely up to 20, .15-4 in. long, linear, ciliated with bristles, mainly along the midrib below. *Racemes* axillary, simple, peduncled; pedicels short, ascending. *Calyx* .25-.3 in. long; lips about equal, acute, entire, with a

few short deciduous scattered bristles; nerves parallel, close. *Corolla* bright-yellow with a brown band in the throat. *Pod* of 4-6 joints, densely papillose on the faces.

KHASI HILLS up to 3000 ft., generally in grass-lands.

Flrs. and Fr. 10-11.

***S. ciliata* Royle.**

An annual herb with much-branched slender stems up to 2 ft. in height. *Leaves* 5-1 in. long. *Leaflets* 6-16, 2-3 in. long, linear, strongly bristly along the midrib below and bristly-ciliate along the margins. *Racemes* axillary, simple, short-peduncled, secund; bracteoles leafy, ciliate. *Calyx* 25 in. long, reticulate-venose, densely bristly-ciliate; upper lip truncate. *Corolla* yellow, (bluish-white, Haines), little exserted. *Pod* of 6-8 joints, obscurely papillose.

KHASI HILLS up to 6000 ft. in grass-lands.

Flrs. and Fr. 9-10.

2. *Smithia grandis* Benth. Vern.; *Alkhani*, Ass.; (Darr.).

Stems stout, 6-8 ft. high, finely sulcate, glabrous, without bristles. *Leaves* 3-4.5 in. long; rachis glabrous or with a few bristles near the base; stipules fixed by the middle, persistent; upper portion about 1 in. long, oblong-lanceolate, glabrous; lower 25-3 in. long. *Leaflets* 20-24, 5-6 by 1-1.5 in., subsessile, linear-oblong, cuspidate, firmly subcoriaceous, glabrous; lateral nerves invisible. *Racemes* subsecund, forming terminal panicles, 5-8 in. long; pedicels 5-6 in. long, rigid, ascending with few scattered subdeciduous bristles near the top; bracteoles 2 to each flower, 25-35 in. long, persistent, glabrous. *Calyx* 4-5 in. long, persistent and enlarged in fruit to 8 in., lips divided nearly down to the base, each lip undivided, broadly obovate, obscurely crenulate-serrate at the tips, strongly reticulate veined and with few bristles on the back near the apex. *Corolla* much exserted, 1-2 in. long, yellow with dark veins. *Pod* of 20-25 joints; joints suborbicular, about 15 in. across, conspicuously veined.

Sub-Himalayan Tracts from Dikrain in LAKHIMPUR westward to near Kachugaon in GOALPARA, in grass-lands or edges of swamps.

Flrs. 3-4. Fr. 1-2.

S. blanda Wall. Vern. *Bat-shakuriao*, Synt.

A perennial suffruticose herb 2-4 ft. high; stems clothed with fine yellow bristles. *Leaves* about 1 in. long; rachis bristly; stipules fixed by the middle, persistent, .5-.7 in. long, linear lanceolate with a long cusp at both ends, with scattered bristles outside. *Leaflets* 6-10, .4-.17 by .15-.2 in., subsessile, oblong, cuneate or rounded at the base, membranous but firm, with bristles along the edges and midrib. *Racemes* paniced, terminal; pedicels .1-.15 in. long, bristly; bracteoles about .12 in. long, bristly. *Calyx* about .25 in. long, densely bristly outside, the lower lip 3-lobed. *Corolla* bright yellow, about .5 in. long. *Pod* of 5-6 joints, each about .1 in. across, dark brown, reticulated.

KHASI and JAINTIA HILLS, 4-6000 ft., common in water-logged places and edges of swamps.

Flrs. and Fr. 9-11.

10. ÆSCHYNOMENE Linn.

Erect herbs or undershrubs. *Leaves* imparipinnate; stipules lanceolate or setaceous, deciduous, sometimes auricled. *Leaflets* very numerous, linear, sensitive, without stipels. *Flowers* yellow, generally in lax axillary racemes, each supported by a couple of bracteoles at the base of the calyx and a bract resembling the stipules at the base of the pedicel. *Calyx* deeply 2-lipped, the lips entire or faintly toothed. *Corolla* exserted, fugacious; standard orbicular; wings transversely barred; keel not beaked. *Stamens* in two bundles of 5 each. *Ovary* stalked, many ovuled. *Pod* long-stalked of 4-8 one-seeded separating joints. *Seeds* without a strophiole.

Stems slender. Flowers about .4 in. long.

Upper suture of pod straight or nearly so. .. 1. *Æ. indica*.

Stems stout. Flowers about .75 in. long.

Upper suture of pod indented like the lower. .. 2. *Æ. aspera*.

1. Æschynomene indica Linn. Vern.; *Kuhila*, Ass.; (Sibs.).

An erect slender much-branched annual, 1-3 ft. high; branchlets terete, finely striate and scabrid with minute warts. *Leaves* 1.5-3 in. long; stipules .2 in. long, membranous, auricled, ciliate-toothed. *Leaflets* 41-61, .08-.1 by .02 in., close, oblong, mucronate, 1-nerved. *Racemes* axillary, appearing terminal after the leaves are shed, often branched, viscid; bracts and bracteoles deciduous, often gland-ciliate;

pedicels .25-.35 in. long. *Calyx* about .2 in. long, membranous, glabrous. *Corolla* yellow, about twice as long as the calyx. *Pod* of 5-10 joints, 1-1.7 by .15-.2 in., papillose on the faces, on stalks .25-.35 in. long; lower suture indented.

Fairly common in wet grass-lands in the plains and up to 4,000 ft. in the hills.

Flrs. 9-10. Fr. 10-12.

2. *Æschynomene aspera* Linn. Vern. *Sola*, Beng.

A little-branched stout herb up to 12 ft. in height, the stems attaining a diam. of about 2 in.; bark greenish-grey, warty, deeper-green underneath the cuticle. *Leaves* 3-6 in. long; stipules auricled, deciduous. *Leaflets* 61-101, .3-.6 by .1-.2 in., oblong or linear, 1-nerved. *Racemes* 1.5-3 in. long, lax-flowered and often branched, clothed with bristly hairs; pedicels .1-.15 in. long, hairy. *Calyx* .3-.4 in. long, hispid, supported by a pair of hairy bracteoles. *Corolla* .6-.7 in. long, yellow, hispid. *Pod* 1.5-3 by .3 in., of 3-6 joints, each .4 in. long, indented along both sutures, echinate over the seeds.

In swamps and jheels especially in the SURMA VALLEY.

The wood is white, pith like, soft and very light. It is made into hats, toys and decorative flowers. The stems are tied together in bundles and used as rafts.

Flrs. 4-9. Fr. 10-11.

***Pycnospora hedysaroides* R. Br.**—A perennial herb with trailing caespitose stems up to 2 ft. in length. *Leaves* pinnately 3-foliolate; petiole flattened, sparsely ciliate; stipules free, scarious, striate. *Leaflets* stipellate, .3-1.5 in. long, obovate, pale and reticulately veined beneath. *Flowers* small, in slender terminal or axillary racemes; pedicels downy; bracts deciduous, membranous; bracteoles 0. *Calyx* about .08 in. long, deeply cleft. *Corolla* purplish, exserted. *Stamens* diadelphous (9+1). *Ovary* sessile, many-ovuled; style slender, inflexed. *Pod* about .5 in. long, turgid, 6-10 seeded, continuous, transversely veined, black when mature. *Seeds* small, minutely strophiolate.

Common in grass-lands and meadow in the KHASI HILLS above 3000 ft.

11. URARIA Desv.

Perennial herbs or undershrubs. *Leaves* 1-foliolate or pinnately 3-9 foliolate; stipules scarious, striate; stipels

subulate. *Flowers* small, purple or yellow in simple or compound often elongated terminal racemes; bracts resembling stipules; bracteoles 0. *Calyx* tube very short; limb 2-lipped; the three lower teeth elongated, setaceous. *Corolla* small; standard broad, clawed; wings falcate, adherent to the obtuse keel. *Stamens* diadelphous; style filiform, inflexed. *Pod* of 2-6, small, 1-seeded, indehiscent joints, often folded face to face. *Seeds* orbicular or globose without a strophiole.

- | | | |
|------|---|---|
| I. | Upper leaves 5-9 foliolate. Leaflets linear, variegated. Racemes terminal, simple, dense, up to .7 in. across. | 1. <i>U. picta</i> . |
| II. | Upper leaves 3-7 foliolate. Leaflets oblong, generally not variegated. Racemes terminal, simple, dense, up to 1.5 in. across. | 2. <i>U. crinita</i> . |
| III. | Upper leaves 1-3 foliolate. Leaflets oblong or elliptic :—
Racemes terminal and axillary, simple, dense, lower calyx teeth much longer.
Racemes terminal, paniced, lax; calyx teeth subequal. | 3. <i>U. alopecuroides</i> .
4. <i>U. hamosa</i> . |
| IV. | Usually all leaves 1-foliate. Leaflets oblong-lanceolate. Racemes terminal, simple, dense. | 5. <i>U. prunellæfolia</i> . |

1. *Uraria picta* Desv.

A little-branched erect undershrub, 3-6 ft. high; stems terete, finely downy. *Leaves* very variable; the lowermost simple, small, orbicular, followed by 3-5-7-9-foliate leaves with linear leaflets mixed with a few 1-foliate ones; common petiole 3-4.5 in. long, downy; stipules up to .9 in. long, obliquely ovate or lanceolate, sharply long acuminate. *Leaflets* 3-7 by .3-1 in., linear, rigidly subcoriaceous, glabrous and variegated with irregular greyish blotches along the midrib above, harshly pubescent and strongly net-veined beneath, minutely mucronate, generally rounded at the base; lateral nerves about 10 on either half, very oblique; petiolules very short, downy; stipels subulate, longer than the petiolules. *Racemes* terminal, simple, very dense and hairy, 3-10 in. long and .5-.7 in. across; bracts scariosse, deciduous, gradually narrower upward; pedicels .2-.25 in. long, abruptly incurved at the tip after flowering, clothed with

bristles. *Calyx* deeply divided; lobes subulate, feathery with spreading bulb based hairs. *Corolla* purple, exserted. *Pod* of 3-6 polished joints.

In drier grass-lands in the plains of LOWER ASSAM and up to 4000 ft. in the HILLS.

Flrs. 6-9. Fr. 9-10.

2. *Uraria crinita* Desv. Vern. *Dieng-kha-riu*, Khasi.

A shrub 3-6 ft. high; stems stout, striate, strigose with hooked hairs when young. *Leaves* 6-10 in. long; common petiole ribbed; stipules .4-.6 in. long, broadly subulate, striate, rusty-shaggy. *Leaflets* 3-7, 2-5 by 1-2 in., oblong, acute or subacute at the apex, minutely mucronate, generally rounded at the base, coriaceous, smooth, glabrous and usually without blotches above, strongly net-veined and pubescent along the nervules beneath; lateral nerves generally 10 on either half, arched. *Racemes* terminal, simple, 2-14 in. long and .8-1.5 in. across, very hairy; pedicels .5-.6 in. long, shaggy with spreading brown bristles; bracts densely ciliate. *Calyx* shaggy; segments plumose with spreading hairs. *Corolla* .3-.4 in. long, purple, delicately veined. *Pod* of 4-6 opaque joints.

Appears to be confined to the KHASI HILLS up to 4,000 ft., generally in open grass-lands.

The roots are used to intoxicate or kill fish.

Flrs. 10-11. Fr. 12-2.

3. *Uraria alopecuroides* Wight. Syn. *U. lagopus* F. B. I. Vern. *Dieng-soh-mulh*, *Jermei-soh-phlang*, Khasi.

An undershrub 3-4 ft. high with dark-brown woody root stock and somewhat hispid stems; young parts pubescent. *Leaves* 4-7 in. long; rachis pubescent; stipules .3-.4 in. long, broadly deltoid-subulate, hairy; stipels subulate. *Leaflets* generally 3, sometimes solitary, 2-4 by 1-2 in., terminal largest, oblong to ovate-elliptic; apex obtuse, rounded or slightly emarginate, shortly mucronate, rounded or very slightly cordate at the base, chartaceous, green and hispid with scattered hairs above, pale and softly pubescent chiefly along the nerves and nervules beneath, often very lightly

variegated along the midrib; lateral nerves 8-12 on either half, slightly arched, tertiaries not so strong as in the last two species; petiolules very short, stout, shaggy with rusty hairs. *Racemes* generally terminal, 3-9 in. long and 1-1.3 in. across, not so dense as in the two foregoing species; pedicels .5 in. long, densely crinate, up-turned at the apex after flowering; bracts up to .35 in., obliquely suborbicular ovate to lanceolate, acuminate, ending in a sharp point, striate hairy outside, margins ciliate, imbricating and conspicuous in bud, early deciduous. *Calyx* .15-.2 in. long, almost concealed in dense spreading hairs; lower teeth much longer than upper. *Corolla* .2 in. long, deeply purple. *Pod* of 2-8 blackish or greyish joints, about .1 in. diam.

The hairs of this plant and possibly to some extent of the other species also, exude beads of saltish sap.

KHASI HILLS and the plains of LOWER ASSAM, chiefly in grass-lands and forest glades.

Flrs. 9-10. Fr. 11-12.

4. *Uraria hamosa* Wall. Vern. *Salpan*, Beng.

An undershrub 3-5 ft. high resembling some species of *Desmodium*; young branches pubescent; hairs both straight and hooked. *Leaves* 1-or 3-foliolate; stipules setaceous. *Leaflets* 2-6 by 1-3 in.; lateral much smaller than the terminal, oblong elliptic or ovate-lanceolate, chartaceous, rounded or slightly cordate at the base, tapering to the obtuse apex, green and glabrescent above, fulvous hairy on the nerves beneath; lateral nerves 10-18 on either half, sub-parallel; stipels setaceous. *Racemes* paniced, 6-12 in. long, glandular pubescent and hairy, covered when young with imbricating ovate cuspidate, ciliate, bracts which are adpressed silky outside and caducous before flowers open and about .45 in. in length; pedicels up-turned in fruit, 1-3 together, often in pairs. *Calyx* .1-.12 in. long, hairy; teeth subequal, longer than the tube. *Corolla* .2-.35 in. long. *Pod* of 4-8 brown, puberulous joints.

In grassy ravines in sal areas.

The decoction of the leaves in combination with some other drugs is used as a febrifuge.

Flrs. 8-10. Fr. 10-12.

U. neglecta Prain. (U. Lagopus F. B. I. II. 156 partly, not of DC.)

An erect herb, rather shrubby rusty, usually bifoliate. *Leaflets* oblong, 1-2 in. by .6-1 in., short petiolate or sessile; lateral nerves distinct, 7-11 on either half. *Heads* densely flowered, cylindric; bracts pubescent, deciduous; joints of pod shining, pale, quite glabrous.

Probably occurs in the similar localities to that of *Uraria hamosa*; Aka Hills (No. 15316).

U. clarkei Gagnep. incl. *U. Lacei Craib*.

A shrub about 4 ft. high with ferruginous, hairy, more or less sulcate stems. *Leaves* pinnately 3-foliate; common petiole .75-1.4 in. long, hairy, channelled above; stipules about .4 in. long, subulate, filiform; leaflets 4-5 by 1.5-2 in., terminal largest, ovate-lanceolate, obtuse, mucronate at the apex, chartaceous, sinuate, adpressed pubescent with somewhat harsh hairs above, pilose beneath, specially on the nerves; lateral nerves 10-13 on either side of midrib; petiolules short. *Flowers* in terminal ferruginous panicles up to 14 in. long; bracts densely imbricate, caducous, ovate acuminate, about .25 in. long. *Calyx* about .15 in. long; lobes lanceolate, acute, two upper short. *Standard* .25 in. long; wings slightly shorter than the keel, which is about .3 in. long. *Pod* upto 6 jointed, glabrescent with age.

NAGA HILLS,—Meebold! Kohima.—C. B. Clarke (No. 40924E).

Flrs. 10-11. Fr. 12.

5. Uraria prunellæfolia Grah. Vern. *Mirong-rondai*, Mech.

An undershrub scarcely exceeding 2 ft. in height with a woody root stock; branches slender, hairy when young; tap root fusiform, orange-yellow. *Leaves* 1-foliate; petiole .1-.6 in. long; stipules upto .5 in. long, triangular, acuminate, striate. *Leaflets* 2-6 by .5-3 in., oblong or lanceolate, obtuse or acute, generally rounded at the base, chartaceous, glabrous or glabrescent above, somewhat harshly pubescent along the nerves beneath; margins ciliate; lateral nerves 10-12 on either half, obliquely arched; tertiaries prominently reticulate. *Racemes* terminal, rarely lateral, simple, 1-3 by .6-.8 in., somewhat lax, densely covered with short hairs. *Flowers* in fascicles of 2-3, bluish purple; pedicels .3-.5 in. long, covered with short hooked and spreading bulb-based hairs; bracts acuminate, ciliate. *Calyx* about .15 in. long, hairy; lower teeth much longer than the upper. *Corolla* bluish purple, about .2 in. long. *Joints* of pod 3-6, spirally coiled, sparsely hairy.

In grass-lands in GOALPARA and perhaps throughout LOWER ASSAM.

Macerated green roots mixed with unboiled milk are given with good results in black water fever (G. N. Simeon).

Flrs. 9-10. Fr. 10-12.

Alysicarpus Wallichii W. & A.

A diffuse herb, almost glabrous. *Leaves* 1-foliolate. *Leaflets* about 1 in. (1.3 in. Hook). *Flowers* small in terminal racemes. *Pod* turgid, moniliform.

Aka Hills. (15317).

12. DESMODIUM Desv.

Herbs or shrubs. *Leaves* pinnately 3-foliolate or 1-foliolate; stipules free. *Leaflets* stipellate. *Flowers* small, usually in axillary or terminal racemes, less often in axillary umbels or fascicles. *Calyx* campanulate or turbinate, the two upper teeth often subconnate. *Corolla* exserted; standard obovate or orbicular; wings obliquely oblong, more or less adhering to the keel; the petals of which are obtuse, sometimes spurred. *Stamens* usually diadelphous (9+1); upper stamen entirely or partially free; anthers uniform. *Ovary* sessile or stalked, few or many-ovuled; style incurved; stigma capitate. *Pod* of several 1-seeded usually indehiscent joints, rarely joints dehiscent along one suture or pod dehiscing as a whole along the lower suture. *Seeds* compressed, reniform, without a strophiole.

ARTIFICIAL KEY.

Pods distinctly jointed; joints articulate not continuous, 1-seeded :—

A. Leaves 3 foliolate :—

1. Flowers umbelled :—

Bracts minute, deciduous. Pod of 4-5 joints; branchlets triquetrous, densely grey silky.

1. *D. Cephalotes.*

Bracts large, foliaceous, persistent, hiding the umbels. Pod usually 2 jointed; branchlets terete, finely grey downy.

2. *D. pulchellum.*

2. Flowers racemed :—

Joints of pod indehiscent :—

i. Pods 6-12 jointed :—

- * Joints of pod with hooked hairs :—
- + Leaflets not sinuate; joints of pod about twice as long as broad :—
- Leaflets shining above; pods pendulous, 2-3 in. long, joints 6-10. .. 3. *D. laburnifolium*.
- Leaflets not shining above; pods not pendulous, usually 1-1.5 in. long; joints 6-10. .. 4. *D. laxiflorum*.
- ++ Leaflets sinuate at least on the upper half, joints of pod slightly longer than broad or length and breadth nearly equal :—
- Branchlets densely pubescent; pod .5-.8 in. long, joints 6-8; racemes 2-3 in. long. .. 5. *D. sequax*.
- Branchlets puberulous; pod 1-1.5 in. long; joints 8-12; racemes 4-6 in. long. .. 6. *D. sinuatum*.
- ** Joints of pod appressed pubescent or glabrescent :—
- Pod glabrescent, 1-2 in. long, upper suture straight, indented on lower suture; joints 8-10; branchlets terete, glabrescent; leaflets minutely adpressed pubescent beneath. .. 7. *D. racemosum*.
- Pod densely adpressed pubescent, .8-1.2 in. long, indented on both sutures, more deeply on the lower, joints 6-8; branchlets angled, densely pubescent along the angles; leaflets densely grey silky beneath. .. 8. *D. sambuense*.
- ii. Pods 3-6 jointed, upper upto twice as long as broad :—
- Branchlets angled; stipules .15-.2 in. long; leaflets cuspidate acuminate; pod 1-1.8 in. long, 3-6 (rarely upto 8) jointed, joints glabrescent. .. 9. *D. khasianum*.

Branchlets terete; stipules
·3·5 in. long; leaflets round-
ed at both ends; pod 1 in.
or less, joints 4-6, minutely
downy.

- iii. Pods 1-4 jointed, joints 2-3
times as long as broad :—

* Lowest joint of pod stalked,
pod under 1 in. long, joints
1-3, more or less crescent or
scimitar shaped, constrictions
reaching from lower to upper
suture or near its racemes
lax :—

Pod 1-2 jointed; stalk
about ·3 in. long; corolla
small, ·12 in. long; stipules
small, subulate, deciduous;
bracts minute, linear; pedi-
cels ·2 in. long.

10. *D. concinnum.*

Pod 1-3 jointed, stalk short
about ·1 in.; corolla large
·2·4 in. long; stipules
·25·4 in. long, lanceolate,
persistent; bracts ·15·2
in. long, ovate-lanceolate;
pedicels ·2·1·5 in. long.

11. *D. laxum.*

** Lowest joint of pod not
stalked; pod over 1 in. long,
joints more or less straight;
constrictions reaching half or
a little more to the upper
suture; racemes dense :—

Pod 3-4 jointed; corolla
large; pedicels up to
·25 in. long.

12. *D. Scalpe.*

Joints of pod more or less dehiscent
along the lower suture :—

Joints 5-8, slightly broader than
long or length and breadth equal,
reticulate, with hooked hairs
along the sutures.

13. *D. confertum.*

14. *D. polycarpum.*

B. Leaves 1 foliolate :—

1. Petiole not winged :—

- a. Joints of pod twice or more as long
as broad :—

Pods pendulous, 6-8 jointed;
branches 3-quetrous.

15. *D. ormocarpoides.*

- b. Joints of pod less than twice as
long as broad :—

Branchlets slightly angled; grey downy leaflet ovate or lanceolate, entire, glabrescent above, joints of pod 6-10, slightly longer than broad.

16. *D. gangeticum*.

Branchlets terete, brown pubescent; leaflet broadly ovate or deltoid, more or less repand, hispid on the upper surface, joints of pod 3-6, slightly longer than broad.

17. *D. latifolium*.

Branchlets terete, rounded, glabrescent, joints of pod 3-5, as long as broad; leaflets entire, orbicular-cordate; pedicels sharply reflexed.

18. *D. retroflexum*.

2. Petiole broadly winged :—

Branchlets 3-angular; joints of pod 6-8, square.

19. *D. triquetrum*.

II. Pod indistinctly jointed, dehiscing in a continuous line along the lower suture, joints not separating :—

Leaves 1-3 foliolate; flowers comparatively large :—

Under shrub 3-5 ft. high; side leaflets if present minute; pod glabrescent.

20. *D. gyrans*.

Shrub attaining 10 ft.; side leaflets fairly well developed; pod persistently hairy.

21. *D. gyroides*.

1. *Desmodium Cephalotes* Wall. Vern. *Gohate-jhar*, *Bon-landu*,* *Makhiloti*, Ass.; *Sambraphong*, Garo; *Dangshikhop*, Mech; *Non-the*, *Non-chang-pher*, Mik.; *Samrong-thep*, Kach.; *Thing-kani*, Kuki; *Kakhang-skei*, Khasi.

A shrub 4-6 ft. high with grey bark; branches zig-zag, sharply 3-quetrous, densely grey-silky. *Leaves* 3-foliolate; petiole 1-2 in. long, deeply furrowed, grey-downy; stipules caducous, about .8 in. long, linear-lanceolate. *Leaflets* 3·5-6 by 1·5-2·5 in., terminal usually largest, oblong or elliptic, acute at both ends, subcoriaceous, green and glabrous above, densely grey-silky beneath; lateral nerves 10-20 on either half, oblique, parallel, straight, very prominent beneath. *Flowers* .3-.4 in. long in dense short

* Landu—Arahar-dal plant (*Cajanus indicus* Spreng).

peduncled axillary umbels; umbels usually solitary but sometimes on short leafless branches; peduncles upto .3 in. long; bracts caducous, hairy outside, dry, linear-oblong; bracteoles linear or setaceous; pedicels .1 in. long, short jointed at the apex. *Calyx* .15 in. long; teeth lanceolate; lower most longest. *Corolla* red, .25 in. long. *Pod* about 1 in. long, indented along both sutures, densely grey-silky; joints 4-5, about as long as broad.

Fairly common in sal areas, chiefly in glades; cattle and goats eat the leaves, but the pods are said to be poisonous for cattle.

Flrs. 7-8. Fr. 11-1.

2. *Desmodium pulchellum* Benth. Vern. *Ursi*, Ass. (Sibs.); *Takamala* (string or rupees), *Jharua*; *Jata-salpar*, Beng. & Sansk.

A shrub 4-6 ft. high; branches ribbed, grey downy, specially when young. *Leaves* 3-foliolate; rachis about 1 in. long; stipules subulate. *Lateral leaflets* 1.5-2.5 by .6-1 in., on petiolules .05-.08 in. by *terminal* 2.5-4 by 1.2-1.5 in., both elliptic-oblong or ovate-lanceolate, generally acute at the apex, more or less rounded at the base; lateral nerves 8-10 on either half, slanting, slightly arched. *Flowers* .2-.3 in. long in 2-6 flowered umbellate clusters, each being subtended by a pair of persistent, obliquely orbicular, foliaceous, strongly nerved, subcoriaceous bracts, .3-.5 in. across, placed back to back on a densely pubescent stalk ending in a long fine point, the umbels being arranged in axillary or terminal plicate racemes, 4-10 in. long. *Calyx* .1 in. long; teeth shorter than the tube. *Corolla* .25 in., white, tipped with light red. *Pod* of 1 or 2 joints, about .15 by .12 in., very thin, delicately veined, indented along both the sutures, glabrate or downy.

Common in the plains of ASSAM, generally in Sal areas or other types of deciduous forests, as far up as SIBSAGAR.

It is generally believed that if a branch of this plant is kept under the bed or anywhere in the house it drives away bed-bugs from it.

Flrs. 7-9. Fr. 11-1. leafless in March.

3. *Desmodium laburnifolium* DC. Vern. *Biyoni-haputa* or *Bor-Biyoni-haputa*, Ass. (Dan.); *Tangam-asing*,

Miri; *Samthai*, Mech; *Kobuelchick*, Kuki; *Bhuter-chira*, Beng.

A lanky shrub 6-8 ft. high; branches few, slender, terete or imperceptibly angled, glabrescent. *Leaves* 3-foliolate; common petiole .8-1.5 in. long, channelled; stipules .2-2.5 in. long, free, subulate. *Leaflets* 1-4 by .4-1.5 in., terminal usually largest, oblong-lanceolate, subcoriaceous, slightly pubescent along the nerves above, otherwise glabrous, dark-green and shining above, pale and sparsely adpressed, pubescent beneath. *Racemes* 4-12 in. long, lax; pedicels .2-.3 in. long. *Calyx* .1-.15 in. long; teeth lanceolate, as long as the tube, the lowest linear and longer than the others. *Corolla* whitish, .25-.35 in. long. *Pod* 2-4 by .15-.2 in.; joints 6-8, .3-.4 in. long, covered with short hooked hairs by means of which they stick to clothes and to the bodies of animals.

Brahmaputra Valley right up to Sadiya and in the Hills up to 4,000 ft., generally in shady damp localities.

Flrs. 6-9. Fr. 9-1.

4. *Desmodium laxiflorum* DC. Vern. *Khong-sir*, Khasi.

An erect undershrub 3-5 ft. high; branches angled, adpressedly grey-hairy. *Leaves* 3-foliolate, 6-10 in. long; common petiole 1.5-2 in. long, sulcate, grey-hairy; stipules persistent, .4-.6 in. long, subulate, striate, hairy. *Leaflets* 4-8 by 2-3 in., terminal largest, lateral somewhat oblique-ovate, ovate-elliptic or lanceolate, cuspidate-acute or shortly acuminate; base rounded, membranous, green and scabrid, puberulous above, somewhat pale and glaucous and more densely hairy beneath, ciliate along the marginal nerve; lateral nerves 10-12 on either side of the midrib, prominent, joining to form a marginal nerve; lateral petiolules .1-.15 in. long, short, hairy; stipels persistent, .2-.3 in. long, setaceous, grey. *Racemes* axillary and terminal, sometimes paniced, 6-15 in. long, lax-flowered, except towards the extremity; flowers fascicled; bracts lanceolate, .2-.3 in. long, pedicels .2-.35 in. long, slender, hairy, reflexed in fruit. *Calyx* about .08 in. long, densely hairy; teeth longer than the tube. *Corolla* purplish pink; standard .2 in. long,

lighter coloured than the wings and keel. *Pod* 1-1.5 by about .08 in., 6-8 jointed, scarcely constricted at the joints, covered with gland-based minute hooked hairs; joints about .2 in. long.

Sub-montane tracts in LOWER ASSAM; e.g., Barnihat, Rani, etc.; Sohrarim—*Clarke*, Haflong, *Craib*.

Flrs. 9-10. Fr. 12-1.

5. *Desmodium sequax* Wall. Vern. *Horu-biyoni-haputa*, Ass.; *Samthai*, Kach.

A cæspitose shrub usually up to 10 ft. in height; branches terete, clothed with short brown pubescence. *Leaves* 3-foliolate; common petiole .7-1.5 in. long, sulcate, angled, densely pubescent; stipules .08 in. long, ovate, densely brown-ciliate, caducous. *Leaflets* closely resembling those of *Desmodium sinuatum* Bl. in size and shape, 1.5-3.5 by 1-2.5 in., elliptic or rhomboid, tapering to a more or less acute tip, repand in the upper half, subcoriaceous, dark green and densely grey pubescent beneath; lateral nerves 4-5 on either half, conspicuous beneath, slightly arched. *Racemes* 2-3 in. long, terminal and axillary, rather lax, sometimes paniced; pedicels .15-.2 in. long, pubescent; bracts minute. *Calyx* about .08 in. long, broadly funnel-shaped, hairy outside; teeth deltoid, very short, strongly ciliate. *Corolla* light purple, about .3 in. long. *Pod* .5-.8 by .1 in., indented along both sutures; joints 6-8, rhomboid or lentil-shaped, as broad as long, soon separating, densely clothed with short hooked brown hairs.

SUB-HIMALAYAN TRACTS and the KHASI HILLS upto 5,000 ft. Nonai in DARRANG, Matharguri, Rajakata, etc., KAMRUP, Duragiri, GARO HILLS.

Flrs. 9-10. Fr. 12-1.

6. *Desmodium sinuatum* Bl.

An undershrub 6-8 ft. high; branches terete, indistinctly sulcate, minutely puberulous. *Leaves* 3-foliolate, 2-6 in. long; common petiole .5-1.5 in. long, sulcate, rusty hairy; stipules about .1 in. long, deltoid, closely ciliate. *Leaflets* 1.5-3.5 by 1-2.5 in., elliptic or rhomboid, acute, repand in the

upper half, subcoriaceous, dark-green and lightly adpressed hairy above, pale and grey-velvety beneath; lateral nerves usually 4 on either side of the midrib, oblique, much arched. *Racemes* 4-6 in. long, terminal and axillary, often branched; pedicels .15-.25 in. long, ascending or spreading, rusty-downy; bracts about .1 in. long, caducous. *Calyx* .08 in. long; teeth short, rounded. *Corolla* purple, about .25 in. long. *Pod* 1.1-1.5 by .08-.12 in., clothed with minute hooked brown hairs; joints 8-12, as broad as long.

KHASI HILLS, 3,000-5,500 ft., generally in shady ravines e.g., Un-ja-sai in Upper Shillong.

Flrs. 8-9. Fr. 11-12, but apparently remaining long on the plant after ripening.

7. *Desmodium racemosum* (Thunb) DC. Vern. *Ja-top-rit*, Khasi.

A handsome undershrub 4-5 ft. high; branches slender, terete, glabrescent. *Leaves* 3-foliolate; common petiole 1-2 in. long, thinly adpressed-hairy; stipules .1-.15 in. long, ovate or lanceolate. *Leaflets* 1-4 by .5-1.3 in., elliptic or lanceolate, sharply acute, entire or obscurely repand, membranous, light-green and glabrescent above, pale and very minutely adpressed pubescent beneath; lateral nerves 4-6 on either half, very slender, arched; lateral petiolules .1-.15 in. long, hairy; stipels .1 in. long, bristle-like. *Racemes* terminal and lateral, much paniced and corymbose, 2-5 in. long; pedicels capillary up to .6 in. in length, ascending; bracts .25-.3 in. long, lanceolate, cuspidate-acuminate, densely silky, caducous. *Calyx* about .1 in. long, sub-glabrous; teeth deltoid. *Corolla* pink, glabrous, about .3 in. long; standard obovate. *Pod* 1-2 by .2 in., on a short stout stalk, glabrescent, indented along the lower suture, the upper suture being nearly straight; joints 8-10, slightly longer than broad, rather strongly veined.

KHASI AND JAINTIA HILLS, 5-6,000 ft.

Flrs. 7-8. Fr. 9-11.

This plant has been described as *D. oxyphyllum* DC. in F. B. I., but this name applies to a different plant (*vide* Prain. Journal As. Society, Bengal LXVI-2). The name adopted is the one under which the Calcutta herbarium sheets have been identified by Schnieder.

8. *Desmodium sambuense* DC. Syn. *D. floribundum* G. Don. Vern.; *Ja-kythem*, *Ja-thoh*, Khasi.

A woody shrub 3-5 ft. high; branches angular, often switchy, densely pubescent along the ridges. *Leaves* 3-foliolate, 4-8 in. long; common petiole 1-2 in. long; sulcate, grey-silky; stipules .25-.4 in. long, lanceolate, cuspidate, paleaceous, strongly ciliate. *Leaflets* 1-3 by .6-1.5 in., ovate or obovate-oblong, acute or subacute, usually cuspidate, subcoriaceous, green and lightly adpressed hairy above, pale and densely grey-silky beneath; lateral nerves 6-8 on either half, nervules finely reticulate; petiolules about .1 in. long; stipels small, subulate. *Racemes* terminal and axillary, often paniced, 3-6 in. long; flowers in fascicles of 3-5 at the nodes; pedicels .2-.4 in. long, slender, hairy, ascending; bracts resembling the stipules, narrower upwards. *Calyx* .12 in. long, turbinate, hairy; teeth as long as the tube. *Corolla* .35-.4 in., pink or nearly white. *Pod* .8-1.2 by .12 in., indented along both sutures; joints 6-8, slightly longer than broad, clothed with adpressed short hairs.

Fairly common in the BRAHMAPUTRA VALLEY upto SIBSAGAR also in the KHASI HILLS upto 5,000 ft.

Flrs. 8-9. Fr. 9-10.

9. *Desmodium khasianum* Prain. Vern. *Deing-chakuriao*, Khasi.

A shrub 3-6 ft. high; stem grey, branches trigonous, sulcate; young parts silky pubescent. *Leaves* 3-foliolate; common petiole .7-1.4 in. long, sulcate, adpressed hairy; stipules .15-.2 in. long, lanceolate, cuspidate-acuminate, striate, ciliate. *Leaflets* 3, .8-2.5 by .5-1.5 in., ovate obovate or elliptic, acute or shortly cuspidate-acuminate, subcoriaceous, green and lightly adpressed hairy above, pale and densely hairy beneath; lateral nerves 5-6 on either half, arched, rather indistinct above; stipels about .1 in. long, setaceous. *Racemes* axillary or terminal, 3-5 in. long, solitary or in tufts of 5-6 pedicels, capillary, .3-.7 in. long. *Calyx* about .1 in. long, funnel-shaped, deeply divided, glabrous. *Corolla* purple, about .3 in. long; keel straight. *Pod* 1-1.8 by .1-.2 in., nearly straight along the upper suture, scalloped along the lower; joints 3-6 (less often upto 8), half

as long again as broad, reticulately veined on the faces, adpressed-hairy when young, glabrescent.

KHASI HILLS 4, -5,500 ft., *e.g.*, Mawmlah, Lynkyrdem, Nongstoin, Nongbri, etc.

Flrs. 8-9. Fr. 10-12.

10. *Desmodium concinnum* DC.

A handsome shrub with slender terete drooping branches; young parts grey-pubescent. *Leaves* 3-foliolate, common petiole .5-1 in. long, sulcate, covered with spreading hairs; stipules .3-.5 in. long, broadly subulate, paleaceous, striate. *Leaflets* 1-3 by .5-1 in., oblong, oblong-obovate or elliptic-oblong, rounded at both ends, minutely mucronate, subcoriaceous, green and glabrate above, pale and clothed with matted adpressed grey hairs beneath; lateral nerves 5-10 on either half, prominent beneath, very oblique, slightly arched; petiolules .05-.08 in. long; stipels setaceous, about .25 in. long. *Racemes* 3-9 in. long, terminal and at the ends of lateral branchlets or axillary, lax pilose; pedicels .3-.6 in. long, ascending or spreading, densely grey-pubescent; bracts .25-.4 in. long, ovate-lanceolate, shortly awned, striate, imbricating, densely silky, especially outside, caducous. *Calyx* .1 in. long, campanulate; teeth deltoid, rather short. *Corolla* pinkish or lilac, .25-.35 in. long. *Pod* about 1 by .12 in., straight along the upper suture; joints 4-6, minutely downy.

KHASI HILLS, 4,000 ft. in open grass-lands.

Flrs. 9-10. Fr. 11-12.

11. *Desmodium laxum* DC. Syn. *D. podocarpum* DC. Var. *laxum* Baker.

An erect usually unbranched semiherbaceous undershrub 2-3 ft. high; stem angular, minutely pubescent. *Leaves* 3-foliolate; common petiole 2-4 in. long; stipules small, subulate. *Leaflets* 3-6 by 1.5-3 in., lateral obliquely lanceolate, terminal ovate-lanceolate, shortly acuminate or acute; base narrowed, usually cuneate, membranous or chartaceous, somewhat hispid at first, but glabrescent when mature, green above, pale beneath; lateral nerves about 4 on either half,

much arched, the lowest sub-basal; lateral petiolules $\cdot 2\cdot 25$ in. long, pilose; stipels setaceous. *Racemes* 9-15 in. long, axillary and terminal, often paniced, very lax; bracts minute, linear. *Calyx* $\cdot 06$ in. long, turbinate, almost truncate, the teeth being very minute. *Corolla* pink, $\cdot 12$ in. long. *Stamens* 1-adelphous. *Pod* 1-2-jointed, lowest joint on stalk, $\cdot 3$ in. long; each joint $\cdot 3\cdot 35$ by $\cdot 15\cdot 2$ in., obliquely crescent-shaped or subtriangular, the lower suture almost touching the upper between the seeds; both sutures thickened, the upper also flattened.

Garampani in SIBSAGAR.

Flrs. 8-9. Fr. 11-12.

In var. *typica* leaflets are smaller, 1-2-3 in. long. KHASI and JAINTIA HILLS, 4-5,000 ft. Mann !

12. *Desmodium Scalpe* DC.

An undershrub 2-4 ft. high; branches terete, slender, patently downy. *Common petiole* $\cdot 5\cdot 1$ in. long, flattened, ciliate; stipules $\cdot 25\cdot 4$ in. long, lanceolate, persistent. *Leaflets* 3, $\cdot 5\cdot 4$ by $\cdot 3\cdot 3$ in., suborbicular or oblong-obovate, often emarginate, membranous, green and glabrate above, pale and finely downy beneath; lateral nerves about 8 on either half, very slender, slightly arched; lateral petiolules $\cdot 05\cdot 1$ in. long. *Racemes* mostly terminal, 2-12 in. long, very lax, pedicels filiform, $\cdot 2\cdot 1\cdot 5$ in. long; bracts caducous, $\cdot 15\cdot 2$ in. long, ovate-lanceolate, caudate, striate, ciliate on the margins. *Calyx* about $\cdot 1$ in. long, downy. *Corolla* bright-red, $\cdot 2\cdot 4$ in. long. *Pod* of 1-3 joints. *Joints* $\cdot 2\cdot 25$ by about $\cdot 1$ in., half-rhomboidal; apex oblique; upper suture thickened.

Apparently rare; KHASI HILLS, upto 4,000 ft.

Flrs. 8-9. Fr. 11-1.

13. *Desmodium confertum* DC.

An undershrub; branches terete, finely downy when young. *Common petiole* 1-1-5 in. long. *Leaflets* 3, 2-6 in. long, obovate or oblong, sub-coriaceous, glabrous above, pale, distinctly reticulate veined and minutely hairy beneath. *Racemes* axillary and terminal, the latter usually paniced, short, dense; bracts $\cdot 2\cdot 25$ in. long, scariosse; pedicels $\cdot 15\cdot 2$

in. long, ascending. *Calyx* .1-.15 in. long, turbinate, shortly toothed, scarcely hairy. *Corolla* .35-.4 in. long. *Pod* 1-1.5 by .2-.25 in., much indented along the lower suture; joints 3-4, twice as long as broad, densely clothed with spreading silky hairs.

KHASI HILLS upto 4,000 ft., apparently in grass lands.

14. *Desmodium polycarpum* DC.

An undershrub 2-4 ft. high with a creeping root-stock; branches somewhat sulcate or angular, with adpressed hairy extremities. *Leaves* 3-foliolate; common petiole stout, slightly margined; stipules about .5 in. long, subulate, setaceous. *Leaflets* sub-equal, 1-2.5 by .6-1.2 in., elliptic, oblong or obovate, rounded or slightly notched at the apex, sub-coriaceous, green and glabrous above, paler glaucescent and thinly adpressed-hairy beneath; lateral nerves 7-9 on either half, slender, slanting, arched; tertiaries more slender, very close, transverse, sub-parallel; petiolules of lateral leaflets about .1 in. long, grey-silky; stipels .15-.25 in. long, setaceous, very slender. *Racemes* terminal and axillary, 2-4 in. long, rather dense; bracts caducous, closely imbricating in bud, .15-.25 in. long, concave, lanceolate or ovate lanceolate, awned, striate, ciliate; pedicels capillary, erect, about .2 in. long. *Calyx* .08-.1 in. long; teeth longer than the funnel-shaped tube. *Corolla* purple, .2-.25 in. long. *Pod* .5-.8 by .1-.12 in., very thin, ciliate with hairs curled at the tips along the sutures; upper suture nearly straight; joints 5-8, slightly broader than long or length equalling breadth, reticulate, opening by the lower suture.

SIBSAGAR—Gaurisagar; KHASI HILLS, 4-5,000 ft.

Flr. and Fr. 6-8.

The pods stick together and persist long after ripening.

Var. *trichocaulon* also occurs in the KHASI HILLS, and differs from the type by its spreading hairs on the branches, laxer racemes, broader ovate-cuspidate bracts and larger and more densely hairy pods.

There is an intermediate form between these in which the hairs at the extremities are spreading, and bracts and pods as in the type.

Mamloo Forests—4,000 ft.

15. *Desmodium ormocarpoides* DC.

A slender erect undershrub; stem usually unbranched, angled, downy when young. *Leaves* 1-foliolate; petiole .5-1 in. long; leaflet 4-7 in. long, ovate or lanceolate, chartaceous or subcoriaceous, somewhat downy beneath. *Racemes* terminal, 6-9 in. long; flowers in few-flowered distant fascicles; bracts minute, setaceous; pedicels .25-.35 in. long. *Calyx* .08 in. long, with short deltoid teeth. *Corolla* pale-violet. *Pod* pendulous, 3-4 by about .25 in., constricted along both the sutures; joints 6-8, flattened, at least twice as long as broad, ribbed, covered with minute hooked hairs.

Gauhati, Kurz ! MANIPUR, Meebold ! and possibly in many other similar localities.

Flowering and fruiting time not known.

16. *Desmodium gangeticum* DC. Vern. *Nai-khong*, Khasi; *Salpan* or *Saluani*, Beng.; *Sala-parni*, Sans.

A suberect undershrub 3-4 ft. high; branches sub-terete, grey-downy towards the extremities. *Leaves* 1-foliolate; petiole .5-1.3 in. long; stipule .2-.35 in. long, subulate, striate, ciliate. *Leaflets* 2-4 by 1.5-2 in., ovate to lanceolate or elliptic lanceolate, acute, rounded at the base, membranous or chartaceous, glabrous or puberulous along the nerves and somewhat shining above, adpressed grey hairy or glaucescent beneath; lateral nerves 8-10 on either half, nearly straight; stipels setaceous. *Racemes* 6-12 in. long, mostly terminal or from upper axils, slender, often with short lateral branches, rather lax, pubescent, usually with reflexed hairs pointing upwards; pedicels .08-.2 in., ascending, strigillose; bracts minute, setaceous. *Calyx* .08 in. long; teeth lanceolate, longer than the tube. *Corolla* about .2 in. long, purplish white. *Pod* .5-.7 by about .1 in., deeply indented along the lower suture; joints 6-8, slightly longer than broad, usually clothed with minute hooked hairs.

SUB-MONTANE tracts upto 4,000 ft.

The root of this plant is used as a febrifuge by Hindu physicians.

Flrs. 8-10. Fr. 10-12.

17. *Desmodium latifolium* DC. Vern. *Gach-bionihaputa*, Ass.; *Bagh-chhala*, Tharua; *Soh-pyrtheit*, *La-hniu*, Khasi; *Nonth-arong*, Mik., *Achhak-kimachan*, Garo.

An undershrub 4-6 ft. high; branches terete, striate, densely hirsute. *Leaves* 1-foliolate; common petiole .3-.6 in. long, densely hairy; stipules .2-.3 in. long, subulate. *Leaflets* 2-5 by 1.5-3.5 in., broadly ovate, obtuse to subacute tip, generally mucronate; base truncate or cordate, chartaceous, hispid with stiff white hairs above, densely soft-pubescent beneath; lateral nerves 7-8 on either side, the first 1-3 of which are subbasal; stipels setaceous. *Racemes* 2-6 in. long, axillary or terminal, the latter often paniced, ascending, rather congested; bracts densely brown, hairy, .2-.25 in. long, linear subulate, plumose hispid; pedicels very short. *Calyx* .08 in. long, campanulate, hairy; teeth lanceolate to triangular, about equalling the tube. *Corolla* purplish, .25-.35 in. long. *Pod* .6-1 by .1 in., slightly falcate, indented along both the sutures, densely clothed with dun hooked hairs; joints usually 3-6, about as broad as long.

BRAHMAPUTRA VALLEY from Dalu and Goalpara to Lumding on the south and Charduar on the north, generally associated with Sal. The fibre of the bark can be used for manufacturing paper.

Flrs. 9-11. Fr. 11-12.

18. *Desmodium retroflexum* DC.

Small undershrub; branches terete, woody with short spreading hairs when young. *Leaves* usually 1-foliolate; common petiole .5-1 in. long, deflexed at the extremity. *Leaflets* 1-2 in. diam., orbicular-cordate, coriaceous, glabrous and green above, densely adpressed-silky beneath, rarely with a pair of much smaller lateral leaflets. *Racemes* about an inch long, terminal or axillary, very dense. *Calyx* .08 in. long, bristly. *Corolla* .2-.25 in. long. *Pod* .35-.5 by .1 in., minutely hairy; joints 3-5, as long as broad.

KHASI HILLS, Jenkins!

19. *Desmodium triquetrum* DC. including *D. auriculatum* DC. Vern. *Ulucha*, Ass., Miri & Abor; *Ettang*, Garo.

An erect or suberect undershrub, generally 3-5 ft. long

but often attaining 6-8 ft.; branches sharply triquetrous, strigose along the ridges when young. *Leaves* 1-foliolate; petiole .5-1.3 in. long by .1-.2 in., winged; wing oblanceolate, .25-.4 in. broad, ending in stiff points; stipules .5-.7 by .1-.2 in., tapering from a broad base, sub-persistent, striate. *Leaflets* 2.7.2 by .5.2.2 in., oblong-lanceolate, rounded or subcordate at the base, acute or shortly acuminate, entire, subcoriaceous, sub-glabrous or scaberulous above with scattered bristle-like white hairs and with such hairs on the midrib and nerves beneath; lateral nerves 15 to 19 on either half, usually much arched and strongly reticulate between. *Racemes* 4-12 in. long, axillary or terminal and sometimes paniced, covered with minute pubescence and with stiff adpressed hairs, specially along ridges; pedicels .1-.2 in. long, minutely hairy; bracts .2 in. long with smaller ones at the base. *Calyx* about .1 in. long, campanulate, with scattered hairs outside; two upper teeth combined forming one broad deltoid tooth; the lowest tooth linear and the longest. *Corolla* purplish pink, .2-.25 in. long; keel acute. *Stamens* monadelphous, the upper being free above the middle. *Pod* 1-2 by .2 in., flat, clothed throughout with matted hairs, slightly indented along the lower suture; joints 5-8, slightly broader or as broad as long; seeds escaping from an opening at the upper end after fall of the terminal joints.

Fairly common in the plains throughout the Province and upto 4,000 ft. in the GARO, KHASI and MIKIR HILLS. Generally in grass-lands.

The Abors and Miris of Upper Assam use the leaves as a substitute for tea.

Flrs. 10-12. Fr. 11-3.

The following are very closely allied forms and probably not more than varieties of the last :—

Desmodium alatum DC. incl. *D. Triquetrum* F. B. I. in part.

Shrub 4-5 ft. high. Differs from the foregoing as follows :—

Leaves often much narrower than in the last species; stipules more persistent, about .4-1 by .15 in. *Racemes* more densely flowered; flowers smaller, about .2 in. long, light pink with dark purple veins at the base of the petals. *Pods* broader sometimes, nearly .5 in. and much thinner, 3-7 jointed, glabrous, shining, very finely though somewhat distantly reticulate.

SYLHET—Managuli Hill, CACHAR (between Ghuttermukh and Changsil) Prazer! LAKHIMPUR—Clarke! KHASI AND JAINTIA HILLS, Mousto, Shaila (Shella?), Nongklow—Clarke.

Desmodium pseudo-triquetrum DC. Syn. *D. Triquetrum* F. B. I. in part.

A trailing undershrub. *Branches* 3-gonous-usually ciliate along the angle. *Leaves* smaller than those of *D. triquetrum* or *D. alatum*, glabrous or nearly so above, pilose along the nerves beneath at least till mature; lateral nerves about 8-12 on either half, wings narrower than in *D. triquetrum*; stipules .4-.8 in. by .15-.2 in. long, persistent. *Flowers* about the same size as those of *D. alatum*, but on shorter pedicels. *Pods* densely hispid along the edges, specially when young, glabrous or puberulous and finely reticulate on the sides.

North-East Frontier—Dipimukh, KHASI HILLS upto 4,000 ft., SIBSAGAR—Master! GOALPARA, Hamilton! SYLHET—Wallich! Kohima—Prain!

The leaves are used like tea by Mikirs and Abors.

Flrs. 9-10. Fr. 10-12.

20. Desmodium gyrans DC. Vern. *Gorachand*, Beng.; *Kali-manac*, Kh.; *Mushud-biphang*, Mech.; *Samphleng-gap*, Garo. The telegraph plant.

A semi-herbaceous and somewhat variable undershrub usually 4-5 ft. high; stems terete, indistinctly striate, green, glabrous, usually unbranched. *Leaves* normally 3-foliolate, but the lateral leaflets, if present, are reduced to very small sizes or are altogether absent, sometimes by early fall; common petiole .5-1.5 in. long; stipules .3-.6 in. long, subulate with a broad base, erect, striate. *Terminal leaflets* 1.5-4 by .3-1.5 in., oblong or oblong-lanceolate, obtuse at both ends, quite entire, rather membranous, almost glabrous and often with irregular, glaucous blotches above, glaucous and more or less densely adpressed-pubescent beneath; main lateral nerves 7-10 on either half, oblique, arched, very slender. *Lateral leaflets* when present .25-.7 by .05-.12 in., rotating by jerks under atmospheric stimules; petiolules .06-.15 in. long, slender; stipels about the same length, very slender. *Racemes* axillary and terminal, the latter often branched, 2-6 in. long; pedicels .2-.3 in. long, finely downy; bracts about .25 in., caducous, ovate-cuspidate, concealing the flower-buds. *Calyx* about .1 in. long, campanulate; teeth deltoid, small. *Corolla* .25-.4 in. long, dull-purple. *Stamens* diadelphous. *Pod*

1-1·7 by ·2 in., falcate, sub-glabrous or glabrescent, indented and at length continuously dehiscent along the lower suture; seeds reniform, compressed, with a prominent winged strophiole.

BRAHMAPUTRA VALLEY upto Dhansiri-mukh, and upto 5,500 ft. in the KHASI, JAINTIA and GARO HILLS, generally in grass-lands.

Flrs. & Fr. 10-2.

Var. *Roylei* which is a taller undershrub with larger leaves occurs in the southern parts of the JAINTIA HILLS and possibly in similar localities elsewhere.

21. *Desmodium gyroides* DC.

A shrub 5 to 10 ft. in height closely allied to the last species; stem freely branched; branches terete, densely grey-hairy when young. *Leaves* normally 3-foliolate, but often 1-foliolate by supression; common petiole ·5-1·2 in. long; stipules ·3-·7 in. long, subulate with an attenuated fine point, striate, sub-persistent. *Leaflets* ·7-2·5 by ·5-1·3 in., the side ones when present, being much smaller than the terminal, ovate elliptic or obovate, obtuse, sometimes emarginate at apex, membranous or chartaceous, green, often blotchy and very thinly pubescent above with minute adpressed hairs, glaucous and more or less densely adpressed hairy beneath; lateral nerves 5-7 on either half, slender, arched; stipels ·15-·2 in. long, bristle-like. *Racemes* axillary and terminal, usually branched, 2-5 in. long; pedicels ·2-·3 in. long, very hairy, elongating in fruit; bracts ·15-·25 in. long, broadly ovate, striate, strongly ciliate, caducous. *Calyx* campanulate, about ·08 in. long. *Corolla* ·2-·3 in. long, purplish. *Stamens* diadelphous. *Pod* 1-1·5 by ·15-·2 in., indented along the lower suture and dehiscing along it in scallops to set free the seeds, covered with intricate harsh brown hairs, curling up as in the last species after dehiscence; joints 3-10, as broad as or broader than long; seeds reniform, black with a winged strophiole.

Throughout the BRAHMAPUTRA VALLEY from GOALPARA to SIBSAGAR. Not noticed in LAKHIMPUR.

Flrs. 10-11. Fr. 11-2.

Desmodium parvifolium DC.

A much-branched prostrate wiry herb; branches hairy. *Leaves* 1-3-foliolate; common petiole capillary; stipules .1-.4 in. long, scarious, striate. *Leaflets* of two kinds, the smaller generally not exceeding .15 in. in diam., orbicular and much crowded, and the larger up to .5 in. in length, ovate or elliptic, not so crowded, both glabrous above, sparsely hairy underneath; stipels microscopic. *Racemes* numerous, terminal and lateral upto 2 in. long; pedicels .3-.5 in. long, filiform, rusty, hairy; bracts about .1 in., lanceolate or ovate caudate, concave, densely pubescent. *Calyx* .1-.15 in. long; teeth subulate, long-hairy. *Flowers* blue or pinkish. *Standard* orbicular, .25 in. diam. *Stamens* 2-adelphous, alternately sterile; keel petals spurred. *Pod* .3-.5 by .1 in., indented between the joints along both the sutures; joints 2-4, rarely 1 or 5, puberulous when young, veined in a regular pattern.

Var. *macrocarpum* has pods with broader joints and the upper suture straight or nearly so.

KHASI HILLS 4,500 ft., e.g. Nongstoin, Shillong, etc.

The leaves are good as cattle fodder and are used as a vegetable in Chota-Nagpur.

Flrs. & Fr. 9-11.

Desmodium Griffithianum Benth.

A trailing herb 1-2 ft. long, shaggy with fine spreading hairs. *Leaves* 3-foliolate; common petiole .5-1 in. long. *Leaflets* .5-1 in. long, terminal largest, obovate or oblong, sub-coriaceous, glabrous above, adpressed-hairy beneath. *Racemes* terminal, 2-6 in. long, dense towards the top; pedicels .1-.15 in. long, silky; bracts .25-.35 in. long, ovate cuspidate, densely silky. *Calyx* .1-.12 in. long, hairy; teeth deep, setaceous. *Corolla* .2-.25 in. long, bluish purple, exserted. *Pod* .5-.6 by about .1 in.; joints 4-5, obscurely downy.

KHASI HILLS, 4,500 ft.

Desmodium triflorum DC.

A cæspitose and much branched trailing perennial herb upto 2 ft. in length, often rooting at the nodes, covered with fine spreading hairs. *Leaves* 3-foliolate, scarcely exceeding .7 in. in length; common petiole .15-.25 in. long; stipules .1 in. long, lanceolate, persistent. *Leaflets* .12-.5 in. long, ovate, truncate or emarginate, with scattered adpressed hairs beneath. *Flowers* very small, white or purple, generally 1-3 together from the axil of the upper leaves; pedicels .25-.35 in. long, capillary. *Calyx* about .1 in. long; teeth long, setaceous. *Pod* about .5 by .12 in., somewhat curved, indented along the lower suture; joints 3-5, rather longer than broad, pubescent or nearly glabrous, reticulate-veined.

Common in meadows upto 5,500 ft. in the hills. An excellent fodder.

Flrs. & Fr. chiefly 8-12.

Desmodium heterophyllum DC.

Similar to the above in habit but larger. *Leaves* 3-foliolate upto 1.5 in. in length; common petiole .35-.5 in. long, pubescent; stipules .12 in. long, caudate-acuminate, persistent. *Leaflets* obovate-oblong, .5-1 in. long, hairy beneath. *Flowers* purple, axillary, solitary or two together or in 2-6-flowered lax racemes; pedicels .5-.7 in. long; bracts lanceolate, deciduous. *Calyx* as in the last species, but teeth longer. *Pod* .5-.7 by .12-.15 in., much indented along the lower suture, glabrescent; joints 4-5, as broad as long.

Plains of both valleys and in the KHASI HILLS, usually in meadows.

Flrs. & Fr. probably at the same time as the last species.

Desmodium oblongum Wall.

A slender under-shrub; stem hairy. *Leaflets* oblong. *Flowers* in lax much branched, paniced racemes.

Aka Hills (15303).

Desmodium dioicum DC.

An undershrub (woody); stem reddish brown, glabrous. *Leaves* usually 3 foliolate, elliptic, entire, acute, coriaceous, glabrous. *Racemes* 4-6 in. long. *Pods* moniliform, 1-2 in. long, densely villous.

Aka Hills. (15307).

13. ABRUS Linn.

Dextrorse twining shrubs with woody stems. *Leaves* paripinnate; rachis ending in a bristle; stipules lanceolate, deciduous. *Leaflets* opposite, shortly petioluled; stipels minute, rigid, persistent. *Flowers* in fascicles in dense axillary racemes or branchlets; bracts and bracteoles small, deciduous. *Calyx* campanulate, almost truncate; the teeth being very short. *Corolla* much exserted; standard broadly ovate, narrowed down to a short claw, slightly adnate to the staminal tube. *Stamens* 9 in a sheath, the 10th absent. *Ovary* subsessile, many-ovuled; style short, incurved, not bearded; stigma capitate. *Pod* more or less compressed, thinly septate between the seeds.

Leaflets not exceeding .3 in. in width; pod	
turgid, 3-5 seeded, globose or ovoid.	1. <i>A. precatorius</i> .
Leaflets up to .5 in. in width; pod flat, 6-10	
seeded; seeds compressed.	2. <i>A. pulchellus</i> .

1. Abrus precatorius Linn. Vern. *Latur-mani* or *Ratur-mani*, Ass.; *Kunch*, Beng.; *Gunja*, Hind. & Sans. Crab's eyes, Eng.

A handsome twining shrub. *Leaves* 2-3·5 in. long; stipules ·15 in. long, subulate. *Leaflets* 20-40, ·4-1 by ·2-·3 in., oblong-ligulate, minutely apiculate, membranous, glabrous or thinly silky beneath; stipels minute. *Flowers* reddish or dull white, clustered on tubercles in dense pedunculate racemes, which are shorter than or sometimes as long as the leaves; peduncle often leaf-bearing; pedicels very short. *Calyx* ·1-·15 in. long, truncate, thinly silky. *Corolla* ·3-·5 in. long; standard ovate, acute, narrowed to a short claw, wings oblong, falcate and shorter than the arcuate keel. *Pod* 1-1·7 by ·4-·5 in., 3-5 seeded, oblong, with a sharp deflexed beak, thinly pubescent, turgid but thinly septate between the seeds. *Seeds* about ·2 in. long, generally two-thirds scarlet or white and the rest jet-black, sometimes wholly white, rarely wholly black, smooth, shining.

On bushes in scrub jungles in the plains of both VALLEYS.

The roots, leaves and seeds are used medicinally. The seeds which are said to weigh constantly about 1·75 grains are used by Indian jewellers as their lowest unit of weight-rati. The seeds contain a poisonous principle known as *abrin*.

Flrs. 8-9. Fr. 12-1.

2. Abrus pulchellus Wall. Vern. *Mei-marang-theng*, Khasi (Sylhet border).

Of the same general habit as the foregoing species. *Leaves* 3-5·5 in. long. *Leaflets* 16-30, ·5-1·3 by ·25-·6 in., oblong or oblong-obovate, shortly apiculate with scattered adpressed hairs beneath. *Flowers* pinkish, ·4-·5 in. long, in clusters arranged on protuberances on one sided, long peduncled, terminal and axillary racemes, usually exceeding the leaves; peduncles considerably lengthening in fruit. *Calyx* about ·1 in. long, campanulate, with a wavy mouth. *Pod* 2·5-3 by ·4-·5 in., compressed, adpressed hairy outside, 6-10 seeded. *Seeds* compressed, ellipsoid, about ·2 in. diam., uniformly dark-brown or black.

In about the same localities as the last species, but more common in the vicinity of hills.

Flrs. 9-10. Fr. 11-12.

PISUM Linn.

Pisum arvense Linn. Vern. *Matar*, Beng. & Hind.; *Matar-mah*, Ass.

An annual scandent herb with hollow stems. *Leaves* paripinnate, the rachis ending in a tendril; stipules auricled, often larger than the leaflets. *Leaflets* 2-3 pairs, .3-.5 in. long, obovate or elliptic, toothed. *Flowers* generally purple. *Staminal* tube truncate. *Style* firm, dilated into a sheath. *Pod* turgid, 1-1.5 in. long, 3-5 seeded. *Seeds* globose but with lateral depressions, mottled.

Cultivated as a field crop, often in combination with mustard, in the LOWER BRAHMAPUTRA VALLEY.

Pisum sativum Linn. Vern. *Matar*, Hind. & Beng. & Ass.—Very closely resembling the above in almost all respects excepting the colour of the flower which is always white and the size of the plant and of its pods and seeds. The pods of some varieties attain 6 in. by 1 in. and the green seeds .5 in. diam. The mature seeds are ordinarily about .4 in. diam., globose and dry, usually pale yellow.

This handsome and useful plant has begun to be cultivated in gardens in towns and their suburbs.

14. SHUTERIA W. & A.**Shuteria vestita** W. & A.

A wiry climber with patently hairy stem. *Leaves* 3-foliolate; common petiole 1-2 in. long, very slender, patently hairy; stipules .15-.2 in. long, oblong-lanceolate, scarious; persistent. *Leaflets* 1-2.5 by .8-1.5 in., ovate; apex obtuse and cuspidate, rounded or subcordate at the base, green and usually glabrous or nearly so above, and adpressed grey-pubescent beneath; lateral nerves 5-6 on either half, very slender; lateral petiolules .1-.15 in., stipels setaceous. *Racemes* 1-3 in. long, sessile, dense, often fascicled; patently hairy; bracts small, rigid, lanceolate, persistent; pedicels short. *Calyx-tube* deeply campanulate, gibbous, about .15 in. long, densely hairy; teeth slender, shorter than the tube. *Corolla* reddish or purplish, about .5 in. long; standard with fine purple veins, slightly exceeding the keel, not spurred; wings spurred; keel petals connate, both wings and keel tipped with purple. *Stamens* 2-adelphous. *Ovary* many-ovuled; style incurved, filiform, beardless. *Pod* 1-1.25 in. long, linear, compressed, shaggy with rusty hairs, 5-6 seeded.

KHASI HILLS, 4,500 ft., chiefly in forest glades.

Fl. & Fr. 11-1.

Var. *glabrata* also occurs in the same localities which differs from the type by having glabrescent leaflets and calyx.

S. hirsuta Baker, also occurs in the KHASI HILLS. The stem is more rigid and more densely hairy with reflexed hairs, the leaves are coated with adpressed hairs on both surfaces, the racemes are peduncled and laxer flowered and the flowers are purplish.

15. DUMASIA DC.

Slender climbing herbs. *Leaves* pinnately 3-foliolate; leaflets with minute stipels. *Flowers* in axillary racemes; bracts small; bracteoles minute. *Calyx tube* cylindrical, gibbous, much obliquely truncate. *Corolla* yellow, exserted; standard obovate, clawed, spurred; wings and keel very long-clawed, adherent above the claws. *Stamens* 2-adelphous. *Ovary* linear; style long, flattened upwards, not bearded. *Pod* linear, falcate, torulose. *Seeds* subglobose; testa hard, blue-black.

Leaves long petioled; leaflets distinctly petioled, ovate; corolla twice as long as the calyx-tube.

1. *D. villosa*.

Leaves subsessile; leaflets subsessile, suborbicular; corolla only slightly exceeding the calyx-tube.

2. *D. cordifolia*.

1. *Dumasia villosa* DC.

A slender twiner with thinly hairy wiry stem. *Petiole* 1-2 in. long, very slender; stipules subulate, .15 in. long. *Leaflets* 1.5-3 by 1-2 in., ovate, obtuse, obscurely mucronate, subcuneate or rounded at the base, membranous, dark-green above, paler underneath, thinly adpressed pilose on both surfaces; lateral nerves 5-6 on either half, lowest pair from near the base and strongest petiolules about .1 in. short, very slender. *Calyx-tube* .2-.3 in. long, thinly hairy outside. *Corolla* yellow, .5-.7 in. long. *Pod* dun-velvety, 1-2 in. long, 2-4 seeded, torulose between the seeds.

KHASI HILLS, 4,600 ft., e.g., Kynshi, Mawphlang, etc., Var. *leiocarpa* with subglabrous leaflets and pods also occurs in the same localities.

Flrs. & Fr. 7-10.

2. *Dumasia cordifolia* Benth.

Differs from the above by subsessile leaves and leaflets, the latter being cordate-orbicular much smaller and glabrous; shorter, laxer and fewer-flowered racemes, glabrous calyx and less exserted corolla.

KHASI HILLS Hk. f. & Th.

Glycine Soja Benth. Syn. *Glycine hispida* Maxim. Vern. *Patni-jokra*, Ass.; *U Rymbai-kutung*, Khasi. The Soy Bean.—A suberect stout annual herb, 1-2 ft. high, densely covered with patent rusty hairs. *Leaves* 3-foliolate; common petiole 2-6 in. long, hairy; stipules about .2 in. long, subulate, concealed in the hairs of stem. *Leaflets* 1.5-3.5 by 1-1.25 in., oblong-lanceolate, membranous, hairy on both surfaces; lateral nerves about 5 on either half, faint; lateral petiolules .1-1.15 in. long, densely hairy. *Racemes* axillary, sessile with few congested flowers. *Calyx* reddish, little exserted; petals subequal. *Stamens* almost completely monadelphous. *Ovary* subsessile; style short, incurved, beardless. *Pod* 1-1.5 in. by .3-3.5 in., flattish, recurved, narrowed towards the base, densely hairy, 1-3 seeded. *Seeds* brown, ellipsoid, compressed, .3-4 in. long, with a long hilum.

Cultivated as a field crop in the KHASI HILLS for the seeds which are used as a pulse and as fodder for cattle.

Flrs. 9-10. Fr. 11-1.

16. TERAMNUS Sw.

Teramnus flexilis Benth. Vern. *Nongsangpher*, Mik.

A twining herb with terete, sparingly adpressed hairy, green stems. *Leaves* pinnately 3-foliolate; common petiole 4-5 in. long, slender, channelled; stipules obliquely lanceolate. *Leaflets* 4-5 by 2-2.5 in., ovate or ovate-oblong, acuminate, rounded at the base, membranous, dark-green above, paler beneath, more or less adpressed hairy on both surfaces; lateral nerves 5 or 6 on either half; lateral petiolules about .15 in. long, covered with bristles; stipels minute, setaceous or subulate. *Racemes* axillary, up to 1 in. long, shaggy with white bristles, the flowers crowded at the extremity. *Calyx-tube* about .12 in. long, campanulate, hairy outside; teeth deltoid, sub-equal. *Corolla* reddish, slightly exserted; petals nearly all equal; standard not spurred. *Stamens* monadelphous, alternate stamens sterile. *Ovary* sessile, many ovuled; style short, beardless. *Pod* 2.5-3 by .2 in., straight, flat, sparingly adpressed hairy, 8-10 seeded, septate between the seeds.

Fairly common in forest glades and on fallow lands in the plains and upto 2,000 ft. in the hills.

Flrs. 9-10. Fr. 11-12.

17. MUCUNA Adans.

Perennial or annual climbing herbs or shrubs. *Leaves* large, pinnately 3-foliolate, minutely stipellate. *Flowers* large, usually dark-purple, generally fascicled on the tumid nodes of the axillary or lateral racemes which are sometimes corymbose. *Calyx* campanulate, the two upper teeth connate. *Corolla* much exserted; keel rostrate, much exceeding the standard and generally slightly exceeding the wings. *Stamens* 2-adelphous; anthers 2-morphous, alternately basi-fixed and dorsifixed. *Ovary* sessile, many-ovuled; style incurved, beardless. *Pod* hard, usually covered with irritating bristles.

I. Pod obliquely plaited on the faces :—

- | | |
|-----------------------------------|---------------------------|
| Pod winged, 2-4 seeded. | 1. <i>M. imbricata</i> . |
| Pod not winged, 1-seeded. | 2. <i>M. monosperma</i> . |

II. Pod not plaited, nor winged :—

- | | |
|--|---------------------------|
| A. Pod 12-18 in. long, 8-12 seeded. Leaves glabrous. | 3. <i>M. macrocarpa</i> . |
|--|---------------------------|

- | | |

| B. Pod not exceeding 4 in. in length, 5-6 seeded :— | |
|---|--|

- | | |
|---|--------------------------|
| Pod without longitudinal furrows. | |
| Peduncles conspicuously bracteate. | |
| Leaves adpressed hairy. | 4. <i>M. bracteata</i> . |
| Pod longitudinally furrowed. Bracts small. Leaves grey-silky beneath. | 5. <i>M. prurita</i> . |

1. *Mucuna imbricata* DC. Vern. *Mekuri-ghila*, Ass.; *Tapo-tapi-rubi*, Abor; *Suthai-makhra*, Kach.

A large climber with slender glabrescent branches. *Common petiole* 3-5 in. long, slender. *Leaflets* 4-6 in. long, lanceolate, ovate lanceolate or elliptic, more or less acuminate, membranous, glabrous above, sparsely yellow hairy beneath; petiolules stout, .25 in. long. *Racemes* 4-12 in. long, pendulous, long peduncled, laxly 8-10 flowered; bracts large, caducous; pedicels .5 in. long. *Calyx* .7 in. long with a few irritating bristles; teeth nearly as long as the tube. *Corolla* 2-2.25 in. long, dull purple; keel abruptly reflexed at the tip; standard 1 in. broad. *Pod* 4-6 by 2 in., oblong, 2-4 seeded, with two wings on each suture about .5 in. broad,

and with close oblique plaits on the faces, densely covered with brittle ferruginous bristles. *Seeds* large, flat.

UPPER ASSAM, not very common. Nizamghat in the N. E. FRONTIER DISTRICT to the Dhansiri Reserve, NOWGONG.

Flrs. Rainy season. Fr. 12-4.

2. *Mucuna monosperma* DC. Vern. *Mei-sia-ryntim*, Khasi.

A large woody climber; branches longitudinally ribbed; branchlets slender, glabrescent. *Common petiole* 2-4 in. long, slender, generally red, ferruginous-pubescent; stipules caducous. *Leaflets* 3-5 by 2-3·5 in., ovate-oblong, the lateral very oblique, abruptly acuminate, quite entire, chartaceous, glabrous above, covered when young with ferruginous pubescence underneath; midrib and lateral nerves generally red, the latter 5 or 6 on either half, slender, much arched, ultimate nervules very closely and finely reticulate; petiolules ·25-·3 in. long, stout, terrete, pubescent. *Racemes* axillary or from old nodes, 2-4 in. long, subcorymbosely 6-12 flowered, short peduncled; rachis coloured or zigzag, velvety, sometimes reduced to tendrils; pedicels ·5-·8 in. long, velvety. *Calyx* bowl-shaped, ·5-·6 in. across, with scattered bristle-like reddish hairs both inside and outside, hispidly velvety outside; lobes short. *Flowers* about 2 in. long; standard ·7-1 by ·5-·7 in., suborbicular, dull purple; wings 1·2-1·5 by ·3-·35 in., oblong, conforming to the keel, dull purple; keel slightly longer but narrower than the wings, greenish; standard outside, wings and keel towards the base with scattered reddish brown bristles. *Pod* about 2 by 1·3 in., ovate-ovoid, 1-seeded, densely covered with reddish or dark-brown irritating bristles, which on young pods completely conceal the plaits on the faces.

Along the southern foot of the KHASI HILLS between Shella and Nongkla, generally in swampy localities.

Flrs. 11-12. Fr. 12-2.

3. *Mucuna macrocarpa* Wall. Vern. *Mei*-, *Jermi*- or *Thar-jendru*,—*jenreu* or —*jinriu*, Khasi; *Dushmai-doukha*, Kach.

A very large woody climber with whitish lenticellate

bark exuding sticky watery gum from cuts; branches obscurely sulcate, at first adpressedly grey-pubescent, glabrescent with age. *Common petiole* 2-6 in. long, slender. *Leaflets* 3-7 by 2-5 in., elliptic-ovate, lateral oblique, abruptly acuminate, coriaceous, adpressed grey-hairy on both surfaces when young, soon glabrescent above and nearly so beneath; lateral nerves about 5 on either side of the midrib, prominent beneath, arched; petiolules .3-.4 in. long, brown-tomentose. *Racemes* axillary and generally solitary on short branches, but more generally in fascicles from the old wood, often branched above the short peduncle; rachis densely grey-velvety; bracteoles .5-.7 in. long, ovate-oblong, velvety. *Calyx* about 1 in. long, somewhat gibbous, dark-green, with deciduous irritating bristles; lobes short, unequal. *Corolla* 2-3 in. long; petals covered outside with similar deciduous bristles as the calyx; standard 1.2-1.5 in. broad, greenish; wings 1.7-2 by .6-.7 in., fleshy, purple; keel 1.7-2.5 in. long, abruptly turned up and gradually narrowed to the tip. *Style* glabrous. *Pod* 12-18 by 1.5-2 in., on a stipe, 1.5-2.5 in. long, laterally compressed, 8-12 seeded, constricted between the seeds, channelled along the suture, velvety when young. Seeds 1.2 by 1 in., rhomboid or ellipsoid; testa dark-brown, horny, glabrous and shining outside; hilum round three quarters of the edge (giving the seed the appearance of a leather purse).

NORTH CACHAR and KHASI HILLS upto 4,500 ft., also in the neighbourhood of Dulong-mukh, NORTH LAKHIMPUR (not very common).

Flrs. 3-4. Fr. 9-11., but apparently remaining long on the plant after maturing.

4. *Mucuna bracteata* DC. Vern. *Wakmi*, Garo.

An annual or perennial climber; branchlets at first adpressed grey pubescent, glabrescent. *Common petiole* 4-5 in. long, slender, nearly glabrous. *Leaflets* 2.5-4 by 1.7-3.5 in., terminal rhomboid, lateral deltoidly oblique, acute or subacute, membranous or chartaceous, dark-green and glabrescent above, finely adpressed pubescent beneath; lateral nerves 6-7 on either side of the midrib; lateral petiolules .15-.2 in. long, hairy; stipels subpersistent, about

·15 in. long, setaceous. *Racemes* axillary, 6-10 in. long, bracteate down to the base; rachis softly pubescent; bracts ·5-·6 in. long, ovate or obovate, tip usually pointed, pubescent and also with scattered bristles. *Flowers* about 1·5 in. long, blackish-purple. *Calyx* ·4-·5 in. long; teeth linear, covered with grey tomentum and scattered bristly hairs; standard broad, wings falcate, much longer than the standard, ciliate along the base on the outer margin; keel exceeding the wings. *Pod* 3-4 in. long, 5-6 seeded, almost terete, when fully mature, serpentine curved, covered with reddish bristles, not longitudinally ribbed.

UPPER ASSAM, generally in glades in evergreen forests, also in the GARO and KHASI HILLS, upto 3,000 ft., -not very common.

The seeds and the hairs of the pod have probably the same economic uses as those of the next species *M. prurita*.

Flrs. 1-2. Fr. 3-5.

Mucuna exserta C. B. Clarke Ms. ex. C. E. C. Fisher.

A perennial or annual climber; branchlets striate; common petiole glabrescent, striate, 1·2-7·8 in. long. *Leaflets* rigid, 2·7 by 1·2-4·5 in., terminal rhomboid; lateral obliquely ovate, broader half outwards, acute or acuminate, margins subundulate, glabrous or nearly above, adpressed brownish pubescent beneath; main lateral nerves 5-6 on either half, ultimate reticulations fine; petiolules ·15-·2 in. long. *Racemes* terminal, upto 9·5 in. long, densely clothed with soft brown pubescence mixed with stiff, red irritating bristly hairs. *Bracts* upto ·8 in. long, those at the base of the raceme more or less persistent. *Flowers* about 1·5 in. long; pedicels ·2-·5 in. long. *Calyx* about ·4 in. long, thinly pubescent and bearing rufous bristly hairs. *Corolla* deep purple, about ·8 in. long, wing narrow oblong, lower half brown hairy, about 1·2 in. long; keel exceeding the wings and recurved at the apex. *Stamens* as long as the keel. *Pod* 2-3 in. long, linear-oblong; apex rounded, turgid, densely covered with dark brown bristles.

KHASI HILLS (1500 ft. C. B. Clarke. ASSAM—Griffith); MANIPUR—Neechugard.

Flrs. 2.

Closely allied to *M. bracteata* DC. differing by its rigid leaflets, more finely reticulate tertiary nerves and by its flowers and pods being more densely clothed with brown bristles.

5. Mucuna prurita Hk. Vern. *Akolshi*, Beng. The Cowitch or Cowage plant.

A twining annual very similar in appearance to the above. *Common petiole* 4-7 in. long. *Leaflets* 3-8 in. long,

ovate or rhomboid, glabrescent above, adpressedly grey-silky beneath. *Racemes* 4-8 in. long, short-peduncled, drooping, 10-20 flowered. *Calyx* .25-.4 in. long, 2-lipped with irritating bristles. *Corolla* 1.3-1.6 in. long, dark-purple; wings about .25 in. broad, shorter than the incurved keel. *Pod* 2-3 by .6-.8 in., 5-6 seeded, almost terete, ends curved in opposite directions, longitudinally ribbed, covered with dense pale-brown bristles.

Generally in scrub forests and waste lands in the plain.

The seeds are used as an aphrodisiac and the irritating hairs as a vermifuge.

Flrs. 1-3. Fr. 4-6.

18. ERYTHRINA Linn.

Generally trees with prickly branches. *Leaves* pinnately 3-foliolate; common petioles sometimes prickly; stipels gland-like. *Flowers* large, usually bright red, in long peduncled axillary or terminal racemes. *Calyx* oblique at the mouth, spathaceous or campanulate and 2-l labiate. *Corolla* much exserted; petals very unequal, the standard much exceeding the wings and the keel. *Stamens* 10, the upper stamen free or nearly so, other stamens free above, alternately long and short. *Ovary* stalked, many-ovuled; style incurved, not bearded. *Pod* linear, turgid, septate between the seeds, more or less torulose. *Seeds* ovoid-oblong without a strophiole.

- | | | | |
|-----|--|---------|----------------------------|
| I. | Calyx spathaceous, entire. Pod 2-3 seeded, scarcely torulose. Leaflets nearly as broad as long. | | 1. <i>E. stricta</i> . |
| II. | Calyx campanulate and 2 labiate :— | | |
| | Standard as broad as long. Pod 6-8 seeded, distinctly torulose. Leaflets ovate-oblong. | | 2. <i>E. ovalifolia</i> . |
| | Standard much longer than broad. Pod 4-6 seeded, flat and broad. Leaflets at least as broad as long. | | 3. <i>E. arborescens</i> . |

1. *Erythrina stricta* Roxb. Vern. *Madar* or *Mandar*, Beng. & Ass.; *Tagat-asing*, Miri & Abor; *Pharse* or *Pharche-arong*, Mik.; *Bol-Madal* or *Mandal*, Garo; *Antu*, *Bag-long-thing*, *Kuong-cho-thing*, Kuki; *Mander-phang*, Cach.; *Dieng-song* or *R'song*, *Dieng-song'-dkhar*, Khasi; *Phartu*, Lush.; *Kung-choh*, Tipp.; *Phalita*, *Phalidha*, Nep.

A fairly large tree with a striking appearance when in flower. *Bark* deeply furrowed, greenish-yellow outside, often with strong prickles, inside white or dun-brown with white streaks; branchlets stout, glabrous, with many slightly incurved prickles; pith large, shoots pubescent when young. *Common petiole* 6-9 in. long, terete, not armed; stipules falcate. *Leaflets* 5-7 in. across, sometimes broader than long, rhomboid-orbicular or ovate, lateral oblique, all shortly acuminate, rather membranous, glabrous and shining above, glaucous and minutely pubescent along the nerves beneath; lateral nerves 6-8 on either half, the lowest basal, slightly arched, tertiary nerves rather irregular, transverse to the secondary with very fine reticulations between; base very broadly cuneate; lateral petiolules $\cdot 35\text{--}\cdot 5$ in. long, thicker than the petiole. *Racemes* 6-9 in. long, horizontal, secund, crowded at the ends of branchlets, pubescent when young; peduncles 5-7 in. long and $\cdot 2$ in. thick at the base; bracts caducous, up to 2 in. long, linear or subulate, brown pubescent. *Flowers* coral-red. *Calyx* spathaceous, about $\cdot 5$ in. long, pubescent in bud; standard scarlet, 1.5-2 in. by 1 in., ovate or obovate with parallel white lines inside; keel $\cdot 7\text{--}\cdot 9$ in. long, scarious, light greenish; wings minute, truncate, reddish. *Pod* 4-5 in. long, obscurely torulose, spindle-shaped, sharply pointed, glabrous outside, white silky inside. *Seeds* 2-3, kidney-shaped, red.

Fairly common throughout the province ascending to 3,500 ft. in the Hills.

Wood white, soft, very light, weighing about 16 lbs. per c. ft. It can however be used as planks, specially in carriage building.

Flrs. 1-3. Fr. 3-5.

2. *Erythrina ovalifolia* Roxb. Vern. *Hari-kekra*, Beng.

A small tree. *Branches* pale-grey, armed with numerous black prickles; bark thick, deeply cracked. *Common petiole* 2-4 in. long, terete, sometimes armed. *Leaflets* 3-9 by 1.5-5 in., ovate-oblong, subcoriaceous, glabrous above, glaucous beneath; lateral nerves 6-8 on either half, tertiaries indistinct; base broadly cuneate; lateral petiolules 1.5-1.7 in. long. *Racemes* terminal, 4-6 in. long, horizontal. *Flowers* scarlet,

1.5-1.7 in. long, mostly in groups of three on the rachis. *Calyx-tube* about .5 in. long, turbinate, bursting irregularly, brown-tomentose outside. *Standard* 1.5-2 by 1.5 in., obcordate, erect; keel .7-1 in. long; wings still shorter with coloured tips. *Pod* 3.5 in. long, 6-8 seeded, constricted between the seeds along the upper suture; seeds black, kidney-shaped, about .5 by .25 in.

Said to occur in SYLHET and ASSAM PROPER.

Flrs. 1-3. Fr. 4-6.

Erythrina arborescens Roxb. Vern. *Dieng-son*, *Dieng-song*, *Dieng-ja-ra-song*, *Dieng-r-song-hadem*, Synt.; *Dieng-song*, Khasi.

A small tree with a low spreading crown. *Bark* rough, with a shining layer of cork outside, bright-green underneath the cork, inside pale white. *Common petiole* 8-10 in. long, stout, terete, glabrous. *Leaflets* 5-7 in. long and as broad and often broader, broadly triangular-ovoid or rhomboid with a cuneate base, sharply acuminate, membranous, bright green shining and quite glabrous above, subglaucous and slightly hispidulous along the nerves beneath; lateral nerves 5-7 on either half, nearly straight, tertiaries transverse to the secondaries, reticulations very fine; lateral petiolules about .5 in. long, stout. *Racemes* axillary, 8-10 in. long, long-peduncled, pubescent when young; pedicels slender up to .2 in. long. *Calyx* silky or nearly glabrate outside. *Standard* orange-red, 1.5 by 1 in., elliptic, concave, emarginate, veined, velvety inside; wings pale-green, lineate, .5 in. long, ovate; keel triangular ovate, acuminate, .7 in. long, pale-green. *Pod* much curved, 6-9 by 1 in., narrowed at both ends, 4-6 seeded. *Seeds* about .5 in. long, oblong-reniform, white (at least when not fully ripe); testa smooth.

KHASI HILLS 4,500-6,000 ft., often planted.

Wood as of *E. stricta*.

Flrs. 8-9. Fr. 10-11.

19. BUTEA Roxb.

Trees or shrubs, the latter erect or climbing. *Leaves* pinnately 3-foliate (very rarely 1-foliate in *B. frondosa*);

stipules small, caducous. *Leaflets* large; stipels serrulate. *Flowers* large, showy, fascicled in axillary or terminal, simple or compound racemes; bracts and bracteoles small, caducous. *Calyx* campanulate; teeth deltoid, the two upper connate. *Corolla* much exserted; petals subequal or unequal, generally orange-red; standard ovate or lanceolate, recurved; wings falcate, adnate to the keel. *Stamens* diadelphous, anthers uniform. *Ovary* sessile or shortly stalked, 2-ovuled; style filiform, curved, beardless. *Pod* oblong, flat, with only one seed at the apex and dehiscent only above the seed. *Seed* obovate, compressed; hilum small.

- I. Flowers at least 2 in. long; keel much incurved, acute. Pod stalked :—
 - A middle-sized tree. Lower calyx-teeth deltoid; pod grey-tomentose. 1. *B. frondosa*.
 - A large climber. Lower calyx-teeth lanceolate; pod rusty-tomentose. 2. *B. superba*.
- II. Flowers about 1 in. long; keel slightly curved, obtuse. A sub-erect shrub. Pod sessile. 3. *B. minor*.

1. *Butea frondosa* Roxb. Vern. *Polah*, *Polak*, Ass.; *Palas*, Beng.; *Bol-ori*, or *-uri*, *Bol-aphal-uri*, Garo; *Dhak*, Hind.; *Kinsuka*, *Palasa*, Sans. Flame of the forest.

A tree up to 50 ft. in height and 6 ft. in girth; young parts softly silky, often gnarled; bark rough, bluish-grey or dark-brown outside, fibrous and light red inside, exuding from wounds a light red gum which dries to ruby-coloured beads. *Common petiole* 5-9 in. long; stipules short, tomentose. *Leaflets* 5-8 by 4-5-7 in., hard, rigidly coriaceous, glabrescent and somewhat shining above, silky tomentose beneath, lateral obliquely ovate or broad elliptic; terminal rhomboid or broadly obovate from a cuneate base; lateral nerves 4-7 on either half, slightly arched, very prominent beneath, petiolules .2-.4 in. long, stout. *Racemes* axillary, crowded towards the extremities of leafless branchlets, 4-6 in. long, rigid, often subcorymbose; pedicels .5-1.3 in. long, the stout rachis and bracts and calyx covered with dark chocolate or brown velvety tomentum. *Calyx* .5 in. long, cup-shaped, fleshy, grey-silky inside. *Petals* bright orange-red, equal, silvery tomentose outside; standard 1 in. broad,

recurved; keel incurved, beaked; wings falcate, adhering to the keel. *Ovary* shortly stalked. *Pod* 4-6 by 1·2-1·7 in., ligulate, firm, pendulous, silky tomentose, more densely so along the sutures, abruptly narrowed to a stalk, ·5-·7 in. long. *Seed* 1·2-1·5 in. long, oval, compressed, dark-brown.

Plains of Assam up to SIBSAGAR, generally in water-logged localities,—not reported from LAKHIMPUR. Also in the GARO HILLS up to 1,000 ft.

The wood is dirty white, porous, soft, weighing 36 lbs. per c. ft. It is durable under water and is used for well-curbs and piles. The red juice which hardens into a ruby coloured gum is used as a substitute for Kino. The flowers give an orange dye and a decoction of them is used to keep out white ants from fields. The seeds have a medicinal use. Lac is often grown on the branches. The leaves are used as plates like those of *Sal*, and to wrap up grocers parcels. They are also lopped for buffalo fodder.

Leafless 2-3. Flrs. 3-4. New leaves 4. Fr. 6-7.

2. *Butea superba* Roxb. Vern. *Lata-palash*, Beng.

A large woody dextrorse climber with fairly smooth brownish bark, exuding a red juice like the preceding species and closely resembling it in foliage and flowers. *Leaflets* usually much larger, sometimes attaining over 18 in. in young plants, the racemes much longer, thinner and more flexuous and the flowers larger and of a brighter yellow but with a smaller calyx than in *B. frondosa*. *Pod* somewhat shorter, but longer stalked, not so broad, somewhat rigid, densely rusty tomentose.

Only found in the drier parts of *Sal* areas in GOALPARA.

The gum, the leaves and the flowers can respectively be put to the same uses as those of *B. frondosa*.

Flrs. 3-4. Fr. 4-6.

3. *Butea minor* Ham. Vern. *Dieng-la-palang*, Khasi and Synt.

An erect shrub with long switchy branches covered with grey-silky tomentum. *Common petiole* 4-8 in. long, channelled, tomentose; stipules about 1 in. broad, semicircular, often persistent. *Leaflets* often up to 15 by 12 in., more or less of the same shape as, but somewhat less coriaceous than of the other two species, glabrate above, bright grey-silky beneath; lateral nerves 7-9 on either half, very oblique. *Racemes*

4-12 in. long, erect, angular, often with short branches at the base; pedicels .5-.7 in. long, terete, tomentose. *Flowers* .8-1 in. long, red. *Calyx* about .3 in. long, silky tomentose; teeth short, acute. *Corolla* densely velvety; standard .5 in. broad; wings .5-.6 in. long, very slightly falcate, shorter than the slightly inflexed keel. *Style* hairy. *Pod* 3-3.5 in. long, rigid, sessile, cuneate at the base, rusty-tomentose.

KHASI HILLS, 3-5,000 ft. in open grass-lands, specially in the Jowai Sub-division where the leaves are used for wrapping parcels.

Flrs. 8-10. Fr. 10-12.

20. SPATHOLOBUS Hassk.

Spatholobus Roxburghii Benth. Syn. *Butea parviflora* Roxb. Vern. *Sallata*, *Hallot*, *Mal-leo*, *Maru* or *Mari-lewa*, *Panlota*, *Hati-bandhalata*, Ass. (Kam.); *Gobang-lata*, Ass. (Darrang); *Salmama*, Beng & Mech.; *Jermei* or *Ther-la-moh-dak*, Khasi; *Mari*, *Maru*, *Mauri*, Garo; *Dumori* or *Dumri-doukha*, *Tou-mudru*, *Salmama*, Cach.; *Chichipia-ringkhong*, Mikir; *Jong-obi*, Tipp.; *Ngoi-hrui*, Lush.; *Maloi-lewa*, Jharua, *Debre-lawar*, Nep.; *Jema-soi-sen*, Kuki.

A large sinistrorse evergreen climber; stem with concentric layers of bast inside which exude a red gum when cut; branches grey-pubescent. *Leaves* pinnately trifoliolate, stipellate. *Common petiole* 3-4 in. long, terete or only slightly channelled above, glabrescent; stipules deciduous, triangular-acute, .3 in. long. *Leaflets* 4-9 by 3-6 in., ovate to rhomboid or obovate, lateral very oblique, shortly acuminate, acute or obtuse, subcoriaceous, glabrous above, more or less pubescent beneath; lateral nerves 7-10 on either half, slightly arched, uppermost meeting near the margin in loops; tertiaries transverse and parallel; petiolules .2-.3 in. long; stipels setaceous. *Racemes* compound, forming large terminal panicles, 2-3 ft. long, lower portion often leafy. *Flowers* white, cream-coloured or reddish, .3-.4 in. long, solitary or in fascicles of 2-3; pedicels very short; bracts minute, linear, caducous. *Calyx* campanulate, grey-velvety; teeth acute, the two upper connate. *Petals* subequal; standard longer than the keel, emarginate; wings free; keel obtuse, nearly straight. *Stamens* 2-adelphous. *Ovary* shortly stalked, 2-ovuled; style

incurved, beardless; stigma capitate. *Pod* 3-6 by $\cdot 6\text{--}1\cdot 6$ in., 1-seeded, generally more or less constricted and flat below the seed, narrowed at the base into a stalk, $\cdot 4\text{--}6$ in. long, softly brown-velvety, dehiscing from the apex only sufficiently to set free the seed.

Except above a line drawn across the Brahmaputra Valley through Dhansirimukh common throughout the PROVINCE, generally in deciduous types of forest. Always present with Sal to which it does considerable harm by bending and distorting its stem round which it twines with a very tight grip.

Dry stems are often used as tinder.

Flrs. 8-12. Fr. 1-3.

21. MASTERSIA Benth.

Mastersia assamica Benth. Syn. *M. cleistocarpa* Baker.
Vern. *Tille-iyndru*, Synt.

A stout woody climber; branches sarmentose, terete, glabrous, lenticelled, twining anti-clockwise. *Leaves* pinnately 3-foliolate; *common petiole* $3\cdot 5\text{--}5$ in. long; stipules broader at the base than long. *Leaflets* 4-6 by 3-4 in., ovate or obovate, tapering acuminate, the lateral oblique, chartaceous, glabrous above, minutely adpressed pubescent beneath; lateral nerves 9-10 on either half, oblique, slightly arched, tertiary subparallel, transverse to the secondaries; base rounded or subcordate; stipels about $\cdot 25$ in. long, subulate. *Racemes* generally terminal and paniced, 12-18 in. long; nodes tumid; flowers germinate, conspicuously bracteolate. *Calyx-tube* $\cdot 5$ in. long, turbinate; teeth long, the two upper connate. *Corolla* bluish-white, only slightly exerted; standard suborbicular; keel obtuse, almost straight. *Stamens* 2-adelphous. *Ovary* sessile, many-ovuled; style short, filiform, incurved. *Pod* 3-5 by $1\cdot 1\text{--}25$ in., very flat, strap-shaped, septate between the seeds, the dorsal suture bordered by an erect sharp wing, $\cdot 1\text{--}15$ in. broad, indehiscent or tardily dehiscent. *Seeds* oblong, 15-20 or more, black, shining, $\cdot 15\text{--}2$ by $\cdot 1$ in. on long filiform funicles.

Evergreen forests in UPPER ASSAM, e.g., Kalioni in SIBSAGAR, Dulong Valley, N. Lakhimpur, etc., also in the KHASI HILLS, 4,500 ft. and in the Borail Reserve, NORTH CACHAR HILLS.

Flrs. 10-11. Fr. 12-1.

22. CANAVALIA DC.

Canavalia ensiformis DC. Vern. *Kamtal-urahi*, Ass.; *Makhan-sim*, Beng.; *Naga-thepak-rikang*, *Thepa*, Mik.; *Inam-athepa-arong*, Mik. (Barnihat); *Heppua-teipi*, Naga. The Sword Bean.

A fairly large perennial climber; branchlets glabrous, twining from right to left. *Leaves* pinnately 3-foliolate; common petiole 3·5-5·5 in. long, shallowly channelled; base swollen; stipules minute, deciduous. *Leaflets* 4-7 by 3·5-5 in., ovate to rhomboid-elliptic, terminal usually largest, lateral somewhat oblique, acute or shortly acuminate, minutely cuspidate, broadly cuneate at the base, membranous, glabrous but more or less scaberulous, specially on the upper surface; lateral nerves 6 or 7 on either half, slender, arched; petiolules ·25-·4 in.; stipels setaceous. *Racemes* axillary, 5-6 in. long on stout terete peduncles, 6-8 in. long; nodes tumid, thinly pubescent. *Flowers* large, white, usually with a dash of pink or purple, solitary or in pairs; pedicels short, reflexed, woody in fruit. *Calyx* ·5-·6 in. long, 2-lipped, upper lip notched, lower 3-lobed, sparsely adpressed pubescent to glabrescent outside, silky, specially at the throat inside; lobes much shorter than the tube, upper largest. *Corolla* 1·2-2 in. long, exserted; petals all clawed and auricled at the base; standard suborbicular, rather broader than long, slightly exceeding the wings and the keel often with two ridge-like callosities above the auricles; keel incurved, obtuse. *Stamens* monadelphous. *Ovary* silky, many-ovuled; style incurved, beardless; ovules 10 or more. *Pod* 8-10 by 1·3-1 in. (in cultivation much longer), flat but with two prominent longitudinal ridges along the upper suture, with a slight serpentine curvature along its vertical plane. *Seeds* 6-10, about 1 in. diam., compressed, pink or white when fully ripe.

UPPER ASSAM, SIBSAGAR, Silghat, etc., cultivated in SYLHET. The tender pods are used as a vegetable and the seeds as a pulse.

Flrs. & Fr. 8-12.

Var. *virosa* Vern. *Kathsim*, Beng., differs by its smaller leaves which are more persistently hairy on the undersurface, hairy petioles, smaller lilac flowers borne on denser and shorter racemes and much smaller pods (3-6 in. long) and less compressed marbled seeds. The pods are not edible and the seeds are said to be poisonous.

23. DIOCLEA H. B. K.**Dioclea javanica** Benth. Syn. *D. reflexa* Hk. f.

A slender woody climber; branchlets terete, pubescent when young. *Leaves* pinnately 3-foliolate. *Leaflets* 3-4 by 1·5-3 in., ovate or elliptic, acute or shortly acuminate, entire, coriaceous, thinly adpressed hairy above, more densely and more softly hairy beneath; lateral nerves 8-10 on either side of the midrib, arched, prominent beneath; base rounded; lateral petiolules ·15-·2 in. long, stipellate. *Racemes* 12-18 in. long, long-peduncled, subspicate, thickened at the nodes; bracts ·5 in. long, linear, reflexed, silky, caducous. *Clayx-tube* ·3-·5 in. long, bracteolate, trubinate; teeth as long as the tube. *Corolla* ·7-·9 in. long, bluish-white or reddish; standard orbicular or ovate, reflexed, auricled at the base; keel free, incurved, not beaked. *Stamens* 10, monadelphous, the uppermost free at the base. *Ovary* subsessile, 2-3 ovuled; style incurved, beardless. *Pod* 3-4 by 2 in., half-moon-shaped, 2-seeded, wrinkled outside over the seeds, not septate, covered with short brown hairs; lower suture sharp, upper about ·5 in. broad. *Seeds* somewhat compressed.

Forests of SYLHET, Hk. f. & Th.

Flrs. 12-1. Fr. 2-3.

24. PUERARIA DC.

Twining or diffuse shrubs or herbs. *Leaves* pinnately 3-foliolate; stipules herbaceous, sometimes fixed by the centre; leaflets sometimes palmately lobed; stipels subulate. *Racemes* long usually, axillary when simple and terminal when compound. *Flowers* bluish to reddish, generally ternate on the node of the rachis; bracts and bracteoles small, caducous. *Calyx* campanulate; teeth long or short, the two upper connate. *Corolla* exserted; petals subequal; standard usually spurred at the base; wings narrow, often falcate, adnate to the straight or incurved keel. *Stamens* 10, monadelphous, the odd filament being usually coherent with others at the middle to form a tube, rarely 2-adelphous; anthers uniform. *Ovary* sessile or shortly stalked, many-ovuled; style long, filiform, much incurved, beardless; stigma globose. *Pod* linear, flattish, glabrous or hairy. *Seeds* transversely oblong.

- I. Flowers bluish appearing before the leaves.
Pod flat, membranous, constricted between the seeds :—
Leaflets not lobed; pod bristly; climbing shrub. 1. *P. tuberosa*.
- II. Flowers reddish or red-tipped, appearing with the leaves. Pod not constricted between the seeds :—
 - A. Leaflets not lobed :—
 1. Pods glabrous. Stipules basifixed :—
Pod membranous, flexible. Pedicels longer than calyx; herbaceous climber. 2. *P. peduncularis*.
Pod coriaceous, rigid. Pedicels not exceeding the calyx. Subscandent shrub. 3. *P. Wallichii*.
 2. Pod shaggy. Stipules fixed by the midrib. Climbing shrub. 4. *P. Thunbergiana*.
 - B. Leaflets more or less lobed :—
Stipules basifixed. Pods glabrescent, rigid. Climbing annuals :—
Leaflets shallow-lobed. Flowers .5-.75 in. long. Pod cylindrical with unthickened sutures. 5. *P. phaseoloides*.
Leaflets deeply lobed. Flowers 1 in. long. Pod broader than thick, with thickened sutures. 6. *P. subspicata*.

1. *Pueraria tuberosa* DC.

A large woody climber with very large tuberous roots*, flowering when leafless; old stem with grey fibrous bark; branchlets grey velvety. *Common petiole* 5-8 in. long; stipules minute, cordate-ovate, deciduous. *Leaflets* 4-8 by 3-6 in., terminal broad-ovate or rhomboid, lateral oblique-ovate, all acuminate, membranous, silky-pubescent when young, glabrescent above and thinly adpressed pubescent beneath when mature; main lateral nerves 6-8 on either half; the basal pair being opposite and stronger than the others; base truncate or obtusely cuneate, 3-5 nerved; lateral petiolules .2-.3 in. long; stipels .2-.3 in. long, lanceolate-subulate. *Racemes* erect, usually paniced and terminal or from axils of fallen leaves, 6-15 in. long,

* Sometimes attaining 1-2 ft. in length and 10-12 in. in diameter, and often several strings of tubers connected by thin roots are developed from the same plant.

grey or brown pubescent; bracts minute. *Calyx* about $\cdot 2\cdot 3$ in. long, densely grey-silky; teeth triangular, shorter than the tube, ciliate on the margins. *Corolla* bright-blue, fading to bluish purple, $\cdot 4\cdot 5$ in. long; standard often light in colour with a pale yellow central spot, orbicular, emarginate, clawed, generally spurred; wings oblong-falcate, minutely spurred above the base; keel obtuse, nearly straight. *Stamens* usually 2-adelphous. *Pod* 2-3 in. long, flat, flexible, 3-6 seeded, constricted between the seeds with long bristle-like brown silky hairs.

Not uncommon in deciduous scrubs where the rainfall is not above 50 in. e.g. Upper reaches of the Nambor Valley and SUB-HIMALAYAN TRACTS in KAMRUP and E. GOALPARA.

The tubers have a liquorice like taste and are eaten raw, also used in medicine.

Leafless 12-5. Flrs. 3-4. Fr. 5-6 to 11-12 (?).

2. *Pueraria peduncularis* Grah. Vern. *Ting-khla*, Khasi.

An extensive twining herb; branchlets thin, clothed with short, weak, deflexed grey hairs. *Common petiole* 2-4-5 in. long, clothed like the branchlets; stipules basifixed, $\cdot 25$ in. long, lanceolate, shaggy. *Leaflets* 4-6 by 3-5 in. ovate, ovate-rhomboid, lateral oblique, membranous, green and subscabrous above, grey and softly pubescent beneath; petiolules short, hairy; stipels subulate. *Racemes* 6-12 in. long, slender, rachis downy, unbranched; peduncle 2-5 in. long; pedicels filiform, $\cdot 1\cdot 25$ in. long, fascicled; bracts subulate, adpressed silky, shorter than the pedicels. *Calyx* $\cdot 12\cdot 2$ in. long, slightly gibbous, densely hairy outside. *Corolla* $\cdot 5$ in. long, red or purple tipped; standard not spurred. *Upper stamen* usually free. *Pod* 2-3 by $\cdot 25$ in., membranous, glabrous, 4-8 seeded.

KHASI HILLS, e.g., the Kyllong Rock and such other places.

Flrs. 9-10. Fr. cold season.

3. *Pueraria Wallichii* DC. Vern. *Mei-soh-ktaw*, Khasi.

A semi-scandent shrub with glabrous terete branches. *Common petiole* 3-4 in. long, slender, glabrous or glabrate; stipules basifixed. *Leaflets* 2-5-6 by 1-5-3-5 in., lateral

obliquely ovate, terminal elliptic or subrhomboid, acuminate, membranous, glabrescent but more or less scabrous and green, sparsely adpressed pubescent and pale beneath; lateral nerves 6-8, arcuate, lowest pair basal, tertiaries subparallel; petiolules $\cdot 2 \cdot 25$ in. long, pubescent. *Racemes* 4-8 in. long, short-peduncled, dense flowered, puberulous or glabrate; bracts subulate, $\cdot 25$ in. long; pedicels $\cdot 06 \cdot 1$ in. long, fascicled, minutely bracteolate near the upper extremity. *Calyx* $\cdot 15$ in. long, slightly gibbous, shallowly toothed, thinly pubescent. *Corolla* pink or brick-red or white tipped with red, $\cdot 5 \cdot 8$ in. long; standard rounded, not spurred, white veined inside. *Stamens* 2-adelphous. *Pod* glabrous, straight, flat, rigid, coriaceous, strap-shaped, 8-10 seeded, slightly thickened and obscurely repand at the sutures. *Seeds* dark-brown, reniform, glabrous.

KHASI and JAINTIA HILLS between 2,500 and 5,000 ft.

Flrs. & Fr. 8-11.

4. *Pueraria Thunbergiana* Benth. Syn. *P. Thomsoni* Benth. Vern. *Suting*, *Suting-rit*, Khasi.

A large climbing shrub; branches slender, clothed with fine deflexed brownish hairs. *Common petiole* 4-6 in. long, brown-pilose; stipules 1 in. long, fixed by the middle, membranous, brown velvety. *Leaflets* 5-7 by 4-6 in., rotundorhomboid to ovate, lateral oblique, sharply acuminate, membranous, dark-green and nearly glabrous above and grey and thinly covered with very short adpressed hairs beneath when mature; lateral nerves 5-7 on either half, lowest pair basal; base subcuneate or rounded; petiolules upto $\cdot 2$ in. long; stipels linear or subulate, $\cdot 5 \cdot 7$ in. long. *Racemes* simple, 8-15 in. long, dense-flowered towards the extremity; rachis stout, pubescent; bracts paired, about $\cdot 3$ in. long, lanceolate, pubescent; pedicels very short, elongating in fruit, each with a pair of lanceolate adpressed pubescent bracteoles, $\cdot 1 \cdot 15$ in. long at the top. *Calyx* $\cdot 5 \cdot 6$ in. long, deeply divided into lanceolate teeth, $\cdot 3 \cdot 45$ in. long, silky pubescent outside. *Corolla* purple or reddish, 1 in. long, sweet scented; standard sub-orbicular, $\cdot 5 \cdot 65$ in. across, emarginate, distinctly spurred. *Vexillary stamen* free. *Pod* 4-5 by $\cdot 35 \cdot 5$ in., flat, straight, 8-16 seeded, densely covered with patent rusty hairs.

KHASI HILLS, 4-5,500 ft.

Cattle and buffaloes browse on the leaves.

Flrs. 8-9. Fr. 9-10.

5. *Pueraria phaseoloides* Benth. Vern. *Jermei-kyn-saw*, Synt.; *Jermei-soh-gonsoh*, Khasi.

A twining annual, often trailing on sandy beds of streams; young shoots covered with patent brown hairs. *Common petiole* 2-4 in. long, covered with ascending hairs; stipules basifixed, lanceolate, closely ribbed, strongly ciliate with long brown hairs. *Leaflets* 2-5 in. long and almost as broad, sub-rhomboid to broad ovate, lateral oblique, obtuse or acute, very shallowly lobed or sometimes not lobed at all, membranous, green above, grey or glaucous and somewhat satiny beneath, adpressed hairy on both surfaces; lateral nerves 3-5, almost straight; lowest pair basal; lateral petioles .15-.2 in. long; stipels setaceous. *Racemes* simple, 4-9 in. long, long-peduncled; pedicels about .15 in. long, slender; bracts and bracteoles lanceolate, closely ribbed, ciliate. *Calyx* .3-.4 in. long, adpressed hairy outside; teeth terminating in bristles. *Corolla* pale blue or reddish upto .75 in. long. *Vexillary stamen* generally free. *Pod* 3-5 by .15 in., reflexed, linear, sub-terete, straight, black when mature, thinly clothed with stiff adpressed hairs, 10-20 seeded; sutures not thickened. *Seeds* black, tranversely oblong.

In open evergreen forests in the SURMA VALLEY, e.g., Badarpur, Isamati, etc. KHASI HILLS up to 4,000 ft. e.g., Shangpung (Jowai Sub-Division); also in GOALPARA.

A useful strong white fibre is extracted from the stem and switchy branches, which is made into twines or ropes.

Flrs. 9-10. Fr. 10-11.

6. *Pueraria subspicata* Benth.

Very similar to the preceding species with more deeply lobed somewhat larger and harsher leaflets, larger flowers, and less cylindrical pods with thickened sutures. The fibre is probably equally good.

Flrs. 9-10. Fr. 10-11.

25. PHASEOLUS Linn.**Phaseolus calcaratus** Roxb. Vern. *Rumbai*, Khasi.

A twining herb; stem covered with spreading grey hairs. *Leaves* 3-foliolate; common petiole 5-6 in. long; stipules adpressed, .2-.3 in. long, subfalcately lanceolate. *Leaflets* 1.5-3.5 by .8-2 in., rhomboid-ovate, often obscurely lobed, tapering acuminate, cuneate at the base, membranous, sparsely hirsute or glabrescent; lateral nerves about 5 on either side of the midrib, the lowest pair basal; stipels setaceous, about .15 in. long. *Racemes* 3-5 in. long, elongate, 10-20 flowered; bracts lanceolate and subfalcate, about .2 in. long; bracteoles about .1 in. long, linear, caducous. *Calyx* cup-shaped, about .1 in. long, membranous; teeth triangular, shorter than the tube. *Corolla* .5 in. long, pale-yellow, the keel terminating in a twisted beak. *Stamens* diadelphous. *Ovary* sessile, many-ovuled; style filiform, twisted with the keel, bearded; stigma oblique. *Pod* 2-3 by .2 in., slightly compressed, 8-12 seeded, septate between the seeds, slightly scabrous when young. *Seeds* .2 by .15 in., oblong, brown, smooth.

KHASI HILLS up to 5,000 ft., where it is truly wild, possibly also in the plains. It is cultivated in other Provinces for the sake of the seeds which are used as a pulse.

Flrs. 8-9. Fr. 10-11.

26. DYSOLOBIUM Prain.

Dysolobium grande Prain. Syn. *Phaseolus velutinus* Grah. Vern. *Bahdar-kakua* (?), Ass. (Nowg.); *Makai-phok*, Garo.

A large woody climber; branches terete, minutely pubescent. *Leaves* pinnately 3-foliolate; rachis 5-9 in. long; stipules lanceolate, .3-.5 in. long. *Leaflets* 5-9 by 4-6 in., broadly subrhomboid-ovate or sub-orbicular, lateral oblique, cuspidate-acuminate, chartaceous, green and glabrescent above, pale and more or less scabrid along the nerves beneath, specially when young; base rounded or broadly cuneate; lateral nerves on either side of the midrib; petiolules .2-.25 in. long; stipels terminal, setaceous, lateral subulate and longer. *Racemes* 12-20 in. long including the peduncle, which is 9-15 in. long, 8-12 flowered; pedicels up to .15 in.; bracteoles small,

broad, adpressed to the calyx. *Calyx* about .5 in. long, silky; upper four teeth triangular obtuse; lowermost longest and lanceolate, all shorter than the tube. *Corolla* about 1.5 in. long, reddish; standard 1 in. broad; keel with a long lateral depressed beak. *Stamens* 2-adelphous (9+1). *Ovary* sessile, many-ovuled; style filiform, bearded. *Pod* 5-8 in. long and about .7 in. across in the middle, stout, sub-cylindric, pointed at both ends, deeply longitudinally channelled along sutures, woody, densely brown-velvety outside, septate between the seeds. *Seeds* 8-12, of which however usually not more than half fully developed, with a reticulately hirsute testa.

Plains of the BRAHMAPUTRA VALLEY also up to 2,000 ft. in the KHASI and GARO HILLS, often with a tendency to be gregarious.

Flrs. rainy season. Fr. 11-3.

27. VIGNA Savi.

***Vigna vexillata* Benth.** Vern. *Jermei-soh-lang-tor*, Khasi.

A slender twiner with fusiform tuberous roots; stem terete, more or less scabrid with deflexed hairs. *Leaves* 3-foliolate; common petiole 2-3 in. long, hairy; stipules .15-.25 in. long, basifixed, lanceolate, strongly ribbed. *Leaflets* 3-5 by .5-1.5 in., narrowly lanceolate, less-often ovate-lanceolate, finely acuminate, more or less rounded or truncate at the base, membranous, dark-green above, scabrid with adpressed hairs on both surfaces; lateral nerves about 4 on either side of the midrib, lowest pair basal or sub-basal, oblique, arched, reticulations close and fine; lateral petiolules .1-.15 in. long, shaggy with rusty hairs; stipellæ minute, setaceous. *Peduncles* 3-10 in. long, tapering, hirsute with reflexed hairs. *Flowers* so congested at the end of the peduncle as to appear to be in heads. *Calyx* about .5 in. long, sub-campanulate with long hairy teeth. *Corolla* purple, very finely veined with deeper purple, 1-1.5 in. long; standard as broad as long; keel beaked. *Style* filiform, bearded along the inner margin. *Pod* 3-4 by .25 in., slightly compressed, scabrid with dark-brown bristly hairs, 15-20-seeded; seeds dark-brown or almost black, broader than long.

KHASI HILLS 3-5,000 ft., e.g., Nongstoin, Umran, etc.

The seeds are used as a pulse and the tuberous roots are eaten.
Flrs. 8-9. Fr. 9-10.

Vigna Catiang Endl. Vern. *Urhi-mah*, Ass.; *Barbati*, Beng.—is cultivated in kitchen gardens. The tender pods are used as a vegetable and the seeds as a pulse. A green dye is obtained from the leaves.

28. DOLICHOS Linn.

Twining herbs with stipellate trifoliolate leaves. *Flowers* in axillary racemes or in axillary fascicles of 2-3 or solitary; bracts and bracteoles minute, *Calyx-tube* campanulate. *Corolla* much exserted; standard orbicular, auricled at the base; wings oblong obovate, slightly adnate to the keel; keel incurved, not twisted. *Stamens* 2-adelphous. *Ovary* subsessile; style thickened upwards and bearded along the inner face or filiform and bearded only round the stigma. *Pod* flat, linear to linear-oblong, recurved. *Seeds* large, thick.

I. Style filiform, hairy round the stigma :—

Root tuberous. Flowers pink or purple on slender bracteate peduncles. Calyx glabrous. Pod 6-8 seeded.

1. *D. falcatus*.

Root annual. Flowers yellow, 1-3 together from the axils, not racemed.

Calyx downy. Pod 5-6 seeded.

D. biflorus.

II. Style thickened upwards, bearded on the inner face. Flowers on elongate racemes.

2. *D. Lablab*.

1. *Dolichos falcatus* Klein.

A slender perennial twiner with tuberous roots; stem at first pilose, glabrescent afterwards; stipules small, persistent. *Leaflets* 1-3 in. long, ovate, often slightly 3-lobed, pilose or glabrescent. *Flowers* 2-8 on an axillary peduncle up to 2 in. long; pedicels very short. *Calyx* glabrous; teeth deltoid. *Corolla* pink or purple, about .5 in. long; keel obtuse. *Pod* 2-3 by .35 in., linear, glabrous, with 6-8 kidney-shaped seeds.

Said to occur in the KHASI HILLS up to 6,000 ft.

Flrs. & Fr. 11-12.

Dolichos biflorus Linn. Vern. *Kulthi*, *Kurthi*, Beng.; *Kulthi-Mah*, Ass.; The 'Horse Gram' of Madras.

An annual suberect or twining plant with hairy stem; stipules scarious. *Leaflets* 1-2 in. long, ovate, acute, not lobed, membranous, pilose. *Flowers* pale yellow, 1-3 independently from the axils of the leaves without a common peduncle. *Calyx* downy; teeth elongate, exceeding the tube. *Corolla* about .5 in. long; standard with a

crimson spot; keel obtuse, shorter than the standard. *Pod* 1-2 by $\cdot 25 \cdot 3$ in., adpressed hairy. *Seeds* 4-6, reniform, grey or blackish.

Believed to occur in Assam. Much cultivated in Chota Nagpur and Madras both for the pulse and the straw which is an excellent fodder.

Flrs. 9-11. Fr. 10-12.

2. Dolichos Lablab Linn. Vern. *Urohi*, Ass.; *Shim*, Sim, Beng.

A large climber generally with sarmentose branches. *Stipules* basifixed. *Leaflets* 2-6 in. long, broadly ovate or rhomboid, shortly acuminate, lateral oblique; base cuneate, strongly 3-5 nerved. *Peduncles* 3-9 in. long, axillary or terminal, with tumid nodes; pedicels fascicled, $\cdot 15 \cdot 25$ in. long; bracteoles oblong. *Calyx* $\cdot 25$ in. long, campanulate. *Corolla* red, purple or white; standard up to $\cdot 75$ in. in breadth; keel beaked. *Style* thickened upwards, bearded down the inner face. *Pods* white, pink or purplish, 3-6 by $\cdot 5 \cdot 1 \cdot 5$ in. flat, valves tight, -(in var. *lignosus* green sub-cylindrical and torulose valves loose). *Seeds* large, oval, reddish or black.

This is represented by a large number of cultivated varieties chiefly grown in village kitchen gardens.

Fl. & Fr. 10-2.

29. CLITORIA Linn.

Clitoria mariana Linn.

A scandent undershrub with thin terete branches. *Leaves* imparipinnate, usually 3-foliolate. *Common petiole* $1 \cdot 5 \cdot 3$ in. long, slender, glabrous; *stipules* lanceolate, $\cdot 15 \cdot 3$ in. long, closely parallel nerved. *Leaflets* $1 \cdot 5 \cdot 4$ by $\cdot 6 \cdot 1 \cdot 6$ in., ovate elliptic or lanceolate, more or less acute or shortly acuminate, mucronate, chartaceous, glabrous, green above, pale beneath; lateral nerves 10-12 on either side, anastomosing near the margin, prominent beneath; base rounded or subacute; lateral petiolules $\cdot 1 \cdot 15$ in. long; stipels setaceous to subulate about $\cdot 1 \cdot 2$ in. long. *Peduncles* axillary, $\cdot 5 \cdot 2$ in. long, slender, glabrous, usually 2-flowered, with a pair of small bracts at the apex, $\cdot 1 \cdot 2$ in. long; bracteoles two to each flower, about $\cdot 2$ in. long, elliptic or oblong, acute, membranous. *Calyx*

·6·8 in. long, tubular, membranous, glabrous; lobes ·2·25 in. long, lanceolate. *Petals* whitish or pale blue, glabrous; standard 1·5-2 by 1·1·3 in., much exceeding the other petals. *Stamens* 1-adelphous, the vexillary one being absent. *Ovary* stalked, many ovuled; style compressed, incurved, bearded along the inner side. *Pod* 1·1·5 in. long, 1-3 seeded, glabrous, septate and adpressed on the sides between the seeds crowned with the long persistent style and seated on the marcescent calyx. *Seeds* about ·25 by ·12 in., transversely oblong, dark-brown.

KHASI HILLS, 5-6,000 ft. Deserves to be cultivated for its handsome flowers.

Flrs. 7-8. Fr. 9-10.

Clitoria ternatea Linn. Vern. *Aparajita*, Beng. which has white or blue flowers, the latter often double, is cultivated in gardens in the plains towns and villages. It differs by having shorter petioles, 5-7 leaflets, solitary flowers on shorter peduncles and longer pods with 5-10 seeds. Its seeds and root-bark have medicinal properties.

30. FLEMINGIA Roxb.

Shrubs or undershrubs, rarely erect or trailing herbs. *Leaves* digitately 3-foliolate or simple, gland-dotted beneath, sometimes also above; stipules usually scarious with fine parallel veins. *Flowers* in axillary or terminal simple or compound racemes, rarely in cymes or heads, sometimes with large conduplicate bracts; bracteoles minute or 0. *Calyx-tube* narrow. *Corolla* more or less exserted; standard auricled at base; wings obliquely oblong or obovate, adnate to the slightly beaked keel. *Stamens* 2-adelphous (9+1); anthers uniform. *Ovary* subsessile, 2-ovuled; style beardless; stigma capitate. *Pod* obliquely oblong, inflated, continuous within, 2-seeded; seeds orbicular, attached to the funicle at the centre.

I. Leaves 1 foliolate :—

Flowers in cymose clusters arranged in racemes, cymes hidden by a pair of large persistent membranous conduplicate bracts.

1. *F. strobilifera*.

II. Leaves 3 foliolate :—

A. Flowers in racemes :—

1. Flowers not small; racemes spike-like; bracts not conduplicate :—

- a. Branches sharply angled; stipules over 2 in. long, rigid; bracts large, exceeding the flowers. 2. *F. stricta*.
- b. Branches not sharply angled or subterete; bracts small not exceeding the flowers, thin :—
 - i. Racemes congested, usually not exceeding the petioles :—
 - Erect shrub, 4-6 ft. high; leaves ovate or oblong lanceolate. 3. *F. congesta*.
 - Suberect or prostrate undershrub under 3 ft. high; leaves narrow lanceolate. 4. *F. prostrata*.
 - ii. Racemes elongate, 4-6 in. long :—
 - Base of leaflets 3-4 nerved. Leaf glands not persistent; bracts long, acute or acuminate; pods almost glabrous. 5. *F. semialata*.
 - Base of leaflets 5 nerved; leaf glands persistent; bracts short, subacute or obtuse, densely brown felted; pods gland pubescent. 6. *F. latifolia*.
- 2. Flowers very small in lax peduncled often paniced racemes exceeding the leaves. Bracts not conduplicate. small. An undershrub. 7. *F. lineata*.
- B. Flowers in heads :—
 - Erect shrub, surrounded by large bracts. 8. *F. involucrata*.
 - Trailing herb with tuberous root; bracts small, caducous. Cultivated. 9. *F. vestita*.

1. Flemingia strobilifera R. Br. Vern. *Makhloti*, Upp. Ass.; *Makhloti*, Ass. (Kam.); *Ka-Khong*, Khasi.

A shrub usually 5 ft. high but sometimes up to 10 or even 12 ft.; stem blackish, rough; branches terete, more or less

velvety. *Leaves* 1-foliolate, 3-6 by 1-3 in., oblong to ovate-lanceolate, acute or acuminate, rounded at the base, chartaceous or subcoriaceous, green and glabrescent above, pale, thinly silky pubescent and with garnet-like gland dots beneath; lateral nerves 8-12 on either side of the midrib, often subopposite, very oblique, almost straight, rusty pubescent; tertiary nerves transverse; petiole $\cdot 2\cdot 75$ in. long, swollen at both ends; stipules $\cdot 2\cdot 4$ in. long, linear-lanceolate, acuminate, scarious. *Flowers* about $\cdot 3$ in. long, purplish, first in small 3-4 flowered cymes hidden in the axils of large kidney-shaped conduplicate membranous bracts, $\cdot 8\cdot 1\cdot 4$ in. across, often cuspidate at the apex, which again are arranged in terminal and axillary racemes, 3-6 in. long; rachis zigzag, downy; bracts translucent, scarious with age, strongly reticulate, more or less puberulous, sparsely gland dotted on the inner surface; bracteoles minute, linear, caducous. *Calyx* velvety and gland dotted outside; teeth linear-lanceolate, almost longest. *Corolla* glabrous, exserted. *Pod* $\cdot 3\cdot 4$ in. long, finely downy, 2-seeded.

Grass lands in UPPER ASSAM and sal areas in LOWER ASSAM; also up to 4,000 ft. in the KHASI HILLS.

At the end of the month of Chaitra (= about the middle of April) cattle are given a special bath in the Assam Valley after which they are gently beaten with the branches of this plant to keep them free from disease.

Flrs. 2-3. Fr. 4-6.

2. *Flemingia stricta* Roxb. Vern. *Dangshu-khop*, Mech; *Mi-surung-pu-arong*, Mik.; *Kombat-lai-jiri*, Khasi.

A sparingly branched shrub 6-12 ft. high; branches 3-quetrous, hairy. *Leaves* digitately 3-foliolate; common petiole 2-5 in. long, 3-quetrous or flattened, scarcely or very narrowly winged, furrowed; stipules 2-4 in. long, lanceolate, acuminate, finely silky outside, rigid and closely longitudinally parallel veined. *Leaflets* 6-12 by $2\cdot 5\cdot 4$ in., lanceolate or oblong-lanceolate, gradually narrowed to a sharp apex, terminal narrowed also to the base, lateral oblique, the outer half being rounded at the base, subcoriaceous, glabrous or somewhat hispid above, pubescent along the nerves beneath; glandular dots few, minute, black, opaque; lateral nerves 12-20 on either half, very oblique, slightly arched; petiolules $\cdot 15\cdot 3$ in. long,

terete, stout, densely rusty-silky. *Racemes* 3-4 in. long, spicate, dense-flowered; bracts caducous, .6-1.5 in., resembling the stipules in every respect excepting in size imbricating when young, giving the inflorescence a cone like appearance in bud; pedicels very short. *Calyx tube* about .12 in. deep; teeth long, the lowest as long as the corolla, densely hairy. *Corolla* .3-.45 in. long, purple. *Pod* .5-.6 in. long, glabrescent.

In shady and more or less damp localities in the PLAINS, also in ravines in the HILLS in both Valleys.

Flrs. 1-3. Fr. 6-9.

3. *Flemingia congesta* Roxb. Vern. *Samnaskhat*, Garo.

A shrub 4-6 ft. high; old stem terete, glabrescent; branches flattened or angular, slightly ribbed, adpressed silky pubescent when young. *Leaves* 3-foliolate; common petiole 2-4 in. long, flattened, often margined but never winged, sulcate; stipules .5 in. long, linear-lanceolate or triangular, scarious, caducous. *Leaflets* 4-6 by 2-3 in., ovate or oblong-lanceolate, acute or shortly acuminate, the lateral oblique, glabrescent but more or less scabrid above, pubescent along the nerves and with brownish glandular dots beneath; base in terminal leaflet cuneate, in the lateral leaflets rounded on the outer margin, strongly 3-nerved; main lateral nerves about 6 on either side of the midrib above the basal pair. *Racemes* usually dense, 1-2 in. long, sessile, sometimes branched; often fascicled; bracts about .2 in. long, lanceolate, sharply acute or acuminate, scarious, silky caducous; pedicels very short. *Flowers* about .5 in. long, purplish. *Calyx* densely silky, gland dotted; teeth lanceolate, lowest longest but narrower. *Corolla* as long as the calyx; standard greenish-white, striped with pink. *Pod* about .5 by .3 in., turgid, obscurely brown-velvety, gland dotted when young, 2-seeded. *Seeds* about .1 in. diam., brown or blue-black, shining.

Fairly common in dampish localities throughout the plains of both VALLEYS, specially in submontane regions.

In Var. *typica* the petiole is scarcely margined. In our area var. *viridis* Prain appears to be common which differs from the type in having the petioles slightly winged towards the top.

A purple dye is obtained from the glands at the base of the hairs covering the pods.

Flrs. 4-8. Fr. 11-2.

4. *Flemingia prostrata* Roxb. Syn. *F. congesta* var. *semialata* *F. B. I.* in part.

A suberect or trailing undershrub up to 2·5 ft. long; stem angled, grooved, silky tomentose when young. *Leaves* 3-foliolate; petiole 3 angled, slightly or not winged, silky pubescent; stipules ·3-·4 in. long, scarious, lanceolate. *Leaflets* 1·5-3 by ·3-·5 in., narrow-lanceolate, cuspidate-acute; base of terminal leaflet cuneate; lateral leaflets oblique and rounded on the outer side, subcoriaceous, somewhat rough and thinly pubescent or glabrescent above, softly brown tomentose beneath; basal nerves usually 3, short; lateral nerves 6-8 on either side above the basal, all impressed above, prominent beneath. *Racemes* very dense, usually shorter than the petioles; bracts up to ·3 in. long, lanceolate, acuminate, densely pubescent outside. *Flowers* up to ·25 in. long, pink and yellowish green. *Calyx* densely villous; lobes linear, acuminate, lower exceeding or equalling the corolla. *Pod* hairy, gland dotted when young up to ·4 in. long.

KHASI HILLS, 5,000 ft., Mann. Probably in grass lands in other Districts also.

The stems are usually annual from a perennial root stock. This plant appears to be a degenerate and dwarfed form of *F. congesta*, but as it has sufficiently well-marked characters differentiating it from that species it has been separated.

Flrs. 8-9. Fr. 9-11?

5. *Flemingia semialata* Roxb. Syn. *F. congesta* var. *semialata* *F. B. I.* Vern. *Salpan*, Beng.; *Bhatte*, Nep.; *Achakkimi-chong*, (=dog's tail), Garo; *Papai*, Jharua; *Kelbe*, Tipp.

A shrub very closely resembling *F. congesta*, but generally much taller; the branches more sharply angular; the petiole shorter and winged; leaflets 3-4 nerved at the base; the racemes much longer (up to 6 in.) exceeding the petioles and laxer; calyx-teeth narrower and the pod only very slightly pubescent. *Flowering* and fruiting time and

habit about the same, but it ascends to a higher elevation, nearly up to 5,000 ft.

Wood with discontinuous concentric soft wavy bands and close continuous medullary rays, not durable.

6. *Flemingia latifolia* Benth. Syn. *F. congesta* var. *latifolia* *F. B. I. Vern. Jambru-soh-attekki-arong*, Mik.

A robust shrub up to 10 or 12 ft. in height with dark-brown cylindrical stem, and obscurely angular sulcate branches. *Leaves* 3-foliolate; common petiole 2·5-4·5 in. long, flattened and narrowly margined. *Leaflets* 4-9 by 2·3-5 in., elliptic or obovate-lanceolate, chartaceous or subcoriaceous, acute or acuminate, finely tomentose and dotted with long persistent ruby or garnet coloured glands on both surfaces, base acute, in lateral leaflets sometimes rounded on the outer margin, strongly 5-costate; inner pair of nerves often running to near the top; petiolules ·2-·25 in. long, stout, terete, densely velvety. *Racemes* terminal and lateral, 2-5 in. long, solitary or in fascicles of 2-3; rachis stout, swollen at nodes, greyish or brown silky-tomentose; bracts ·3-·4 in. long, obtuse or sub-acute, concave, densely silky-tomentose. *Calyx* cup-shaped; teeth ·2-·4 in. long, lanceolate, brown velvety outside, pubescent and thinly gland dotted within. *Corolla* purple, ·4-·5 in. long. *Pod* ·5 by ·2 in., hairy and dotted with glands; seeds ·1 in. diam., globose, dark-brown.

Fairly common, GARO, KHASI and NORTH CACHAR HILLS, up to 4,000 ft.

Flrs. 10-11. Fr. 12-2.

7. *Flemingia lineata* Roxb.

A diffuse erect undershrub 3-5 ft. high; stem terete, glabrescent, blackish; branchlets obscurely angled, pubescent. *Leaves* 3-foliolate, generally not exceeding 4 in. in length; common petiole ·5-·7 in. long, margined, scarcely winged; stipules ·25-·4 in. long, lanceolate, slightly falcate, scarious. *Leaflets* subsessile, ·8-3 by ·3-·8 in., obovate lanceolate or elliptic-oblong; lateral leaflets oblique; apex sub-acute, often, cuspidate, usually 3 nerved and cuneate at the base, chartaceous, plicate between the nerves, subcoriaceous,

glabrescent above, silky pubescent, specially along the nerves and with minute light yellow gland beneath; lateral nerves 3-5 on either half (excluding the basal), very oblique; intramarginal nerve 0 or very obscure. *Racemes* terminal and axillary, 1.5-3 in. long, few flowered, lax, often paniced; rachis slender, pubescent; bracts about .15 in. long, deltoid or subulate, scarious. *Flowers* usually towards the upper portions of the racemes; bracteoles minute, linear, hairy. *Calyx* .2 in. long, hirsute; teeth as long as the tube. *Corolla* purple, not or only slightly exserted. *Pod* .3-.4 by .15 in., obliquely oblong, with short silky bristly hairs, glandular bases outside; seeds 2, black, slightly truncate at the base.

Gregarious on banks and islands of the Brahmaputra below GOALPARA forming dense thickets where it occurs e.g., Kareya in the Mechpara Estate.

Flrs. & Fr. 9-11.

8. *Flemingia involucrata* Benth.

An erect shrub 3-5 ft. high; stem terete, more or less zigzag, patently downy, very finely striate. *Leaves* 3-foliate; common petiole .4-.5 in. long, slightly channelled, brown-felted; stipules as long as the petiole or shorter, lanceolate, scarious-hairy, caducous. *Leaflets* 1.5-3 by .7-1.25 in., elliptic-oblong, lateral oblique, chartaceous, green and somewhat rough above, grey-tomentose and with dark-brown gland dots beneath; lateral nerves 10-15 on either half, slender, straight, continuous; intramarginal nerve 0 or very obscure. *Heads* about 1 in. broad, many flowered, both terminal and axillary, villous, supported by a whorl of 9-12 lanceolate, sharply acuminate, scarious bracts with densely ciliate margins, .4-.6 in. long; peduncle about .5 in. long with usually 2 pairs of decussate bracts which are somewhat broader and shorter than those of the involucre. *Calyx* .5-.7 in. long, densely grey-shaggy; teeth very long, subulate. *Corolla* wholly included, purple; keel obtuse. *Pod* about .2 in. long, oblong, canescent, more or less papery, 1-seeded; seed about .1 in. long, dark-brown or almost black, shining.

Apparently rare. Only once found by the senior author in grasslands at Kaziranga, SIBSAGAR DISTRICT.

Flrs. 9-10. Fr. 11-12.

9. *Flemingia vestita* Benth. Vern. *Soh-phlang*, Khasi.

A much branched trailing herb 1-3 ft. long with patently hirsute wiry stems. *Leaves* 3-foliolate; common petiole .5-1.5 in. long, slender, patently hairy; stipules about .2 in. long, ovate to oblong-lanceolate, scarious. *Leaflets* .5-1 by .4-.8 in., rhomboid or obovate-cuneate, usually sub-acute, overlapping by their margins, sub-membranous, ciliate, green above, pale and with dark-brown glandular dots beneath, sparsely pubescent on both surfaces; petioles very short. *Peduncles* 2-3.5 in. long, mostly terminal, hairy, bearing a 3-6 flowered head of subsessile flowers about .5 in. long; bracts about .1 in. long, boat-shaped, cuspidate. *Calyx* .3-.4 in. long, densely brown-velvety; teeth longer than the tube. *Corolla* deep purplish-red, distinctly exserted; keel much incurved, beaked. *Pod* cylindrical, finely hairy, 1-seeded.

Doubtfully wild. Much cultivated as a field crop in the KHASI HILLS for the sake of its tuberous roots which are eaten raw by the Khasis. The tubers are 1.5-2 in. long and are rubbed clean of the outer skin by trampling by the feet in running water, when they acquire a creamy white, smooth surface.

Flrs. 8-10. Fr. 10-12.

31. ERIOSEMA DC.

***Eriosema chinense* Vogel. Vern. *Soh-pen* or *Pen*, Khasi.**

An erect undershrub 1-2 ft. high growing from a tuberous rootstock; stem slender, sparingly branched, covered with patent brown hairs. *Leaves* 1-foliolate; stipules about .15 in. long, subulate, persistent. *Leaflet* .5-2 by .1-.25 in., ligulate, acute or sub-acute, cuspidate, sub-coriaceous, margins recurved, pilose, dark-green and with a few adpressed hairs above, glaucous, densely grey canescent with concealed glands beneath; midrib prominent, brown pilose; lateral nerves very oblique, indistinct. *Flowers* axillary, solitary or two together. *Calyx* .1-.15 in. long, densely pilose. *Corolla* .2-.3 in. long, yellowish, finely purple

veined, fading to reddish purple; standard roundish, auricled at the base, patently hairy-wings, obovate-oblong, shorter than the standard, but exceeding the keel; keel slightly beaked, gland dotted and hairy towards the top. *Stamens* 2-adelphous. *Ovary* sessile, 2-ovuled, densely villous with spreading silky-hairs; style filiform, glabrous; stigma capitate. *Pods* about .4 by .2 in., compressed, often slightly inflated, densely pubescent, 1-2 seeded. *Seeds* oblique with the funicle attached to the end of a linear hilum.

KHASI HILLS, 4-5,000 ft., fairly common in grass-lands.

The tuberous roots are eaten raw and their cortex is used medicinally.

Flrs. & Fr. 6-10, probably most of the year.

Rhynchosia viscosa DC. Vern. *Bhim-khatraj*, Beng.

A wide spreading climber (woody); young parts glandular-pubescent. *Leaves* usually 3-foliolate. *Leaflets* broadly ovate, acute, terminal one somewhat deltoid. *Racemes* lax, long-peduncled. *Corolla* twice the calyx. *Pod* finely pubescent. *Seeds* not arillate.

Aka Hills. (15321).

32. DUNBARIA W. & A.

Woody climber or twining herbs. *Leaves* pinnately 3-foliolate; stipules setaceous; leaflets gland dotted beneath; stipules rarely present. *Racemes* axillary, flowers generally in pairs; bracts ovate, membranous, caducous; bracteoles 0. *Calyx-tube* campanulate; teeth long and narrow. *Corolla* exserted; standard orbicular, auricled; keel incurved, not beaked. *Stamens* 2-adelphous; anthers uniform. *Ovary* sessile or stalked, many-seeded; style inflexed, beardless. *Pod* compressed, not depressed between the more or less orbicular seeds.

- I. Leaflets membranous, rhomboid or ovate :—
 Terminal leaflet acuminate; flowers distinctly stalked. 1. *D. circinalis*.
 Terminal leaflet acute; flowers subsessile. 2. *D. conspersa*.
- II. Leaflets subcoriaceous, ligulate-oblong;
 terminal rounded at both ends; pedicels as long as the calyx. 3. *D. debilis*.

1. *Dunbaria circinalis* Baker.

A slender woody climber with terete glabrescent stem. *Stipules* minute, caducous. *Leaflets* broadly ovate, acute or acuminate, green and glabrescent above, finely downy beneath. *Flowers* in 6-10 flowered, subsessile, compact racemes. *Calyx* .3 in. long. *Corolla* slightly exserted. *Pod* 2-3 by .35 in., stalked, 8-10 seeded.

Plains of the BRAHMAPUTRA VALLEY.

2. *Dunbaria conspersa* Benth.

A filiform twining herb with downy stem. *Stipules* minute, linear. *Leaflets* orbicular-rhomboid, green and glabrescent above, pale green, obscurely downy and gland dotted beneath. *Flowers* 1-2, rarely 3-4 on very short stalks in the axils of the leaves. *Calyx* .25 in. long. *Corolla* reddish, .35-.5 in. long; keel beaked. *Pod* 1.5-2 by .3 in., recurved, 6-8 seeded.

Plains of both VALLEYS.

3. *Dunbaria debilis* Baker.

A slender twining herb with downy stem. *Stipules* setaceous persistent. *Leaflets* 3-4 times as long as broad, densely canescent beneath, strongly nerved. *Calyx* .25 in. long, grey-downy; teeth linear. *Corolla* yellowish, about .35 in. long; keel beaked. *Pod* linear, recurved, 1.5-2 by .25 in., glabrescent, 8-10 seeded.

KHASI HILLS, 4-5,000 ft.

33. ATYLOSIA W. & A.

Leaves 3-foliolate; stipules small, generally caducous; leaflets gland dotted beneath. *Flowers* in few flowered, long-peduncled racemes, rarely axillary. *Calyx-tube* cup-shaped; teeth distinct. *Corolla* more or less exserted. *Stamens* diadelphous. *Ovary* sessile; ovules 3 or more; style filiform, incurved, glabrous. *Pod* generally oblong, more or less turgid, marked with transverse lines between the seeds. *Seeds* strongly strophiolate.

Terminal leaflet comparatively longer, petioluled; pod 5-6 seeded.

Leaflets all equally and shortly petioluled;

pod 3-4 seeded.

1. *A. barbata*.

2. *A. elongata*.

1. *Atylosia barbata* Baker.

A woody climber with densely pubescent terete branches. *Common petiole* 1-3 in. long, fairly stout, pubescent; stipules about .2 in. long, subulate, caducous. *Leaflets* 2-4 by 1.5-3 in., ovate-rhomboid, rounded and often abruptly subcordate at the base, subcoriaceous, green and somewhat hispid above, greyish and softly pubescent beneath; lateral petiolules about .1 in. long, terminal .5-.7 in. long; stipels bristle-like, minute. *Racemes* terminal or axillary, 3-6 in. long, elongating in fruit, patently pilose; peduncle 2-3 in.; bracts ovate, densely hairy. *Calyx* .5 in. long, shaggy, greenish-grey; teeth about .3 in. long, lanceolate. *Corolla* about .6 in. long, yellowish. *Pod* 1.5-2.2 by .5 in., compressed, shaggy with shining brownish spreading hairs, 5-6 seeded; the depressions between the seeds slightly oblique.

SUB-HIMALAYAN TRACT. Bijni Reserve, GOALPARA.

Flrs. & Fr. 12-2.

2. *Atylosia elongata* Benth.

A slender herbaceous twiner tomentose throughout. *Common petiole* .8-3 in. long, slender. *Leaflets* .7-1.5 by .5-1 in., rhomboid-ovate; petiolule .05-.1 in. long. *Peduncles* 1-3 in. long, slender, 2-4-flowered; pedicels .2-.3 in. long, including the filiform teeth. *Corolla* purple, about .4 in. long. *Pod* .8-.4 in. long, beaked, 3-4 seeded.

In grass-lands in the KHASI HILLS.

Flrs. 8-9.

34. CAJANUS DC.

Cajanus indicus Spreng. Vern. *Arahar*, *Arhar*, *Oror*, Beng., Hind.; *Tuar* or *Tuwar*, Hind.; *Hrhaki*, *Tubarika*, Sans.; *The Pigeon pea*, Eng.

An erect shrub 6-10 ft. high with slender sulcate grey-silky branchlets; main stem terete, smooth, green, often

blotched with large black spots. *Leaves* 3-foliolate; common petiole .8-1.5 in. long, slender, indistinctly ribbed; stipules minute. *Leaflets* 1.5-3 by .3-1 in., narrowly elliptic or oblong-lanceolate, finely acute or acuminate, narrowed at the base, subcoriaceous, green above, grey beneath, silky-velvety, indistinctly gland dotted, minutely stipellate, aromatic when bruised; lateral nerves 5-6 on either half, arched, very oblique; lateral petiolules about .1 in. long; terminal and axillary, long peduncled, silky-pubescent; flowers congested and corymbose at the extremity of the peduncle. *Calyx* .25 in. long; tube campanulate, gland pubescent; teeth short. *Corolla* .6-.7 in. long, yellow, sometimes veined with red. *Stamens* 2-adelphous; filaments alternately longer and shorter. *Style* long, filiform, up-curved; stigma capitate. *Pod* 1.5-2.2 by .3-.4 in., 3-6 seeded, often with purple blotches or streaks, narrowed at both ends, somewhat torulose, with oblique depressions between the seeds, hirsute. *Seeds* .2 in. diam., slightly compressed, not strophiolate; testa from brown-reddish-yellow to blackish or variegated.

The seed is an important pulse and lac is grown on the plant. Extensively cultivated for both purposes, specially in the GARO and MIKIR HILLS.

Flrs. 4-8. Fr. 10-2.

35. DALBERGIA Linn. f.

Trees or climbing shrubs. *Leaves* imparipinnate, with alternate exstipulate leaflets. *Flowers* small in terminal or axillary panicles; bracts and bracteoles small. *Calyx* campanulate; teeth 5, short. *Corolla* exserted, often only shortly; standard broad; wings oblong, as long as the standard; keel-petals obtuse, shorter than the standard, connate at the tip. *Stamens* 9 or 10, monadelphous or diadelphous, usually in two bundles of 5 each, rarely 9+1; anthers minute. *Ovary* stipitate, few-ovuled. *Style* short, incurved, glabrous; stigma capitate. *Pod* thin, flat, coriaceous, 1-4 seeded, indehiscent.

I. Trees :—

A. Stamens 9 in one bundle. Pod strap-shaped :—

Leaflets 3-5, rotundo-rhomboid, acuminate. Flowers in cymosely

branched axillary panicles. Pod 1-3 seeded.

B. Stamens in two bundles of 5 each :—

1. Pod thin, strap-shaped :—

a. Leaflets 9-15, obtuse, glabrate.
Flowers in corymbosely branched axillary and terminal panicles.
Pod 1-3 seeded :—

Reticulations of tertiary nerves weak and open, panicles lax spreading; standard broad obovate or sub-orbicular with a hardened and thickened claw; wood continuous.

Reticulations of tertiary nerves stronger and closer, panicles compact, standard narrow oblong or oblong-obovate; claw not thickened or hardened; wood with concentric rings of bast.

b. Leaflets 15-21, obtuse, glabrate.
Flowers in short axillary panicles.
Pod 1-2 seeded.

Leaflets 17-27, obtuse, hairy.
corymbose panicles. Pod 1-3
Flowers in congested axillary
seeded.

2. Pod rigid, orbicular :—

Leaflets 7-11, acute, glabrous.
Flowers in axillary racemosely branched panicles. Pod 1-seeded.

II. Scandent shrubs :—

A. Stamens 9, rarely 10, in one bundle.

Pod strap-shaped :—

1. Leaflets 5-9, broadly oblong.
Flowers very small in corymbosely branched axillary or terminal panicles. Pod 1-2 seeded.

2. Leaflets 9-15, oblong, glabrous.
Flowers small, usually in corymbosely branched terminal panicles.
Pod 1-2 seeded.

3. Leaflets 13-17, oblong, pubescent.
Flowers in corymbosely branched axillary panicles. Pod 1-3 seeded.

4. Leaflets 25-33, oblong, not oblique at base. Flowers in short congested panicles. Pod 1-2 seeded.

B. Stamens in 2 bundles of five each.

Pod strap-shaped :—

2. *D. lanceolaria.*

3. *D. paniculata.*

4. *D. assamica.*

5. *D. sericea.*

6. *D. reniformis.*

7. *D. rimosa.*

8. *D. confertiflora.*

9. *D. tamarindifolia.*

10. *D. mimosoides.*

1. Leaflets 9-15, obtuse, glabrous. Flowers in axillary and terminal panicles. Pod 1-seeded. .. 11. *D. Thomsoni*.
2. Leaflets 9-13, obtuse, glabrous. Flowers ebracteate in axillary and terminal panicles. Pod 1-2 seeded. 12. *D. volubilis*.
3. Leaflets 17-25, obtuse, nearly glabrous. Flowers persistently bracteate and bracteolate in axillary panicles. Pod 1-seeded. .. 13. *D. stipulacea*.

1. Dalbergia Sissoo Roxb. Vern. *Hihu*, *Shisham* (Goal.) Ass.; *Khujiap*, Mech.

Ordinarily a middle-sized gregarious and deciduous tree, but in favourable localities quite a large tree; young parts grey-downy. *Bark* grey or light brown, somewhat reticulately longitudinally furrowed, exfoliating in narrow strips, inside light-brown, soon turning to dark-brown, very fibrous. *Leaves* 4-9 in. long; common petiole zigzag, pubescent when young; stipules .2 in. long, caducous. *Leaflets* 3-5, distinctly alternate, 1-2.5 in. across, ovate, obovate orbicular or rhomboid, firmly sub-coriaceous, abruptly acuminate and cuspidate; main lateral nerves about 5 on either half, rather indistinct; tertiaries prominent; petiolules .1-.3 in. long. *Flowers* .2-.3 in. long, in cymose racemes, 1-1.5 in. long, which are corymbosely arranged in axillary peduncled panicles, 2-3 in. long; pedicels minute, usually secund. *Calyx* downy, about half the length of the flowers; teeth short, lowest sub-acute and longest, others obtuse. *Corolla* yellowish-white, standard with a long claw. *Stamens* 9, united in a sheath which is slit along the top. *Ovary* pubescent; style short; stigma large. *Pod* 2-3 by .3-.5 in., strap-shaped, pale-brown, glabrous narrowed at the base to a stipe, .3-.4 in. long, mostly 1-seeded, less often 2-3 seeded, not veined over the seeds. *Seeds* .25 in. long, kidney-shaped, flat.

Throughout the SUB-HIMALAYAN TRACT from above Sadiya down to Kachugaon, on porous sandy and gravelly soils on islands and river banks.

Heartwood brown, mottled with darker longitudinal veins, close grained, very hard and durable; medullary rays very fine, transversely crossed by wavy whitish concentric bands; weight 45-55 lbs. per c. ft. A very valuable timber eminently suitable for furniture and for all purposes where strength and elasticity are required. The twigs and

leaves are lopped for fodder. The tree can be easily raised from seeds or root-cuttings. The best results are obtained from shoot cum root cuttings of healthy nursery raised seedlings.

Flrs. 2-5 with new leaves. Fr. 11-2.

2. *Dalbergia lanceolaria* Linn.

A large deciduous tree, sometimes buttressed at the base; bark smooth, greenish-grey or brownish-yellow inside but instantly turning brown on exposure; young parts rusty hairy. *Leaves* about a foot long; common petiole slightly pubescent; stipules .3 in. long, caducous, linear-oblong. *Leaflets* 7-17, usually 1-2·2 by .6-1·2 in., elliptic or oblong, rounded at the base, generally emarginate at the apex, subcoriaceous, glabrous and green above, lightly grey pilose and pale beneath; lateral nerves very indistinct, slightly arched; reticulations of tertiary nerves rather open; petiolules up to .2 in. long. *Panicles* axillary and terminal, 6-10 in. long with wide spreading branches, which are generally pubescent; bracts minute, caducous. *Calyx* about .1 in. long, silky outside; teeth unequal; upper teeth obtuse, lowest longest and acute. *Corolla* .2·3 in. long, dull-white or pinkish white; standard broadly obovate or sub-orbicular, about .25 in. broad, with a greenish callosity at the base of the limb, somewhat abruptly bent from the hardened and thickened short claw longer than the wings, which again are longer than the keel. *Stamens* in two bundles of 5 each. *Pod* 2·5 by .5·7 in., often sinuate between the seeds, and narrowed at both ends, flexible on a stipe, .3·5 in. long, glabrous, light-brown, mostly 1-3 seeded, veined over the seeds.

UPPER ASSAM between Makum and Margherita, very rare. Wood pale-yellow, not durable, no distinct heartwood.

Flrs. 5-6. Fr. 9-10.

3. *Dalbergia paniculata* Roxb.

Very similar to the above in appearance and the one is very likely to be mistaken for the other. The tertiary nerves of the leaves are more closely and more strongly reticulate, the undersurface is often more densely pubescent along the midrib, the panicles are compact and smaller and all calyx teeth are sub-deltoid. The standard is narrower being oblong-

obovate, often auricled and without any callosity at the base, and the claw is neither hardened nor thickened, but is longer than in the last species.

The wood is useless as timber, having bands of bast alternating with woody tissue.

A specimen collected by Mann, who does not mention the locality, has been referred to this species. It is too incomplete for verification. Very rare if it occurs at all in the province.

4. *Dalbergia assamica* Benth. Vern. *Medeluwa*, *Mouhita*, Ass.; *Murkimora*, *Cach.*; *Iling-kung*, Tipp.; *Peret-asing*, Miri & Abor; *Bon-subaim*, Mech.; *Dieng-maw-phur-wang*, *Dieng-khar-ir*, Khasi; *Dieng-kapudi*, *Dieng-khyrwang-sniang*, Synt.; *Pinhele-siris*, Nep.

A middle-sized deciduous tree attaining 80-90 ft. in height and 6-8 ft. in girth. *Bark* dark-brown, thin, rough, with more or less parallel vertical fissures, on old trees exfoliating in overlapping strips; inside fibrous, in thin plates, dun or yellowish-brown, turning deep brown on exposure, smelling somewhat like coffee. *Leaves* 9-12 in. long; common petiole terete, glabrous except when very young; innovations silky with adpressed buff or rusty hairs. *Leaflets* 15-21, 1·7-2·8 by ·8-1·2 in., oblong, more or less rounded or subcuneate at the base; apex slightly emarginate, chartaceous or firmly membranous, green above, pale beneath, with adpressed pale hairs on both surfaces especially when young, turning yellow before falling; lateral nerves indistinct, oblique, slightly arched; petiolules about ·15 in. long, always pubescent. *Panicles* axillary, 4-6 in. long, slender, pubescent. *Calyx* obconic, silky outside with the lowest tooth much longer and more pointed than the others. *Corolla* white or purplish blue, about ·25 in. long; standard orbicular, purple veined, with a light green central spot; wings broad; keel incurved. *Stamens* in two bundles of 5 each. *Pod* 1·5-3 by ·25-·5 in., strap-shaped, flexible, pointed at both ends, glabrous, on a slender stipe, ·25-·35 in. long, 1-4 seeded, often warted over the seed.

Closely resembling *D. lanceolaria*.

A rare tree although occurring sporadically in every District, more common in UPPER ASSAM and in the N. E. FRONTIER DISTRICT ascending to about 3,000 ft. in the KHASI HILLS.

Wood light-pale brown, pores large, irregularly distributed, joined by fine wavy lines; medullary rays very fine and regular, fairly ornamental on a radial section.

Flrs. 4-5. Fr. 12-1.

5. *Dalbergia sericea* G. Don. Syn. *D. hircina* Benth. Vern. *Pered-asing*, Miri; other local names of the preceding species are indiscriminately applied where they occur together.

A middle-sized tree up to 80 ft. in height and 6 ft. in girth, often fluted in old age. *Bark* grey, smooth but with very close longitudinal fissures and distant horizontal wrinkles, on old stems, exfoliating in overlapping strips, inside pale yellow, soon turning yellowish brown. *Leaves* 6-12 in. long, rachis terete, persistently grey-hairy. *Leaflets* 17-27, 1-1.5 by .35-.7 in., elliptic or oblong, emarginate, subcoriaceous, persistently adpressed hairy on both surfaces, somewhat pale below, rather strongly veined; petiolules .15-.2 in. long. *Panicles* axillary, corymbose, congested; ramifications ascending, pubescent. *Calyx* about .1 in. long, campanulate, densely pubescent. *Corolla* about .2 in. long, whitish; standard obovate; keel shorter than the wings. *Pod* 1-1.5 by .2 in., very thin, strap-shaped, glabrous, 1-3 seeded, rarely 4-seeded; stipe about .2 in. long.

Very rare. Found along the foot of the Himalayas, *e.g.*, near Sadiya in the N. E. FRONTIER DISTRICT, at Dikrang in LAKHIMPUR, at Charduar in DARRANG and at Maktaigaon in GOALPARA.

Wood greyish white, moderately hard with no distinct heartwood appears to season well, weighing about 40 lbs. per c.ft.

Flrs. 4-6. Fr. 10-11.

6. *Dalbergia reniformis* Roxb. Vern. *Kures*, Sylh.

A large bushy tree with brown-silky branches. *Leaves* 6-11 in. long. *Leaflets* 7-11, 1.5-2 in. long, ovate, acute, rounded at the base, coriaceous, glabrescent. *Panicles* axillary, dense, with silky ramifications. *Calyx* .12 in. long, campanulate, silky; teeth rounded. *Corolla* .2-.3 in. long, white; standard obovate, emarginate. *Stamens* in two bundles. *Pod* rigid, 1-1.2 by .25-.3 in., glabrous, usually 1-seeded, rarely 2-seeded, fleshy when ripe, joints reniform; stipe .25-.35 in. long.

SYLHET-Roxburgh, CACHAR-Frazer, in swampy localities.

Flrs. 3-4. Fr. 10-11.

7. *Dalbergia rimosa* Roxb. Vern. *Gajai-lata*, (Lakh.); *Mermeri-lata*, (Darr.), *Kata-ghoh* (Kam.), Ass.; *Siboudoukha*, *Sibou-phang*, Kach.; *Mei-nup-synrang* (Tharia), *Jermai-bu-tem* (Nongkla), Khasi; *Dieng-thniat-nirai?* Synt.; *Khot*, Garo; *Hikongiru*, Tipp.; *Lewa-phukri*, Mech.; *Kawagurum*, Sylh.

A suberect straggling or climbing shrub with branchlets often formed into tendrils; dormant buds sometimes develop into spines about .3 in. long. *Bark* white outside, yellowish inside. *Leaves* 5-9 in. long; common petiole 2.5 in. long, terete, glabrescent. *Leaflets* 5-9, 2.4.5 by 1.3.5 in., elliptic, obovate or oblong, acute or rounded at the base; acute to obtuse, often emarginate, shortly cuspidate, chartaceous, glabrous, dark-green and shining above, pale and with short adpressed hairs beneath; main lateral nerves about 10 on either half with 1-3 minor ones between each two, arched, tertiaries strongly reticulate; petiolule about .15 in. long, usually pubescent. *Panicle* axillary and terminal, 4-8 in. long with corymbose branches and secund pubescent ramifications. *Flowers* very small (among the smallest in the Papilionatæ), sweet scented. *Calyx* .04 in. long, pubescent; teeth subequal, obtuse, subacute, ciliate. *Corolla* dull-white, scarcely .1 in. long. *Stamens* 10 in one bundle. *Pod* 2.5-4.5 by .7-1.2 in., strap-shaped, much thickened and strongly reticulate over the seeds. *Seeds* 1, rarely 2.

Throughout the plains of both VALLEYS.

The stem is used as axe handles. The seeds are eaten by the Cacharis.

Flrs. 4-5. Fr. 11-12.

8. *Dalbergia confertiflora* Benth.

A woody climber. *Leaflets* 9-15, 1-2 by .5-.8 in., oblong or obovate, more or less emarginate and usually with a small cusp, glabrous, pale beneath, strongly veined. *Panicles* terminal and over a foot long or axillary and 2-4 in. long; ramifications densely pubescent. *Calyx* about .12 in. long, pubescent, supported by a pair of minute bracts.

Corolla .2-.25 in. long. *Stamens* 9, monadelphous. *Pod* 1.5-2.5 by .5-.6 in., thin and flexible, shortly stipitate, generally 1-seeded, veined over the seed or seeds.

Apparently not very common. KHASI HILLS—Kurz, DUFFLA HILLS—Lister, SYLHET—Wallich.

Flrs. 1-3. Fr. 5-6 (?).

***Dalbergia velutina* Benth.**

Woody climber; branches densely brown-tomentose. *Leaves* 6-9 in. long, supported by large persistent velvety stipules. *Leaflets* 13-17, 1.5-2 by .8-1 in., oblong, obtuse at both ends, chartaceous, pale and densely rusty pubescent beneath. *Panicles* axillary, about 9 in. long, peduncled, corymbosely branched, rusty pubescent throughout; pedicels short, bracteate, congested at the ends of the corymbs. *Calyx* about .1 in. long. *Corolla* .15-.2 in. long. *Pod* 2.2-2.5 by .6-.7 in., oblong, flat, deep tan-brown when dry, shining, very finely lanceolate, generally 1-seeded, rarely 2- or 3- seeded.

SYLHET, Wallich's catalogue 5868 B, KHASI HILLS, very scarce.

Flrs. 12-2. Fr. 4-6.

9. *Dalbergia tamarindifolia* Roxb. Vern. *Laleng-chhali*, Ass. (Lakh.), *Dat-bijli*, Ass. (Kam.), *Bon-subai-doukha*, Kach.; *Subin-rikang*, Mik.; *Dukhentri*, Khot, Garo; *Jermei-thuat-siar*, Khasi; *Amlai-lewa*, Jharua & Mech; *Keti*, Beng. (Sylh.).

A large deciduous woody climber often with twisted greenish branchlets; stem blackish, not rough; young parts pubescent. *Leaves* 3-6 in. long; common petiole terete, pubescent. *Leaflets* 25-41, .5-1 by .15-.25 in., subsessile, oblong, slightly emarginate, oblique at the base, membranous, pubescent on both surfaces, thinly above, more densely beneath, strongly nerved when fully mature; petiolule very short. *Panicles* mostly axillary, 1-2 in. long, sessile with corymbose rusty-pubescent branches, dense; flowers with very short pedicels, buds rusty tomentose; bracts and bracteoles broad-ovate or suborbicular, very small, tomentose. *Calyx* with a pair of bracteoles at the base, .1-.12 in. long, campanulate, rusty downy; petals and stamens inserted below the middle of the calyx tube; teeth ovate, obtuse or subacute. *Corolla* white, .25-.3 in. long; petals all clawed; blade of standard orbicular with a small callosity at the base, somewhat abruptly bent from the claw; claw broader and thicker

than those of other petals; wings broader and keel auricled with long slender claws. *Stamens* 9 or 10, monadelphous. *Pod* 1·5-2·5 by ·3-·6 in., strap-shaped, very thin, shining brown, glabrous, finely lineolate, somewhat more closely nerved over the seed or seeds.

Fairly common in the plains and up to 3,000 ft. in the Hills throughout the province.

The bark is often chewed with pan leaves in SOUTH LAKHIMPUR.

Flrs. 1-3. Fr. 9-12.

10. *Dalbergia mimosoides* Franch. Vern. *Dumi-tum*, Garo.

A large woody climber; branchlets blackish, lenticelled, glabrous, often hooked to function as tendrils. *Leaves* 3-5 in. long; common petiole slender, glabrous. *Leaflets* 25-33, ·4-·6 by ·15-·2 in., oblong, sub-cuneate, not oblique at the base, emarginate, membranous, glabrous or nearly so, pale beneath, very finely lineolate underneath; petiolules ·05-·1 in. long, filiform. *Panicles* axillary, 1-2 in. long, rather lax; ramifications minutely puberulous; pedicels about ·1 in. long. *Calyx* campanulate, very small; teeth small, rounded or subacute. *Corolla* not seen. *Stamens* 9, monadelphous. *Pod* 1-2·2 by ·2-·25 in., very thin, flexible, glabrous, 1-3 seeded. *Seeds* straw-colour, ·25-·15 in.; testa thin and papery.

KHASI and NORTH CACHAR HILLS also LAKHIMPUR along the foot of the NAGA HILLS.

Flrs. 3-4 (?) Fr. 12-1.

11. *Dalbergia Thomsoni* Benth. Vern. *Bon-subai-doukha*, Cach.; *Subin-rikang*, Mik.

A large woody climber, glabrous throughout; bark not rough; branchlets lenticelled, often cirrhose. *Leaves* 4-6 in. long; common petiole terete. *Leaflets* often subopposite, 9-15, ·5-1·2 by ·3-·7 in., oblong-obovate or elliptic, emarginate, more or less cuneate at the base, chartaceous, glabrous, green on both surfaces, elegantly veined underneath; petiolules about ·1 in. long. *Panicles* axillary or terminal with ascending branches and scorpioid branchlets. *Flowers* very small, falling off early. *Calyx* very slightly pubescent.

Pod 2·3·5 by ·7·1 in., thin but firm; base cuneate, greenish, glabrous, thickened and veined over the solitary seed; stipe usually ·3·5 in. long.

KHASI and NORTH CACHAR HILLS, apparently not very common.

Flrs. 4-5. Fr. 12-1.

12. *Dalbergia volubilis* Roxb. Vern. *Budu-galwang*, Garo.

A large woody climber with deeply fluted ash-coloured stem; branchlets often functioning as tendrils. *Blaze* white, turning to reddish-brown. *Leaves* 4-7 in. long; common petiole terete, glabrous or puberulous. *Leaflets* 9-13, 1·2 by ·5·1·2 in., obovate, cuneate; apex obtuse, truncate or emarginate, glabrous and green above, very thinly adpressed pubescent and somewhat pale beneath; main lateral nerves numerous, slender, oblique, straight; tertiaries finely reticulate; petiolules about ·1 in. long, slender, thinly pubescent. *Panicles* terminal and axillary, copious, densely rusty pubescent; main branches up to 5 in. long, with dense often recurved corymbose branches, ultimate ramifications secund. *Pedicels* very short. *Bracts* ovate or spatulate; bracteoles oblong-obtuse, both very small and densely pubescent. *Calyx* about ·1 in. long, velvety outside with a pair of bracteoles at the base, upper 2 lobes, obtuse and lower three more or less pointed. *Corolla* ·2·25 in. long, bluish white or light mauve; petals all clawed; standard orbicular, somewhat abruptly bent from the claw, with a swelling at the base, claw thicker than those of other petals; keel petals slightly connate. *Stamens* diadelphous in 2 bundles of 5 each. *Pod* 1·5·2·5 by ·7·1 in., thin, flexible, glabrous, light greenish yellow, usually 1-seeded, somewhat thickened over the thin dark-brown seed.

In deciduous types of forests in GOALPARA, GARO HILLS, SYLHET, KHASI JAINTIA HILLS; probably in similar forests elsewhere.

Flrs. 12-3. Fr. from January onward.

13. *Dalbergia stipulacea* Roxb. Vern. *Dat-bijla* or *Bijuli*, Ass.; *Garo-deosal*, Mech; *Phalwang*, *Khot-budu*, Garo;

Sabima-rikang, *Chamangpe-sude-arong*, Mik.; *Dieng-mei-soh-khwang*, *Dieng-khuruang*, *Mei-phyrwang*, *Dieng-soh-jeruan*, Khasi; *Ching-ching-dit*, Lush.

A large climbing shrub, often a small erect tree or bush; old stems fluted, greyish brown outside. *Leaves* 5-9 in. long; common petiole terete, slender, glabrous, supported by a pair of ovate falcate stipules, about .1 in. long. *Leaflets* 17-25, .8-1.5 by .3-.5 in., oblong, cuneate and slightly oblique at the base, emarginate, membranous or somewhat firm when mature, green and glabrous above, subglaucous and minutely and sparsely hairy beneath; lateral nerves about 15 on either half, slender, irregular. *Panicles* axillary, 3-5 in. long with ascending more or less secund, racemose branches; flowers rather distant, supported by persistent, large bracts and bracteoles; pedicels .2 in. long. *Calyx* about .15 in. long; lowest tooth linear and longer than the others. *Corolla* reddish-purple, .25-.3 in. long. *Stamens* diadelphous in two sheaths of 5 each. *Pod* 2-4 by 1-1.2 in., pendulous, thin, flat, dark-green, ripening to deep brown oblong, more or less obtuse, generally 1-seeded, thickened and rugose over the seed; stipe .5-.6 in. long, slender. *Seed* .7-.9 in. across, flat; testa brown.

Throughout the plains of the Province, very common in the GARO HILLS.

The stem is woody enough to be used as small posts and tool handles.

Flrs. 3-4. Fr. 11-12, often remaining till March.

D. foliacea Wall. An erect tree; young parts pubescent. *Leaf rachis* straight, 3.5-5 in. long. *Leaflets* 9-13, rarely fewer, 2-3 by .5-1.1 in., elongate-oblong or oblong-lanceolate, sub-acute, obtuse or acute, often minutely cuspidate, rigidly sub-coriaceous, thinly pubescent on the nerves when young, glabrescent with age; lateral nerves not prominent, about 10-13 pairs; petiolules .1 in. long. *Flowers* white, fragrant, about .22 in. long in corymbosely branched pubescent panicles at the base, sometimes also from upper leaf axils. *Bracts* and *bracteoles* very small, oblong, ciliate, the latter opposite. *Calyx* about .12 in. long, the lowest tooth longest and sharply acute, others obtuse to sub-acute. *Corolla* about .2 in. long; standard short clawed, about .17 in. long, oblong-obovate, other petals with long claws. *Stamens* 9, rarely 10, united in a sheath slit at the top. *Ovary* on a pubescent stipe. *Pod* not seen, according to Baker in F. B. I. "just like that of *D. rimosa*."

Grown in Govt. Park grounds Shillong; no indigenous specimen collected.

Flrs. 5.

36. PONGAMIA Vent.

Pongamia glabra Vent. Vern. *Naktamala*, Sans.; *Karana*, Sans. & Beng.; *Karchaw*, *Karach*, *Karcha*, Ass.; *Hedem*, Mik. (?).

A small or middle-sized tree with a short trunk and spreading crown, evergreen or leafless only for a short time in March or April; bark grey or blackish and rough outside, green below the cork; blaze soft, light-brown and yellow, .2-.3 in. thick, fœtid smelling. *Leaves* 6-10 in. long, imparipinnate; common petiole terete, slender; stipules caducous, small, oblong, obtuse. *Leaflets* opposite, rarely alternate,* 5-7, 2.4 by 1.2-.3 in., ovate elliptic, acuminate, subcuneate or rounded at the base, chartaceous, glabrous, dark-green above, pale underneath; petiolules .25-.3 in. long. *Racemes* axillary, simple, peduncled, 3-6 in. long; pedicels .2-.3 in. long, in fascicles of 2-4, pubescent, with a pair of minute bracteoles in the middle. *Calyx* small, subtruncate. *Corolla* .5 in. long, white and purple; petals cohering by the tips; standard broad, appendiculate at the base, shortly clawed; wings slightly adhering to the keel, silky outside. *Stamens* monadelphous; the upper stamen being only partially free; anthers versatile. *Ovary* subsessile, 2-ovuled; style incurved; stigma small, terminal. *Pod* 1.5-2 by 1.1-.2 in., woody, flattened, oblong, indehiscent, much thickened at the sutures, not winged, 1- rarely 2-seeded, tipped with the remains of the style. *Seeds* reniform, white streaked with brown, oily.

Occurs in all districts in both valleys except perhaps LAKHIMPUR, often planted along road-sides for shade.

The leaves are good fodder for cows and have valuable medicinal properties. The seeds yield an orange coloured thick oil which is used for illuminating purposes in CHOTA NAGPUR and S. INDIA and is good for many kinds of skin diseases. The wood is yellowish, moderately hard, coarse but even grained, not durable, weighing about 40 lbs. per c. ft.

Flrs. 5-6. Fr. 12-2.

* *Vide* Mr. Sen Gupta's specimen collected from SYLHET and numbered 7691 in my Herbarium.

37. DERRIS Lour.

Usually climbers, rarely trees. *Leaves* imparipinnate, usually exstipellate. *Leaflets* opposite, exstipellate. *Flowers* usually fascicled on the branches of axillary or terminal racemes or panicles; bracts and bracteoles small and usually caducous. *Calyx* campanulate, truncate or minutely toothed. *Corolla* much exerted; standard broad, not auricled; wings long-clawed, often spurred, more or less adnate to the obtuse keel. *Stamens* usually monadelphous; anthers versatile. *Ovary* sessile or subsessile, few-ovuled. *Pod* indehiscent, usually thin, winged down the upper or both sutures. *Seeds* 1 or few, reniform or orbicular.

- I. A middle-sized tree. Leaflets up to 25.
Pod strap-shaped, winged along the upper suture only. 1. *D. robusta*.
- II. Woody climbers :—
 - A. Branches and leaflets glabrous :—
 - Leaflets 3-5. Racemes short, simple or with short basal branches. Pedicels fascicled. Flowers reddish-purple. Pod less than twice as long as broad, upper suture winged. . . 2. *D. uliginosa*.
 - Leaflets 5-7. Racemes paniced. Pedicels solitary. Flowers light red. Pod about 3 times as long as broad, winged along both sutures. . . 3. *D. marginata*.
 - Leaflets 5-9. Panicles with spreading branches. Flowers white. Pod about twice as long as broad, winged on both sutures. 4. *D. thyrsiflora*.
 - B. Branches and leaflets more or less pubescent. Corolla red :—
 1. Racemes short, usually with short branches at the nodes :—
 - Leaflets 5-11. Pod 4-5 times as long as broad. Upper suture winged. 5. *D. cuneifolia*.
 - Leaflets 9-13. Pod about 3 times as long as broad. Upper suture winged. 6. *D. elliptica*.
 2. Racemes paniced :—
 - Leaflets 5-9. Pod 2-3 times as long as broad. Both sutures winged. 7. *D. ferruginea*.

C. Branches prominently lenticelled :—

- Leaflets 7-9, green beneath. Panicles much branched. Pedicels not fascicled. Flowers white. Pod winged along both sutures. 8. *D. Wallichii*.
 Leaflets 9-11, glaucous beneath. Panicles short, usually fascicled. Flowers bluish. Pod winged along both sutures. 9. *D. monticola*.

1. *Derris robusta* Benth. Vern. *Kothia-koroi*, *Mouhita*, *Hitkura*, *Sirkhi*, Ass.; *Diengthing*, *Diengphullot*, *Diengbanthen*, Khasi; *Bon-narje*, *Bon-subai*, Mech; *Bon-subai-phang*, *Murki-mora*. Cach.; *Thing-kha*, Lush.; *Aleng-* or *Aling-thing*, Kuki; *Theng-sak-arong*, *Theng-saksu*, *theng-chak*, Mik.; *Bol-kakharu*, *Bol-tara*, Garo; *Ileng-kung*, *Horuth-ching*, *Kho*, Manip.; *Karanch*, Nep.

A middle-sized deciduous tree with an oval crown. *Bark* greyish white, fairly plain, coarsely fibrous, very light, dun-brown inside with occasional broad streaks of white with rather an unpleasant smell. *Leaves* 5-8 in. long; common petiole slender, channelled above, minutely pubescent. *Leaflets* 5-1·7 by 3·7 in., oblong or elliptic, subacute, minutely mucronate, thinly coriaceous, green and glabrescent above, minutely silky pubescent beneath; main lateral nerves 5-6 on either half; nervules very closely reticulate; base unequal; petiolules upto 1 in. long. *Racemes* axillary, 5-10 in. long. *Flowers* white, fascicled on slender grey-downy pedicels, 2·3 in. long. *Calyx* 1·15 in. long, broadly campanulate, subequally deltoid-toothed, brick-red outside, pubescent with golden hairs. *Corolla* 3·5 in. long; standard erect, orbicular, emarginate, faintly parallel veined with a faint yellow blotch above the 1 in. long claw; wings 25 in long, clawed; keel-petals sub-falcate about 3 in. long. *Stamens* often diadelphous. *Ovary* canescent; style incurved. *Pod* 1-2·5 by 35·5 in., 1-5 seeded, narrowed to both ends, glabrous, reticulate, winged along the upper suture. *Seeds* brown, about 1 in. across, orbicular, compressed.

Common throughout the plains of all DISTRICTS in the PROVINCE and up to 2,500 ft., in the HILLS.

Wood hard of a light-brown colour, no distinct heartwood, used

for house-posts and ploughs, weighing about 50 lbs. per c. ft. The leaves are lopped for fodder. The tree is much planted as a fertilizer in tea-gardens.

Flrs. 4-5. Fr. 11-12.

2. *Derris uliginosa* Benth.

A large climber with glabrous branchlets marked with large white lenticels. *Leaves* 6-10 in. long; common petiole terete, puberulous, stout. *Leaflets* 3-5, 2-4 in. long, oblong or oblanceolate, or oblong, usually bluntly short acuminate or subobtusate at apex, coriaceous, glabrous but often pubescent along the nerves beneath; lateral nerves 5-7 on either half, oblique, fairly straight, prominent beneath, depressed above; petiolules .1-.12 in. long, stout and stiff. *Racemes* axillary, short-peduncled, 3-6 in. long, generally unbranched; pedicels fascicled, short. *Calyx* about .1 in. long, campanulate; teeth obscure. *Corolla* about .4 in. long, reddish-purple. *Pod* 1-2.5 by .7-.9 in., oblong, 1-2 seeded, flat but rigid, glabrous or thinly pubescent, prominently veined, thickened at the sutures, sharply winged along the upper suture.

Apparently not very common. Grows in swampy places in certain parts of the SIBSAGAR DISTRICT, e.g., Tengapukhri.

Flrs. 4-5. Fr. 8-10.

3. *Derris marginata* Benth. Vern. *Mei-indroh*, *Mei-soh-phlang*, Khasi.

A powerful evergreen climber with dextrorsely twining thickly lenticelled branches. *Leaves* 6-10 in. long, 5-7 foliolate, glabrous throughout. *Leaflets* 3-7 in. long by 1-2 in., oblong, lanceolate or elliptic oblong, long acuminate, more or less rounded at the base, thinly coriaceous, shining above, pale beneath; main lateral nerves 10-12 on either half with many fainter ones between; tertiaries closely reticulate; petiolule .2-.4 in. long. *Racemes* paniced with several slender lax-flowered branches; pedicels filiform, bracteate, .5 in. long. *Calyx* small, broader than long. *Corolla* pale-red, about .5 in. long. *Pod* 4-6 by 1.5-1.7 in., oblong or oblong-lanceolate in outline, narrowed at both ends, thin and flexible, finely veined, 1-2 seeded, broadly winged along both sutures.

SUB-HIMALAYAN TRACTS in KAMRUP, *e.g.*, Doimara and southern slopes of the KHASI HILLS, *e.g.*, Nongkla, etc.

The inner wood is hard and tough and might be utilized in bent-wood industry.

Flrs. Rainy season. Fr. 12-1.

4. *Derris thyrsiflora* Benth. Vern. *Thebu-rikang* or *Thepu-rikang*, Mik.; *Rumaiji-doukha*, Cach.

A large woody climber; bark rough and grey outside, yellow inside. *Leaves* 9-12 in. long, glabrous throughout. *Leaflets* 5-9, 2-6 by .9-2 in. long, elliptic to oblong-lanceolate, abruptly bluntly acuminate, quite entire, rounded or cuneate at the base, coriaceous, pale beneath; main lateral nerves 5-7 on either half, slender, arched. *Panicles* terminal, up to a foot long, with numerous ascending racemose branches with pubescent rachis; pedicels short, not fascicled. *Calyx* about .12 in. long. *Corolla* whitish, about .5 in. long. *Pod* 1.5-3 by .7-1.2 in., glabrous, veined, 1-3 seeded, with narrow wings of uniform width on both sutures.

NORTH CACHAR HILLS, *e.g.*, Panimur, banks of the Daiung river, etc.

Flrs. 8-9. Fr. 12-1.

5. *Derris cuneifolia* Benth.

A large climber with tomentose extremities while young; old stem warted. *Leaves* 6-12 in. long. *Leaflets* 5-9, rarely up to 11, variable in size, usually 3-5 in. long, but sometimes attain 7.5 in. or may be only 1.5 in. long, sometimes alternate, obovate-oblong, or elliptic-oblong, usually bluntly short acuminate, cuneate or narrowed, sometimes rounded at the base, entire, subcoriaceous, pale underneath; main lateral nerves 5-6 on either half, very faint; petiolules short. *Racemes* axillary, sometimes fascicled, often .2 in. long, slender, pubescent. *Calyx* about .12 in. long, campanulate, shortly toothed or sub-truncate, densely brown ciliate. *Corolla* about .5 in. long, red or purple, fading to white. *Pod* obliquely elliptic-obovate or oblong, 1-1.5 by 1 in. long, turgid, generally 1-seeded. with a narrow but sharp wing along the lower suture.

Evergreen forests in UPPER ASSAM, e.g., Gaurisagar in SIBSAGAR, at Jhalukbari in KAMRUP, also in SYLHET and CACHAR and southern slopes of the K & J HILLS.

Flrs. 4-5. Fr. 11-12.

6. *Derris elliptica* Benth. Vern. *Bakal-bih*, *Mokoi-sopa*, *Etam-chali*, Ass.; *Hiru-alu*, Mik.

A large woody dextrorse climber with long switchy velvety branches. *Leaves* 9-15 in. long, long-petioled. *Leaflets* 9-13, 2.5-6 by 1-2 in., oblong, obovate-oblong, sub-acute, or abruptly and often bluntly short acuminate, minutely mucronate, firmly chartaceous, glabrous above, softly pubescent beneath; lateral nerves 6-7 on either half, oblique, slightly arched, impressed above; petiolules .15-.2 in. long, stout, brown-pubescent. *Racemes* terminal or from upper axils, 3.5-10 in. long with short branches from the nodes and sometimes with long branches from near the base, lax-flowered; rachis and branches brown-pubescent. *Calyx* .15-.2 in. long, oblique, short toothed, pubescent outside. *Corolla* red or whitish, .6-.7 in. long; standard silky on the back. *Stamens* monadelphous, but upper nearly free except in the middle. *Pod* 1.5-3 by .7-1.2 in., 1-3 seeded, rigid, reticulate, but with raised sutures, with a narrow wing along the upper suture, glabrescent.

Throughout the plains of Assam, generally in grass-lands and glades.

The roots are used to poison fish and the bark is chewed with betel leaves.

The roots contain a large percentage of rotenone which is known to be a valuable insecticide. There is a growing demand for the roots on this account in Europe for agricultural insecticides and for sheep ointment. The fibres are made into coarse ropes.

Flrs. 3-4. Fr. 3-6.

7. *Derris ferruginea* Benth. Vern. *Ruphang-doukha*, Cach.; *Aru*, Tipp.

A woody climber with blackish-brown bark which exudes a watery sap; young parts ferruginous pubescent. *Leaves* 7-10 in. long; long petioled. *Leaflets* 5-9, 2.5 by 1.2-2 in., elliptic or obovate-oblong, usually abruptly but bluntly acuminate, round at the base, subcoriaceous, glabrous

above, softly ferruginous pubescent beneath, specially along the raised veins; lateral nerves 6-7 on either half, arched, impressed above; petiolules $\cdot 15\text{--}\cdot 25$ in. long, stout. *Racemes* axillary, more or less paniced, 8-12 in. long with flowers fascicled at the nodes on filiform pedicles, $\cdot 3\text{--}\cdot 5$ in. long. *Calyx* broadly campanulate, $\cdot 1\text{--}\cdot 12$ in. deep, pubescent outside. *Corolla* $\cdot 5$ in. long, reddish white or red; standard glabrescent or thinly pubescent along the nerves on the back near the top; stamens monadelphous; upper stamens free. *Pod* $1\cdot 5\text{--}3$ by $\cdot 8\text{--}\cdot 12$ in., flat, strongly veined, densely brown silky when young, thinly hairy or glabrescent with age, 1-3 seeded, with a narrow wing along the much thickened upper surface; lower suture with a sharp edge or very imperceptibly winged.

Evergreen forests in UPPER ASSAM down to DARRANG and SIBSAGAR, e.g., Charduar, Dikhumukh, Kalioni, etc.

Flrs. 4-5. Fr. 6-11.

8. *Derris Wallichii* Prain in Journ. Ass. Soc. Beng. Vol. LXVI, pp. 99, 462.

A large subarborescent climber with densely lenticelled brown stem and branches. *Leaves* 10-15 in. long; common petiole terete, glabrous. *Leaflets* generally 7, 3-6 by $2\cdot 2\text{--}5$ in., oblong-lanceolate, lateral somewhat oblique at the base, sub-acute, coriaceous, glabrous; main lateral nerves 5-6 on either half, arched; tertiaries strongly reticulate; petiolules $\cdot 2\text{--}\cdot 3$ in. long. *Panicle* terminal, 8-12 in. long, with ascending racemose branches, 3-5 in. long. *Flowers* white, not fascicled; pedicels $\cdot 15\text{--}\cdot 2$ in. long, pubescent. *Calyx* broadly obconical, sub-truncate, slightly pubescent. *Corolla* $\cdot 6\text{--}\cdot 8$ in. long; standard glabrous. *Stamens* diadelphous. *Ovary* rusty pubescent. *Pods* winged along both the sutures, mature not seen.

Near Haflong in the NORTH CACHAR HILLS, apparently not very common.

Flrs. 4-5. Fr. 7-10 ?

9. *Derris monticola* Prain. in Journ. Ass. Soc. Beng. Vol. 66, pp. 361 and 463.

A climber; stem verrucose with prominent lenticels;

innovations rusty tomentose. *Leaves* 6-9 in. long; common petiole grooved above, glabrous; stipules ovate-obtuse, adnate, rusty pubescent, up to .1 in. long. *Leaflets* 7-11, 2.5-4 by 1-1.5 in., oblong-oblongeolate or oblanceolate, shortly acuminate, cuneate or slightly rounded at the base, chartaceous, glabrous and shining above, glabrescent with age and pale beneath; lateral nerves 6-8 on either half, slender, slightly arched, nervules finely reticulate, but rather indistinct. *Flowers* blue, pale lilac or purple in fascicles on compact racemes; rachis pubescent when young, 2.5-7 in. long; bracts caducous, ovate, small; bracteoles narrower, both densely-pubescent. *Calyx* about .15 in., brown, pubescent; teeth subdeltoid; standard suborbicular, clawed with a green centre. *Stamens* monadelphous, upper nearly free at the base and towards the top. *Pods* winged along both sutures.

KHASI HILLS above 5,000 ft., e.g., Saitshylliah near Nongkersin, Gunner falls etc.

Flrs. 3-4.

Derris scandens Benth.—A large woody climber with lenticellate branches; young parts rusty pubescent. *Leaves* imparipinnate; rachis 2.5-6 in. long, channelled, glabrescent with age. *Leaflets* 7-11, .9-3 in. by .5-1.4 in., oblong or obovate-oblong, apex often tapering, obtuse, subcoriaceous, glabrous above, puberulous beneath; secondary nerves somewhat obscure, 6-8 on either half; petiolule .1-1.5 in. long, slender, pubescent. *Flowers* white or pink, .25-.3 in. long in fascicles on long axillary and terminal rusty pubescent racemes, up to 12 in. long, often branched; pedicels up to .2 in. long. *Calyx* .1 in. long, truncate, silky pubescent. *Corolla* exserted; standard suborbicular, slightly cordate near the claw. *Stamens* monadelphous; upper stamen half or more, free. *Pod* 2-3 by .4-.5 in., 1-3 seeded, often sinuate between the seeds with a narrow wing on the upper suture.

May be found in LAKHIMPUR, KAMRUP & DARRANG DISTRICTS.

Flrs. rainy season. Fr. Cold season.

38. DALHOUSIEA Grah.

Dalhousiea bracteata Grah. Vern. *Pahari-lata*, *Tekala-lata*, Ass. (Sib.); *Teli-lat*, Ass. (Darr.); *Paitha-gach*, *Hunkhuri-lewa*, Ass. (Kam.); *Nirong-riubi*, Abor; *Mei-mithai*, *Mei-dieng*, Khasi; *Luyang-thu*, *Angthu-rikang*, *Loi-angthu*, Mik.; *Mishen-doukhka*, *Makhoi-jalla-doukhka*, Cach.; *Nahoi-rang*, Tipp.; *Kali-gauj*, Nep.

An evergrown woody climber with ashy grey bark; young shoots thinly hairy. *Leaves* bifarious, 1-foliolate; stipules .2-.3 in. long, ovate or suborbicular ovate, acute, more or less pubescent, many nerved; petiole terete, .5-2.5 in. long, swollen at both extremities. *Leaflets* 3-8 by 2.5 in., ovate-elliptic or oblong-elliptic, quite entire, abruptly bluntly acuminate, rounded or subcordate, sometimes peltate at the base, chartaceous, glabrous, dark-green, shining above, adpressed-pubescent beneath, specially along the nerves when young, ultimately glabrous; main lateral nerves 8-10 on either half; nervules very closely and finely reticulate, (2,000-25,000 meshes per sq. inch); stipules 0. *Peduncles* axillary, solitary, once or twice bifid, each branch terminating in a bracteate flower; bracts about .2-.3 in. long, resembling the stipules, in pairs at the joints of the peduncle; bracteoles up to .6 in., similar but larger, also in pairs, concealing the flowers. *Calyx* small, campanulate, hairy outside; teeth very short, deltoid, caducous. *Corolla* white, about .25 in. long, exserted; petals almost sessile; standard orbicular, deeply emarginate, wings oblique; keel-petals slightly incurved, connate along their lower margins. *Stamens* 10; filaments free, subulate, glabrous, all fertile; anthers versatile. *Ovary* subsessile, 2-4 ovuled; style incurved, subulate; stigma terminal, small, capitate. *Pod* 3-4 by 1.2-1.5 in., turgid, compressed, tapering at both ends, coriaceous, 1-3 seeded, continuous and white inside. *Seeds* about 1 in. long, compressed and faceted; testa brown; albumen 0.

Common in evergreen forests of all Districts except GOALPARA and GARO HILLS.

The leaves are excellent as wrappers for country cigarettes known as *biris* and would be well worth creating a demand for in Calcutta and other centres.

Flrs. 5-6 (sometimes a second flush in 10-11). Fr. 12-1.

39. SOPHORA Linn.

Sophora acuminata Benth.

A shrub 6-10 ft. high. *Branches* at first grey-silky, but soon glabrescent and green; young parts adpressed rusty villous. *Leaves* imparipinnate, 6.5-12 in.; rachis and

petiolules rusty pubescent. *Leaflets* 9-19, opposite or sub-opposite, 1.5-4 by .5-1 in., oblong-elliptic, oblong-ovate or lanceolate, finely acuminate, quite entire, chartaceous, glabrous and dark-green above, glaucous and with adpressed silky hairs beneath; midrib prominent and perfectly straight; lateral nerves obscure, about 10-12 on either side of the midrib; lateral petiolules about .07 in. long. *Flowers* about 1 in. long, bright yellow, in axillary peduncled racemes. *Calyx* .2-.3 in. long, oblique, grey silky. *Corolla* much exserted; petals equal in length, long-clawed; standard broad, keel obtuse. *Stamens* free or sometimes slightly connate at the base; anthers uniform, versatile. *Ovary* stalked; style incurved. *Pod* 3-5 in. long, 1-4 seeded, distantly moniliform, glabrous, strongly veined and often with a slight metallic lustre; seeds about .35 in. long, oblong, smooth, bright scarlet.

KHASI & JAINTIA HILLS, 3-4,000 ft., e.g. Mawsmat, Sutunga, Lait-soh-um, etc.

Flrs. rainy season. Fr. 9-12.

40. ORMOSIA Jackson.

***Ormosia robusta* Wight.** Vern. *Porghum*, Miri; *Sanachi* or *Sanachi-bloma*, Garo.

A lofty tree upto 100 ft. in height. *Bark* greenish-grey or brown, rough and longitudinally fissured outside, fibrous and light brown or yellowish inside; young parts and inflorescence tawny or rusty tomentose. *Branchlets* thick, sulcate, prominently lenticelled with age. *Leaves* imparipinnate; rachis 5-12 in. long, angled, rusty pubescent, ultimately glabrate; stipules subulate, persistent. *Leaflets* 7-11, opposite, 3-6 by 1-2 in., elliptic-oblong or lanceolate or oblong-lanceolate, entire, acute or shortly, usually bluntly acuminate, rounded or acute at the base, coriaceous, glabrous, dark green above, paler beneath; midrib prominent beneath; main lateral nerves 7-9 on either half, arched; petiolules .15-.25 in. long, stout. *Flowers* in terminal panicles the lower branches of which are from the axils of upper leaves: pedicels upto .2 in. long, enlarging in fruit; bracts .2-.25 in. long, rusty tomentose. *Calyx* persistent, .4-.5 in. long and

about as broad at the mouth, rusty tomentose; lobes subequal. *Petals* dull-white .5-.6 in. long, glabrous, clawed; standard largest, orbicular or slightly broader than long; wing petals obliquely oblong; keel petals obliquely ovate-oblong. *Stamens* 10, free, unequal; anthers versatile. *Ovary* subsessile, villous; style long, filiform, coiled at the end; stigma oblique. *Pod* orange-yellow, 2-4 in. long, 1-2 less often 3-seeded, contracted at the base, dehiscing by both sutures; valves coriaceous, thick, hard when dry. *Seeds* about 1 in. long, oblong, enclosed in a scarlet arillus.

Not common, Nizamghat, NORTH EAST FRONTIER TRACT, Barusali in SIBSAGAR DISTRICT; Lakhipur near CACHAR and SYLHET.

Wood light brown, soft but fairly tough with wavy bands of horny dark tissue. Pores large, scanty; weight roughly 32 lbs. per c. ft.

Flrs. 11-12. Fr. 12-2.

Sub-family II. CÆSALPINIOIDEÆ. (Leguminosæ).

Trees or shrubs, sometimes climbers, rarely herbs. *Leaves* usually 1 or 2-pinnate, sometimes with only 1 pair of leaflets, sometimes 1 foliolate by the union of these; stipels usually 0. *Flowers* irregular or less often subregular, usually 2-sexual. *Calyx* sometimes spathaceous, often with short tube; lobes 5, less often 4, from the fusion of the upper two, usually imbricate. *Petals* usually 5 or less often fewer or 0, ascending, imbricate, the upper one being innermost in bud. *Stamens* 10, some often reduced to staminodes or aborted, rarely indefinite, usually free. *Ovary* free or united by the stipe to the calyx tube. *Pod* indehiscent or dehiscent, often septate but not breaking into 1-seeded joints. *Seed* various, albuminous or exalbuminous.

ARTIFICIAL KEY TO THE CÆSALPINIOIDEÆ.

I. Leaves bipinnate :—

A. Usually armed woody climbers; (in our area). Calyx cleft nearly to the base :—

- | | |
|---------------------------------|-----------------|
| Pod not winged. | 1. Cæsalpinia. |
| Pod winged on upper suture. . . | 2. Mezzoneurum. |

B. Unarmed trees; calyx cleft never more than half way down :—

- Leaflets 2-4.5 in. long; stamens
5, equal. pod thin, dry, not

- saponaceous, winged on the upper suture. 3. *Acrocarpus*.
 Leaflets .75-1 in. long; stamens 10, alternately short and long; pod saponaceous, not winged. 4. *Gymnocladus*.
- II. Leaves pinnate, usually paripinnate :—
 A. Petals 5; stamens unequal, usually 3-5, reduced to staminodes. 5. *Cassia*.
 Stamens equal, all perfect, usually 10. 6. *Cynometra*.
 B. Petals 3, unequal; stamens monadelphous, only 3 perfect; anthers versatile. 7. *Tamarindus*.
 C. Petals 0. Stamens usually 7-8. 8. *Saraca*.
- III. Leaves 1-foliolate, usually of 2 connate leaflets. 9. *Bauhinia*.

1. CÆSALPINIA Linn.

Trees, shrubs or climbers, usually prickly. *Leaves* abruptly 2-pinnate. *Flowers* showy, usually yellow, red, rarely white, in axillary or terminal racemes or panicles. *Bracts* present at least when young. *Calyx* deeply 5 cleft; lobes imbricate, lowest largest and concave; tube short, disk-lined. *Petals* spreading, orbicular, clawed, uppermost smaller than the others (ascending imbricate). *Stamens* 10, free, declinate; filaments often villous at the base; anthers oblong, uniform, versatile. *Ovary* few ovuled; style filiform; stigma terminal. *Pod* various in form, dehiscent or not, smooth or prickly.

Pods armed with sharp prickles :—

Leaflets large. 1. *C. crista*.

Pods unarmed, fleshy :—

Leaflets 7-10 pairs on each pinna, less than 4 times as long as broad. 2. *C. digyna*.

Leaflets 14-23 pairs on each pinna, more than 4 times longer than broad. 3. *C. microphylla*.

1. *Cæsalpinia crista* Linn. Syn. *Cæsalpinia Bonducella Fleming*. The fever nut. *Putikaranja*, Sans. Vern. *Lataguti*, Ass. & Kach.; *Kamburu-rikang*, *Ching-sum-arong*, Mik.; *Nata*, Beng.

A scandent or scrambling prickly shrub; branches downy and armed with more or less straight, fine to strong prickles. *Leaves* 12-18 in. long; stipules large, 2 fid; rachis and its

branches brown pubescent and bearing recurved prickles; stipules foliaceous, pinnatisect; segments obovate. *Leaflets* 6-10 pairs on each pinna, opposite, .7-1.7 by .4-.8 in., oblong or elliptic, subacute or obtuse, mucronate, puberulous on both surfaces, specially beneath, petiolules minute, with a pair of short hooked prickles at the base. *Racemes* 6-12 in. long, supra-axillary and terminal, peduncled, gradually denser towards the top; rachis, bracts, buds and pedicels brown-tomentose; bracts .4-.5 in. long, linear-lanceolate, acuminate, exceeding the buds; pedicels .2-.3 in. long. *Calyx* .2-.3 in. long; lobes obtuse, finely rusty tomentose on both surfaces. *Petals* .4-.5 in. long, yellow, the uppermost and smallest often spotted with red. *Filaments* silky hairy on the lower half. *Pod* 2-3 by 1.5-2 in., coriaceous, dehiscent, thickly beset with sharp wiry prickles, .2-.3 in. long. *Seeds* 2-3; testa very hard, shining, lead-coloured, with numerous very fine horizontal cracks when dry.

N. E. FRONTIER, DARRANG, NOWGONG, CACHAR, SIBSAGAR, probably throughout the province in plains and low elevations.

The nuts and the root bark are considered to be tonic, antiperiodic and febrifuge.

Flrs. rainy season. Fr. cold season.

2. *Cæsalpinia digyna* Rottler.

A large scandent or straggling shrub armed usually with hooked prickles. *Leaves* 6-12 in. long, rachis and its branches pubescent or glabrescent; pinnæ 8-12 pairs, 1.5-2.7 in. long; leaflets 7-10 pairs on each pinnæ, .3-.5 in. by .15-.25 in., oblong, glabrescent on both surfaces or minutely adpressed pubescent beneath; apex obtuse or rounded; base oblique; petiolule minute. *Racemes* supra-axillary and terminal, sometimes branched, pubescent when young; bracts nearly obsolete, caducous; pedicels slender, .4-.9 in. *Flowers* bright yellow, .5-.7 in. across. *Calyx* .35 in. long, glabrescent with age; lobes obtuse, lowermost early deciduous. *Petals* orbicular, uppermost reflexed. *Filaments* exserted, lower portion densely wooly. *Pod* 1.3-2.5 by .7-1 in., fleshy, shortly stipitate, crowned by the remains of the style,

1-2 seeded, constricted between the seeds when more than 1-seeded. *Seeds* dark brown, roundish; testa very hard.

CACHAR—Shaik Mokim! probably in other Districts also.

Pods contain as much tannin as *C. coriaria*—the Divi-divi of commerce. It may be therefore worthwhile planting it.

Flrs. 8-10. Fr. 1.

3. Cæsalpinia microphylla Ham. Syn. *C. cinclidocarpa* Miq. *Dari-chik*, Garo.; *Shumugushim-khashiba*, Kach., *Ling-kai-rek*, *Wok-pin-rung*, Kuki.

A prickly climbing shrub; branchlets pubescent when young, lenticellate later on, prickles recurved, almost horizontal with flattened bases on old stems. *Leaves* 9-15 in. long; rachis with paired recurved prickles, finely downy as also the pinnæ; pinnæ 9-12 pairs, 2-4·75 in. long; leaflets 14-23 pairs, ·3-·6 by ·08-·15 in., sessile, linear-oblong, oblique at the base, subcoriaceous and more or less rigid, glabrous and dark-green above, puberulous beneath. *Racemes* paniced, terminal and axillary, 8-15 in. long, brown pubescent when young. *Flowers* yellow; buds ·45 in. long; pedicels ·4-·7 in. long, puberulous. *Calyx* glabrous outside; lobes ·4-·5 in. long. *Petals* obovate to suborbicular, about ·5 in. long, clawed. *Stamens* villous towards the base. *Pod* fleshy, 2-4·5 in. by 1-1·2 in., 1-3 seeded, constricted between the seeds, seeds black, broadly obovoid, plano convex, about ·7 in. long.

LAKHIMPUR, DARRANG, N. CACHAR HILLS, SIBSAGAR, GARO HILLS, GOALPARA—probably in all Districts.

Flrs. 5. Fr. 2-3.

Cæsalpinia pulcherrima Swartz. Syn. *Poinciana pulcherrima* Linn. Vern. *Krishna-chura*, Beng.; Peacock flower; Barbadoes Pride.

A handsome branchy shrub almost unarmed or with few prickles. *Leaves* with 6-9 pairs of pinnæ, rachis 7-11 in. long; leaflets 8-12 pairs, ·4-·7 in. long, broadly oblong or obovate-oblong, emarginate and mucronate, glabrous. *Flowers* orange or yellow, about 1·5 in. across in elongate terminal and axillary racemes; pedicels articulate near the top up to 2·2 in. long in flower, elongating with age. *Petals* 4, subequal, about ·7 in., clawed, crisped, fifth with smaller blade and longer claw. *Pod* compressed.

Sometimes cultivated in gardens in the plains.

Flrs. most of the year except middle of rainy season.

2. MEZONEURUM Desf.

Armed scandent shrubs. *Leaves* bipinnate; stipules small or 0; stipels 0. *Flowers* yellow in axillary or terminal paniced racemes; bracts narrow, usually deciduous; bracteoles 0. *Calyx* very oblique; the tube short, lobes imbricate, lowest longest, hood-like and outermost in bud. *Petals* 5, 4 spreading, subequal or the uppermost smallest. *Stamens* 10, free, exserted; anthers uniform. *Ovary* sessile or shortly stalked, 2-many ovuled; style filiform; stigma small, capitate. *Pod* quite flat, thin, indehiscent with a broad wing along the upper suture. *Seeds* transverse, compressed, orbicular or reniform.

Leaflets 3-6 pairs, 1·5-3 in. long, pod 1 seeded. 1. *M. cucullatum*.

Leaflets 6-10 pairs, ·6-1 in. long, pod 3-6 seeded. 2. *M. enneaphyllum*.

1. *Mezoneurum cucullatum* W & A. Vern. *Baghasora*, *Bagh-anchora*, Ass., *Ghilakata*, (Kam.) Ass.; *Do-jasing-bushu*, *Dudachin*, *Dukher-thri*, *Jakskil*, *Mingoni-jaksikol-bol*, *Mengo-jakskel*, Garo; *Ling-khang*-, *Lushai*; *Banjotatke*, *Kempnerikom-riubi*, *Insu-tengang*, *Miri*; *Kempu-riubi*, *Abor*; *Paniphigag-taraw*, *Duff.*; *U-sia-lobo-sning*, *Mei-sai-ong*, *Mei-sia-singiong*, *Kh.*; *Kuchai-lot*, *Syl.*; *Sa-musrom*, *Sila-Nasukur*, *Mech.*; *Ingsu-chartel-arong*, *Mik*.

A large straggling scrambling shrub; branches glabrous, covered with blackish hooked prickles which in old stems have thick corky bases. *Bark* thin, yellowish grey outside, light red inside. *Leaf* rachis and its branches armed with hooked prickles, the latter 8-12 in. long; pinnæ 2·7-5·5 in. long, distant, 2-4 pairs; leaflets 1·5-3 by ·9-1·2 in., 3-6 pairs, ovate or elliptic to obovate-oblong, bluntly acuminate; base cuneate or rounded, sometimes unequal, glabrous, somewhat glaucous beneath, subcoriaceous; sec. nerves fine, not stronger than tertiaries. *Racemes* terminal and axillary, often from old wood, branched, attaining about the same length as the leaves, usually with few weak prickles; pedicels jointed, ·2·3 in. long. *Calyx* ·4 in. long, deeply divided, tube lined with the disk, yellow, lowest lobe much hooded, largest, ·3·5 in. long, obtuse at the apex. *Petals* ·25·3 in. long, bright yellow, upper folded, purplish, deeply 2 lobed. *Stamens*—one exceeding the others and 5 short; filaments with

few hairs near the base; anthers red. *Pod* 3-4 by 1.1-1.3 in., reddish-brown including the papery wing, which is about .25 in. broad, obliquely oblong, thin, stipitate, 1-seeded.

Throughout the province ascending to about 2000 ft., in the KHASI HILLS.

Flrs. 11-2. Fr. 3-4.

Var. *grandis* F. B. I.—is the robust form of the plant with leaflets up to 4 in. long and 1.6 in. broad and occurs in the same localities.

2. *Mezoneurum enneaphyllum* W&A. *Erachora*, Kochra, kaint, Ass.; *Sujigubung*, Cach.; *Ling-khang*, Lushai; *Hamputo*, Naga; *Ingsu*, *Borplak-asimi*, Mik.; *Ratiasing*, Miri; *Dadu-asing*; Abor.

A scandent glabrous shrub armed with sharp hooked prickles. *Leaf-rachis* 8-12 in. long, armed; pinnæ 12-20, 2-3 in. long, usually unarmed; leaflets 6-10 pairs, .6-1 by .2-.4 in., oblong or obovate oblong, obtuse at apex; base often unequal, thin, glabrous or nearly so. *Racemes* paniced, attaining 12 in., pubescent when young; pedicels .5-.7 in. long, jointed near the top. *Flowers* about .5 in. across. *Calyx* greenish-yellow, .3 in. long; petals bright yellow; filaments shaggy, unequal. *Pod* 3.5-6 by .9-1.6 in., sometimes 7 by 2.2 in.; wing .3-.6 in., 3-6 seeded.

NOWGONG, SYLHET, LUSHAI HILLS, SIBSAGAR, CACHAR, GOALPARA, probably in all plains forests.

Flrs. 9-11. Fr. 12-1.

3. ACROCARPUS W & A.

Acrocarpus fraxinifolius Wight. Vern. *Bol-mangal*.? *Silchhal*, Garo; *Thing-rigetot*, Kuki; *Dieng-ji-rep*, Kh.; *Mech-kuri-bol*, Kam.

A tall deciduous unarmed tree, ordinarily attaining about 100 ft. in height and over 10 ft. in girth; stem often buttressed. *Bark* dark-brown or brownish-grey, rough and warty, reddish-brown inside; young shoots and inflorescence reddish brown, tomentose; branches with warty lenticels. *Leaves* bipinnate, pinnæ 5-7, 6-12 in. long; leaflets 5-8 pairs, 2.4-5 by .75-2.2 in., oblong-ovate or elliptic-lanceolate,

shortly acuminate; base often unequal, ultimately glabrous or nearly so, subcoriaceous; lateral nerves 7-10 on either half; petiolules up to .1 in. long. *Flowers* about 1.2 in. long (including the stamens), dull red or orange, nodding, in dense erect racemes up to about 12 in. long; pedicels short, tomentose. *Calyx* about .4 in. long, campanulate, brown pubescent outside, cleft half way down. *Calyx tube* persistent, at least partly in fruit; segments 5, equal, lanceolate or ovate acute, more or less villous towards the apex outside; disk completely lining the tube. *Petals* 5, slightly imbricate in bud, about .4 in. long, red towards the extremity, greenish towards the base, linear-oblong or oblanceolate-oblong, rusty villous. *Stamens* 5, long exserted, equal; filaments stout, dilated towards the base; anthers uniform, versatile. *Ovary* linear, extruded on a long thinly hairy stipe, the base of which is adnate to the lower end of the calyx tube; ovules many; style incurved, very short; stigma small, terminal. *Pod* 4-5.5 in. long, thin, dark-brown, winged on the upper suture, tapering at the base to the long stalk, which is .5-.7 in. long. *Seeds* up to 18, compressed, .15-.2 in. across.

GOALPARA, GARO HILLS, CACHAR, low elevations in KHASI HILLS, on the slopes above SYLHET, NOWGONG.

Usually branches very high up. Trees upto 200 ft. in height and 150 ft. to the first branch have been recorded from the Madras Presidency.

Sap wood white, heart wood light reddish-brown, pores moderate sized to very large, partitioned, enclosed and joined by wavy lines of soft tissue; medullary rays fine and moderately broad, fairly close. Weight about 39 lbs. per c. ft. (-Gamble). It is used in the Darjeeling District for tea boxes and furniture.

Flrs. 2-3. Fr. 5.

4. GYMNOCLADUS Lam.

Gymnocladus assamicus Kanjilal ms ex Kanjilal. f. sp. Nov. Assam Forest Records Vol. I. p. 7, 8.

A small tree attaining about 40-50 ft. *Bark* reddish brown with an outer reticulating corky layer, living bark thin, yellowish. *Leaves* 2-pinnate, rachis terete, 12-15 in. long, obscurely glandulose, swollen at the base, pinnæ 12-14 pairs, opposite or distantly subopposite, 5-9 in. long, slightly channelled. *Leaflets* odd pinnate, 25-27 on each pinna.

minutely petioluled, subopposite to alternate, .75-1 by .25-.4 in., oblong to ovate-oblong, minutely mucronate, nearly glabrous above, minutely brown pubescent beneath on the mid-rib; main lateral nerves 6-8 on either side, very obscure, slightly elevated above, depressed beneath; base rounded to slightly cuneate, often very slightly oblique, petiolules short, sparsely adpressed hairy. *Flowers* .4-.6 in. long in erect, densely grey, shaggy racemes, 4.5-9 in. long; bracts and bracteoles 0. *Calyx* villous outside and also at the throat and along the ribs inside, except towards the base; tube .25-.33 in. long, narrowly funnel shaped; segments 5, subequal, short, .17-.25 in. long, linear lanceolate to subulate. *Corolla* purplish, grey, shaggy throughout; petals 5, .3-.4 in. long—narrowly ovate to liguliform. *Stamens* 10, exserted, alternately shorter, longer opposite the calyx segments; filaments stout, very short, shaggy; anthers oblong, ovoid, 2 celled. *Pod* 5.5-7 by about 1.5 in., 6-8 seeded, compressed, turgid over the seeds, valves fleshy; paricarp polished, mesocarp saponaceous. *Seed* .6-.8 by .5-.66 in., ovoid or subglobose, bluntly trigonous; testa black, horny, extremely hard, radicle erect.

KHASI HILLS about 5000 ft. Laitseh, Marngor—rare.

The Khasis use the fleshy pods for washing the hair as substitute for soap. Wood hard, yellowish white, weight about 57 lbs. per c. ft.; medullary rays fine, numerous, fairly equidistant. Pores moderate sized in irregular strings of 3-5, joined by lines of soft tissue, annual rings marked by a thin line of soft tissue.

Flrs. 2-3. Fr. cold season next year.

5. CASSIA Linn.

Trees, shrubs or herbs. *Leaves* paripinnate, rachis often with glands between the leaflets or at the base; stipules various; stipels 0. *Flowers* often showy, usually yellow, sometimes pink, in racemes, panicles, supra-axillary fascicles or solitary; bracts and bracteoles present. *Calyx tube* very short; lobes 5, imbricate. *Petals* 5, imbricate, subequal or the lower largest. *Stamens* 10, rarely all perfect or equal, 3-5, usually the uppermost wanting or reduced to staminodes; anthers of the three lowermost stamens often longest, all dehiscing by terminal slits or pores. *Ovary* sessile or stalked, linear, many ovuled; style incurved; stigma terminal, usually

truncate, sometimes ciliolate. *Pod* variable, dehiscent or indehiscent, terete or flat, usually septate between the seeds. *Seeds* transverse in the pod, usually compressed, albuminous.

- I. Trees. Stamens 10, all anther bearing; pod woody, indehiscent; leaflets not exceeding 12 pairs :—
 - Flowers yellow in lax racemes; leaflets 4-8 pairs. 1. *C. Fistula*.
 - Flowers pink in corymbose racemes; leaflets 10-12 pairs. 2. *C. nodosa*.
- II. Shrubs or tall herbs; stamens 6-7 only fertile; pods not woody dehiscent; leaflets not exceeding 12 pairs :—
 - A. Leaf-rachis with one or more glands; valves of pod not winged :—
 1. Leaf rachis with a solitary gland at the base below the lowest pair of leaflets, none between the leaflets :—
 - a. Mature leaves and pods not hirsute; suture of pods more or less thickened :—
 - Leaflets 3-5 pairs, .8-1.2 in. broad, fœtid. 3. *C. occidentalis*
 - Leaflets 6-12 pairs, .4-7 in. broad, not fœtid. 4. *C. Sophera*.
 - b. Mature leaves and pods hirsute; suture of pods not thickened. 5. *C. hirsuta*.
 2. Leaf rachis with glands between the leaflets, none below them :—
 - a. Flowers in pairs on axillary peduncles; pod sub-tetragonous, seeds subcylindric with obliquely truncate ends :—
 - Leaflets obtuse or sub-acute. 6. *C. Tora*.
 - b. Flowers in peduncled racemes; pod turgid, seeds compressed, broadly obovate :—
 - Leaflets under 1.2 in. long, obtuse or rounded at apex. 7. *C. bicapsularis*.
 - Leaflets 1.7-3.5 in., cuspidate acuminate at apex. 8. *C. lævigata*.
 - B. Leaf rachis without any glands, valves of pod with projecting wings along the middle. 9. *C. alata*.
- III. Diffuse undershrub or herb. Stamens 10, all fertile, unequal; pod thin, strap-shaped, dehiscent. 10. *C. mimosoides*.

1. Cassia Fistula Linn. *Suvarnaka, rajataru*, Sans. Vern. *Sonaru, Sonari, Honalu, Honaru*, Ass.; *Honaru, Sonaruarong*, Mik.; *Sonaruphang*, Carh.; *Soneru, Sinaru*, Garo; *Raj-brishi*, Nep.; *Sonali*, Beng. The Indian Laburnum.

A medium sized tree with adpressed pubescent young shoots. *Bark* pale or ashy grey, smooth, usually with horizontal wrinkles or cracks up to middle age, thereafter rougher and dark-brown, green below the outer layer, inner substance light-pink, hard. *Leaves* 9-18 in. long, rachis puberulous; stipules minute, pubescent, early deciduous. *Leaflets* 4-8 pairs, opposite, 2-6 by 1·3-3 in., ovate or elliptic-oblong, acute or sometimes short, acuminate; base cuneate or rounded, subcoriaceous, dark-green and shining above, under-surface silvery pubescent when young and puberulous when mature; lateral nerves fine, subparallel, numerous; petiolule ·2-·3 in. long. *Flowers* yellow, about 1·5-2·5 in. across in axillary, lax, drooping racemes, 8-24 in. long, pubescent when young; pedicels up to 1·7 in. long, gradually longer towards the base; bracts subulate, up to ·2 in. long; bracteoles about ·1 in., both caducous. *Calyx* divided nearly to the base, caducous; segments about ·3-·4 in. long, elliptic oblong, obtuse. *Petals* ·7-1 in. long, obovate, veined, shortly clawed. *Stamens* 10, three lowest longest with curved filaments about 1 in. long and anthers opening by slits, 4-6 lateral with shorter straight filaments about ·4 in. long and anthers opening by pores, the upper 1-3 smallest with indehiscent anthers. *Pod* 1-2 ft. long and about 1 in. across, cylindric, indehiscent, smooth between the seeds. *Seeds* 40-100, about ·4 in. across, ovate in outline, flattened, immersed in a dark-brown sweetish pulp.

Almost all over the province ascending to about 2,000 ft. in the K. & J. HILLS.

A very handsome tree when in flower for which it is sometimes grown in gardens. The heartwood is hard and fairly durable. The pulp of the fruit is a powerful purgative. The leafy twigs are good for cattle fodder. The bark is a good tanning material.

Flrs. 3-6. Fr. cold season.

2. Cassia nodosa Ham. Vern. *Moroi*, Cach.; *Bandarlathi*, Cach. & Syl. *Chohui*, Manipur; *Khorinu-khodong*, Tipp.

A small to middle sized tree with pubescent shoots. *Bark* grey or dark-brown about .2 in. thick, inside fibrous, light brown with streaks of darker brown, yellowish near the cambium. *Leaves* 8-12 in. long, rachis pubescent or glabrescent; stipules crescent-shaped, cuspidate at the free ends, early deciduous; leaflets 10-12 pairs, 2-4 in. by 1-1.7 in., sometimes attaining 5 by 2 in., lowest usually smaller, oblong, oblong lanceolate or elliptic oblong, shortly and sometimes bluntly acuminate or acute; base often somewhat unequal, subcoriaceous, glabrous above, minutely more or less pubescent beneath, specially along the midrib; main lateral nerves 12-15 on either half, slender but prominent beneath; petiolules up to .2 in. long. *Flowers* pink, 2.5 in. across in corymbose racemes, 5-7 in. from old nodes. *Pedicels* 1.2-2 in. long, pubescent, usually supported by a bract and two bracteoles. *Bracts* subpersistent, lower falcate about .6 in., spurred, upper smaller, obliquely lanceolate-acuminate; bracteoles very small, both pubescent. *Calyx* pubescent, red; segments .2-.25 in. long. *Petals* 1.1-.25 by .3-.5 in., subequal, oblong-obovate, subacute or obtuse with distinct midrib. *Stamens* 10; filaments yellow, 3 longer with globose swellings about the middle and hairy anthers, 4 shorter, bearing spurred anthers opening by basal pores, 3 incurved, bearing apparently sterile anthers. *Ovary* hairy. *Pod* 9-18 in. by .5 in., smooth and similar in appearance to that of the last species but more distinctly transversely ribbed.

Not common, Arunachal, Phulertal. Lower Jiri Reserve, etc., CACHAR, Mahur, Mailongdisa, etc., N. CACHAR HILLS, Singla Reserve, Longai Reserve, etc., SYLHET; probably in other Districts also.

A handsome tree in flower.

Flrs. 5-6 and probably throughout the rainy season. Fr. cold season.

3. *Cassia occidentalis* Linn. Vern. *Hant-thenga*, Ass. (Kam), *Naguni*, *Jhan-jhani-gach*, Syl.; *Mithep-phang*, Kach.; *Mei-tar-bi*; Kuki; *Hadi-dika-arong*. Mik.: *Taw-eit-niang-thynthai*, Kh.

A foetid soft wooded undershrub or annual attaining 8 ft. in height, innovations pubescent. *Leaf rachis* 5.5-8 in. long, channelled with a gland at the base; stipules about .3 in.

long, obliquely cordate acuminate, caducous; leaflets 4-5 pairs, 1·6-3·2 by ·8-1·2 in., ovate to oblong lanceolate, sharply acuminate, margin minutely bristly-ciliate at least when young, membranous, glabrous on both surfaces or slightly pubescent beneath; lateral nerves 8-10 on either half; petiolules very small. *Flowers* yellow, ·5-·7 in. across, in few flowered short, axillary or terminal peduncled, corymbose racemes, often forming more or less leafy panicles; pedicels ·2-·25 in. long, elongating in fruit; bracts up to ·6 in. long, whitish with a tinge of pink, ovate to lanceolate, cuspidate acuminate. *Calyx* segments obtuse, ·3 in. long. *Petals* ·5 in. long, obovate-oblong with darker coloured veins. *Stamens* 10, the upper 3 reduced to staminodes, the lower three longer and with larger anthers than the others. *Pod* 3-5 in. by ·25-·3 in., subfalcate, compressed with transverse depressions between the seeds, sutures thickened. *Seeds* 20-30, compressed, pale brown.

Probably originally introduced from TROPICAL AMERICA but now fairly common in forest glades and waste lands ascending to 3,000 ft. in the KHASI HILLS.

The seeds are said to be used as a substitute for coffee in Africa and Mauritius. The leaves, roots and seeds are medicinal. The plant is also used for skin diseases.

Flrs. 7-9. Fr. cold season.

4. *Cassia Sophora* Linn.

An undershrub about 4-5 ft. in height; young parts pubescent. *Leaf rachis* 5·5-10 in. with a conical gland at the base, grooved; leaflets 6-12 pairs, 1·2-2·8 by ·4-·7 in., lanceolate or narrow lanceolate, acuminate or acute; base somewhat unequal, glaucous beneath; lateral nerves about 4 on either half, rather obscure; petiolules very short. *Flowers* yellow, 1-1·5 in. across in short, axillary and terminal corymbose racemes, the whole often paniced at the ends of branches; pedicels ·2-·3 in. long, pubescent, elongating in fruit; bracts caducous, green, small, ovate, acute. *Calyx segments* ·3 in. long, greenish, elliptic or elliptic-ovate, pubescent outside. *Petals* about ·5 in. long, obovate or obovate-oblong, yellow with dark veins. *Stamens* 10, 3 or sometimes 4 sterile, lower 3 longest. *Ovary* hirsute. *Pod* 2·5-4·5 in. by ·2-·3 in., not

or scarcely depressed between the seeds, somewhat turgid and subterete, sutures more or less thickened.

KAMRUP, SIBSAGAR, KHASI & JAINTIA HILLS, 2,000-3,000 ft. and probably in other Districts also, not common. The leaves, roots and seeds are used medicinally similar to those of the last species.

Flrs. rainy season. Fr. cold season.

5. *Cassia hirsuta* Linn.

An annual or an undershrub about 4 ft. in height, all parts hirsute with dense spreading hairs. *Leaf rachis* 4-6 in. long with a solitary gland at the base; stipules subulate, .4-.6 in. long; leaflets 3-5 pairs, 1-2.5 by .5-.3 in., lower gradually smaller, ovate to oblong-lanceolate, acuminate; base unequal; petiolules very small. *Flowers* few together, .75 in. across on short peduncles, which are borne on upper leaf axils or are crowded at the ends of shoots. *Calyx segments* about .25 in. long, densely villous. *Petals* yellow, .3 in. long, oblong-obovate, obtuse, pubescent outside. *Stamens* 6-7, fertile, 2 longer than the others, 3-4 reduced to staminodes. *Ovary* densely villous. *Pods* hirsute, 3-6 in. long, slender, flattened; seeds broadly ovate.

A native of Tropical America, now naturalized in several parts of our area, e.g., KAMRUP, NOWGONG, DARRANG, probably in other Districts also.

Flrs. 10-11.

6. *Cassia Tora* Linn. Vern. *Bon-medelua*, *Dari-diga*, Ass.; *Taw-eit-nyang-synrang*, *Taw-blei*, Kh.; *Hadi-dika-arong*, Mik.

An annual attaining about 4 ft. with pubescent young parts. *Leaf rachis* 1.75-2.5 in., more or less puberulous with two subulate glands between the 2 lowest pair of leaflets, grooved; stipules linear, subulate, .3-.6 in. long; leaflets 3 pairs, gradually decreasing in size downwards 1-2.5 by .4-1.2 in., obovate or obovate-oblong, obtuse or subacute, minutely mucronate; base unequal, thin, glabrescent above, pubescent beneath; main lateral nerves 6-9 on either half; petiolule .1 in. long. *Flowers* yellow, .5 in. across, borne in pairs on very short axillary peduncles, one often abortive;

pedicels $\cdot 2 \cdot 25$ in. long, hirsute. *Calyx segments* $\cdot 2 \cdot 3$ in. long, ovate to elliptic, usually obtuse, ciliate and thinly pubescent in bud, glabrate with age. *Petals* $\cdot 4 \cdot 5$ in., obovate-oblong, prominently veined. *Stamens* 7, perfect, 3 reduced to staminodes. *Pod* 5-8 in. long, sub-tetragonous, imperfectly septate between the seeds; seeds sub-cylindric with obliquely truncate ends.

SIBSAGAR, KHASI and JAINTIA HILLS, KAMRUP, CACHAR, ascending to 2,500 ft. in N. CACHAR HILLS.

Probably all over the Province in waste land.

The leaves and seeds contain chrysophanic acid and are good remedies for skin diseases like ringworm, etc.

Flrs. rainy season. Fr. 11-12.

7. *Cassia bicapsularis* Linn. Vern. *Dieng-phareng*, Kh.

A shrub about 4 ft. in height. *Leaf rachis* with one or two glands between the lower pairs of leaflets; stipules early caducous, subulate, small; leaflets 2-4 pairs, $\cdot 7 \cdot 1 \cdot 2$ by $\cdot 4 \cdot 7$ in., obovate, obtuse or rounded at the top, glabrous, glaucous beneath, membranous; petiolules very small. *Racemes* peduncled, attaining the size of leaves; pedicels $\cdot 3 \cdot 5$ in. long. *Flowers* yellow. *Calyx segments* $\cdot 2$ in. long. *Petals* $\cdot 4$ in. long. *Pod* 3-5 in. by $\cdot 4 \cdot 6$ in., turgid, more or less cylindric, marked with fine horizontal lines.

A native of Tropical America, now run wild in many places in the KHASI HILLS in the vicinity of habitations, Shillong, Shangpung, Sohgympkor, Nongstoin.

8. *Cassia lævigata* Wild.

A handsome shrub with glabrous branches. *Leaf-rachis* 4-7 in. long with a gland between each pair of leaflets except the uppermost pair; stipules about $\cdot 25$ in. long, usually caducous; leaflets 3-5 pairs, $1 \cdot 7 \cdot 3 \cdot 5$ by $\cdot 7 \cdot 1 \cdot 2$ in., lanceolate, cuspidate-acuminate, glabrous, undersurface pale; petiolules minute. *Flowers* yellow, in a few flowered peduncled corymbose racemes, $1 \cdot 5 \cdot 3 \cdot 7$ in. long; bracts linear, acuminate, up to $\cdot 2$ in., caducous; pedicels $\cdot 3 \cdot 7$ in. long, glabrous. *Calyx-segments* $\cdot 2 \cdot 3$ in. long, unequal. *Petals* about $\cdot 5$ in. long, broadly abovate. *Stamens* 7, fertile, 2 longer than

others, 1 intermediate and 4 short; ovary glabrous. *Pod* 2.5-3 by .6 in., cylindric, stipitate at the base, turgid, marked with fine transverse lines. *Seeds* more or less compressed, obovate, about .25 in. long.

Originally introduced from tropical America and now naturalized in KHASI and JAINTIA HILLS, e.g. Borpani, Shillong, Cherrapunji, etc.

In the Khasi Hills specimens a gland is sometimes present between the upper most pair of leaflets.

Flrs. and Fr. almost throughout the year.

9. *Cassia alata* Linn. Vern. *Dadulhou*, Kuki & Tipp.; *Daudpata*, Syl.

A soft wooded shrub with thick downy branches. *Leaf-rachis* 9-24 in. long, stout, channelled with slightly margined ridges, but without glands; stipules persistent, about .3 in. long, rigid, deltoid, acuminate with auricled base; leaflets 10-12 pairs, 2-6 by 1-2 in., oblong, obtuse but apiculate with unequal base, subcoriaceous, glabrous on both surfaces or slightly downy beneath; lateral nerves 13-15 on either half, prominent beneath. *Racemes* 6-12 in. long, spiciform, stout, downy; pedicels short; bracts .7-1.2 in. long, prominent, enveloping the buds, caducous, usually obliquely obovate, membranous. *Calyx-segments* .4-.5 in. long. *Petals* bright yellow, .6-.7 in. long, obovate, veined, clawed. *Stamens* 7, fertile 2 longer than others. *Pod* 4-7 in. long, compressed, membranous with a crenulate wing about .4 in. broad along the middle of each valve.

CACHAR—opposite Lakhipur-Barak Reserve, SYLHET-Singla Reserve. GOALPARA-Makra, LAKHIMPUR-Jaipur, SIBSAGAR-Barpathar—apparently naturalized.

The leaves as the vernacular names indicate are considered to be good for ring worm.

Flrs. 9-12. Fr. 1-2.

10. *Cassia mimosoides* Linn.

Usually a diffuse, sometimes an erect undershrub, attaining 4 ft. often with spreading branches; branches, leaf rachis and inflorescence clothed with adpressed hairs. *Leaf rachis* 2-4 in. long, slender, with a sessile gland close to the

lower pair of leaflets; stipules $\cdot 25\text{--}\cdot 35$ in. long, subulate with a broad base. *Leaflets* 45-70 pairs, crowded and overlapping, $\cdot 15\text{--}\cdot 2$ in. long, subfalcately linear oblong, acute, obliquely mucronate, rigid, nerves somewhat prominent beneath, often with a few hairs near the margin on the undersurface. *Flowers* solitary or in pairs; pedicels axillary or extra-axillary, up to 1 in. long; bracts one pair at the base of the pedicels, about $\cdot 2$ in. long, resembling the stipules; bracteoles 2, a little below the calyx about half the size of the bracts. *Calyx-segments* $\cdot 15\text{--}\cdot 25$ in. long, unequal, long-ovate, acuminate, thinly pilose outside. *Petals* $\cdot 2\text{--}\cdot 25$ in. long, yellow, elliptic, obtuse. *Stamens* usually 10, alternately shorter. *Pod* 1.5-2 in. long, strap-shaped with scattered short hairs outside, septas between the seeds, oblique; seeds compressed, obliquely oblong.

KHASI HILLS—Borpani, Umsingkhla, near Nongstein, etc., about 3,000 ft., KAMRUP, probably in most districts.

The flowers are often borne on branches with aborted leaves which give the former appearance of terminal racemes.

The leaflets are sensitive show sleep movements.

6. CYNOMETRA Linn.

Cynometra polyandra Roxb. Vern. *Ping*, Cach; *Bonsuthai-buphang*, Kach.; *Chherasu*, Garo; *Dieng-rai-heh*, *Dieng-soh-pyda*, Khasi; *Nanop*, Manip.; *Korhai-ha*, Lushai, Kuki; *Bam-kung*, Tipp.; *Rang-koroi-ching*, *Thing-changleing-theing*, Naga.

A large evergreen tree; stem sometimes buttressed at the base. *Bark* dark-brown or grey, somewhat rough, fibrous, light pink or brownish inside. *Branchlets* lenticellate, shoots enveloped at first in imbricating scales, the lower small up to $\cdot 3$ in. across, upper membranous and longer. *Leaves* paripinnate, rachis 2.4-5 in. long, puberulous; leaflets 2-3 pairs, sessile, 2.4 by $\cdot 8\text{--}1.5$ in., lowest pair smallest, obliquely obovate-oblong, oblong-lanceolate or elliptic oblong, obtusely sub-acuminate; base unequally cuneate, inner side with straight margin, on the lower half, narrower than the outer half, subcoriaceous, glabrous on both surfaces; main lateral nerves 7-8 on either half, rather indistinct, meeting in loops near the margin. *Flowers* white, in axillary rusty pubescent

corymbs, 1-2 in. long, floriferous to the base, in bud enclosed by imbricating deciduous, hard, striate, scarious, broadly ovate scales, which are up to .3 in. across and more or less silky pubescent outside; pedicels .6-1 in. long, pubescent, with 2 caducous basal bracteoles up to .2 in. long; buds pubescent. *Calyx tube* very short, with a disk at the base; lobes 4, white, imbricate to obovate-oblong, ultimately reflexed, thinly pubescent outside, .3-.4 in. long. *Petals* 5, linear-oblong to oblanceolate, clawed, about .4-.5 in. long. *Stamens* 40-60, white; filaments slender, glabrous, about .5 in. long. *Ovary* densely woolly, subsessile, very oblique; style filiform; stigma capitate; ovules 1-2. *Pod* 1.5-2.5 in. by .75-1.25 in., falcate or oblique, oblong, woody, usually rather rugose with lenticular dots. *Seeds* solitary.

SYLHET, CACHAR, GARO HILLS, LUSHAI HILLS, KHASI HILLS, low elevations on slopes above SYLHET, Dibrugarh—N. Gill!

The timber is light red, hard, close grained. It is said to be useful for building and charcoal. Weight about 60 lbs. per c. ft. (G. Mann).

Flrs. 3-4. Fr. 5-6?

7. TAMARINDUS Linn.

Tamarindus indica Linn. The tamarind tree. *Tintiri*, *Amlika*, Sans. Vern. *Tentul*, Beng.; *Tetuli*, Ass.; *Imli*, Hind.; *Dieng-soh-tantai*, Kh.; *Thei-apai*, Kuki; *Khen-thiri*, Garo.

A large handsome evergreen tree with shallow fissured, dark-grey, rough bark. *Leaves* 2-5 in. long, even pinnate; stipules caducous (persistent in young plants), linear lanceolate. *Leaflets* 10-20 pairs, .4-.7 in. by .15-.2 in., linear-oblong; lateral nerves meeting in a more or less continuous, undulating line close to the margins, slightly notched at the apex, coriaceous, glabrescent; petiolules minute. *Racemes* lax, terminal, few flowered, up to 4 in. long. *Flowers* pale yellow or cream coloured, .5 in. long. *Calyx* segments lanceolate, lowest connate. *Petals* streaked with red, 3 only developed, lower reduced to scales. *Stamens* monadelphous below, only 3 perfect, rest reduced to 3-4 setaceous staminodes. *Ovary* stipitate, stalk adnate to the calyx tube. *Pod* indehiscent, 3-8 by 1 in., usually curved, somewhat compressed, pericarp crustaceous, brittle, scurfy;

seeds dark-brown, smooth, .5 in. across with hard testa imbedded in brown acid pulp, which is traversed by fibres.

Cultivated both for the fruits and as an ornamental tree, all over the province in the plains.

The pulp is largely eaten in curries and chutneys. It is believed to be refrigerent, digestive, carminative and laxative. An adhesive could be made from the seeds which yield considerable quantities of mucilage when steeped in water.

Flrs. 4-6. Fr. cold season.

8. SARACA Linn.

Saraca indica Linn. Syn. *Jonesia asoca* Roxb. *Ashok* Sans. & Beng. *Ahok*, Ass.; *Biardala* (Bridal plate) Cach.; *Asubuphang*, *Thaibor-phang*, Kach.; *Maikam-par*, Lushai, Kuki; *Bai-kang*, Tipp.; *Bok-bang*, *Khen-thiri*, Garo; *Mir-krem-arong*, Mik.; *Dieng-ja-mar-aih*, *Dieng-soh-kyrkha*, *Dieng-soh-rym-sein*, Khasi.

An umbrageous low branched middle sized handsome tree. *Bark* dark-brown to almost black, rough with lenticels, reddish-brown and fibrous inside. *Leaves* paripinnate, rachis 4-9 in. long, glabrous, leafy almost to the base, pulvinous corky and wrinkled, 4-9 in. long; stipules intrapetiolar, completely united, .35-.5 in. long, scarious, ovate-oblong, obtuse, ciliolate. *Leaflets* 3-6 pairs, 3-10 by 1-2.5 in., oblong-lanceolate to oblong, sub-obtuse to acuminate, coriaceous, glabrous, purplish pink and drooping when young, dark-green above when mature; base slightly unequal; main lateral nerves 8-12 on either half; petiolules short, stout, wrinkled; stipules deciduous. *Flowers* fragrant, orange scarlet, 1-1.5 in. long, in compact glabrous panicles of corymbs from leaf axils or nodes on old wood, rachis coloured; pedicels .3-.5 in. long, red; bracts deciduous, ovate, subacute; bracteoles persistent, 2 at the base of the calyx tube, .15-.2 in. long, spatulate, oblong, ciliolate, amplexicaul, coloured like the calyx. *Calyx* passing from yellowish orange to scarlet, petaloid; tube elongate, cylindric, .5-.75 in. long, crowned by the lobed disk, solid at the base; segments 4, subequal, .3-.4 in. long, obovate, oblong, ciliolate at least when young. *Petals* usually 0. *Stamens* 7-8, much exserted; filaments filiform; anthers

purple, versatile. *Ovary* more or less hairy on the sutures, stipitate, the stipe adnate below to side of the disk, pubescent; style curved, forming a complete ring; ovules many. *Pod* 5-10 by 1.75-2 in., compressed, tapering at both ends, coriaceous, glabrous, veined. *Seeds* 4-8, ellipsoid-oblong, 1.5 in. long, slightly compressed.

SIBSAGAR, NOWGONG, CACHAR, SYLHET, GARO HILLS (planted?) KHASI HILLS, low elevations on the slopes facing SYLHET plains. Planted and sometimes naturalized in UPPER ASSAM.

The wood is used for ploughs and shafts locally. The flowers and bark are medicinal. The former is considered to be an excellent uterine tonic. Fruits are chewed by Mikirs as a substitute for areca nuts.

A very beautiful tree when in flowers. The purplish pink new leaves appear at intervals. In cultivation sometimes few of the stamens are transformed to purple petals. In some forms the leaf rachis and stipules are puberulous, which thus approach var. *puberula* Prain.

Flrs. 2-4. Fr. 9.

Poinciana regia Bojr. Gold Mohur tree. Vern. *Radhachura*, Beng.

A large soft wooded fast growing handsome tree. *Leaves* large, feathery, 2-pinnate; pinnæ 11-18 pairs; stipules pectinate. *Flowers* gorgeous scarlet and orange; petals 2 in. or more long, orbicular with a long claw. *Pod* 1-2 ft. long.

9. BAUHINIA Linn.

Trees or shrubs, erect or climbing by means of circinate tendrils. *Leaf* usually more or less cleft at the apex, rarely of 2 leaflets, palmately veined; stipules various, usually caducous. *Flowers* more or less zygomorphic, in terminal or rarely axillary racemes, or in spreading or corymbose terminal panicles; bracts and bracteoles small, often caducous. *Calyx tube* tubular or turbinate, lined by the disk; limb entire and spathaceous with 5 teeth or cleft into lobes. *Petals* 5, subequal, uppermost petal being innermost. *Stamens* 10, often 5 or more reduced to staminodes; filaments free; anthers versatile, dehiscing longitudinally. *Ovary* stalked, many ovuled, stipe free or adnate to the sides of the calyx tube; style short or filiform. *Pod* linear or oblong, flattened, coriaceous or woody, continuous within or rarely septate, dehiscent or indehiscent. *Seeds* orbicular or ovate, compressed, albuminous.

I. Fertile stamens 10 :—

Calyx spathaceous; flrs. large; an erect shrub; leaves not acid.

1. *B. acuminata*.

Calyx of 5 segments; flrs. small; a moderate sized tree; leaves acid.

2. *B. malabarica*.

II. Fertile stamens 3 or sometimes 4-5 :—

A. Erect trees :—

Flrs. when leafless or nearly so; flr. buds not angled; fertile stamens 5, rarely less.

3. *B. variegata*.

Flrs. after leaves; flr. buds sharply angled; fertile stamens 3, rarely more.

4. *B. purpurea*.

B. Climbers :—

1. Branches not flat or ribbon like :—

a. Mature leaves more or less persistently pubescent at least on the under surface :—

Lobes of leaves obtuse.

5. *B. VahlII*.

Lobes of leaves acute or acuminate; (pedicels more slender than in *B. VahlII*).

6. *B. rufo*.

b. Mature leaves quite or nearly glabrous :—

i. Lobes of leaves more or less acute or acuminate :—

Flrs. in corymbs forming terminal panicles; petals hardly exserted; branches cirrhose only at the base; lobes of leaves subacute or bluntly short acuminate.

7. *B. khasiana*.

Flrs. in simple or branched racemes; petals exserted; branches with many tendrils; lobes of leaves acuminate.

8. *B. macrostachya*.

ii. Lobes of leaves more or less obtuse :—

Calyx tube about as long as the limb, or slightly longer; petals 1.2-1.5 in. long.

9. *B. nervosa*.

Calyx tube two to three times the limb; petals .5-.6 in. long.

10. *B. tenuiflora*.

2. Branches ribbon like, twisted in alternate directions :—

Flrs. very small, in copiously paniced racemes; calyx tube scarcely any. 11. *B. anguina*.

1. *Bauhinia acuminata* Linn. Vern. *Mati-katota*, Ass.; *Gainchhong*, Cach.; *Megong-aphal*, Garo.

An erect shrub attaining about 10 ft.; young parts pubescent. *Leaves* 3-5 in. long, slightly longer than broad, cleft about one-third way down into two acute or subobtusate lobes; base subcordate to nearly truncate, 9-11 nerved, glabrous above, finely pubescent beneath, thinly coriaceous; petiole .7-1.5 in. long, pubescent; stipules subulate with acuminate tip, .3-.6 in. long. *Flowers* white, 2.5 in. across, in short leaf opposed racemes; bracts and bracteoles linear pubescent, the latter .2-.4 in. long, sometimes up to .5 in.; pedicels .5-.8 in. long. *Calyx* 1-1.5 in. long, tube short; limb spathaceous, acuminate, with setaceous teeth. *Petals* 1-1.75 in. long, elliptic with prominent midrib and ascending veins. *Stamens* 10, fertile. *Ovary* stipitate. *Pod* glabrous, 3-5 by .5-.7 in., beaked, tardily dehiscent. *Seeds* 5-8, flat.

Rani Reserve—KAMRUP, N. CACHAR HILLS, Mupa Valley, GARO HILLS—N. Range, Bhumeswar Hill—GOALPARA. Often cultivated in gardens.

Flrs. 4-5.

2. *Bauhinia malabarica* Roxb. Vern. *Kotra*, *Tengakotra*, Ass.; *Bakbakhol*, *Migong-thak*. Garo; *Mugung-laphang*, *Mugung-glap-gig*, *Pakhri*. Kach.; *Hanthar*, *Kuthor-arong*, *Hanthar-arong*, Mik.; *Waithur*, Kuki; *Khormang*, Mech; *Dieng-thar-lang-jou*, *Dieng-thar-lang-soh*. Kh.; *Takikural*, *Tangi*, Nep.

A moderate sized tree with bushy crown; bark dark-brown or grey, exfoliating in thin long rectangular flakes, fibrous and red in side, about .75-1 in. thick; young parts pubescent. *Leaves* acid, broader than long, 1.5-4 by 1.8-2.5 in., cleft about a fourth of the way down into two rounded lobes, 7-9, sometimes 11 nerved, cordate subcordate or less often, subtruncate, coriaceous, glabrous above, glaucous and glabrate beneath; petiole .8-1.4 in., swollen

at both ends, rusty pubescent. *Flowers* dull white, .5 in. long. *Racemes* axillary and terminal, 1.5-2.2 in. long, often 2-3 together, sometimes branched from near the base; buds ovoid; pedicels slender, .4-1 in. long, jointed below the calyx, tomentose; bracts and bracteoles minute. *Calyx* brown, tomentose; tube .3-.5 in. long; lobes 5, slightly longer, linear, subulate. *Stamens* 10, alternately longer and shorter. *Ovary* pubescent; style produced. *Pod* 7-14 by .7-1 in. on a stalk 1 in. long, flat, flexible, straight or sub-falcate, beaked, marked when dry with more or less reticulate raised lines, which descend obliquely from the middle of the valves to the sutures. *Seeds* 20-30, ovoid, globose, .2 in. long, dark-brown, polished.

GARO HILLS, KAMRUP, NOWGONG, GOALPARA, N. CACHAR HILLS, KHASI HILLS, up to 2200 ft.—Nongpoh, Umling forest Road etc.; SIBSAGAR.

About 320 seeds weigh 1 oz.

Flrs. 8-10. Fr. 1-5.

3. *Bauhinia variegata* Linn. *Kanchanar*, Sans. vern. *Tulla*, *Kanchon*, Sylh.; *Bogakatra*, *Kurol*, *Kotora*, Ass.; *Darichiksam*, *Bol-migong*, *Migong*, Garo; *Kolka*, *Jharua*; *Mukhunglap-baphang*, *Kural-bi-phang*, *Mugam-galap*, Kach.; *Mai-hou-lei*, Manip.; *Chinghau*, Nep.; *Wai-bi*, *Vaibeh*, Kuki; *Inku-arong*, Mik.; *Dieng-tharlong*, *Dienglong*, Khasi; *Baije*, Lushai; *Khormang*, Mech.

A moderate sized tree with dark grey or brown somewhat rough bark; shoots tomentose when young. *Leaves* 2.6-6 in. long, as broad as long or sometimes broader, usually deeply cordate, 11-15, nerved, thinly coriaceous, glabrous and dull green above, grey glaucous and puberulous along the nerves beneath, cleft through about a quarter or third the length; lobes obtuse or rounded; petiole 1-1.5 in. long. *Flowers* large, pure white, pink or purple, 2-3 in. across when fully opened, in few flowered corymbose grey pubescent racemes, from leafless axils or terminating lateral shoots; pedicels very short or 0, stout; bracts and bracteoles very small deltoid. *Calyx* covered with grey and somewhat sticky pubescent tube. .5-1 in. long, slender; limb spathaceous, 5 toothed at the apex, .6-1.2 in. *Petals*

1·5-2 in. long, obovate or obovate-oblong; base clawed, with distinct midrib and ascending veins, glabrous, 4 white and 1 coloured or in 4 pink and 1 deeper purplish-pink or in some—cultivated forms 4 pure white and one with yellowish centre (*B. candida* Roxb.). *Stamens* usually 5, rarely fewer; filaments stout, unequal, incurved. *Ovary* with a long stipe which is extruded ·5-·7 in. beyond and adnate at the bottom to the calyx tube, covered with mealy pubescence and with spreading hairs along the sutures; style short. *Pod* 6-10 by ·7-·9 in., hard, flat, glabrous, prominently veined when dry, slightly falcate, dehiscent. *Seeds* 10-15.

Throughout the Province ascending to 2500 ft. in the KHASI HILLS, more common in hilly country.

The flower buds are curried and eaten, the leaves are good fodder, often cultivated for its handsome flowers.

About 70-100 seeds weigh 1 oz.

Flrs. 2-4, when nearly leafless or leafless. Fr. rainy season.

4. *Bauhinia purpurea* Linn. Vern. *Kurial*. Ass.

A moderate sized tree; bark greenish, ashy-grey or dark-brown, somewhat rough on old stems, inside pinkish white with streaks of brown; young parts brown pubescent. *Leaves* 3-6 in. long, rather longer than broad, cleft about third to half way or more down, rather thin but tough, glabrous above, glabrate or minutely puberulous on the nerves beneath; base cordate, less frequently truncate, 9-11 nerved; lobes narrowed towards the apex, acute or sub-acute at the tip, sometimes slightly overlapping on the inner margin; petiole 1-1·6 in. long, swollen at both ends. *Flowers* rose purple in few flowered terminal, corymbose or paniculate brown tomentose racemes; pedicels ·2-·5 in. long, tomentose; buds acutely 5-angled. *Calyx* tomentose; bracts and bracteoles very small, deltoid, tomentose; tube ·3-·4 in. long; limb spathaceous, usually splitting into two segments, nearly twice as long as the tube. *Petals* 1·5-2 in. long, oblanceolate, long clawed, with distinct midrib and veins. *Stamens* usually 3 fertile, slightly shorter than the petals; staminodes unequal. *Ovary* downy with a long stipe. *Pod* 6-10 by ·6-·8 in. on a tomentose stipe, which is ·6-1 in. long, slightly falcate, flat, greenish purple, pubescent along the

sutures, tardily dehiscent. *Seeds* 12-15, flattened, roundish, dark-brown, smooth.

Very ornamental when in flower for which it is sometimes cultivated.

KAMRUP, GOALPARA, LAKHIMPUR, etc.

Heartwood reddish-brown, moderately hard, fairly close grained, suitable for agricultural implements and building where not exposed. The leaves are fair cattle fodder. The bark could be used for tanning.

Flrs. 9-11. Fr. 1-3.

5. Bauhinia Vahlia W. & A. Vern. *Nak-kati-lewa*, Ass.

A gigantic climber, often with irregularly fluted stem showing on cross section irregular masses of xylem tissue, arranged roughly in a floral pattern separated by masses of bark-like tissue. *Branchlets* often ending in a pair of tendrils; young parts, petioles and leaves beneath, specially along the nerves, densely rusty or rarely greyish tomentose. *Leaves* very variable in size, usually 4·5-18 in. across, sometimes smaller, as broad as long or broader, cleft through about a third of the length; lobes obtuse rounded, thin but tough, dark-green and glabrescent above, more or less downy beneath; base deeply cordate, 11-15 nerved; petiole 2·5-6 in. long, swollen at both ends stout; stipules ovate oblong, obtuse, about ·2 in. long. *Flowers* 1·5-2 in. across, white or cream coloured, in terminal woolly corymbs or corymbose racemes; pedicels 1-2·5 in. long, densely tomentose-like the calyx with lanceolate caducous; bracts at the base ·15-·2 in. long, and a pair of small linear and bracteoles above the middle. *Calyx* tube ·2-·3 in. long, slender; limb ·4-·5 in. long, 5 toothed, irregularly splitting into two broadly ovate, reflexed lobes. *Petals* ·8-1·2 in. long, obovate or oblanceolate, silky pubescent outside along the back; margins crisped, glabrous. *Fertile* stamens 3. *Ovary* densely woolly, stipe adnate to calyx tube, densely woolly; style glabrescent towards the apex. *Pod* 5·5-12 by 1·75-3 in., flat, woody, rusty, velvety. *Seeds* 8-12, about 1 in. across.

GOALPARA, KAMRUP, and probably in other forests.

The bark yields a tough fibre which is used for cordage, the leaves are used as plates, the pods are roasted and the seeds eaten.

Flrs. 4-6. Fr. cold season.

6. Bauhinia rufa Grah. Vern. *Hambiokalik-arong*, *Hambi-okalik-arikang*, Mik.

A large cirrhose climber, climbing tall trees. *Young* shoots, inflorescence, petioles, pedicels and outer surface of calyx densely ferruginous, tomentose, cirrhi axillary, ultimately becoming stout and woody round their supports. *Leaves* 3·7-8·5 by 3-7·5 in. near the inflorescence, incised about a third way down, sinus deltoid; lobes usually with an acute or shortly acuminate rarely sub-acute tip, glabrous when mature above, pubescent atleast along the nerves beneath, thinly coriaceous; base cordate to subtruncate, 9-11 nerved; petiole up to 5·2 in., swollen at both ends; stipules about ·3 in. long, subfalcate. *Flowers* white in terminal corymbose racemes; pedicels 1-1·8 in. long, more slender than in *B. Vahlii*; bracts ·25-·35 in. long, linear, acuminate, persistent. *Calyx* tube ·25-·3 in. long; limb 3-4 in. long, irregularly split, ultimately reflexed. *Petals* ·7-·8 in. long, suborbicular-obovate to broadly spatulate with crisped margins, long clawed, densely silky on the back; fertile stamens about 3. *Ovary* densely silky, shortly stipitate; style long, glabrous. *Pods* not seen.

SIBSAGAR—Borpathar, Jamguri, Kaloni forests, etc., N. E. FRONTIER, Sarpo Valley, LUSHAI HILLS.

Flrs. 4.

7. Bauhinia khasiana Baker.

A large climber, often deeply fluted; branchlets cirrhose only at the base, angled, coppery silky when young. *Leaves* 3·5-7 by 3-6 in., ovate or suborbicular in outline, cleft about a third or fourth way down into sub-acute or bluntly short acuminate; lobes thinly coriaceous, glabrous, strongly 7-9 nerved, widely cordate or truncate; petiole 1·25-3 in. long, smaller near the inflorescence, glabrescent with age, swollen at both ends. *Flowers* in corymbs 2-5 in. long, several together forming a terminal spreading panicle; the lower branches of which are sometimes form upper leaf

axils, densely covered when young like the pedicels and the calyx with ferruginous silky hairs; bracts .2 in. long, ovate-lanceolate, caducous; pedicels 1-1.5 in. long, slightly dilated upwards. *Flowers* .5 in. across, brownish-red. *Calyx tube* .25-.3 in. long, sub-cylindrical, sharply kneed in open flowers; limb about the same length, irregularly split, rosy inside. *Petals* about .35 in. long, oblanceolate or obovate, densely silky outside with reddish-brown pubescence, sparingly so inside. *Stamens* usually 3 fertile; filaments tapering, glabrous, red. *Ovary* densely pubescent along the sutures, shortly stipitate. *Pod* not seen.

KHASI HILLS, e.g. Um Eu (beyond Barpani), Suntong, Watt!
Flrs. 7.

Bauhinia piperifolia Roxb. Syn. *B. glabrifolia* Baker. in F. B. I. in part. *B. Lucida* Wall.

A large cirrhose climber; young shoots silky pubescent, tendrils axillary, forked and curled. *Leaves* ovate in general outline, entire at the ends of shoots, cleft along a fifth to a third at apex and the whole way down in young plants and root shoots, chartaceous, glabrous when mature; base broadly cordate to subtruncate, 9-11 nerved, 7-nerved in upper leaves; petiole 1-4 in. long, swollen at both ends. *Flowers* .4-.5 in. across in many short peduncled dense flowered corymbs at the ends of branches, all together forming terminal corymbose panicles; corymbs 2.5-3.5 in. long, brown or grey (?), silky tomentose like the pedicels and calyx. *Bracts* minute, lanceolate, caducous; bracteoles minute, early deciduous; pedicels slender 1-1.2 in., broader upwards. *Calyx tube* about .15-.2 in. long; limb .25 in. long. *Petals* .25-.3 in. long, obovate, clawed, shaggy outside with brown hairs. *Stamens* 3 fertile. *Ovary* glabrous, short stalked style produced. *Pods* not seen, according to Roxburgh round or oval, glabrous, 1-2 seeded.

SYLHET, C. B. Clarke!

8. *Bauhinia macrostachya* Wall. Vern. *Ram-jakhola*, *Makhori-ghila*, Ass.; *Nagbeli*, Nep.; *Mugung-glap-jola-dukha*, *Jong-rak-kal-hrin-rang*, Kuki.

A large climber, usually with copious, stalked and 2-forked tendrils. *Leaves* 3-6 in. long, broadly ovate or suborbicular in outline, incised, $\frac{1}{6}$ th- $\frac{1}{4}$ th way down or upper leaves nearly entire; lobes acuminate, sometimes widely divergent; upper surface glabrous, puberulous along the nerves or glabrescent beneath; base broadly cordate, usually

9 nerved; nerves converging towards the apex; petiole 2-3 in. long, swollen at either end. *Racemes* 3-6 in. long, simple or branched, terminal or from upper axils; bracts small, deltoid like the pedicels and sepals, densely brown pubescent; pedicels .25-.5 in. *Calyx* campanulate; tube .25-.4 in. long, turbinate; limb .25 in. long, 5-cleft to about half way down; segments sub-regular. *Petals* exserted, about .5 in. long, pale yellow, obovate, long clawed, densely brown tomentose. *Fertile* stamens 3. *Ovary* densely ferruginous-woolly, shortly stalked; style short, glabrate towards the apex. *Pod* 4-6 in. by 2 in., flat, indehiscent, persistently tomentose, 2-4 seeded.—Hooker.

Flrs. 4-5.

9. *Bauhinia nervosa* Wall. Vern. *Mi-jalong*, Khasi; *Hrui-wai-be*, Kuki.

A large cirrhose climber; young shoots pubescent; tendrils in pairs. *Leaves* 3-4.5 by 2-3 in., longer than broad, thinly coriaceous, glabrous above, puberulous along the nerves beneath, lobed less than half way down; lobes sub-obtuse; base 11-15 nerved, subcordate; petiole 1.7 in. long, shorter upwards; stipules .2-.4 in. long, obliquely oblong. *Flowers* white in elongate ferruginous pubescent terminal racemes; bracts and bracteoles spatulate, early deciduous; pedicels 1-2 in. long. *Calyx* pubescent outside; tube cylindrical, about 1 in. long; limb .7-.8 in. long, divided ultimately into oblong acute segments. *Petals* about 1.2-1.5 in. long, long clawed, white, fading to dun-brown, ferruginous, silky. *Fertile* stamens 3. *Ovary* clothed with dense brown or rufous silky pubescence, stipitate; style stout; stigma dilated, capitate. *Pod* 6-8 in. by 1.7-2 in., with thick valves, glabrescent, stipitate and often with a slender beak.

KHASI and JAINTIA HILLS up to 3,000 ft.; CACHAR.

***Bauhinia albo-lutea* Prain.** Syn. *Phanera albolutea* Miq. Vern. *Jermei-dieng-long*, Kh.

A climbing shrub; innovations rusty pubescent; tendrils few, glabrescent with age. *Leaves* 2·5-4 in. long, roundish, sometimes broader than long, cleft about $\frac{1}{3}$ way down; lobes usually subacute, dark green and glabrous above, more or less pubescent or ultimately puberulous beneath; base subtruncate, subcordate, or cordate, 11-13 nerved; petiole 1·5-2·5 in. long, swollen at both ends, puberulous; stipules ·2-·3 in. long, obovate-oblong or oblong-obtuse. *Flowers* in few flowered lax terminal corymbose rusty pubescent racemes, 3-4 in. long; bracts about 2 in. long, lower broadly ovate, narrower upwards; bracteoles subulate, ·15 in. long; pedicels ·7-1·5 in. long, rusty puberulous like the calyx; buds ·9-1 in. long, clavate. *Calyx* tube ·3-·45 in. long, dilated downwards to the base; limb ·65-·75 in. long, splitting into 5 reflexed, oblong-lanceolate lobes. *Petals* 1·25 by ·3 in., cream coloured, subequal, oblanceolate, subacute, clawed, pubescent outside along the lower third of the midrib and the claw. *Stamens* 3 fertile. Ovary stipitate, rusty, pubescent; style slender, glabrous. *Pod* not seen, "thin, oblong with black glabrous woody valves"—Prain. *Seeds* 2 (Miquel Flr. Ind. Bat. I, 1079).

KHASI HILLS, Hatmawadan.

Flrs. 9-10.

Bauhinia Championii Benth.

A large climber; young shoots and inflorescence densely pubescent. *Leaves* 2·5-4·5 by 2-3·5 in., cleft $\frac{1}{4}$ th way down into two obtuse or broadly subacute or bluntly short acuminate lobes, glabrescent above, thinly pubescent beneath; base about 7 nerved; petiole ·6-1 in. long. *Flowers* small, white, in elongate and usually branched racemes, which are axillary or terminate branches; bracts minute, early deciduous; pedicels ·2-·25 in. long, pubescent. *Calyx* pubescent; tube very short; limb about ·15 in. long, ultimately reflexed and 5-fid. *Petals* about ·2 in. long, clawed. *Stamens* 3 fertile, others rudimentary or absent. Ovary stipitate, glabrous or nearly so. *Pod* 1·75-2·5 in., thin, glabrous, 1-2 seeded with a slender stipe.

Brahmakunda—Masters!

Material incomplete for satisfactory determination.

10. *Bauhinia tenuiflora* Watt. ex Clarke in Journ. Linn. Soc. XXV. 18. Vern. *Nga-hiamba*, Naga; *Jong-rekal*, Kuki.

A large cirrhose climber. *Bark* dark or reddish-brown, pinkish inside; shoots and inflorescence clothed with copper coloured hairs when young; tendrils usually forked and axillary at the base of the shoots. *Leaves* 2-4 in. long, usually as broad as or sometimes broader than long, lobed, about $\frac{1}{3}$ th- $\frac{1}{4}$ th way down, thin, glabrate above, glaucous and often with scattered pubescence along the nerves beneath;

base truncate or broadly subcordate, with 7-9 nerves which end in loops near the margin; petiole 1-1.5 in. long; stipules falcate, .15-.2 in. long, early deciduous. *Flowers* white, in terminal and lateral many flowered corymbs; bracts subulate, .15-.2 in. long; bracteoles 2 on each pedicel, filiform, .1-.15 in. long, lower pedicels attaining 1 in., at first densely afterwards thinly pubescent like the calyx. *Calyx tube* linear, .6-1.2 in. long; limb about a half to a third of the calyx tube, greenish, ultimately reflexed, two of the lobes cohering to near the apex. *Petals* .5-.6 in. long, clawed, obovate or oblong-obovate above the claw, erose with scattered hairs outside. *Fertile* stamens 3. *Ovary* glabrous. *Pod* 5-8 by 1.5-1.75 in., glabrous, very thin, flexible, about 15-20 seeded. *Seeds* flat, about .2 in. across.

N. CACHAR HILLS, Jatinga, Mailongdisa, Haflong, KHASI HILLS, Mairung (?) Nartiang, NAGA HILLS, MANIPUR.

11. *Bauhinia anguina* Roxb. Vern. *Nagput*, Sylh.; *Deo-jokhola*, Ass.; *Dukhoi-akhlem*, Kach.; *Kipiadong-kam*, *Tiso-donri-rikang*, *Tiso-adon-arikong*, *Tisodonri*, Mik.; *Zongalei-lon*, Lushai; *Mei-lang-rih*, Khasi. "The snake climber."

A large climber, with flat ribbon like stems, twisted to form depressions on alternate sides; branchlets terete; tendrils few. *Leaves* 2.5-6.5 by 2.5 in., broadly ovate, almost entire on old plants, deeply lobed, sometimes almost to the base into acuminate or caudate lobes, in young plants or coppice shoots, chartaceous, glabrous; base broadly cordate, 5-7 nerved; petiole .6-1.5 in. long, glabrous. *Flowers* very small in racemes, 3.5-5 in. long, arranged in terminal panicles, often extending to the axils of upper leaves; pedicels up to .2 in. long, slender, at first pubescent, ultimately puberulous as are the axis of the inflorescence and its branches; bracts minute, subulate; buds globose. *Calyx tube* very short; limb about .07 in., 5-cleft. *Petals* .15 in., obovate, clawed, white, puberulous. *Fertile* stamens 3. *Ovary* stipulate, glabrous; style slender. *Pod* 1.2-1.5 in., indehiscent, obliquely oblong, often ending in a recurved tip, thin, flat, glabrous, 1-2 seeded.

Common. KHASI HILLS; LUSHAI HILLS, Tipaimukh; NOW-GONG, Dhansiri.

The bark is used in rope-making. The most regularly serpentine

pieces of the stems and large branches are carried about by numerous mendicants to keep off serpents.

Fr. 11.

Sub-family—3. MIMOSAOIDEÆ (Leguminosæ).

Trees, shrubs or woody climbers, rarely undershrubs or herbs. *Leaves* usually bipinnate, less commonly simply pinnate, sometimes pinnæ and leaflets reduced to one pair. *Flowers* small, regular, generally 5-merous, usually hermaphrodite, sometimes polygamous, usually in heads or spikes, sometimes in racemes or umbels; bracts small; bracteoles very small or 0, usually deciduous. *Calyx* more or less campanulate, truncate or valvately toothed or lobed, sometimes minute. *Petals* valvate, more or less connate into a tubular or funnel shaped corolla or free. *Stamens* as many or twice as many as petals or indefinite, free or monadelphous, sometimes adnate to the base of the corolla. *Ovary* free, 2-many ovuled. *Pod* dehiscent or indehiscent, sometimes many jointed. *Seeds* exalbuminous or albuminous, sometimes arillate.

I. Stamens definite, usually 8-10 :—

A. Flowers spicate; anthers usually with an apical gland, unarmed :—

Large climber with immense pod, septate between the seeds; seeds very large, dark reddish-brown. ..

1. Entada.

Erect tree, valves of pods spirally twisted when dehiscing; seeds scarlet.

2. Adenantha.

B. Flowers in heads; anthers without apical glands :—

Unarmed tree. Pod not breaking up into 1 seeded joints. ..

3. Parkia.

Prickly shrub or undershrubs.

Pod breaking up into 1 seeded joints.

4. Mimosa.

II. Stamens indefinite :—

A. Stamens free. Armed trees or shrubs.

5. Acacia.

B. Stamens monadelphous :—

1. Pods dehiscent not septate between the seeds :—

Unarmed trees; pod thin, flat, suture not thickened.

6. Albizzia.

Unarmed trees; pods twisted or

- | | |
|---|-------------------|
| circinate, unarmed (or sometimes armed in exotic species). .. | 7. Pithecolobium. |
| Trees or shrubs with weak or strong stipular spines, sutures of pod much thickened. | 8. Calliandra. |
| 2. Pods indehiscent, septate between the seeds. | 9. Enterolobium. |

1. ENTADA Adans.

Entada scandens Benth. Vern. *Gila*, Beng.; *Gila-lewa*, Bor-ghilla, Ghila, Ass.; *Gilar lot*, Ass. (Cach.); *Chhui*, Suebudu, Shuri, Garo; *Gila-lewa*, Mech; *Hambi-arikong*, Mik.; *Ther-kanup*, *Mei-nap*, *Mei-nok*, *Mei-keronath-dom*, Kh.; *Jermei-tang-nop*, *Tille-nop*, Synt.; *Papia-riube*, Miri & Abor; *Koy*, Lushai; *Poy*, Kuki; *Kangthro*, Manip.

An immense woody climber; stems angled and much twisted. *Bark* greyish-brown or blackish; blaze red, fibrous, green below the outer dead layers. *Innovations* and inflorescence brown, tomentose. *Leaves* 2-pinnate; rachis usually ending in a long bifid tendril or sometimes in a point; stipules small, bristle-like. *Pinnæ* usually about 2 pairs, 2-5 in. long. *Leaflets* 2-4 pairs, 1-3 by .6-1.5 in., obovate or oblong to elliptic, obtuse or bluntly short-acuminate, usually emarginate at the tip; base often oblique, glabrous, dark green and shining above, rigidly coriaceous; lateral nerves rather indistinct, about 7-8 on either half with similar intermediates, meeting in loops near the margin; petiolule about .1 in. long, pubescent. *Flowers* .1-1.5 in. long (excluding stamens), scented, small, pale yellow, crowded on elongate peduncled spikes, 5-7.5 in. long, axillary or paniced from the upper nodes of old leafless branches; bracts minute, linear. *Calyx* green, very small, campanulate, tomentose or pubescent outside, with 5 minute teeth. *Corolla* yellowish-green; petals 5, connate at the base, about .12 in. long, oblong-lanceolate. *Stamens* 10, free, exserted; anthers tipped with minute, deciduous, globose glands. *Ovary* subsessile with many ovules; style as long as the stamens; stigma concave, terminal. *Pod* woody, largest in the family in India, 1-3 ft. by 3-4 in., with thick sutures and a stout stipe, valves adpressed and jointed between the seeds; joints square or the terminal nearly

orbicular, breaking up from one another and the suture. *Seed* discoid, 1·5-2 in. across.

Throughout the Province in plains, ascending up to 1,500 ft.

The seeds contain saponin. They are made into a paste and used as a substitute for soap specially for washing the hair. The shell of the seeds is used for polishing the borders of *dhoties*.

Flrs. 4. Fr. 3-5, the flowering year.

In seedlings all the pinnæ are transformed into tendrils.

2. ADENANTHERA Linn.

Adenanthera pavonina Linn. *Kuchandana*, Sans.; Vern. *Dieng-thing*, Khasi; *Karli-arong*, Mik.

A handsome middle sized to large unarmed deciduous tree. *Bark* dark-brown or greyish brown, rough on old trees, white or brownish white inside. *Leaves* bipinnate, rachis usually 8-14 in. long but sometimes much longer; pinnæ 3-6 pairs, 3·5-7 in. long, puberulous or glabrescent; leaflets 6-16, alternate, ·8-2 by ·4-1 in., oblong to ovate oblong or elliptic oblong; apex obtuse or subtruncate, sometimes cuspidate; base cuneate, somewhat unequal, dark-green and glabrous above, glaucous and minutely puberulous or glabrescent beneath; main lateral nerves slender, rather indistinct beneath, 8-10, meeting in loops near the margin; petiolule ·1-·15 in. long. *Flowers* minute, 5-merous, greenish-yellow, ·1-·12 in. long in axillary short peduncled, puberulous, racemes, up to 7 in. long or in terminal panicles; pedicels a little shorter than the flowers in length, pubescent; bracts minute, caducous. *Calyx* minute, slightly pubescent or puberulous outside. *Corolla* pale yellow, puberulous outside; segments valvate, equal, connate at the base, linear or lanceolate, acute. *Stamens* 10, free, hardly exserted; anthers crested with deciduous glands. *Ovary* sessile, many ovuled; style filiform; stigma capitate. *Pod* 6-9 in. by ·6 in., flat, curved, valves spirally much twisted when opening. *Seeds* 8-15, bright scarlet, about ·3-·35 in long, convex on either side, round and lenticular or oblong.

SIBSAGAR, DARRANG, foot of KHASI and JAINTIA HILLS and low elevations on slopes above SYLHET-Shellia, Hatmawadan, Tharia, etc. Sometimes planted in gardens.

The seeds are strung into beads in other parts of India. They are supposed to weigh about 4 grains each and are also used as

weights. The heart wood is coral red, when freshly cut and turns purple on exposure, hard and durable.

Flrs. 3-5. Fr. 8-10.

3. PARKIA R. Brown.

Parkia Roxburghii G. Don. Vern. *Khorial*, Manipuri-*urohi*, Ass.; *Zongto*, Lushai; *Jongta*, *Jongcha*, Kuki; *Yongchak*, Manip.; *Jongcha*, Tipp., *Lonchak*, Sylh.; *Aoelgap*, Garo; *Barri-phang*, Cach.; *Themuk-arong*, Mik.; *Unkam-pinching*, Naga.

A middle sized unarmed tree with spreading branches and pubescent shoots. *Bark* light grey nearly white to brown with white patches, rough; blaze reddish brown with white lines. *Branchlets* with raised lenticels. *Leaves* 2-pinnate; main rachis puberulous or glabrescent, 12-24 in. long, with a gland below the lower pair of pinnæ and a few 1-5, between the upper pinnæ; pinnæ 8-30 pairs, opposite, secondary rachis 3-6 in. long; leaflets 40-80 pairs, close set, sessile, .3-·35 by .75-·1 in., linear oblong, falcately curved forwards, tip acute; base unequally truncate, lower half sub-hastate, dark-green above, puberulous on the margin; midrib prominent. *Flowers* in dense turbinate or clavate long peduncled heads, 1·5-2·25 in. long and .75-1·2 in. across; peduncled, 10-16 in. long, heads sterile towards the bottom; bracts upto .3 in. long, spatulate, silky pubescent outside. *Calyx* tubular, .25-·3 in. long, shortly 5-cleft; teeth tomentose, elsewhere glabrous. *Corolla* pale yellow, tubular, upper portion free; segments extruded above the calyx, sub-valvate. *Stamens* 10, exserted, the filaments connate below and adnate to the corolla tube; anthers narrow, not gland tipped. *Ovary* stalked; many ovuled; style filiform; stigma capitate. *Pod* 10-20 in. by 1·5 in., smooth, dark-brown, ultimately dehiscent.

SIBSAGAR, LUSHAI HILLS, CACHAR, SYLHET, GARO HILLS.
The tender pods are eaten. The timber is not used.

Flrs. 12.

4. MIMOSA Linn.

Mimosa himalayana Gamble Incl. *M. rubicaulis* in part.
Vern. *Kuchoi--kaitkusia-kant*, *Kauri-kanta*, Ass.; *Ingsu-maha*,

Su-ye-arong, Mik.; *Katasarkhi*, Mech; *Remsum*, Garo; *Rose*, Jharua.

A large shrub; bark smooth and reddish brown on young branches and pale brown and rough on older stems; branchlets grooved, thickly beset with straight or curved prickles, innovations brown tomentose. *Leaves* bipinnate; rachis 4-9 in. long, prickly, at first downy, glabrescent with age ending in a stiff bristle; stipules $\cdot 2\text{--}\cdot 25$ in. long, subulate; pinnae 8-12 pairs, often with a short stiff bristle between each pair, ending in a short bristle. *Leaflets* 10-20 pairs on each pinna, lowest pair often reduced to bristle, $\cdot 25\text{--}\cdot 3$ in. long, oblique, oblong; midrib terminating in a stiff point, glabrous and dark-green above, paler and sparingly hairy beneath. *Heads* $\cdot 4\text{--}\cdot 6$ in. across on downy peduncles, 1-2 in. long, which are either fascicled on leaf axils towards the ends of branches or arranged on terminal panicles. *Flowers* pink or white, tetramerous; bracts minute, linear, spathulate, hairy outside. *Calyx* campanulate, shortly toothed. *Corolla* $\cdot 1$ in. long; lobes about $\cdot 04$ in. long; stamens 8; filaments filiform, free, much exserted; anthers not gland tipped. *Ovary* glabrous, stipitate, many ovuled; style filiform; stigma terminal, entire. *Pod* 3-5 in. by about $\cdot 4$ in., slightly curved, smooth, 6-10 jointed; joints broader than long, 1-seeded, breaking up and separating from the persistent sutures.

LAKHIMPUR, DARRANG, KAMRUP, NOWGONG, SIBSAGAR, GARO HILLS, GOALPARA, CACHAR, often in clearances and old Jhum.

Flrs. 7-9. Fr. 11-1.

The plant occurring in our area appears to be intermediate in some respects between Gamble's *M. himalayana* and *M. rubicaulis* F. B. I. On the whole it is closer to *M. himalayana* which name has therefore been adopted first.

Mimosa pudica Linn. The sensitive plant. *Varah-kranti*, *Laj-jalu*, Sans.; *Lajjabati*, Beng.; *Sharmina*, *Chaitemara*, Beng. (Sylh.); *Adoribon*, *Nilaji-bon*, Ass.; *Lajula-pata*, *Lajura*, *Jharua* (Garo Hills); *Samukchhip*, Garo; *Suji-gablau*, Cach.; *Chiekambi*, Kuki; *Kombat-samthia*, *Synteshiuh*, Khasi; *Non-mek-jang*, Mik.

A straggling and spreading deciduous undershrub; stem and branches prickly and clothed with bristles. *Leaves* sensitive; pinnae 4, digitately arranged, 1-3-5 in. long; common petiole beset with ascending bristles; stipules linear-lanceolate with bristly edges; leaflets

12-20 pairs, .3-.4 in. long, obliquely narrow oblong, acute, undersurface adpressed bristly. *Heads* .4-.5 in. across, pink on slender, axillary peduncles, .7-1 in. long, covered with spreading bristles. *Flowers* with the stamens about .1 in. long. *Stamens* 4, much exserted. *Pod* with weak prickles on the sutures, .6-1 in. long; joints 3-5.

A common waste land weed. Originally said to have been introduced from TROPICAL AMERICA.

The roots are used medicinally.

Flrs. 7-11. Fr. 11-12.

5. ACACIA Willd.

Trees or shrubs, sometimes climbing, usually spinose or prickly.* *Leaves* bipinnate,† usually with a gland towards the base of the primary rachis and often several between the pinnæ; stipules sometimes transformed into spines; leaflets small. *Flowers* in globose heads or cylindrical spikes, hermaphrodite or polygamous, usually 5-merous. *Calyx* usually campanulate, shortly toothed. *Petals* valvate, exserted, more or less united in the lower half. *Stamens* indefinite, much exserted, free or connate with one another and to corolla at the base; anthers minute. *Ovary* sessile or stipitate; ovules many; style filiform; stigma minute, capitate. *Pod* dehiscent or indehiscent, often compressed and dry, rarely turgid, subcylindric or moniliform, never breaking up into joints; sutures not thickened, wavy or straight.

I. Erect trees or shrubs with stipular thorns :—

Flowers in heads; prickles straight. 1. *A. Farnesiana*.

Flowers in elongate spikes; prickles curved. 2. *A. Catechu*.

Var. *catechuoides*.

II. Climbers with scattered prickles; flrs. in paniced heads :—

A. Pods dehiscent, flat, thin.

1. Rachis with a solitary gland below the pinnæ :—

Stem terete; leaflets attached at the base near the upper edge :—

Branchlets pruinose. 3. *A. pruinescens*.

Branchlets not pruinose. 4. *A. pennata*.

Stem fluted; leaflets attached at the base about the middle :—

Leaflets close and touching,

* The introduced Australian Acacias have no thorns.

† In many of the Australian Acacias reduced to phyllodes.

- 1-nerved, the second nerve
weak and scarcely reaching
half-way up the leaflet. .. 5. *A. Gageana*.
Leaflets not touching, strongly
2-nerved to near the apex. .. 6. *A. oxyphylla*.
2. Rachis with two conical glands
below the pinnæ. .. 7. *A. diadenia*.
B. Pods indehiscent, with thick fleshy
saponaceous valves. .. 8. *A. concinna*.

1. Acacia Farnesiana Willd. Vern. *Tarua-kadam*, Ass.

A thorny shrub or a small tree with smooth dark brown bark and zig-zag lenticellate branches; young shoots downy. *Spines* stipular, straight, .25-.6 in. long, ashy-grey. *Leaf rachis* 1-3 in. long, pubescent, with a small gland at about the middle of the petiole and ending in a bristle; pinnæ 2-8 pairs, up to 1.2 in. long, terminated by minute bristles. *Leaflets* 10-20 pairs, minute, rigid, up to .25 in. long, oblong, acute, glabrescent. *Flowers* yellow, very fragrant in pedunculate heads, .4-.6 in. across; peduncles up to 1.2 in. long, pubescent, fascicled on leaf axils on minute excrescences with a ring of minute, ciliate bracts at near the top. *Calyx* campanulate, minute. *Corolla* small with short obtuse teeth. *Pod* 1.5-3 in. long, brown, slightly curved, somewhat inflated and subcylindric, marked with diagonal striæ, which meet in the middle. *Seeds* in two rows, immersed in pulp.

A native of Tropical America, often planted, sometimes self sown. The flowers are used in perfumery. The pods and roots are said to be rich in tannin.

Flrs. 9-4. Fr. 4-7.

2. Acacia Catechu Willd. Var. *catechuoides* Wall. Vern. *Khayer*, Beng.; *Khair*, Hind. Ass. & Nep.

A middle sized, often gregarious deciduous tree with rough brown, sometimes grey, at least partly, rarely black furrowed bark exfoliating in narrow strips, which remain attached for a long time, about .5-.6 in. thick; blaze red with fine white lines, deeper layers near cambium, pale yellow, fibrous; young shoots downy, spines stipular in pairs at the base of the leaf recurved, up to .2 in. long, flattened, dark-brown. *Leaf rachis* 2.5-7 in. long, puberulous or pubescent with one large cupular gland near the base and

2.5 between the upper pinnæ; pinnæ 10-30 pairs up to 1.7 in. long; leaflets about .15 in. long, ligulate, usually 30-50 pairs, sometimes fewer or more; petiolule minute. *Flowers* creamy white, .15 in. long in axillary pubescent spikes, 2.5 in. long; peduncle .5-.7 in. long. *Bracts* slightly exceeding the buds, boat-shaped, caducous, nearly glabrous, ciliate on the margins. *Calyx* ultimately glabrous, teeth deltoid. *Corolla* 2-3 times the calyx; lobes glabrous in mature flowers. *Pod* 3.5 by .5-.7 in., stipitate, flat, dark-brown, shining, sometimes constricted between the seeds; apex narrowed or subulate, 3-8 seeded; seeds flat, orbicular, .2 in. across.

Sadiya, DARRANG, KAMRUP, GOALPARA, etc., along streams, usually on recent alluvium.

The heartwood is dark red, very hard and durable, seasons and polishes well. Pores usually filled with cutch. Cutch and katha (khair) are obtained by boiling chips of heartwood. The wood yields a superior charcoal.

Flrs. 4-6. Fr. 11-2.

A. Cathecu Willd—differs from our plant by having a more hairy rachis, calyx and petals, which are covered with spreading hairs. This may be found in Goalpara. Some of the sheets collected from the District have rather densely pubescent rachis and thinly pubescent or puberulous calyx and petals and thus would seem to occupy an intermediate position between the two.

A. Suma Kurz. Vern. *Sankanta*, Beng.

A medium sized tree, resembling the last, with white bark. *Branches* flexuous; branchlets and rachis downy with white or greyish pubescence; spines paired, stipular, short, hooked, sharp, downy when young, afterwards brown. *Leaves* 4-10 in. long with a large oval cup-shaped gland near the base of the petiole and smaller circular glands between the upper pinnæ; pinnæ 10-20 pairs; leaflets 20-50 pairs, .25-.35 in. long, linear-oblong, usually ciliate. *Flowers* white or pale yellow, very small in axillary lax spikes. *Pod* 3.5 by .5-.75 in., pubescent when young.

Sometimes planted in gardens in our area.

Flrs. 8. Fr. 12.

3. Acacia pruinescens Kurz. Vern. *Rampet-riubi*, Miri and Abor.; *Kachoi-lata*, Ass.; *Te-bam*, Naga; *Sujidoukha*, Cach.; *Shitli*, Kh.

A large climber armed with more or less recurved prickles; branches pruinose. *Leaf rachis* 5-10 in. long, with

a large gland, 1-1.5 in. from the base and smaller ones between the upper 2 or 3 pinnæ, glabrous; stipules deciduous; pinnæ 8-15 pairs, 2.5-4 in. long; leaflets 40-60 pairs, closely crowded, .25-.4 in. long, sessile, linear oblong, with the midrib close to the upper edge, subacute to obtuse at apex; base semicordate to truncate, glabrous or ciliate on the margins, pale beneath. *Heads* yellow, .4-.5 in. across, arranged in axillary panicles, which are at first pubescent, the basal portion becoming pruinose with age. *Bracts* .2-.35 in. long, linear-lanceolate to acuminate-spathulate, tomentose. *Pedicels* usually in fascicles in the axils of bracts, .4-.7 in. long, tomentose. *Calyx* up to about .08 in. long, broadly campanulate; teeth short, acute, more or less pubescent at the tips, otherwise glabrous. *Corolla* exceeding the calyx; lobes lanceolate, puberulous. *Ovary* glabrous. *Pod* not seen.

N. C. HILLS, KHASI HILLS upto 2,500 ft., N. E. FRONTIER, LAKHIMPUR, SIBSAGAR, GARO HILLS.

Flrs. 4.

4. *Acacia pennata* Willd. Vern. *Sujai-lewa*, *Bon-siri*, Mech.; *Boloa-lot*, Slyh.; *Kuchai*, Ass.; *Sirengkhi*, *Shil-khing* or *Ser-khing*, *Remsu*, Garo; *Ther-chi-kli*, *Soh-mysiang*, Kh.; *Jermai-sheih-lyng-kshiah*, Synt.; *Suji-phang*, Cach.

A large prickly climber. *Bark* dark brown to grey, often with horizontal cracks; blaze pink to red, fibrous; branches with about 5 rows of small more or less recurved prickles. *Young* shoots, inflorescence, leaf rachis and pinnæ pubescent. *Leaf rachis* up to 9 in. long with a large cup-like gland near the base and 2-4 smaller between the upper pinnæ, usually prickly. *Pinnæ* 7-16 pairs, 1.5-4 in. long. *Leaflets* from 16 pairs in the lower pinnæ to 30-50 pairs in the middle pinnæ, closely set, often overlapping, .15-.3 in. by .03-.05 in., linear-oblong, unequally broad, sharp acute, midrib starting from near the upper margin at the base to nearly median at the apex, glabrous or nearly so. *Flowers* pale white in pedunculate heads, which are .3-.4 in. across; peduncles 1-4 together, .4-.7 in. long, downy on large terminal leafy panicles. *Calyx* glabrous. *Pod* 4-6 by 1-2 in., strap-shaped, reddish to dark-brown and shining when

mature, sutures thickened; base usually narrowed to a short stalk; apex usually shortly beaked; seeds 8-14.

DARRANG, KAMRUP, SIBSAGAR, CACHAR, SYLHET, GARO HILLS, GOALPARA, KHASI HILLS in low elevations, probably also NOWGONG.

The bark is used for poisoning fish.

Flrs. 7-9. Fr. cold season.

5. *Acacia Gageana* Craib. Kew Bulletin 1915 p. 409, Incl. *A. cæsia* Willd. in part.

A large prickly climber with spirally fluted stem; branchlets with 5 lines of prickles, striate; young shoots, rachis and inflorescence pubescent; prickles hooked, small. *Rachis* prickly, up to 7 in. long, with a large circular gland at the base of the petiolar portion and 1-3 glands at the base of the upper pinnæ. *Pinnæ* 7-14 pairs, 1-4 in. long, sometimes with 1-3 glands between the uppermost leaflets; leaflets (6-) 20-30 (-40) pairs, close and usually touching, subsessile, falcate, oblong, obliquely mucronate with the point directed forwards; base truncate, more or less ciliate, glabrous above, hairy on the nerves beneath, .25-.45 by .07-.15 in. with one prominent nerve, the other basal nerves weak and scarcely reaching half way up the leaflet. *Flowers* in paniced heads, lower branches of which arise in upper leaf axils. *Heads* 20-30 flowered; peduncles .4-.7 in. long, 1-4 together; bracts subulate to linear; bracteoles smaller than the calyx, minutely pubescent, somewhat boat-shaped. *Calyx* up to .1 in. long, teeth slightly hairy at the apex. *Corolla* .9-1.2 in. long, glabrous. *Ovary* stipitate, glabrous, pubescent after fertilization. *Pods* pubescent when young, glabrous when mature, thin, variable in size and shape, sometimes with irregular indentations between the sutures, 3.7-6.5 by .8-1.2 in.

Not common, Jenkins! District not mentioned.

Flrs. 10. Fr. later part of cold season.

6. *Acacia oxyphylla* Graham ex Craib, Kew Bulletin (1915) p. 409. Vern. *Sue*, Mik.; *Pochui-kant*, *Kecheri-kaint*, Ass.; *Mei-suai*, Kh.

A large woody prickly climber with fluted stem; young

parts grey or brown pubescent. *Rachis* 4-6 in. long with a conspicuous raised, flat-topped gland near the base and another small one between the uppermost pairs of pinnæ. *Pinnæ* (3-) 6-9 pairs, usually up to 3 in. long, often with a minute gland between the uppermost pairs of leaflets. *Leaflets* 8-24 pairs, usually 12-20 pairs not touching, .3-.5 by .1-.12 in., obliquely oblong, acute with the apex directed forwards; base rounded or subtruncate, 4-5 nerved, the one next to the midrib, just falling short of the apex, remaining basal nerves rather weak and somewhat obscure, ciliate on the margins at least when young, glabrous above, glabrescent or very inconspicuously adpressed pubescent beneath; petiolule 0 or minute. *Flowers* white, 40-50 together in heads, arranged in a terminal panicle extending into the upper leaf axils. *Peduncles* .4-.6 in. long, pubescent; bracts up to about .25 in. long, lanceolate, acute or acuminate, longitudinally nerved; bracteoles oblong, glabrous or nearly so. *Calyx* .08-1 in. long, glabrous or slightly pubescent in the lower portion. *Corolla* .1-.12 in. long, glabrous or nearly so. *Ovary* hairy on a glabrous stipe. *Pod* 4-7.5 in. by .75-1.2 in., breadth unequal, darkish-brown and soon glabrous.

SIBSAGAR, N. E. FRONTIER DISTRICT, SYLHET, Saikh-mokim, LUSHAI HILLS—Prazer, Gage; foot of KHASI HILLS—Tharia, probably throughout the province, extending to low elevations, fairly common.

Flrs. 10. Fr. later part of cold season.

7. *Acacia diadenia* Parker. Indian Forester Vol. V. (1929) p. 332. Vern. *Kelle-doukha*, Cach.; *Sulu-rikong*, Mik.

A large woody climber with fluted stem; branches with about 5 lines of prickles. *Bark* grey, thin, yellowish inside. *Young* shoots, *rachis* and inflorescence more or less densely brown pubescent. *Rachis* 3-5 in. long, with 2 conical glands on the petiolar portion and 1-3 smaller glands between the upper pinnæ. *Pinnæ* 6-11 pairs, up to 3.25 in. long, pubescent with 1 or 2 minute, flat glands between the upper pairs of leaflets. *Leaflets* 17-30 pairs, close and touching, .25-.3 by .08-.1 in., rather obliquely linear-oblong, tipped with a forward directed mucro; base truncate or subtruncate,

glabrous and dark green above, paler beneath, margins ciliate; midrib with spreading hairs. *Heads* about 50 flowered in terminal panicles or axillary, appearing bristly in bud on account of the linear acuminate hispid bracteoles; peduncles .4-.6 in. long, enlarging in fruit, bearing a small linear caducous bract at or above the middle, densely pubescent. *Bracts* linear-subulate, villous. *Calyx* about .08 in. long, glabrous. *Corolla* .1 in. long, glabrous. *Ovary* glabrous on a short glabrous stipe, about .2 in. long, the latter surrounded at the base by a cylindric disk. *Pod* 4-6 by .8-1.2 in., brown pubescent, usually with minute glands when young, sutures often undulate, rather prominent.

N. CACHAR HILLS, DARRANG, SIBSAGAR.

Flrs. 8. Fr. 2.

8. *Acacia concinna* DC. Vern. *Pasoi-tenga*, *Kusiakaint*, *Kachuai*, *Amsikira*, *Suse-lewa*, Ass.; *Sia-thli*, *Jarmiersa*, Kh.; *Sirengkhi*, *Suchei-wak-chigong*, Garo; *Serhuarikong*, Mik.

A straggling prickly shrub or a large climber; stem terete with 5 rows of conical and more or less hooked prickles; twigs lenticelled; young parts grey or ferruginous, tomentose. *Leaf rachis* 2.5-5.5 in. long, more or less downy, often prickly, ending in a subulate awn, with a prominent gland near the base and another below the uppermost pair of pinnæ; stipules about .3 in. long, hairy, obliquely ovate, acute, auricled at the base; pinnæ 3-6 pairs, middle ones 2.3-2 in. long. *Leaflets* from 5-6 pairs in the lower pinnæ to 10-14 pairs on the middle pinnæ, .4-.6 by .15 in., oblong; apex usually rounded, cuspidate; base obliquely truncate and midrib closer to the upper margin, membranous, pale-green and glabrescent above and glaucous beneath. *Flowers* brick red in bud, white after opening, on peduncled heads, which are .4-.5 in. across. *Peduncles* .6-2 in. long, downy, usually in fascicles of 2-4, from leaf axils or arranged in panicles at the ends of branches. *Bracts* deciduous, resembling the stipules. *Calyx* red, funnel-shaped, deeply lobed. *Corolla* slightly exserted; lobes white with red median lines. *Ovary* glabrous, except for a few hairs near the top. *Pod* thick and fleshy, 3-4 by

·7-1 in., often indented between the seeds, sometimes curved, stipitate, saponaceous, indehiscent.

DARRANG, SIBSAGAR, NOWGONG, KAMRUP, KHASI HILLS—up to about 2,500 ft., GARO HILLS, GOALPARA.

Flrs. 3-5. Fr. 12-1.

Var. *rugata* Ham. Ovary villose; leaflets and pods larger than in the type—the latter 1-1·2 in. broad.

SYLHET—Badarpur (My sheet 9,678) and probably also elsewhere in the province.

Acacia dealbata Link. Vern. *Tiw-babur*, Kh. The silver wattle.

A moderate sized unarmed evergreen tree with nearly smooth grey or dark-brown bark; twigs, leaf rachis and inflorescence hoary. *Leaves* 2-6 in. long, bipinnate; rachis often with glands between the pinnæ; pinnæ 10-20 pairs, about 1·75 in. long. *Leaflets* 30-40 pairs, crowded, linear, ·15-·2 in. long, glaucous, green and pubescent. *Flowers* yellow, fragrant in globular heads, which are about ·35 in. across. *Calyx* minute, campanulate. *Corolla* yellow, about twice as long as calyx, deeply 5 lobed. *Ovary* sessile, minute, hairy; style just exceeding the stamens. *Pod* 3-4 by ·3-·4 in., reddish-brown, little or not, constricted between the seeds.

A native of Australia, cultivated and sometimes naturalized at Shillong.

The bark is rich in tannin containing about 30-35 per cent of tannic acid.

Its growth is rapid and it reproduces itself profusely from root-suckers.

Flrs. 12-2, when it is very ornamental.

A few phyllodineous *Acacias* are sometimes met with in gardens at Shillong but the above is the only common Australian *Acacia* in the station.

6. ALBIZZIA Durazz.

Usually unarmed trees, rarely shrubs or climbers. *Leaves* bipinnate, usually with a gland near the base and sometimes between the upper pinnæ. *Flowers* in globose heads (Indian species) sessile or pedicellate, usually pentamerous. *Calyx* campanulate or tubular. *Corolla* funnel-shaped; petals united below the middle. *Stamens* indefinite; filaments several times the length of the corolla, united at the base or high up; anthers minute, not gland

crested. *Ovary* sessile or shortly stalked, many ovuled; style filiform; stigma capitate, minute. *Pod* thin, flat, strap-shaped, indehiscent or tardily dehiscent, continuous within. *Seeds* compressed, exalbuminous.

I. Erect trees; pulvinus not accrescent; pinnæ under 12 pairs; leaflets over .1 in. width :—

A. Pinnæ usually 1 pair, second pair if present much weaker; leaflets never more than 3 pairs, large (2-6 in. long), acuminate; midrib central or nearly so.

1. *A. lucida.*

B. Pinnæ 2-6 pairs; leaflets more than 3 pairs, moderate-sized (under 2.3 in. long), never acuminate; midrib not very close to upper edge :—

1. Flower heads in panicles; flowers sessile :—

Leaf-rachis 10-18 in. long; leaflets over .5 in. broad; midrib diagonal, close to the lower edge for greater length. ..

2. *A. procera.*

Leaf-rachis 4-8 in. long; leaflets under .5 in. broad, midrib parallel to upper edge and closer to it.

3. *A. odoratissima.*

2. Flower heads from upper leaf axils or in short corymbose racemes; flowers pedicellate :—

Leaflets 3-10 pairs; pods straw-coloured.

4. *A. Lebbek.*

Leaflets 12-22 pairs; pods brown.

5. *A. Kalkora.*

C. Pinnæ 6-12 pairs; leaflets small, falcate, oblong; midrib very close to upper edge :—

Stipules conspicuous; flower heads in panicles; stamens pale white. ..

6. *A. stipulata.*

Stipules minute; flower heads from upper leaf axils or in short simple racemes; stamens rose-coloured. ..

7. *A. Julibrissin.*

II. Climber or small straggling tree, pulvinus below leaf-base, enlarging into a firm short recurved hook; pinnæ over 12 pairs; leaflets very small, linear, under .05 in. wide; midrib of leaf central or nearly so. ..

8. *A. myriophylla.*

1. **Albizzia lucida** Benth. Vern. *Moj*, *Michhagach*, Ass.; *Sundi*, Sylh. and Cach.; *Champa shundi*, Sylh.; *Mijjiphang*, Cach.; *Missi*, *Luang-khoi*, Manipur; *Kamatek*, Lush.; *Miji*, Kach.; *Tage*, *Dumbre*, *Lang-git-asing*, Miri; *Dumkol-asing*, Abor.; *Uchupi-arong*, *Ing-hok-arong*, Mik.; *Bumrundu*, Mech.; *Macha-borga*, Garo; *Arda-thol*, *Erbulthing*, Tipp.; *Theng-cher-tam*, *Athi-ong-cha*, Kuki; *Dieng-pantalong*, *Dieng-sa-rynto*, *Dieng-kharu*, Budi, *Dieng-til-pot*, *Dieng-ri-i*, Kh.

A middle-sized nearly evergreen tree. *Bark* nearly smooth, with horizontal wrinkles, and warty with lenticels, green below the cuticle, brown or light red inside, .3-.6 in. thick; young shoots and inflorescence brown, silky. *Rachis* .6-2 in. long, with a large cup-shaped gland .2-1 in. from the base and sometimes another near the top. *Pinnæ* 1.2-5.5 in., usually 1 pair, rarely 2 pairs with a gland at the base of the uppermost pair of leaflets and sometimes below the next pairs. *Leaflets* 2, sometimes 3, rarely 1 pair (second pair of pinnæ when present eglandular with 1 pair of leaflets), generally 2-6 by 1-1.7 in., terminal pair usually largest, lowest sometimes only 1.2 by .6 in., oblong-lanceolate or oblanceolate, somewhat abruptly acuminate; base obliquely cuneate to rounded, glabrous, glossy dark-green above, pale beneath, thinly chartaceous; lateral nerves 7-9 on either half, arcuate; petiolule up to nearly .1 in. long. *Heads* small, peduncled; peduncles .5-1 in. long, slender, glabrate or puberulous with age, 1-4 together, corymbosely or subumbellately arranged on branches, 1.5-6 in. long, which are themselves subcorymbosely arranged on terminal leafy panicles, up to 10 in. long. *Bracts* and bracteoles minute. *Pedicels* up to .1 in. long. *Calyx* about .07 in. long, campanulate, puberulous in mature flowers; teeth short. *Corolla* about .2 in. long, silky outside; segments lanceolate. *Filaments* .5-.6 in. long, pale yellow; staminal tube slightly shorter than the corolla-tube. *Pod* 6-10 in. long, 1-1.25 in. wide, attenuated at both ends, deep brown, reticulated, opposite the seeds, shining elsewhere, thin, flexible at length, dehiscent. *Seeds* 6-8, orbicular.

Throughout the Province ascending to about 2500 ft. in the KHASI HILLS—Common in places in the plains, e.g., SYLHET.

The heart-wood is brown with dark streaks, hard, but it is scarcely used. Weight about 55 lbs. per c. ft. Lac is obtained from the tree. About 550-600 seeds weigh 1 oz.

Flrs. 3-5. Fr. cold season.

Leafless or nearly so for a short time during the hot season.

2. *Albizzia procera* Benth. Vern. *Jigring-bon-phang*, Cach.; *Tantari-asing*, Miri; *Sidak*, Abor.; *Korai*, Sylh.; Ass.; *Lau-khuri*, Mech.; *Khelvi*, *Khreuvi*, Garo; *Chachra-korai*, Jharua; *Warlong-arong*, Mik.; *Sai-noi-ramri*, Kuki; *Dieng-rilong*, *Dieng-soh-krait*, *Dieng-saw*, Kh.

A tall handsome subdeciduous tree, attaining (in Assam) over 80 ft. in height and 7 ft. in girth; bark nearly smooth, yellowish grey or brown outside, peeling off in thin irregular plates, .75 in. thick, green inside below the corky layers, red or pink with white streaks deeper down. *Leaf* rachis 10-18 in. long; basal gland large, oblong or oval. *Pinnæ* 2-6 pairs, 5-9 in. long, often with glands between the upper 1-2 pairs of leaflets; leaflets 6-16 pairs, 1-2.2 by .6-.9 in., oblique, oblong-ovate or rhomboid-oblong, obtuse, silvery when young beneath, both surfaces thinly adpressed pubescent or glabrescent with age, undersurface paler, thinly coriaceous; midrib diagonal, nearer the lower edge except at the apex; petiolules about .05 in. long. *Heads* .5 in. across, usually in fascicles of 2-5, sometimes solitary, arranged in large terminal panicles; bracts caducous; peduncles .5-1 in. long. *Flowers* sessile, yellowish white. *Calyx* about .1 in. long, tubular, glabrous outside; teeth unequal, triangular. *Corolla* up to .2 in. long; lobes oblong-lanceolate, pubescent outside. *Stamens* .4-.5 in. long; filaments yellowish; staminal tube about as long as corolla-tube. *Pods* 4-8 by .6-.9 in., glabrous, reddish-brown, flexible. *Seeds* 6-12.

Throughout the Province ascending to about 2500 ft. in the KHASI HILLS, sometimes grown as standard over tea—for which it is considered very suitable.

Heart-wood brown or with darker bands, resembling that of *A. Lebbek*, durable. The timber is even grained and seasons well. It is suitable for posts, agricultural implements, etc. It is occasionally used for tea boxes for which it should prove very suitable. Average air dry, weight for Assam about 50 lbs. per c. ft. About 500-850 seeds weigh 1 oz.

Growth is fast. Some of the younger branches of the tree are:

irregularly deciduous and have been observed to keep on dropping till the fourth year.

Flrs. rainy season. Fr. cold season.

3. *Albizzia odoratissima* Benth. Vern. *Hiharu*, *Goroi*, Ass.; *Cham-koroi*, (N. Kamrup); *Moroi*, Sylh.; *Turut-arong*, *Narlong*, Mikir; *Khelbi*, *Sisso*, Garo; *Siris-koroi*, Jharua, *Laukhri*, Mech.; *Moroi*, *Khoru*, Kach.; *Rumri*, *Mibang-hing*, Kuki; *Dieng-saw*, Kh.; *Dieng-krait*, Synt.; *Hejui-bang-ching*, Naga.

A large deciduous tree with spreading crown. *Bark* grey or brownish-grey to nearly black and rough outside, inside red with white streaks, soft, about .75 in. thick in old stems; young shoots and inflorescence densely pubescent. *Leaf-rachis* 4-8 in. long, with a large gland at the base, and 1.2 between the upper pinnæ, finely grey downy; stipules small, deciduous. *Pinnæ* 3-5 pairs, 3-6.5 in. long, puberulous or glabrescent. *Leaflets* 7-20 pairs, .6-1.25 by .2-.4 in., oblique, oblong-obtuse or sub-acute, often mucronate, sub-coriaceous, adpressed pubescent on both surfaces or glabrescent above, glaucous beneath; midrib parallel to and closer to the upper edge; base rounded or truncate, and 3-4 nerved on the outer and broader edge; petiolule very short. *Heads* few flowered, solitary or in fascicles of 2-5, on leafy corymbose panicles at the ends of branches; peduncles .5-1.5 in. long; bracts .1-.2 in. long, ovate, acute or acuminate, brown tomentose. *Flowers* sessile, fragrant. *Calyx* very small, campanulate, densely pubescent outside; teeth obsolete or minute. *Corolla* .15-.3 in. long, funnel-shaped, hairy; lobes lanceolate, about .1 in. long. *Stamens* pale-yellow, about .8 in. long; staminal tube about half the corolla-tube. *Pod* 5-12 by .7-1.2 in., shortly stipitate, thin, flexible, tomentose when young, reddish brown or dusky greenish brown, broadly but rather indistinctly reticulate. *Seeds* 8-12.

Plains of ASSAM from GOALPARA & SYLHET to DARRANG, probably in all Districts, ascending to 3000 ft. in the KHASI HILLS.

Sap-wood large, heart-wood dark-brown with darker almost black streaks, hard, durable, takes a fine polish and seasons well; could be used for the same purposes as that of *A. Lebbek*, which it resembles. Weight about 50 lbs. per c. ft. The bark cut into small pieces and

boiled with pounded leaves of *Sarcochlamys pulcherrima* gives a madder-brown dye.

Flrs. 5-6. Fr. cold season.

In some forms the heads are arranged subumbellately or corymbosely on the ends of panicle branches. Larger and more densely pubescent leaflets are usually correlated with this form; as there are intermediates connecting it with the type, it has not been separated.

4. Albizzia Lebbek Benth. The Siris tree. *Sirisha*, Sans. & Beng. *Kothia koroi*, Ass.; *Moroi*, Cach. & Sylh.; *Rumri*, Lushai; *Harish*, Sylh.; *Japhang*, Tipp.; *Dieng-sah-rin*, Kh.

A large deciduous tree with a spreading crown. *Bark* light grey to dark-brown or almost black, rough, irregularly cracked; outer half to third of blaze red or reddish-brown, inner portion yellowish or brown with paler strands. *Branches* lenticellate, lenticels sometimes coalescing to form lines; young shoots and inflorescence pubescent. *Rachis* 3-6 in. long, usually with a large oblong gland near the base and one or between the upper pinnæ; stipules small, linear, tomentose, caducous. *Pinnæ* usually 2-5 pairs, 2-8 in. long, often with glands between the leaflets; stipels at the base of the pinnæ, minute. *Leaflets* 3-10 pairs, 1-1.5 by .3-.8 in., obovate to oblong-narrower downwards, pale-green, glabrescent or adpressed pubescent beneath, obtuse or retuse at apex; base unequal, lower end broader half, 2-3 nerved; lateral nerves not prominent, meeting in loops near the margin, fewer on the broader half; petiolules very short. *Flowers* greenish-white, fragrant in pedunculate heads; peduncles 2-4 in. long, downy, solitary or in fascicles of 2-4 from upper leaf axils or at the ends of short leafless branches; bracts caducous, linear, tomentose; pedicel about .1 in. long, slender, pubescent. *Calyx* .15 in. long, pubescent, short toothed. *Corolla* .3 in. long, funnel-shaped, pubescent outside; segments lanceolate. *Stamens* 1-1.5 in. long, fading to yellowish with a green terminal portion. *Staminal tube* a little shorter than the corolla-tube. *Pod* 6-12 by 1.2-1.7 in., pale, straw-coloured, finely reticulate, alternately depressed on either side over the seeds, 4-12 seeded; sutures thickened.

All over the Province but not very common, ascending to about 2000 ft. in the KHASI HILLS, sometimes planted.

Sap-wood large white, heart-wood dark-brown with darker streaks. The timber is hard, seasons and polishes well and is fairly durable.

It is exported largely to America—probably along with the wood of other Albizzias under the name of East Indian Walnut for decorative furniture work. It is specially adopted for use in veneering and also for turnery. Average weight about 50 lbs. per c. ft. 140-350 seeds weigh 1 oz.

Flrs. 5-6. Fr. cold season; long persisting on the tree.

5. Albizzia Kalkora Prain in Journal of Asiatic Society, Bengal, Vol. LXVI, p. 511. *Mimosa Kalkora Roxb.*

A large tree with rough dark bark; branchlets lenticellate; young parts brown pubescent. *Leaf* rachis 4-8 in. long, at first downy, thin, glabrate, with a large elongated gland .25-.6 in. from the base and often one or more glands below the uppermost pair of pinnæ; stipules .15-.2 in. long, subulate, early deciduous, hairy. *Pinnæ* 3-8 pairs, rarely 2 pairs, 2.5-5 in. long, puberulous, usually with a gland between the uppermost pair of leaflets; lower pairs smaller. *Leaflets* 10-22 pairs, lowest pair often abortive, .5-.9 by .25-.3 in., obliquely oblong, obtuse or sub-acute, often minutely mucronate; base unequal, rigidly subcoriaceous, dark-green and glabrous or nearly so above (when mature), paler and puberulous or glabrescent beneath; midrib parallel to upper edge, lower half broader; lateral nerves 6-7 on the broader half, lower originating from the base; petiolule almost .05 in. long, puberulous. *Heads* 1-5 together from upper leaf axils, many flowered; peduncles 2.5-4 in. long, puberulous, the lower longer, making the inflorescence appear corymbose. *Flowers* deliciously scented, pedicellate, white; bracteoles up to .1 in. long, linear to linear-spathulate, hairy, caducous; pedicels .1-.2 in. long, minutely puberulous. *Calyx* .15-.25 in. long, funnel-shaped, puberulous; teeth unequal. *Corolla* .3-.4 in. long, greenish-white or yellowish-green; lobes lanceolate, .15-.2 in. long, silky on the backs. *Stamens* white, with green tips, 1.1-1.5 in. long; staminal-tube slightly shorter than the corolla-tube. *Pod* 6 by 1 in., strap-shaped, firm, dark-brown, 6-10 seeded, stalked, stalk .35 in. long.

KHASI HILLS, 3000-5000 ft., NAGA HILLS—Gierselere, Kohima, King's collector! nowhere common.

Closely allied to *Albizzia Lebbek* from which it can be at once distinguished by the large number of leaflets, and its dark-brown stipitate pods.

In journal of Royal Asiatic Society, Vol. LXVI, p. 512—says the leaflets are 1-1.5 in. long. The Chinese sheets in Herb. Calcutta, have leaflets of this size but in no Indian sheet in the collection there or in the Assam Herbarium they attain this size.

Flrs. 3-4.

6. *Albizzia stipulata* Boivin. Vern. *Saw-koroi*, *Sau*, Ass.; *Horish*, *Shirish*, Sylh.; *Arbhu*, *Ghoge siris*, Nep.; *Bolphu*, *Beolphiu*, *Borphi*, Garo; *Bhosra koroi*, Jharua; *Gurgeng-aring*, Miri; *Tat kung-asing*, Abor; *Dieng phyneat*, *Dieng-phallut*, Kh.; *Ching-ring-thing*, *Mabang*, Kuki; *Bongsip*, Lushai; *Luang-khoi*, Manipur; *Inghok-arong*, *Ti-ir-arong*, Mik.; *Bon-phru-phang*, Cach.

A large handsome fast growing flat crowned tree. *Bark* smooth, dark-brown or grey, horizontally wrinkled, lenticellate, outside dark-red or crimson, with white streaks inside, .6-1 in. thick and inflorescence tomentose. *Leaf* rachis 5-12 in. long with one large gland near the base and sometimes one or more between the pinnæ; stipules large, about 1 in. long, deciduous, obliquely semicordate, membranous, acute. *Pinnæ* 6-20 pairs, 2-6 in. long. *Leaflets* subsessile 20-40 pairs, .3-.5 in. by .1 in., falcate oblong, tapering to a sharp point; midrib close to the upper edge, glabrate above, pubescent beneath, downy along the margins. *Heads* pedunculate, in terminal and axillary paniced racemes; peduncles .7-1.2 in. long; bracts about .5 in. long, resembling the stipules, deciduous. *Flowers* sessile, yellowish-white. *Calyx* .1 in. long, tubular, funnel-shaped, tomentose outside; teeth short. *Corolla* .2-.25 in. long, pubescent outside; segments ovate-lanceolate. *Stamens* 1-1.3 in. long; staminal tube up to .17 in. long. *Pod* 4-6 by .5-.7 in., light-brown, thin, glabrous, tardily dehiscent; seeds 4-10.

Throughout the Province, often in old Jhums ascending to about 5000 ft. in KHASI HILLS.

The timber is lighter and less durable than that of *A. Lebbek*.

It is scarcely used but might prove suitable for tea boxes. About 900 seeds weigh 1 oz.

Flrs. 5-8. Fr. cold season.

Var. Smithiana Prain. (*Mimosa Smithiana* Roxb.). A tall tree with smooth greenish grey bark. *Stipules* small. *Stamens* with greenish tips.

7. *Albizzia Julibrissin* Durazz. Syn. *A. mollis* Boiv.

A medium-sized deciduous tree attaining about 50 ft. in height and 4-5 ft. girth, with broad crown. *Bark* rough, dark-brown or almost black, fissured, exfoliating in small irregular woody plates. *Blaze* pink with distant white streaks; young shoots, rachis, pinnæ and inflorescence covered with soft yellowish-brown pubescence. *Rachis* 4-10 in. long, pubescent with a large gland, .4-.8 in. from the base and sometimes with one or two more between the uppermost pairs of pinnæ. *Stipules* .2-.3 in. long, caducous, sub-falcately subulate, pubescent. *Pinnæ* (4-) 5-8, sometimes up to 12 pairs, 2.5-4 in. long; stipellæ minute, subulate. *Leaflets* 10-20 pairs, .4-.7 in. by .15-.25 in., subsessile, falcately oblong, acute; midrib close to upper edge; base inequal, broader half 2-3 nerved, truncate, dark-green above, paler beneath, adpressed pubescent on both surfaces. *Flower* fragrant, pubescent outside in peduncled heads which are solitary or in fascicles of 2-3 and arranged in short racemes at the ends of branches or the lowest from leaf axils. *Peduncles* 1.5-3 in. long; heads 20-28 flowered; bracts .15-.25 in. long, linear or subulate, caducous; pedicels very short. *Calyx* about .15 in. long, tubular teeth triangular. *Corolla* .2-.3 in. long, yellowish-green like the calyx; lobes .1-.15 in. long, oblong-lanceolate, acute. *Stamens* exserted, 1-1.4 in. long, upper $\frac{2}{3}$ rose pink and lower portion white or entirely white, filiform; staminal tube .15-.2 in. long. *Pod* 2.5-4 in. by .6 in., pubescent till mature, yellowish-brown. *Seeds* usually 2-6, but sometimes more.

KHASI HILLS 4000-6000 ft.

The specific name is a corruption of Hindustani Gulabi-resham—rosy silk which well describes the stamens.

Flrs. 4-5. Fr. 8.

8. *Albizzia myriophylla* Benth. Vern. *Themfra*, Cach.; *Thabphi-rikang*, Mik.; *Mei-theit*, Khasi; *Madhurang-lata*, Naga.

A large woody climber or a large shrub straggling on trees with raised dots on the branches; young parts brown, tomentose. *Rachis* 3·5-7·5 in. long, downy with soft brown hairs as are also the pinnæ, with a large cup-like gland near the base and several between the upper pinnæ; pinnæ 12-20 pairs, 1-2 in. long; stipules subulate, up to ·25 in. long; pulvinus below the leaf base, enlarging in to a recurved sometimes subspinescent almost woody hook. *Leaflets* 25-50 pairs, ·15·2 in. long, closely crowded, linear, often slightly falcate, subulate; base unequal, hairy along the margins when young, glabrate with age, dark-green above, pale beneath; midrib nearly central. *Heads* small, pedunculate, (peduncles solitary or 2-4 together, ·4·75 in. long, downy), arranged in terminal leafy panicles; bracts ·15·2 in. long, ovate, acute or acuminate, usually accompanied by subulate stipules like those of the leaves. *Flowers* sessile; calyx short, campanulate, brown, silky pubescent; teeth acute. *Corolla* ·1·15 in. long, pubescent outside; lobes lanceolate about one-third the tube. *Stamens* about ·4 in. long; filaments white or greenish; staminal tube about half as long as corolla-tube. *Pod* 4·6·5 in. by ·75-1 in., somewhat flexible, glossy-brown, dehiscent, 6-10 seeded, narrowed at both ends, shortly stipitate.

The fibrous bark is sweetish and of the taste of liquorice.

NOWGONG-Dhansiri Reserve, SIBSAGAR-Barapathar, KHASI & JAINTIA HILLS—Tharia-SYLHET-Hooker.

Albizzia Gamblei Prain in Journ. A. Soc. Beng., LXVI, p. 513.

A moderate-sized tree. *Rachis* 3-4 in. long with a large gland a little above the base. *Pinnæ* 2-3 pairs, 1-4 in. long, with large projecting glands between the last pair of leaflets. *Leaflets* 3-7 pairs, ·6-2 by ·4-1 in., decreasing in size downwards, ovate-lanceolate, acute or sub-acute; base cuneate from the middle, pale green above, glabrescent beneath, sparsely adpressed puberulous on both surfaces. *Heads* peduncled; peduncles about 1 in. long in fascicles, arranged in terminal and axillary panicles, minute. *Calyx* about ·1 in. long, campanulate, puberulous; teeth minute. *Corolla* ·2 in. long; teeth small, lanceolate; stamens ·3·4 in. long, staminal tube about as long as the corolla-tube. *Pod* 6-8 by 1-1·5 in., pale, straw-coloured. *Seeds* 6-8.

NAGA HILLS—Kohima, C. B. Clarke.

Parker suggests in Indian Forester, Vol. LVI (1930), p. 297 *et seq.*, that this plant is a hybrid between *A. Lebbek* and *A. lucida*. A plant has been raised from seeds collected from *A. lucida* tree in the Forest College grounds at Dehra, which is indistinguishable from *A. Gamblei*.

7. PITHECOLOBIUM Mart.

Shrub or trees generally with glands at the base of pinnæ and leaflets. *Unarmed* or with spinescent stipules or axillary spines. *Leaves* bipinnate, pinnæ paripinnate; stipules various; stipels 0. *Flowers* in globose heads or sometimes in subumbellate corymbs or spikes, usually hermaphrodite or pentamerous. *Calyx* campanulate or funnel-shaped with short teeth. *Corolla* funnel-shaped or tubular; petals united about half way up. *Stamens* monadelphous, indefinite, much exserted; anthers not gland tipped. *Ovary* sessile or stalked, many ovuled; style filiform; stigma minute capitate. *Pod* generally coriaceous, usually curved or twisted and dehiscent, suture not thickened. *Seeds* compressed, sometimes arillate.

|---|--------------------------|
| I. Branchlets not prominently angled; pinnæ usually 1-2 pairs; leaflets few, 1-3 pairs. . . | 1. <i>P. bigeminum</i> . |
| II. Branchlets angled; pinnæ and leaflets each more than 4 pairs :— | |
| Terminal leaflets large, usually over 2 in. long; leaflets dissimilar. . . | 2. <i>P. angulatum</i> . |
| Leaflets all small, more or less similar, 1 in. and under. . . | 3. <i>P. montanum</i> . |

1. *Pithecolobium bigeminum* Benth. Ver. *Bhachahu*, Ass.; *Dieng-yap-yar*, Kh. and Synt.

A small to middle-sized tree; branchlet not angled. *Bark* nearly smooth, light grey or pale brown, more or less warty with lenticels; blaze red or brown, finely fibrous; young parts and inflorescence rusty pubescent; branchlets not prominently angled. *Leaf-rachis* 1-4 in. long, stout, with a raised gland below the lowest pair of pinnæ and usually one each at the base of each pair of pinnæ and leaflets. *Pinnæ* 1-2, rarely 2 pairs; 2-4.5 in. long. *Leaflets* 1-3 on the lower pinnæ, sometimes up to 4 pairs on the terminal pinnæ, 1.5-6 by .8-2 in., elliptic to oblong-lanceolate or oblanceolate, cuspidate, acuminate or acute; base not or slightly oblique,

sub-coriaceous, glabrous and shining above, paler or brownish and often puberulous along the nerves beneath; main lateral nerves 8-12 on either side, with few shorter intermediates between, arcuate, anastomosing near the margin; petiolules upto .15 in. long. *Flowers* white or pale creamy, sessile or shortly pedicellate upto about .25 in. long in 6-10 fld. pedunculate heads; peduncles .3-1 in. long in copious terminal or axillary panicles or in axillary racemes or sometimes fascicles, puberulous. *Calyx* small, brown pubescent; teeth acute. *Corolla* about double the calyx, .2-.25 in. long, including the calyx, pubescent outside, cleft deep down; stamens .4-.5 in. *Pod* 3-6 (sometimes upto 9) in. long by .6-1 in. broad, twisted once or twice into a spiral, downy when young, glabrescent with age, valves red inside.

KHASIA & JAINTIA HILLS upto 6000 ft. CACHAR HILLS-Prazer!

Wood light, reddish brown, pores scattered, often partitioned, med. rays very fine, often packed together in bends.

Flrs. 2-5. Fr. 1-2.

***P. glomeriflorum* Kurz.**

A shrub or a small tree; pinnæ one pair; branchlets not prominently angled; shoots pubescent. *Leaflets* 1-2 in. long, upto 3 pairs, elliptic-lanceolate, glabrous above, pale beneath; base slightly oblique. *Flowers* usually somewhat larger than in the last sp., .25-.5 in., upto the extremity of the stamens, in lax axillary and terminal rusty pubescent panicles.

I have not seen complete specimens of the species from our area. Most of the sheets referred to this species are *P. bigeminum*, or the materials are too incomplete for determination.

KHASI & JAINTIA HILLS.

Flrs. 3-4.

***Pithecolobium* sp. near *P. affine* Baker (sheet No. 3,662).**

A small tree, rachis stout, 2-2.5 in. long with a gland below the insertion of the pinnæ. *Pinnæ* 4-5.5 in. with a gland below the insertion of the upper leaflets. *Leaflets* 2 pairs, 5-9.5 by 2.5-5 in., elliptic to ovate-lanceolate, acuminate; base cuneate and thinly coriaceous, glabrous; lateral nerves 5-7 on either half; petiolules stout, upto .2 in. long. Flrs. & Fr. not seen.

LAKHIMPUR-Dulong Reserves.

2. ***Pithecolobium angulatum*** Benth. Vern. *Arda*, Tipp.; *Morog-mara*, Sylh.; *Sorkhi-biphang*, Mech.; *Thorekana*, Bhasahu, Ass.; *Ancharemchu*, Naga; *Theng-semai-arong*, Mik.; *Mongal*, Garo; *Pani-jigni*, Jharua; *Dieng-iap-iar*, *Dieng-khap-iar*, *Dieng-ia-lai-up-siar*, Synt.

A small to middle-sized tree. *Bark* dark-brown or grey, nearly smooth, with thin horizontal lenticular lines, red to reddish-brown inside; young shoots and inflorescence rusty pubescent; branchlets sharply angled. *Rachis* 2·5-8 in. long, angled, puberulous or glabrescent with a large gland near the base, sometimes with a smaller one immediately above, and usually with a small gland just below the insertion of the pinnæ; pinnæ 2-4 pairs, with a gland just below the insertion of each pair of leaflets; upper 3-7 in. long, lower smaller downwards, lowermost ·5-1·5 in. long. *Leaflets* 5-10 pairs in the upper pinnæ, 2-3 pairs in the lower pinnæ, diminishing in size and more oblique downwards, the terminal 3-6 in. by 1·25-2 in., lowermost ·6-1 by ·5·75 in., comparatively broader, oblong-lanceolate to elliptic or rhomboid-ovate, acuminate or acute, terminal usually with narrowed base; base of lower leaflets subtruncate or rounded, sub-coriaceous, puberulous along the midrib or glabrescent and dark-green above, pale and usually thinly pubescent or puberulous, specially along the nerves beneath; lateral nerves from 4 on either side in the lowermost to 14 in the uppermost leaflets, with several intermediates, meeting in loops near the margin; petiolules up to ·1 in. long. *Flowers* white or yellowish-white, ·2·25 in. long in peduncled umbellate corymbs; peduncles ·2·75 in. long, fascicled in the axils of gland bearing bracteoles on the branches of panicles; panicle branches usually fascicled; upper bracts with a large basal gland and a short simply pinnate foliar portion, lower gradually more leafy; panicles terminal and large, extending to the upper leaves; pedicels up to ·1 in. long, in the axils of minute bracteoles, slender, pubescent. *Calyx* ·05·07 in. long, campanulate, puberulous; teeth short acute; corolla about ·2 in. long, pubescent or puberulous outside. *Filaments* exserted, white or pinkish; staminal tube nearly as long as the corolla. *Ovary* puberulous, short stalked. *Pod* spirally twisted, 7-8 in. by ·7 in., distantly

sinuate between seeds on the lower margin; valves coriaceous, velvety when young, puberulous outside when mature, red and glabrous within. *Seeds* 8-10, purplish or bluish-black.

Almost all over the Province from DARRANG southwards ascending to 3000 ft. in KHASI HILLS.

The leaf is used with haritaki (*Terminalia Chebula*), fruits for dyeing cloth black.

Flrs. 3-5. Fr. 1.

3. *Pithecolobium montanum* Benth. Vern. *Tareppochangne*, Duff.; *Riang-arong*, Mik.; *Mathalai-baphang*, Cach.

A small tree. *Bark* dark-brown or grey somewhat rough with close horizontal, lenticular lines, red inside. *Branches* sharply angled; young parts rusty or brown pubescent. *Rachis* 6-8 in. long, pubescent; pinnæ 6-12 pairs, gradually smaller downwards, 1-4.5 in. long; leaflets close, from 5 pairs in the lowermost to 12 pairs or more, in the uppermost pinnæ, .5-1 by .25-.3 in., usually slightly broader and shorter downwards in each pinna, usually very oblique, rhomboid or tapeziform-oblong; margins often nearly parallel, acuminate; base more or less cuneate in the upper leaflets, in others the upper half truncate, lower half abruptly cuneate from or above the middle of the lamina, puberulous along the midrib or glabrate above, thinly pubescent beneath, subcoriaceous; midrib diagonal; main lateral nerves 5-10 on either side, looping near the margin; petiolule .05 in. with a circular gland below the insertion of each pair except the lowest. *Flowers* white, pedicellate in capitate peduncled umbels, which are arranged on the branches of an ample panicle; pedicels .1 in. long; calyx about as long as the pedicels. *Corolla* exserted; petals lanceolate, pubescent outside, about .12 in. long. *Pod* 4-5 in. long, twisted, glabrous.

KHASI HILLS, low elevations above SYLHET.

Flrs. 2-3.

8. CALLIANDRA Benth.

Shrubs or trees. *Leaves* bipinnate; leaflets few, large, glabrous, (Indian species); stipules usually persistent, often

spinescent. *Flowers* in globose heads, polygamous, 5-merous. *Calyx* campanulate; teeth short. *Corolla* funnel-shaped, 5 cleft. *Stamens* indefinite; filaments connate at the base, much exserted; anthers minute, not gland tipped. *Ovary* stipitate, many ovuled; style filiform; stigma minute, capitate. *Pod* strap-shaped, slightly falcate, flat, rigidly coriaceous; sutures much thickened; valves elastically dehiscent, being rolled backwards from top to bottom.

Common petiole 1·3 in. long; stipular spines strong and ultimately woody; glands at the insertion of pinnæ and terminal leaflets. ..

1. *C. umbrosa*.

Common petiole 2·5 in. long; stipular spines weak, never woody, no glands at the insertion of pinnæ and terminal leaflets. ..

2. *C. Griffithii*.

1. *Calliandra umbrosa* Benth. Vern. *Dieng-sia-soh-maria*, *Dieng-sia-soh-krot*, Kh.; *Utilou*, Manip.; *Patpui*, Lushai & Kuki; *Soambri-baphang*, Cach.; *Thing-seki*; Naga.

Usually a small, (sometimes middle-sized) tree; stem with brown-bark often with stipular spines; innovations puberulous; branches lenticellate. *Leaves* 2-pinnate; common petiole 1·3 in. long; stipules spinescent, considerably enlarging, and becoming woody with age and persisting after leaf fall; pinnæ one pair, 1·2-2·5 in. long, usually with a gland between them. *Leaflets* on each pinna, one pair terminal, 2·7-6 by 1·2-2·4 in. and usually a small odd leaflet, 1·3-2·3 by ·7-1·4 in. below on the outside, obliquely oblong-elliptic, lanceolate, bluntly acuminate or subacuminate, glabrous, rigidly subcoriaceous; main lateral nerves 5-10, arcuate; petiolule up to ·1 in. long with a gland between the terminal pair, and often one, on or below the petiolule of the odd leaflet. *Heads* peduncled, globose ·4 in. across, supported by a ring of minute bracteoles; peduncles ·4-1 in. long, usually clustered on old wood, rarely axillary. *Flowers* white or yellowish-white, sessile. *Corolla* ·12 in. long. *Pod* 6-10 by ·75-1 in.; valves finely reticulate with raised nerves; sutures elevated with rounded thickened edges. *Seeds* 4-9, ·5-·7 by ·35-4 in., broader than long, much compressed.

KHASI HILLS towards the foot on slopes facing SYLHET—Tharia, Pamati, Hatmawdan—locally common; SYLHET; CACHAR—Barak Reserve, Lower Jiri Reserve, Katakhal Reserve, etc.

The wood is said to burn badly with an offensive smell.

Flrs. rainy season. Fr. 2.

2. *Calliandra Griffithii* Benth.

A bushy shrub. *Rachis* short, .2-.5 in. long; stipular spines short and weak up to .2 in. long, sometimes obsolete. *Glands* absent at the insertion of pinnæ or leaflets. *Pinnæ* 1 pair, .3-.6 in. long, with a pair of large terminal leaflets, 1.7-3.2 by .5-1.5 in. and an odd smaller leaflet on the outer side .7-1.5 by .25-.6 in., obliquely narrow lanceolate to lanceolate, acuminate, glabrous, rigidly subcoriaceous; main lateral nerves 6-9 on either side. *Heads* axillary, supported by small linear lanceolate bracteoles on slender peduncles .75-2 in. long. *Flowers* sessile, about .35 in. long. *Calyx* .08 in. long. *Corolla* lobes lanceolate, about .1 in. long. *Pod* not seen.

KHASI HILLS 2000 ft., (Mann 426!) Mahadeo—3000 ft., (Kanjilal 4623).

Flrs. 9-10.

9. ENTEROLOBIUM Mart.

Enterolobium saman Prain. Syn. *Pithecolobium saman* Benth. The rain tree.

An evergreen middle-sized to large soft-wooded tree with a spreading crown. *Bark* dark-grey almost black in old trees; young shoots pubescent. *Leaf* rachis 4-6 in. long, often with a gland between each pair of pinnæ but none at the base, pubescent; stipules small, pubescent, deciduous; pinnæ 3-7 pairs, shorter downwards with glands between each pair of leaflets. *Leaflets* smaller downwards, 6-10 pairs in the upper, 2-3 pairs in the lowermost pinnæ; 1-2 by .5-1 in. obliquely rhomboid or ovate-oblong, obtuse, glabrous above, more or less pubescent beneath, specially along the nerves; midrib diagonal. *Flowers* 5-merous in dense rose-coloured heads on pubescent peduncles, 1-3 together from the upper axils and 2-3 in. long; pedicels slender, short, each with a small bract. *Calyx* pubescent outside, about .15 in.

long; teeth broadly triangular. *Corolla* pinkish, .3 in. long; tube puberulous outside; lobes half as long as the tube. *Stamens* connate below; filaments pink about 1.25 in. long. *Ovary* sessile, many ovuled; style filiform. *Pod* 5-9 in. by .6 in., indehiscent; sutures thickened; mesocarp pulpy; endocarp crustaceous and forming septa between the seeds.

A native of Guiana. Planted at Kulsi and often as a shade tree in the plains.

The pod is eaten by cattle. The pulpy mesocarp of the pods is sweetish. The tree is very fast growing and easy to propagate but is easily broken by winds.

Flrs. 2-6. Fr. 3-4.

FAM. 51. ROSACEÆ

Trees, shrubs or herbs. *Leaves* rarely opposite, simple or compound, stipulate; stipules sometimes adnate to the petiole. *Flowers* usually bisexual, regular, 5-merous. *Calyx tube* (hypanthium), free or adnate to the ovary. *Disk* lining the calyx tube or annular. *Stamens* perigynous, usually indefinite, rarely 5, 10 or 1 in one or many series; filaments free, rarely partially united, incurved in bud; anthers small, 2-lobed, opening longitudinally, introrse. *Carpels* free or connate; styles free or connate, basal, lateral or subterminal; ovules 1 or more in each carpel. *Fruit* various, sometimes formed partly from the calyx tube. *Seeds* erect or pendulous; albumen usually 0.

I. Calyx tube free or nearly so in flower:—

A. Calyx tube never completely enclosing the ripe carpels:—

1. Carpels solitary; fruit drupaceous:—

a. Petals conspicuous; drupes not transversely oblong:—

Style in fruit terminal; stone bony or nearly so.

1. *Prunus*.

- Style in fruit sub-basal; stone coriaceous. 2. **Prinsepia.**
- b. Petals inconspicuous; drupes transversely oblong. 3. **Pygeum.**
2. Carpels 5 or more :—
- a. Fruit of free drupes. 4. **Rubus.**
- b. Fruit of follicles :—
- Follicles 5 or more; testa membranous. 5. **Spiræa.**
- Follicle usually solitary nearly enclosed in the calyx tube; testa crustaceous. 6. **Neillia.**
- B. Calyx tube completely enclosing the ripe carpels; leaves imparipinnate; carpels free. 7. **Rosa.**
- II. Calyx tube adnate to the carpels :—
1. Ovary 5-celled; ovules 3 in each cell. .. 8. **Docynia.**
2. Ovary 2-5-celled; ovules 2 in each cell :—
- a. Fruit baccate; flowers in dense panicles. 9. **Eriobotrya.**
- b. Fruit fleshy but not baccate; inflorescence corymbose or in fascicles :—
- Fruit a pome; endocarp not extended nor dehiscent. 10. **Pyrus.**
- Fruit with a crustaceous, loculicidally dehiscent 5-celled endocarp. .. 11. **Stranvæsia.**
- Fruit with membranous endocarp; ovary 2-3 celled :—
- Leafy shoots entirely glabrous; leaves entire; styles nearly free; testa of seeds smooth. 12. **Photinia.**
- Leafy shoots woolly when young; leaves serrate; style united about half way down; testa of seed reticulately lacunate. 13. **Pourthiæa.**
- Fruit a drupe with 2-5 bony stones. 14. **Cotoneaster.**

1. PRUNUS Linn.

Shrubs or trees. *Leaves* alternate, simple, entire or toothed; petiole often 2-glandular towards the top. *Flowers* white or red, racemed, fascicled or solitary. *Calyx* free, completely deciduous or base of tube persistent; lobes 5, imbricate. *Petals* 5. *Stamens* many, 15-16, inserted at the mouth of the calyx tube; filaments free. *Carpel* 1; style terminal; ovules 2, collateral, pendulous. *Fruit* a drupe

with an indehiscent or 2 valved, smooth or rugged, 1 seeded stone. *Seed* pendulous.

I. Leaves serrate :—

A. Leaves closely serrate, deciduous :—

1. Flowers white in many flowered elongate racemes; petiole eglandular :—

Leaves usually glaucous beneath; lateral nerves 13-22; stone hard-shelled, about .6 in. long.

1. *P. nepalensis*.

Leaves green beneath; lateral nerves 8-13; stone thin-shelled, about .25 in. long.

2. *P. undulata*.

2. Flowers in subumbellate fascicles; peduncles short or 0; petiole glandular. Flowers pink, fading to white.

3. *P. cerasoides*.

B. Leaves distantly serrate; evergreen.

Petiole glandular; stone rugose.

4. *P. Jenkinsii*.

II. Leaves entire or nearly so :—

Leaves without black glands beneath; drupe .5-.6 in. long, ovoid with a more or less pointed tip.

5. *P. acuminata*.

Leaves conspicuously dotted beneath with black glands; drupe up to .3 in. across, globose.

6. *P. punctata*.

1. *Prunus nepalensis* Ser. Vern. Saiong, Khasi; Sohiong, Syntang.

A moderate sized to a fairly large deciduous tree attaining about 60 ft. in height and 4 ft. in girth. *Bark* grey or greyish white, somewhat rough with short vertical fissures and warts outside, greenish white inside, about .2 in. thick; branchlets purplish, shining, lenticellate. *Bud-scales* outer smaller, reddish-brown, ciliate, inner longer, membranous, yellow and brown. *Leaves* 3-6 by 1.2-2.5 in., lanceolate, oblong-lanceolate, caudate-acuminate, crenate-serrate; base rounded to acute, thinly subcoriaceous, glabrous above, glaucous beneath; lateral nerves 14-22 on either half; nervules very finely reticulated; petioles .7-1.2 in. long, channelled, glandular; stipules .25-.3 in. long, caducous, linear laciniate. *Flowers* white; racemes terminating leafy shoots or axillary, 2.5-5 in. long, bearing flowers down to the base, grey pubescent; bracts linear, about .1 in. long, early deciduous;

pedicels $\cdot 1\text{--}\cdot 15$ in. long, pubescent, enlarging to $\cdot 3\text{--}\cdot 4$ in. and closely lenticellate in fruit; buds ovoid. *Calyx* turbinate or hemispheric, grey pubescent, nearly $\cdot 1$ in. long; base of the calyx tube persistent and enlarging in fruit; teeth small, obtuse, subacute. *Corolla* $\cdot 1\text{--}\cdot 15$ in. long, broadly-obovate or orbicular. *Stamens* 20-30. *Ovary* glabrous. *Drupe* fleshy, $\cdot 7\text{--}\cdot 8$ in. long, black, globose, acid or subacid; stone smooth, about $\cdot 6$ in. long.

* KHASI HILLS 4-6000 ft; often cultivated for the fruits.

Flrs. 10-11. Fr. 7-8.

Prunus bracteopadus Koehne in Fedde's Report, spec. Nov. Vol. IX, 1910, p. 33.

Leaves 2-5 by $\cdot 5\text{--}\cdot 2\text{--}\cdot 2$ in. oblong or ovate lanceolate, sharply or caudate acuminate, minutely serrulate, lowest pair glandular; base rounded or acute, glabrous pale beneath; petioles usually $\cdot 3\text{--}\cdot 45$ in. long; stipules about $\cdot 2$ in. long, linear, glandular fimbriate. *Racemes* 3-5 in. long, bearing flowers to the base, terminating short leafy shoots, puberulous; bracts upto $\cdot 12$ in. long, membranous, with finely ciliate margins. *Calyx* tube about $\cdot 15\text{--}\cdot 2$ in. across, minutely puberulous or subglabrous, hairy at the base; sepals very short. *Petals* upto $\cdot 2$ in., obovate-oblong. *Stamens* 27-37. *Ovary* glabrous. *Drupe* not fleshy; stone $\cdot 6\text{--}\cdot 7$ in. long.

Jowai-King's collector! KHASI HILLS. Hk. f. & Thomson.

Flrs. 10.

Included under *P. nepalensis* in F. B. I. It differs mainly by the longer persisting bracts and more minute serrature of leaves.

2. **Prunus undulata** Ham. *Dieng-tyrkhum*, Khasi.

A small deciduous tree; young shoots puberulous; branchlets glabrous. *Leaves* 2-3-5 by $\cdot 6\text{--}1$ in., rather narrowly lanceolate or oblong-lanceolate, long acuminate, often undulate, crenate-serrate; teeth gland tipped, basal, often totally glandular; base rounded or acute, membranous, glabrous but hairy along the nerve axils and ultimately glabrescent beneath; lateral nerves 8-13 on either half; petiole $\cdot 2\text{--}\cdot 35$ in. long, eglandular. *Flowers* white. *Racemes* 2-5-5 in. long, puberulous, from axils of fallen leaves; pedicels slender, puberulous or glabrate, $\cdot 1\text{--}\cdot 2$ in. long. *Calyx* shorter than the pedicel, glabrous, more or less persisting in fruit; lobes obtuse, gland-toothed. *Petals* sub-orbicular, about $\cdot 08$ in. long. *Ovary* glabrous. *Stamens*

10-15, short. *Drupe* globose, pointed; stone thin-walled, smooth, about .25 in. long.

KHASI HILLS 3000-5000 ft.

Flrs. 4-5. Fr. 8-9(?).

3. *Prunus cerasoides* D. Don. Syn. *P. Puddum* Roxb. *Dieng-soh-iong-krem*, *Dieng-kadi-tusao*, Khasi; *Dieng-tyr-khung*, Synt.

A handsome middle sized deciduous tree. *Bark* more or less smooth, peeling off in horizontal dark-brown strips, exposing shining copper-coloured surface. *Blaze* yellowish, turning dark-brown. *Leaves* conduplicate in bud, 2-5 by 1-2 in., elliptic or ovate-lanceolate, caudate-acuminate; base rounded or acute, sharply singly or doubly serrate; serratures gland tipped, thin, dark-green and shining above, paler beneath, glabrous on both surfaces except for few tufts of hair on all or some of the nerve axils; lateral nerves 8-12 on either side; tertiaries subparallel; ultimate nervules very finely reticulated; petiole .4-.6 in. long, channelled, with usually a pair sometimes more of small reddish glands near the top; stipules linear, glandular-fimbriate. *Flowers* pink, fading to white, appearing before or with the leaves, in subumbellate, subcorymbose fascicles; peduncles 0 or very short; pedicels slender, .3-.6 in. long. *Calyx tube* narrow, campanulate, about .4 in. long, glabrous; base persistent in and supporting the fruit; lobes ovate, acute, .1-.15 in. long. *Petals* .3-.4 in. long, obovate; stamens many. *Ovary* glabrous. *Drupe* .5-.7 in. long, ellipsoid or oblong, yellow, sometimes tinged with red; stone bony, uneven and furrowed on the ventral face.

KHASI HILLS 4-6000 ft.

The wood is reddish-brown, close grained, polishes well. The branches make excellent walking sticks with the bark on.

Flrs. 10-12. Fr. 6.

Leaves shed towards the end of the rains. Very ornamental when in flower. The stone of our plant is *not* rugose as described by Hooker, Brandis, Parker, etc., but in other respects it does not differ from typical *P. cerasoides*.

4. *Prunus Jenkinsii* Hk. f. & Th. Vern. *Bon-thereju*, *Therejutenga*, Ass.; *Dieng-soh-setang-hi*, Synt.

An evergreen medium sized tree attaining about 60 ft. in height. *Bark* dark-grey or brown with lenticular warts outside, thin inside, light or reddish-brown, darkening on exposure. *Branchlets* glabrous, lenticellate. *Leaves* 4-7 by 1-2·3 in., narrowly lanceolate to oblong lanceolate, caudate-acuminate; base acute or cuneate, sharply but distantly serrate, glabrous, dark-green and glossy above, paler beneath; lateral nerves 9-15 on either half, arched; nervules finely reticulated; petiole 2·3 in. long, eglandular; stipules linear-lanceolate. *Racemes* 1·5-3 in. long, axillary, pubescent, strict, more or less erect, dense fld.; pedicels 25·35 in. long, pubescent. *Flowers* white. *Calyx* about 15 in. long, broadly turbinate, pubescent, specially towards the base; basal portion of calyx tube persistent; lobes obtuse, minutely toothed. *Petals* orbicular. *Stamens* 20-25, about 15 in. long. *Ovary* glabrous. *Drupe* acid, 8·9 in. long, ovoid, obovoid or subglobose; stone pointed or rounded at the apex, rugose, with a thick ridge on one side.

SIBSAGAR, LAKHIMPUR, KHASI HILLS—low elevations. Sometimes cultivated for the fruits.

Leaves turn yellow before falling.

Flrs. 10. Fr. 2.

5. *Prunus acuminata* Wall. Vern. *Dien-soh-iong-blei*, Khasi.

A moderate-sized or small tree. *Bark* grey or dark-brown to almost black and closely warted outside, inside reddish-brown or reddish, finely fibrous, often with a smell of bitter almonds, 2·3 in. thick. *Branchlets* thickly lenticellate, glabrous all over. *Leaves* 3·5·5 by 75-2 in., lanceolate, usually caudate, acuminate, tip often mucronate, subcoriaceous, entire,—undersurface paler and sometimes with obscure minute black glands; lateral nerves 6-8, arcuate; petiole 2·3 in. long, channelled, eglandular; stipules caducous, linear. *Flowers* white, scented, in axillary racemes. *Racemes* 1-3 together, 1·7-3·5 in. long; bracts minute, caducous; pedicels about 1·2 in. long. *Calyx* 12·15 in. long, cup-shaped, basal portion persisting in fruit; teeth

obscure. *Petals* about .1 in. long, broadly elliptic or suborbicular (oblong according to Hooker). *Stamens* about 15. *Ovary* villous; stigma capitate. *Drupe* .5-.6 in. long, ovoid, subacute tip, glabrous; stone thin, quite smooth.

KHASI HILLS 2350-5000 ft. GOALPARA-Mann (?) (if the label is correct).

Wood reddish-brown with pretty silver grain in radial section, takes a fine polish; pores small; medullary rays of two kinds very fine ones, alternating with fewer broad rays. According to Gamble used for planking and boxes in the Darjeeling District.

Flrs. 10-11. Fr. 6.

6. *Prunus punctata* Hk. f. & Th. *Dieng-ning-iong*, *Dieng-snoin-iong*, *Dieng-jar-maikoh*, *Dieng-soh-dkhiew-synrang*, *Dieng-soh-iong-trong*, Kh.

A small evergreen tree; bark dark grey or dark brown to almost black, thin, inside light red or brown turning darker brown on exposure; branchlets pubescent when young. *Leaves* 2.4-5 by .7-1.5 in., lanceolate or oblong-lanceolate, elliptic-oblong, caudate acuminate; tip obtuse, crowned by a hooked mucro; base cuneate to rounded, distantly serrulate, subcoriaceous, glabrous, shining above, dotted below with minute black glands; lateral nerves 8-10 on either half, meeting near the margin in loops; petiole .2-.3 in. long, eglandular; stipules caducous, linear or subulate, .3-.5 in. long with few distant weak gland-tipped teeth. *Racemes* slender, axillary, 1.2-2 in. long, glabrous, bearing up to 10 flowers, lower half to two-third of the racemes with no flowers; pedicels .15-.2 in. long; bracts subulate, .1-.15 in. long, caducous. *Flowers* white about .2 in. across. Calyx broadly turbinate; tube glabrous or silky hairy at the base and persisting in fruit; lobes rounded, erose and ciliate. *Petals* about .1 in. long, suborbicular; stamens about 20? (30 according to Brandis); ovary glabrous. *Drupe* .25-.3 in. across, globose, smelling strongly of bitter almonds; stone thin-shelled, smooth.

KHASI HILLS, 4000-5000 ft.

Flrs. 4. Fr. 9-10.

***Prunus persica* Benth et Hk. f. The Peach.**

A small to moderate sized deciduous tree. *Leaves* 2.5-4 in. long, narrowly lanceolate or oblong lanceolate, acuminate, sharply serrate,

glabrous and dark green above, pubescent beneath along midrib when young; petiole glandular or not; stipules subulate, fimbriate. *Flowers* pink, usually before sometimes with the leaves, mostly solitary from scaly buds on last years wood. *Drupe* downy, succulent; stone deeply and irregularly furrowed.

Cultivated mostly in the hills and also in the plains. A variety with double flowers is grown as an ornamental plant about Shillong.

Flrs. 1-2. Fr. 5-7.

Prunus communis Hudson. incl. *Prunus cerasifera* Ehr. Plum, Damson, etc.

A shrub or a moderate sized tree, sometimes spinescent. *Leaves* lanceolate or oblanceolate, acuminate, glabrous, serrate; petiole glandular; stipules linear fimbriate. *Flowers* white in fascicles from lateral buds. *Drupe* globose or oblong, smooth.

Cultivated in Shillong.

Flrs. 2. Fr. 6-7.

The copper plum *Prunus cerasifera* var. *Pissardi* has been introduced at Shillong where it is grown for its ornamental reddish purple foliage.

Prunus triflora Roxb.

A small tree. *Bark* smooth, blackish, glabrous. *Leaves* 2-3 by 1-1.5 in., obovate, oblanceolate, acuminate, crenulate; base acuminate, biglandular; petiole slender, .3-.6 in. long; stipules ciliate; lateral nerves 6-9 on either side. *Flowers* small, bisexual, regular, arising from the axils of fallen leaves in small fascicles; pedicels slender, about .5 in. long. *Calyx* glabrous; lobes longer than the tube, shortly clawed; filaments many. *Stigma* conspicuous; style long. *Fruit* a drupe, size of a cherry, pruinose, dark purple, cordate-ovoid (Kurz).

Cultivated, KHASI & JAINTIA HILLS.

Leafless in cold season. Flrs. 2. Fr. 5.

2. PRINSEPIA Royle.

Prinsepia utilis Royle. Vern. *Sohmonrit*, *Dieng-sia-soh-khar*, *Dieng-sla-soh-mon*, Kh.

A large straggling shrub attaining about 12 ft. in height; bark rough, exfoliating in papery scales, thin; blaze yellowish; branches several, green, armed with stout axillary often leaf bearing spines, up to 2.5 in. long; young parts puberulous. *Leaves* alternate, 1-3 by .3-1 in. oblong to ovate-lanceolate, acute or acuminate, minutely glandular, serrate, coriaceous, glabrous, dark green above, paler beneath; main lateral nerves 7-9 on either half, impressed

above; base narrowed, often abruptly, to a channelled petiole, up to .6 in. long; stipules caducous, linear, up to .2 in. long. *Flowers* yellowish-white or white, .3-.4 in. across in short axillary racemes; buds globose; racemes often in pairs, up to 2 in. long, puberulous; bracts minute, sharp-pointed; pedicels .3-.5 in. long. *Calyx* cup-shaped, persistent, puberulous, often with a tinge of purple outside; lobes 5, unequal imbricate in bud, up to .15 in. long, suborbicular, more or less erose. *Petals* imbricate in bud, suborbicular-obovate or orbicular, about .2 in. long, shortly clawed. *Stamens* many in several series of the mouth of the calyx tube; filaments short; anther cells separated by a broad connective. *Carpel* 1, free; style basal, short, thick; stigma expanded, depressed in the centre; ovules 2 pendulous. *Drupe* .5-.7 in. long, cylindric-oblong, deep-purple, almost black and pruinose when ripe; style scar sub-basal; endocarp coriaceous, smooth, 1 seeded.

KHASI & JAINTIA HILLS, over 4000 ft. In open slopes, often in village hedges.

Frs. 12. Fr. 3-4.

3. PYGEUM Gærtn.

Evergreen trees or shrubs. *Leaves* alternate, usually quite entire, often with two glands towards base of the blade. *Stipules* minute, fugacious. *Flowers* small, in racemes, sometimes unisexual by the ovary being sometimes absent. *Calyx* free, deciduous; limb 5-15 toothed, often unequal. *Petals* minute, 5-6, often tomentose and undistinguishable from the calyx lobes or absent. *Stamens* 10-50 in one or more series on the rim of the calyx tube; filaments slender, incurved; anthers small. *Carpel* 1, at the base of the calyx tube; style sub-terminal, slender, exserted; stigma capitate; ovules 2, collateral, pendulous. *Fruit* a transversely oblong-obscurely didymous, rarely subglobose drupe; pericarp thin, dry or juicy. *Seeds* usually 2; cotyledons very thick, hemispheric.

The leaves and fruit if crushed emit a strong smell of bitter almonds.

Leaves glabrous beneath; ovary glabrous or nearly so; drupe 1 in. or more across :—

- | | | | | | |
|--------------------|----|----|----|----|------------------------|
| Racemes pubescent. | .. | .. | .. | 1. | <i>P. acuminatum.</i> |
| Racemes glabrous. | .. | .. | .. | 2. | <i>P. glaberrimum.</i> |

Leaves clothed beneath with somewhat harsh brown hairs; ovary densely villous; drupe about .5 in. across.

- | | | | | |
|----|----|----|----|---------------------|
| .. | .. | .. | 3. | <i>P. montanum.</i> |
|----|----|----|----|---------------------|

1. *Pygeum acuminatum* Coleb. *Ril-deng-thing*, Kuki.

A moderate sized to large tree. *Bark* grey or dark-grey, slightly rough with light fissures and warts outside, thin; inside greenish-white or pinkish brown, darkening on exposure; blaze and fruit usually with a smell of bitter almonds; branchlets with raised lenticels; young parts pubescent but soon becoming glabrous. *Leaves* 3.5-7 by 1.5-3 in., oblong, ovate-lanceolate or elliptic, acuminate; base usually unequal, cuneate or acute, quite entire, basal glands 0; lateral nerves 6-8; tertiaries subparallel, both impressed above; petioles .3-.5 in., channelled, puberulous, ultimately glabrous. *Racemes* a little shorter than the leaves, slender, axillary, densely pubescent. *Flowers* small; pedicels about .15 in. long. *Calyx* 6 lobed, lobes narrowly lanceolate, basal portion of calyx tube persisting in fruit; petals 6, villous. *Stamens* about 30. *Ovary* glabrous but with a ring of persistent hairs at the base. *Drupe* about 1 in. across, transversely oblong, glabrous.

GOALPARA, Haltugaon, Guma Reserve; CHACHAR-Barak Reserve, apparently not common.

Fl. 5.

2. *Pygeum glaberrimum* Hk. f. *Bol-mangsam*, Garo; *Gandhi-gach*, Ass.; *Kadong-asing*, Miri, Abor; *Dieng-soh-kynti*, *Dieng-soh-khyrnem*, Kh.; *Raphir*, Lushai; *Ranphir*, Tippera; *Tia*, Nep.; *Bomphang-rakhet*, *Mukhra-Letei*, Mech; *Hanam*, Naga.

A large evergreen tree attaining 100 ft. in height and 8 ft. in girth. *Bark* usually grey, somewhat rough with fissures and lenticular warts outside, thin; blaze reddish-brown to brown with lighter streaks, darkening on exposure and smelling of bitter almonds; young parts puberulous; branchlets lenticellate. *Leaves* rather variable, oblong-ovate-

lanceolate to sometimes elliptic, caudate-acuminate; acumen long or short, entire; base cuneate or acute, usually without glands; lateral nerves 5-8 on either half, depressed; petiole .2-.5 in. long, channelled. *Racemes* slender, glabrous, 1-2 together from leaf axils, 1.5-4 in. long. *Pedicels* .15-.2 in. long, much elongated in fruit. *Calyx* up to .1 in. long, turbinate, glabrous; base of calyx tube silky pubescent and persistent in fruit; teeth obscure, villous. *Petals* about .1 in. long, oblong, hooded. *Stamens* 12-15. *Ovary* thinly hairy, soon glabrate; style exserted, long; stigma dilated. *Drupe* .6-.7 in. long by 1-1.2 in. across, transversely oblong, obscurely didymous; stone reticulately marked and with a short beak.

Throughout the province ascending to about 2000 ft. (to 5000 ft. according to Gamble) in the Hills; nowhere common.

The leaves and fruit smell of bitter almonds when bruised.

Flrs. 11. Fr. 2.

3. *Pygeum montanum* Hk. f. *Dieng-cha-lawan-synrang*, *Dieng-soh-iong-blei*, Kh.; *Dieng-satler-soh*, *Dieng-stain-sine*, Synt.

A small to medium sized tree. *Bark* light grey or brown to almost black and somewhat rough with warts outside, thin; blaze reddish or reddish-brown, turning darker on exposure, with characteristic smell of bitter almonds; young parts tomentose or pubescent; branchlets stout, lenticellate. *Leaves* 3-7 by 1.4-3.5 in., oblong to ovate-lanceolate or elliptic, sharply acuminate; base rounded or subcordate, often unequal and with two raised glands above with corresponding pits on the undersurface, coriaceous, glabrate above except along the midrib and often along the nerves when mature; margins ciliate with spreading hair at least when young, undersurface pubescent or tomentose specially on the nerves; nerves and nervules impressed above; main lateral nerves 9-12 on either side, arched; petioles .2-.5 in. long, rusty pubescent or tomentose; stipules up to .4 in. long, lanceolate. *Racemes* 1-2 in. long, solitary or in fascicles of 2-3 from axils of fallen leaves or from leaf axils, often branched from near the base, tomentose; pedicels up to .12 in. long; bracts minute, tomentose.

Flowers about .3 in. across when fully open, greenish-white or pale-yellowish, slightly scented. *Calyx* about .15 in. long, campanulate, tomentose outside; tomentum brownish or rusty with age, glabrous or nearly so within; base persistent; teeth 5, minute, woolly. *Petals* a little larger, white, woolly. *Stamens* 15-20; filaments white. *Ovary* densely silky-villous; style exserted, hairy towards the base. *Drupe* .3 in. long by .4-.6 in. wide, transversely oblong or obscurely didymous, usually with a very short beak, thinly pubescent.

LAKHIMPUR, DARRANG, KAMRUP, SIBSAGAR, KHASI HILLS—ascending to 5500 ft.; probably also in CACHAR and NOWGONG, not common.

Wood reddish-brown with unevenly distributed pores conspicuous on a longitudinal section, seasons well, but is not used in the Province except for fuel.

Flrs. 10-12. Fr. 2.

The following are very closely allied and are probably only varieties :—

1. *P. ciliatum* Koehne, in Engler's *Botanische Jahrbucher*, Vol. LI, p. 184.

Leaves 3-6 by 1.2-2.5 in., lanceolate, elliptic or ovate, lanceolate, shortly but sharply acuminate; margins ciliate, basal glands raised above, pitted beneath, glabrate above, undersurface pubescent or tomentose, specially on the nerves; lateral nerves 9-10; petioles .2-.3 in. long, thick. *Racemes* 1.5-2.3 in. long, sometimes slightly branched near the base in fascicles of 2-3 from nodes of last year's branches, rusty or brown tomentose. *Calyx-tube* broadly tomentose, about .1 in. across; lobes linear. *Stamens* about 50. *Drupe* .3-.4 in. across.

NAGA HILLS, Tangli Bam. Prain's Collector!

Flrs. 10. Fr. 12.

Differs from *P. montanum* mainly by its longer inflorescence, larger number of stamens and smaller fruits.

2. *P. ocellatum* Koehne in Engler's *Botanische Jahrbucher*, Vol. II, p. 184.

Current year's shoots glabrate with age. *Leaves* 2.4-3.6 in. by 1.2-1.4 in., margins ciliate; base subcordate or rounded, glands pitted on the undersurface, orbicular; lateral nerves 6-11 on either side, rest as in *P. ciliatum*.

KHASI HILLS about 5000 ft. *Hk. f. & Thomson*.

4. RUBUS Linn.

Erect sarmentose or scandent shrubs or sometimes creeping herbs, usually prickly. *Leaves* alternate, simple or compound; stipules free or adnate to the petiole. *Flowers* usually in terminal and axillary corymbose panicles less often solitary, white, pink or purple. *Calyx* persistent, deeply 5-cleft, with a broad tube. *Disk* lining the calyx tube. *Petals* 5; stamens many. *Carpels* many, sometimes few on a convex receptacle; style subterminal; ovules 2, collateral, pendulous. *Fruit* a collection of yellow, red, purple or black drupels, crowded upon a spongy or dry, cylindric or conical receptacle.

I. Leaves simple :—

A. Creeping undershrub, rooting often at the nodes :—

Leaves orbicular, reniform. .. 1. *R. calycinus*.

B. Sarmentose, straggling or climbing shrubs :—

1. Leaves lobulate or not lobed at all or with shallow lobes towards the base, longer than broad :—

a. Base of leaves cuneate, rounded or subcordate, never deeply cordate or hastate :—

i. Petals present :—

Mature leaves glabrous, caudate acuminate. .. 2. *R. acuminatus*.

Mature leaves pubescent beneath, never caudate acuminate. 3. *R. hexagynus*.

ii. Petals 0 :—

Mature leaves clothed with hoary tomentum. .. 4. *R. assamensis*.

b. Base deeply cordate or hastate :—

i. Leaves white or buff tomentose beneath :—

Leaves never hastate; petiole with weak prickles. .. 5. *R. paniculatus*.

- Leaves ovate cordate to hestate; petiole with strong recurved prickles. .. 6. *R. insignis*.
- ii. Leaves green beneath :—
 Leaves bristly pubescent on the nerves beneath; prickles on the petiole and midrib close. .. 7. *R. ferox*.
2. Leaves more or less deeply lobed, mostly as broad as or broader than long :—
 a. Eglanular :—
 Drupes scarlet. .. 8. *R. moluccanus*.
 b. Branchlets, petioles and nerves on the underside of leaves with gland tipped hairs. .. 9. *R. birmanicus*.
- II. Leaves imparipinnate; leaflets 3-5 :—
 A. Normally 3 leaflets :—
 Shoots with long reddish bristles; leaflets tomentose beneath. .. 10. *R. ellipticus*.
 Shoots without bristles; leaflets glabrous on both surfaces. .. 11. *R. lucens*.
 B. Normal leaflets 3-5 :—
 Branches covered with white waxy bloom, glabrous; glands 0; petals white. .. 12. *R. biflorus*.
 Branches pubescent; gland tipped hairs on calyx and often on new shoots. .. 13. *R. opulifolius*.
- III. Leaves imparipinnate; leaflets 5-11 :—
 Petals pink; drupes black :—
 Stem often with waxy bloom, eglandular. .. 14. *R. lasiocarpus*.
 Petals white; drupes red or orange :—
 Stem with (or without form II) gland tipped stiff hairs. .. 15. *R. rosæfolius*.

1. *Rubus calycinus* Wall.

A creeping perennial herb with wiry stems often rooting at the nodes and slender runners. *Branches*, petioles and undersurface of leaves along the nerves hirsute and with

slender, often recurved prickles. *Leaves* 1-2·5 in. across, orbicular-reniform, obscurely 3-5 lobed, coarsely toothed; upper surface thinly hirsute; base deeply cordate, usually 3-nerved; basal nerves 2 branched from near the origin, subcoriaceous; petiole ·7-2·5 in. long; stipules ·25-·5 in., broadly ovate, upper narrower, toothed or nearly entire, membranous. *Flowers* 1 in. across, solitary or twin from leaf axils on short 1-2 leaved shoots; bracts paired, similar to the stipules. *Calyx* hairy and densely covered with straight prickles, about ·1 in. long; lobes foliaceous, coarsely toothed, ·3 in. by ·2-·25 in. *Petals* shorter than the calyx lobes. *Fruit* globose about ·5 in. across, of a few scarlet drupelets, with long persistent styles; stones rugose.

KHASI HILLS 4500-5500 ft., Cherrapunji, Sohrarim, etc.

Fr. 6.

2. *Rubus acuminatus* Sm. *Syr-sym-khlim*, Kh.

A climbing shrub with switchy arching glabrous branches; prickles small, curved, often scattered, mostly on stems, few on the petioles. *Leaves* 3-6·5 by ·8-3 in., ovate or ovate-oblong or lanceolate, caudate-acuminate, doubly serrate, sometimes undulate, chartaceous; base rounded or cuneate, clothed with a few hairs when young, but soon becoming entirely glabrous, undersurface paler green; lateral nerves 7-10 on either half, lowest from near the base; midrib sometimes prickly; nervules very finely reticulated; petiole slender, ·3-·7 in. long; stipules ·15-·2 in. long, slender, subulate, early deciduous. *Flowers* white, 2-5 together, corymbose, usually on short peduncles arranged in leafy terminal panicles, up to about a foot long or from upper axils; peduncles up to ·4 in. long; bracts subulate, about ·1 in. long; pedicels ·3-·7 in. long; calyx ·3-·4 in. long, often rugose outside; segments ·25-·3 in. long, lanceolate, with hooked or recurved often dorsal tips, adpressed pubescent within, erect in fruit. *Petals* ·2-·25 in. long, elliptic-oblong. *Stamens* numerous. *Carpels* glabrous or thinly pubescent; receptacle villous with long erect hairs. *Fruit* scarlet, of large drupels; stone rugose.

KHASI HILLS, 4500-6000 ft.

Flrs. 8-9. Fr. 10-11.

3. *Rubus hexagynus* Roxb. *Soima-joth-let*, Mech.; *Thik-chambak*, *Nachhu-agam*, Garo; *Asari-kanta*, Nep.; *Naga-jejeru*, Ass.; *Sebi-mepung*, Duff.; *Si-um*, Kh.; *Mahui*, Lush.

A spreading woody climber; branchlets tomentose or pubescent with numerous prickles, flattened at the base; young parts villous. *Leaves* 3-4·5 by 1·2-2·2 in., oblong, oblong-lanceolate to ovate-lanceolate, acute, shortly acuminate or obtuse, closely serrate; base subcordate or rounded, coriaceous, glabrous with age above, except along the midrib and sometimes along the nerves, pubescent beneath, specially along the nerves; midrib usually with a few weak prickles; lateral nerves 7-11 on either half, arched, ending in serratures, prominent beneath; nervules finely reticulated; petiole ·2-·3 in. long, tomentose; stipules pectinate, about ·4 in. long including the terminal segments, pubescent or puberulous; segment about ·2 in. long. *Flowers* white in ample tomentose terminal panicles, the lower branches from leaf axils; pedicels ·15-·25 in. long, grey, pubescent; bracts ·15-·2 in., pectinate; segments up to ·1 in. *Calyx* grey pubescent, about ·25 in. long. *Calyx-tube* glabrous within; lobes about ·15 in. long, lanceolate or ovate acute; tip sometimes minutely 2-3 cleft, villous within, but glabrous along an ovate patch towards the base; petals linear oblong, shorter than the calyx lobes. *Stamens* numerous. *Carpels* glabrous, about 6 on a short, hairy receptacle. *Ripe drupels* ·25-·3 in. long, red, ultimately black when ripe; stone ·2 in. long, reticulately pitted.

KHASI HILLS, up to 4500 ft., LAKHIMPUR, DARRANG, SIBSAGAR, GARO HILLS, CACHAR, GOALPARA, SYLHET.

Flrs. 10. Fr. 11-1.

***Rubus Hamiltoni* Hk. f. Syn. *R. pyrifolius* Ham.**

A very similar climber to *R. hexagynus* and probably only a variety. *Branchlets* glabrate. *Leaves* 3-6 by 1·2-1·7 in., lanceolate or oblong-lanceolate, acuminate, (usually longer than in the last species), closely serrate, coriaceous; base rounded or subcordate; midrib prickly; lateral nerves 7-10; pedicels ·2-·3 in. long, pubescent; stipules as in the last species. *Panicles* not densely pubescent; pedicels slender, ·2-·25 in. long, pubescent; bracts up to about ·4 in. long, pectinate, longer than the buds; segments setaceous, up to ·3 in. long. *Calyx* about ·3 in. long, adpressed-pubescent outside, glabrous within; lobes lanceolate, cuspidate-acuminate; tip cleft into minute setaceous segments,

villous within except for an ovate patch at the bottom. *Petals* white, shorter than the calyx lobes. *Stamens* many; carpels 6 on a hairy receptacle. *Fruit* as in the last species.

SIBSAGAR and probably in other Districts.

This plant usually dries brown whereas *R. hexagynus* dries grey but this character can hardly be used for separating the two, as I have undoubted specimens of *R. hexagynus*, which have dried brown. The other characters by which it differs are its less tomentose branches and inflorescence narrower and longer acuminate leaves, much larger bracts with much finer and longer segments and the setaceous segments of the apex of the calyx lobes.

4. *Rubus assamensis* Focke. *Soh-chiria, Soh-nybat, Kh.; Jermai-che, Shi-larnai, Synt.*

Large spreading subsucculent shrub; branchlets, inflorescence and petioles villous with spreading hairs. *Prickles* recurved, small. *Leaves* 2-4 by 1-2 in. oblong or ovate-oblong, often obscurely lobed, shortly acuminate, unequally toothed, glabrescent above with age except along the nerves, undersurface felted with white wool, except along the nerves, which are clothed with spreading hairs; lateral nerves 5-6 on either half, very oblique, excurrent into teeth; base cuneate to rounded or subcordate; petiole .15-.25 in. long; stipules .4-.5 in. long, pectinately pinnatifid, hairy. *Flowers* white .2 in. long in ample conical terminal panicles, lower branches of which arise in leaf axils; pedicels about .25-.3 in. long, slender. *Bracts* about .2 in. long, subulate from half way down cut into small setaceous segments; bracteoles small, subulate. *Calyx* densely felted with silvery white wool and spreading hairs outside; segments ovate-acuminate, glabrous within except at the apex and along the margins. *Petals* 0. *Carpels* 10-22, glabrous or with few long hairs; styles long. *Fruit* hardly exceeding the calyx, globose; drupes few, large; stone pitted; receptacle villous.

KHASI HILLS 5-6000 ft.

Flrs. 5-6. Fr. rainy season.

5. *Rubus paniculatus* Smith.

A large rambling shrub often with dark purplish-brown stems; twigs, petioles, undersurface of leaves and inflorescence white or buff tomentose; prickles few, small, hooked;

glands and bristles absent. *Leaves* 3-6 by 2·5-3·5 in., broad-ovate, cordate, acuminate, often obscurely lobed, irregularly serrate, upper surface clothed with deciduous tomentum when young; base 3-5 nerved; petiole 1-2 in. long; stipules small, laciniate. *Flowers* white, ·7-1 in. across in much branched lax terminal panicles, 4-12 in. long, the lower branches from upper leaf axils; bracts small; pedicels ·2-1 in. long. *Calyx lobes* ·3-·4 in. long, ovate-lanceolate, often caudate-acuminate, erect or reflexed in fruit. *Petals* ·2-·3 in. long, shorter than the calyx lobes. *Carpels* glabrous. *Fruit* ·5-·7 in. long, exposed; drupes black, large, glabrous, succulent; receptacle villous; stone rugose.

KHASI HILLS, 4-5000 ft. *Hooker*.

I have not come across any specimens from our area.

Flrs. 4-6. Fr. 6-7.

6. *Rubus insignis* Hk. f. *Bor-sereli-kanit*, Ass.

A large rambling scandent shrub, clothed with the exception of the upper surface of leaves with buff cottony tomentum and also with spreading hairs; glands and bristles absent; prickles hooked, small. *Leaves* 4-9 by 3·5-5 in., ovate-cordate to hastate, lobulate, shortly and often rather abruptly acuminate, closely toothed, thin but tough, glabrate with age above; base 3-5 nerved; midrib prickly; the lateral nerves (above the basal pair) 8-12 on either half, sometimes with a few prickles; petioles 1-2 in. long, densely prickly. *Flowers* white, ·5 in. across in lax terminal panicles, armed with minute prickles, lower branches arising from upper leaf axil; pedicels up to ·4 in. long, very short in forms with crowded flowers; bracts about ·15 in. long, linear, often shortly 3-fid at the apex. *Calyx* densely buff-tomentose; lobes ·2-·3 in. long, oblong-lanceolate or lanceolate, pubescent within, apex sometimes minutely 2-3-fid into setaceous segments. *Petals* white, obovate, equalling or shorter than the calyx lobes. *Carpels* numerous, glabrous. *Fruit* black; drupes acid; receptacle villous.

DARRANG, Charduar Reserve (Belsiri); KHASI HILLS, probably in other Districts also.

Superficially similar in many respects to *R. paniculatus*, but more robust in all its parts except the flowers.

Flowers according to elevation 1-4. Fr. 5-6?

7. *Rubus ferox* Wall Cat. 724.

A spreading climbing shrub; twigs tomentose; prickles short, hooked, glandular hairs absent. *Leaves* 3-5 by 2-4 in., upper ovate; lower more orbicular in outline, acuminate, often shortly 7 lobed, acute or subobtuse, sharply toothed, thin; base cordate, harsh pubescent along the midrib and often along the nerves above, undersurface green, (not buff or white) with bristly hairs along the nerves; midrib usually prickly, sometimes with weak prickles on the other nerves; basal nerves ordinarily 5; lateral nerves 4-7 above the basal; petiole 1-2·3 in. long with numerous prickles; stipules pectinately pinnatifid as are also the bracts. *Flowers* about ·7 in. across, white in lax panicles with slender ramifications. *Calyx* tomentose outside; lobes ovate or deltoid, often with lacinate segments on the margins, erect in fruit. *Petals* as long as the calyx lobes. *Filaments* hairy. *Carpels* many; drupes many; stones rugose.

N. E. FRONTIER—near Sadiya, KHASI HILLS, Sohra—*Clarke*, Musmai,—*Clarke*.

Flrs. 8-11.

8. *Rubus moluccanus* Linn. Vern. *Jutulipoka*, Ass. (Sibsagar); *Thekhi-sambak*, Garo; *Pingta-Taru*, Duff.; *Inshun-aring-kang-arong*, Mech.; *Sumahar-arikang*, Mik.; *Setai-selu*, Nep.; *Kukur-khata*, *Shumu-kam-khaseba*, Kach.; *Artheimu-chinjat*, Kuki; *Soh-nybbah*, Kh.; *Sa-shei*, Synt.

A straggling or subscandent shrub; stems from about 4 ft. to 20 ft., in robust forms; eglandular; young shoots at first whitish or fulvous, silky villous, later on tomentose, often mixed with longer hairs. *Prickles* hooked and short or in some forms straight and strong attaining ·25 in., scattered over the branches, petiole, midrib and sometimes on the nerves. *Leaves* very variable in size, pubescence and texture 2-8 in. long, as broad as or slightly longer than broad, broadly ovate or rotundate in outline, 3-7 lobed; lobes rounded to acute or acuminate, inequally serrate-dentate; base cordate or retuse, usually 5-nerved, rugose between the nervules, scabrid or nearly smooth and thinly pubescent, sometimes hirsute or glabrate above, undersurface buff or

greyish tomentose and with spreading hairs on the nerves or hairy along the nerves only; lateral nerves 3-5 above the basal; petiole .6-4 in. long, buff or greyish tomentose, hirsute or pubescent; stipules very variable, leafy and ovate-lanceolate or oblong with incised margins or pinnatifid to laciniate, .3-1 in. long, pubescent or tomentose. *Flowers* white, .5-1 in. across, in short few flowered axillary racemes or in contracted terminal panicles. *Inflorescence* villous with silky buff, rarely grey tomentum or sometimes hirsute. *Pedicels* .3-.5 in. long; bracts from .2-1 in. long, resembling the stipules or elliptic to orbicular and sometimes almost entire. *Calyx* densely fulvous or grey silky also with short tomentum; lobes .3-.6 in. long, ovate to lanceolate, acuminate, entire or cleft at the apex or with few teeth or setaceous incisions on the upper half, adpressed pubescent within, erect or ultimately more or less spreading in fruit. *Petals* shorter than the calyx lobes, white, obovate. *Stamens* numerous, glabrous. *Carpels* many, glabrous. *Fruit* globose, .4-.6 in. across, in some forms longer than the calyx. *Drupe*s scarlet, succulent; stone rugose with fine dorsal subparallel, ridges and minute pitted reticulations, receptacle villous.

Practically all over ASSAM, ascending to 6500 ft. in the KHASI HILLS.

The fruit is eaten and the juice of the roots is used as a medicine for fistula.

Flrs. & Fr. according to elevation from 1-12.

The high level subsacendent forms flower and fruit from April to October.

I am unable to find any constant characters by means of which the robust forms of this species could be separated from *R. reticulatus* Wall Cat.

The various forms of this very variable plant are almost impossible to separate as they merge into one another. The forms found in our area may be tentatively grouped as follows:—

Form I. Leaves small to medium sized, longer than or as long as broad; lobes subacute rounded or obtuse; petiole with strong or weak prickles. *Flowers* small to medium sized. *Sepals* and bracts cut up at the tip or almost entire, .2-.4 in. long. Fr. small. Weak straggling shrub up to about 4 ft.

Form II. Low spreading shrub; stem sometimes rooting at nodes; branchlets hirsute. *Prickles* straight or slightly hooked, strong, sharp. *Leaves* medium sized to large, thinly hirsute above; nerves on the

undersurface clothed with rather stiff hairs, space between the nervules glabrous or tomentose; teeth very fine, crowned with tufts of hairs; lobes acute. *Petiole* with strong, nearly straight prickles; stipules .5-.8 in. long, usually laciniate; segments plumose with spreading hairs. *Flowers* .5-.6 in. across; bracts laciniate or pectinate at the apex. *Calyx* lobes usually with few green setaceous segments at the apex. A noticeable form. In shady situations often near water.

Flrs. & Fr. 6-9.

Form III. Straggling shrub, often very robust; stem attaining about 25 ft., in favourable situations. *Prickles* on stem short. *Leaves* as broad as long or longer, mostly large, rugose to nearly smooth above; lobes acute or acuminate, coriaceous to thin; petioles with few or many prickles; stipules foliaceous, variously incised. *Flowers* medium sized to large; bracts orbicular or elliptic to ovate in outline, usually incised, sometimes entire. *Fruit* often large.

KHASI HILLS 5000-6500 ft.

Flrs. & Fr. 5-10.

9. *Rubus birmanicus* Hk. f.

A straggling shrub with wiry stems; branches, petioles, nerves on the underside of leaves and stipules clothed with numerous, flexuous bristly hairs; prickles scattered, hooked with flattened base or straight. *Leaves* usually 5, sometimes 7 lobed; lobes acute, acuminate or subacute; teeth unequal, sharp, membranous; base deeply cordate, 5 nerved, thinly hairy or glabrate above, buff or pale brownish tomentose beneath; petiole 1.5-2.5 in.; stipules .6 by .4-.5 in. long, cut up into many capillary segments. *Flowers* large in panicles with short branches; bracts similar to the stipules. *Calyx* tomentose (but not hairy). *Calyx lobes* subacute. *Petals* white, equalling the calyx lobes, orbicular, clawed. *Stamens* very numerous. *Carpels* many, glabrous; receptacle villous.

KHASI HILLS 5-6500 ft., also GARO HILLS, sheet No. 5336 if the identification of this sheet which is incomplete is correct. The description of floral parts has been based on F. B. I.

10. *Rubus ellipticus* Smith. Vern. *Jotelu-poka*, Ass.; *Shumu-mukram*, Kach.; *Arthei-mu*, Kuki; *Sia-soh-pru*, Khasi; *Sohchi-u-sow*, Sashi, Synt.

A large straggling shrub, with flexuous branches; branchlets angled, shaggy with long reddish bristles often also with

a few glandular hairs; prickles stout, hooked or slightly curved at the tip. *Leaves* pinnately 3-foliolate, lower ones sometimes 1-foliolate; rachis 1-3 in. long, prickly on the underside also shaggy with bristles; stipules .2-.25 in. long, subulate. *Leaflets* 1.2-4 in. long, and as broad or nearly so, terminal largest, broadly obovate, elliptic or orbicular; apex retuse or abruptly acute, closely serrate, dark-green and glabrate above, pale and usually tomentose beneath; lateral nerves 7-9 on either half; petiolules of lateral leaflets very short. *Flowers* .3-.6 in. across, white, crowded in short terminal leafy panicles and also in short racemes from upper leaf axils; pedicels .15-.3 in. long, grey tomentose; bracts small, subulate. *Calyx segments* .2-.25 in. long, ovate or elliptic-oblong, mucronate or acute, tomentose or pubescent on both surfaces. *Petals* white, obovate, exceeding the calyx-segments. *Stamens* in one series. *Carpels* silky. *Fruit* .4-.6 in. across, orange-yellow; drupes succulent, crowded, receptacle tapering upwards, villous; stone rugose.

SIBSAGAR—*Kuji-bali*, GARO HILLS, N. CACHAR HILLS, KHASI HILLS—up to 6500 ft., sometimes gregarious in openings, usually in hilly country from 2000 ft. upwards.

The fruit has an excellent flavour and is much eaten wherever found.

Flrs. 2-3. Fr. 5-6.

11. *Rubus lucens* Focke. Vern. *Jejeru-poka*, *Noga-jhejhelu*, Ass.; *Sum-hal*, Mik.

A stout scandent shrub, climbing tall trees; young parts puberulous, soon becoming glabrous; branches angled, grooved. *Prickles* small, hooked, scattered. *Leaves* pinnately 3-foliolate; rachis 1.7-4 in. long, usually prickly, glabrous or nearly so with age; common petiole 1.5-2.5 in. long; stipules linear. *Leaflets* 2.5-5.5 by 1.3-3 in., elliptic, ovate-elliptic to ovate-lanceolate, shortly caudate-acuminate, sharply and somewhat distantly serrate; base rounded to acute, coriaceous, glabrous, shining above, paler beneath; lateral nerves 8-10 on either half; tertiaries subparallel, ultimate reticulations extremely fine; petiolules of lateral leaflets .1-.15 in. long. *Flowers* .3 in. across on short pubescent corymbose racemes or sometimes in clusters, arranged on the

branches of lax terminal panicles, the lower branches arising in leaf axils; pedicels $\cdot 2\text{--}3$ in. long, thinly pubescent; bracts about $\cdot 1$ in. long, subulate or linear spatulate. *Calyx* very deeply lobed; base of calyx tube sometimes rugose with age; segments $\cdot 15\text{--}2$ in. long, oblong, acute or obtuse, usually mucronate, erect in fruit, densely hoary tomentose, except towards the base outside, adpressed silky pubescent within. *Petals* nearly equalling the calyx segments, "white or pink"—*Hooker*, obovate, clawed. *Stamens* 20-30. *Carpels* few, hirsute. *Fruit* enclosed in the calyx; drupes varying from six to eighteen, juicy, red; stone rugose; receptacle pubescent.

KHASI HILLS and also N. ASSAM.

Fl. & Fr. 10-2.

12. *Rubus biflorus* Buch-Ham.

A large straggling shrub, often gregarious in openings; branches purplish, glabrous, covered with a white waxy bloom giving the plant a "white washed appearance." *Prickles* stout, up to $\cdot 3$ in. long with a broad compressed base, straight on the branches, hooked on young shoots and leaf rachis. *Leaves* (1)-3-5 foliolate. *Rachis* prickly, glabrous or pubescent, sometimes also with very short glandular hairs, $\cdot 7\text{--}3\cdot 5$ in. long; stipules about $\cdot 2$ in. long, subulate or linear, the terminal leaflet largest, 1-3 by $\cdot 8\text{--}2$ in., ovate to lanceolate or rhomboid in outline, mostly lobed, sometimes with subcordate base; the lateral leaflets $\cdot 8\text{--}2\cdot 5$ by $\cdot 4\text{--}1$ in., sessile, lanceolate to ovate, all inciso-serrate, thinly pubescent or glabrate above, white woolly tomentose beneath; midrib often with few weak prickles. *Flowers* white, $\cdot 5\text{--}1$ in. across, drooping, solitary and axillary or in umbellate cymes at the ends of lateral branches or from leaf axils; pedicels glabrous, pruinose, $\cdot 4\text{--}1$ in. long, slender. *Calyx* divided deeply; lobes about $\cdot 2\text{--}3$ in. long, ovate lanceolate, apiculate, erect or spreading, ultimately reflexed in fruit, pruinose, glabrous or tomentose along the margins outside, adpressed pubescent within. *Petals* obovate or suborbicular, equalling or exceeding the calyx lobes. *Carpels* woolly towards the top. *Fruit* $\cdot 4\text{--}6$ in. across, globose, orange or yellow; styles usually collected together towards the apex and falling off in a piece; drupes juicy, palatable, glabrous or floccose, woolly

on the inner face; seeds reticulate pitted; receptacle rugose and densely or sparsely woolly.

KHASI & JAINTIA HILLS 5500-6500 ft., Laitkor Forests. Peak Forests etc.

Flrs. 4-5. Fr. 5-6.

Flowers. & Fruits are borne ordinarily on short lateral shoots bearing leaves with 3 leaflets.

13. *Rubus opulifolius* Bertol.

A straggling shrub; young parts, rachis and inflorescence softly white or greyish tomentose; new shoots often with gland tipped hairs. *Prickles* few, up to .1 in. long, hooked or straight with a flattened base. *Leaves* 3-5 foliolate with few prickles on the back; stipules subulate or linear, .15-.25 in. long. *Terminal* leaflet largest, 1.2-2.5 by 1.2 in., usually irregularly lobed, ovate to ovate-rhomboid in outline; lateral leaflets .7-2 by .5-1.3 in., elliptic to lanceolate, often somewhat oblique at the base, crenate-serrate, acute-acuminate, sometimes subacute, soft, dull green and softly hairy or glabrescent above, clothed beneath with matted wool except on the nerves, which have spreading yellowish hairs; lateral nerves 5-7 on either half, lowest pair from the base; pedicels of lateral leaflets very short. *Flowers* .5 in. across in short congested tomentose racemes up to .7 in. long terminating lateral branches or a few flowers from upper axils; bracts tomentose, subulate or linear up to .25 in. long; bracteoles setaceous, very small; pedicels .15 in. long, stout with or without glandular bristles, elongating in fruit. *Calyx* densely tomentose and with gland tipped bristles outside; lobes about .25 in. long, lanceolate or ovate, acuminate, adpressed silky within. *Petals* about .2 in. long, deep pink, broadly obovate, suborbicular, clawed, erose. *Stamens* numerous; filaments pinkish. *Carpels* clothed with silky hairs. Fruit globose, about .3-.4 in. across; drupels orange or yellow tipped with black, large, succulent; stone pitted, receptacle short, hairy.

KHASI HILLS, usually 5500-6500 ft.

Apt to be mistaken for *R. biflorus* from which it can be easily distinguished by its smaller and fewer prickles, glandular calyx and shoots and its fruits with prominently persistent styles.

14. *Rubus lasiocarpus* Smith. *Shumugam-gamphu, Dieng-soh-khao-iong, Sia-soh-khaw-iong, Kh.; Soh-chi-iong, Sa-kho-iong, Synt.*

A large spreading shrub; branches long, often pruinose, glabrous with age, usually purplish below the bloom; young parts tomentose. *Prickles* stout, hooked or straight, up to .4 in. *Leaves* 5-7, sometimes only 3 or up to 11 foliolate, 3-10 in. long; rachis usually with hooked prickles, tomentose or glabrate with age; stipules .2-.3 in. long, subulate. *Leaflets* 1-4 by .4-2.5 in., terminal often broadest and lobulate, ovate, elliptic or ovate lanceolate, acuminate, acute or subacute, simply or doubly cuspidate, toothed or serrate, subcoriaceous, glabrous or pubescent above, thickly white tomentose beneath; lateral nerves 7-10 on either half, impressed above, prominent beneath, close, straight. *Flowers* .3-.7 in. across, purplish-pink, in terminal and axillary, simple or paniced lax, tomentose corymbs; pedicels of various lengths, usually .1-.25 in. long; bracts linear, small. *Calyx* densely woolly; lobes about .2 in. long, ovate or ovate-lanceolate, acuminate. *Petals* pink or purple pink, obovate or sub-orbicular, usually shorter than the calyx lobes. *Carpels* tomentose, many. *Fruit* .3-.5 in. across; drupes succulent, black when ripe with glaucous bloom, receptacle villous, columnar; stones pitted.

GARO HILLS, N. CACHAR HILLS, KHASI HILLS, usually above 2000 ft., ascending to 6500 ft., often along nalas and streams in low elevations, but by no means confined to such situations in cooler places.

The ripe fruit is sweet and has a delicate flavour. It is much eaten and is also used for jellies and jams wherever available in sufficient quantities. The fruit is however frequently attacked by insects when about to ripen.

Flrs. 3-4. Fr. 5-7.

The flowers and fruits are borne mostly on lateral branches which are borne in leaf axils in the second year on new shoots.

15. *Rubus rosæfolius* Smith. *Soh-sherria, Dieng-soh-bhoroya, Kh.*

A straggling or procumbent shrub; young parts, leaf rachis and inflorescence villous to glabrous, with short or

long, spreading, stiff, purple gland tipped hairs. *Branchlets* green. *Prickles* numerous, sharp, nearly straight with flattened base on older branches, hooked on shoots, leaf rachis and inflorescence. *Leaves* imparipinnate, 5-9-(11) foliolate, often reduced in number at the ends of branches, sometimes to a single leaflet near the inflorescence. *Rachis* of normal leaves 2-6 in. long; stipules $\cdot 2\cdot 3$ in. long, linear-lanceolate. *Leaflets* $\cdot 6\cdot 2\cdot 2$ by $\cdot 3\cdot 1\cdot 2$ in., terminal usually largest and often lobed, ovate to oblong-lanceolate, doubly inciso-serrate, acuminate or acute; base rounded or cuneate, membranous, green on both surfaces, glabrate above, pubescent, sometimes mixed with glandular hairs beneath on the nerves; midrib often prickly; lateral nerves 9-14 on either half, nearly straight, subparallel; petiolules of lateral leaflets very short. *Flowers* white, $\cdot 7\cdot 1$ in. across, terminal or axillary, solitary on stalks, $\cdot 4\cdot 2\cdot 2$ in. long or in lax panicles. *Bracts* resembling the stipules. *Calyx* deeply cleft with or without glandular hairs outside; segments $\cdot 3\cdot 4$ in. long, ovate-lanceolate or oblong, gradually or abruptly caudate-acuminate, reflexed in fruit, glabrate or tomentose along the margins outside, clothed within, except sometimes at the base with dense felted tomentum. *Petals* about as long as or slightly longer than the calyx lobes, obovate or suborbicular, clawed. *Stamens* many. *Carpels* very numerous, glabrous on a villous receptacle. *Fruit* $\cdot 5\cdot 6$ in. long, cylindric or oblong or (in form I) globose and up to $\cdot 7$ in. across. *Drupe*s numerous, small and somewhat dry or succulent and large, orange, yellow or scarlet; seeds rugose.

LAKHIMPUR—Dulong-mukh. GOALPARA—North Sidli Line; N. CACHAR HILLS, KHASI HILLS up to 6500 ft., probably also in other submontane tracts.

Flrs. 2-8. Fr. 3-10, according to altitude.

The above description includes the following varieties :—

Var. *Sorbifolius*. *R. Sorbifolius* Max. Glandular hairs on branchlets long persistent, spreading. *Calyx* densely clothed with glandular hairs. *Fruit* cylindric; drupes very small, almost dry, tasteless, orange or yellow when ripe.

Var. nov *rubrocarpa*; branchlets without or with very few glandular hairs, secondary nerves of leaflets close. *Flowers* and *fruits* larger than in the last variety. *Calyx* without glandular hairs outside. *Fruit* globose to oblong; drupes scarlet when ripe, succulent, edible.

The flowers and fruits are usually borne on short lateral branches, which appear in the second year on the axils of new shoots. The leaves on these lateral branches have mostly 3 leaflets.

KHASI HILLS—Peak forests—6500 ft., also LAKHIMPUR.

The above varieties differ so markedly in their fruits, habits and indumentum that it is probable that we are dealing with two species.

The following variety occurs as an escape in Lakhimpur District and also at Cherrapunji.

Var. *coronarius*, *Rubus sinensis* of horticulturists. A small shrub covered specially on the leaves with minute scales. *Leaflets* 3.5-7 in., terminal sometimes lobulate, 1-2 by .4-1 in., green on both surfaces. *Flowers* white, about 1-2 in. across; double stamens being mostly transformed to petals resembling a small rose. *Carpels* with a few hairs at the top. *Fruit* not known in our area.

Native country unknown—probably S. E. ASIA.

Flrs. almost all the year round.

The following may be mentioned :—

1. *R. khasianus* Card.

A shrub, prickles few, recurved. *Leaves* simple, long petioled; petioles 2.6-3.4 in. long, villous, sparsely aculeate. *Blade* 4.7-5.9 in. by 4.3-5 in., ovate-cordate, 5-lobate, terminal lobe longest, lobes acute, sinuate, more or less toothed, upper surface somewhat rugose with scattered tubercles; nerves pilose, undersurface paler. *Stipules* palmately dissected. *Flowers* in short, axillary or terminal racemes, about 4 in. across; pedicels short, villous; bracts similar to the stipules, apex cut up into narrow segments. *Calyx* campanulate, villous with yellowish silky hairs, segments tomentose within, outer 3, inciso-dentate, inner two subentire. *Petals* white (?), suborbicular, shortly clawed. *Stamens* in many series, apex of connective with few harsh hairs. *Carpels* glabrous; style filiform, glabrous. *Fruit* not known.

KHASI HILLS 3-5000 ft.—*Hk. f. & Thomson* No. 467.

2. *Rubus* sp. near *R. cartægifolius* Bge.

A gregarious undershrub about 3 ft. high, armed with sharp close prickles. *Leaves* longer than broad, lobed, acuminate, unequally serrate, glabrous or nearly so, midrib prickly. Flrs. & Fruit not seen.

In the absence of flowers and fruits it has not been possible to determine the position of this very interesting plant. Probably introduced. Government orchard, Shillong.

3. *R. Burkillii* Rolfe.

A straggling shrub, armed with sharp recurved prickles. *Leaves* simple, 2-4 in. long, broadly ovate to suborbicular in outline, about 5-nerved at the base, somewhat irregularly 3-5 lobed, lobes often rounded, inciso-crenate, hairy along nerves on both surfaces; petioles .5-1.5 in. long; stipules narrow-laciniate. *Flowers* white, 3-7 together, often subcorymbose on short terminal or axillary racemes; pedicels

·2·25 in. long, pubescent. *Calyx* lobes about ·2 in. long, acute, with few lateral segments, thinly pubescent outside. *Petals* obovate, ·2·24 in. *Drupes* few, bright red.

Kobo—Abor Hills.

Fr. 12.

A scandent *Rubus* agreeing in many respects with the above plant has been collected in Mamloo-Khasi Hills (sheet 9363). It may prove to be a local form of the species. It differs from *R. Burkillii* by :—

- (i) its narrower leaves which are longer than broad, sharply acuminate, the lobes being irregular sometimes, completely dividing the leaf into 2 leaflets or almost absent in the upper leaves.
- (ii) more robust corymbs;
- (iii) more densely pubescent calyx with larger number of lacinate lateral segments on the lobes;
- (iv) more succulent drupes.

It is also less prickly on the whole than *R. Burkillii*.

Flrs. & Fr. 9.

***Fragaria indica* Andr.**

A silky pubescent herb with perennial rootstock and slender runners. *Leaflets* usually digitately 3-foliolate; stipules foliaceous, adnate to the slender petiole, 1·5 in. long. *Leaflets* 1·1·5 in. long, obovate, toothed; base cuneate, nerves subparallel. *Flowers* yellow, ·5·1 in. across, solitary on long axillary peduncles equalling the petioles. *Calyx* persistent with 5 long bracteoles exceeding the lobes. *Petals* 5, obovate. *Stamens* many, persistent. *Carpels* many on a convex receptacle. *Fruit* of numerous minute black, achenes on a fleshy red receptacle, spherical, insipid.

Submontane tracts ascending to 6000 ft. in the KHASI HILLS, often covering sheltered banks.

Flrs. & Fr. almost throughout the year.

***Fragaria nilgerrensis* Schdl.**

A stouter herb than the last with perennial rootstock and long runners clothed with long spreading hairs. *Leaves* digitately 3-foliolate; petiole up to 5·5 in. long with more or less sheathing base; stipules adnate to the base of the petiole, broad with scarious margins. *Leaflets* 1·1·5 in. by ·8·1·2 in., obovate, lateral usually oblique, coarsely and sharply toothed, margins pilose, undersurface densely pubescent, nerves prominent beneath. *Flowers* white, ·5·1 in. across, few cymosely arranged on a stout peduncle; pedicels ·8·1·2 in. long. *Calyx* lobes spreading, ovate acuminate; bracts 5, persistent, smaller than the calyx lobes and alternating with them, lanceolate, often cleft at the apex. *Petals* obovate, exceeding the calyx segments. *Stamens* and carpels

many. *Fruit* up to .7 in. across, white with pinkish tinge, subacid; achenes reddish-brown, minute, imbedded in the fleshy receptacle.

KHASI HILLS 5-6500 ft.

The fruit is eaten but is inferior to the wild straw berry of N. W. Himalayas, *F. vesca* Linn.

Potentilla Mooniana Wight. Vern. *Lyngniang-masi*, Kh.

A prostrate or erect hirsute or villous herb with perennial rootstock. *Leaves* 1.5-6 in. long or longer, interruptedly pinnate, larger leaflets alternating with one or more pairs of very small leaflets; rachis silky; stipules membranous or foliaceous. *Leaflets* many, sessile, larger .4-1.5 in. long, elliptic to oblong, smaller, orbicular to cuneate, .1-.4 in. long, all inciso serrate, clothed with spreading hairs beneath. *Flowers* yellow, .3-.5 in. across on congested corymbs or lax panicles with long pedicels. *Calyx* lobes 5, villous, alternating with 5 deeply toothed, more or less lobed bracts. *Petals* 5, obovate-orbicular. *Stamens* many. *Carpels* free, many; style ventral. *Fruit* of minute, smooth, achenes on an elevated hairy receptacle.

KHASI HILLS 4-6500 ft.; common.

The roots are chewed with pan.

Flrs. & Fr. 2-10.

Potentilla fulgens Wall. Vern. *Lyngiang-bru*, Kh.

A prostrate or erect herb attaining 24 in. in height with a stout rootstock, clothed on the stem, inflorescence and leaf rachis with soft spreading hairs. *Leaves* interruptedly pinnate as in the last species, 2-6 in. long; stipules membranous to sessile, foliaceous; leaflets many, sessile, extending to the base of the rachis, larger leaflets .4-1 in. long, obovate to elliptic, smaller, .1-4 in. long, obovate to orbicular, all coarsely serrate, lateral nerves often impressed above, sub-parallel, undersurface villous with silvery white hairs. *Flowers* yellow, .3-.5 in. across, in lax terminal corymbose panicles or congested corymbs. *Calyx* lobes with long spreading hairs; bracts smaller, silvery, entire or lobed. *Stamens* and carpels many. *Achenes* on an elevated villous receptacle.

KHASI HILLS—5-6500 ft., sometimes gregarious in recent clearances.

Flrs. & Fr. 5-9.

Potentilla Kleiniana W & A.

An annual with many slender prostrate hairy stems. *Leaves* digitately 3-5 foliolate; petiole slender, those of radical leaves long, others short; stipules .2-.5 in. long. *Leaflets* obovate or oblanceolate, .3-2 in. long, obtusely toothed. *Flowers* yellow, about .25 in. across, pedicellate in terminal cymes. *Petals* scarcely exceeding the calyx. *Achenes* with sub-parallel wrinkles along the length.

KHASI HILLS 4-5000 ft.

Agrimonia Eupatorium Linn. Vern. *Lynniong-tyinning*, Kh. The Agrimony.

An erect leafy herb with a perennial and more or less woody rootstock, clothed with spreading soft hairs. *Leaves* 2·5-7 in. long, interruptedly imparipinnate with very small leaflets between larger ones; stipules partly adnate to the rachis, large foliaceous up to 1 in. long. *Leaflets* 7-21, sessile, larger 1-3 in. long, obovate to elliptic or lanceolate, smaller ·1-·3 in., cuneate or orbicular, all coarsely toothed, pubescent on both surfaces. *Flowers* about ·25 in. across, yellow, in elongate, terminal, spike-like racemes; pedicels short with 1-3 cleft or fid; bracts ovate acuminate in outline; bracteoles 2. *Calyx tube* ·1-·2 in. long, turbinate, villous, grooved, somewhat enlarged and hardened in fruit, top of tube with a dense ring spines, which become hooked in fruit; lobes 5, elliptic to oblong lanceolate, imbricate in bud. *Petals* 5, oblong-obovate, about ·1 in. long, much exceeding the calyx lobes. *Stamens* about 15, inserted at the mouth of the calyx tube. *Carpels* 2, included in the calyx tube. *Fruit* of 1 or 2 achenes, enclosed in the spinous calyx tube.

KHASI HILLS 4-6000 ft.

Flrs. 4-10.

Poterium longifolia Betrol. Vern. *Bat-tari*, Kh.

A somewhat stiff glabrous herb attaining up to 4 ft., with many branches and stout rootstock. *Leaves* pinnate, 5-16 in. long; stipules adnate to the base of the sheathing petiole, upper foliaceous; leaflets petiolate, ·7-3 in. long, linear oblong, crenate, rigid, nerves prominently reticulate beneath. *Flowers* purple, about ·12 in. long, bracteate and 2-bracteolate, subsessile, collected together in paniced spike-like heads, ·7-2·5 in. long with slender stiff peduncles. *Calyx tube* persistent, compressed, pubescent; lobes 4, in opposite pairs of which one is broader than the other, thickened towards the tip, which is notched and with a mucro in the notch, back with a few hairs. *Petals* 0. *Stamens* 4, with slender filaments. *Disk* closing the mouth of the calyx tube. *Carpel* 1, enclosed in the calyx tube. *Fruit* of 1 achene enclosed in the hardened shortly 4 winged calyx tube.

KHASI HILLS in fallow lands—5-6000 ft.

Flrs. 8-10.

5. SPIRÆA Linn.

Spiræa callosa Thunb. Vern. *Soh-Byrthit*, Kh.

An erect or straggling shrub attaining about 7 ft. in height; branchlets pubescent; young parts grey tomentose. *Leaves* alternate, ·8-2 by ·4-·8 in., ovate oblong to oblong lanceolate or lanceolate, sometimes rhomboid-lanceolate towards the ends of the branches, acute, doubly inciso-serrate; base cuneate, thinly pubescent and ultimately glabrate above,

glaucous and pubescent along the nerves beneath, chartaceous; main lateral nerves 7-9 on either half, prominent beneath, nervules finely reticulated; petiole very short, pubescent; stipules minute, caducous. *Flowers* hermaphrodite, white, often with a touch of pink about .2 in. across in compound, spreading, corymbose, cymes terminating branches. *Pedicels* up to about .1 in. long; bracts linear-lanceolate to spatulate, up to .25 in. long; bracteoles about as long as the calyx, both long persisting. *Calyx* pubescent, about 1 in. long, persistent. *Calyx-tube* obconic, lobes 5, triangular-ovate, reflexed in fruit. *Petals* 5, nearly .1 in. long, orbicular; stamens many. *Disk* lining the calyx tube and ending in a prominent glandular ring. *Carpels* 5, free, villous on the inner face; ovules shining; styles subterminal. *Fruit* of 5, shining follicles, about .1 in. long, thinly hairy or glabrous.

KHASI HILLS about 6000 ft.

Flrs. 6-8. Fr. 8-10.

Spiræa cantoniensis Lour. Syn. *S. corymbosa* Roxb.

A branchy and straggling shrub with purplish or greenish-brown glabrous branchlets. *Leaves* .8-1.5 by .3-.5 in., ovate-oblong to rhomboid, subacute, inciso-serrate on the upper half, entire towards the cuneate and often subtriplinerved base, glabrous above, undersurface glaucous; lateral nerves ascending, straight; petiole .15-.2 in. *Flowers* snow-white, .3 in. across in conspicuous axillary and terminal, umbellate corymbs; pedicels slender, up to .4 in. long. *Calyx* broadly turbinate, about .1 in. long, glabrous; teeth triangular, acute; disk glands prominent as many as, and opposite to stamens. *Petals* orbicular, .15 in. long. *Carpels* free, 5.

Cultivated in the Hills often for hedging and also in gardens in plains.

Flrs. mainly 3, but continue to 5; second flush sometimes in 9-10.

6. NEILLIA Don.

Neillia thyrsiflora Don. Vern. *Torsuin*, Kh.

A branchy shrub with drooping shoots, attaining 6 ft. in height; young parts hairy. *Leaves* 1.5-3.5 by 1.2-2 in., ovate, caudate-acuminate, more or less three lobed, doubly inciso-serrate, dark-green and glabrous above with age, paler and thinly pubescent along the nerves beneath, membranous; base bordered by a pair of strong nerves, subcordate or rounded, often abruptly narrowed along the basal nerves to

the petiole; lateral nerves 4-5 on either half nervules very finely reticulated; petioles .2-.3 in. long, channelled, thinly hairy; stipules .2-.3 in. long, ovate, acute, coarsely toothed. *Flowers* usually in branched terminal or axillary pubescent racemes up to 4 in. long, the latter from upper leaf axils and sometimes simple. *Pedicels* short; bracteoles .2-.3 in. long, persistent, ovate or lanceolate, acuminate, coarsely toothed to almost entirely pubescent. *Calyx* about .25 in. long, campanulate, hairy and sometimes minutely glandular, persistent and glandular-bristly in fruit, lobes 5, about .12 in. long, induplicate, valvate in bud, ovate, caudate acuminate. *Disk* lining the calyx-tube. *Petals* 5, white, about .1 in. long, broadly obovate. *Stamens* 20-25, incurved. *Carpel* 1, free, thinly hairy; style subterminal, shortly extruded; stigma capitate; ovules 8-12 in two collateral rows. *Fruit* a coriaceous follicle almost enclosed in the calyx tube. *Seeds* small, brown, polished, marginally ridged, albuminous; testa hard, inflated.

KHASI HILLS, 5-6000 ft.

Flrs. 5-6. Fr. 8-11.

7. ROSA Linn.

Sarmentose, climbing or erect shrubs, usually prickly. *Leaves* imparipinnate; leaflets serrate; stipules adnate to the petiole. *Flowers* terminal, solitary or in corymbs, white, red or yellow; bracts usually deciduous. *Calyx tube* persistent, globose or ovoid with contracted mouth, lobes foliaceous. *Petals* 5 (in several series in cultivated plants) large. *Stamens* numerous, inserted on the edge of the disk. *Disk* lining the calyx tube and nearly closing its mouth. *Carpels* usually many at the bottom of the calyx tube; styles subterminal, free or connate above; stigma thickened; ovule 1, pendulous. *Achenes* coriaceous or bony, enclosed in the fleshy calyx tube, forming a pseudo-baccate fruit.

Prickles scattered, recurved; leaflets large,
entirely glabrous; flowers in spreading
corymbs; pedicels over .7 in. long; styles
connate.

1. *R. longicuspis*.

Prickles mostly in infrastipular pairs, straight; leaflets small, usually with pubescent midrib; flowers solitary or in congested racemes; pedicels under .4 in. long; styles free.

.. 2. *R. involucrata*.

1. *Rosa longicuspis* Bertol. Vern. *Shia-khari*, *Shia-soh-mei*, Kh.

An evergreen tall and often very strong climber with a stout stem; branchlets glabrous; prickles scattered, recurved, strong. *Leaves* 3-6.5 in. long, rachis often glandular and prickly; stipules .5-.7 in. long, free portion subulate, lanceolate or ovate with glandular margin. *Leaflets* 5-7-(9), sometimes 3, 1-3 by .5-1.2 in., lower gradually smaller, ovate to oblong-lanceolate, caudate or short acuminate, serrate, subcoriaceous, glabrous; lateral nerves 7-11 on either half, very slender; petiolules very short. *Flowers* white, about 1.5 in. across, fragrant in terminal simple or compound corymbs; pedicels .7-2 in. long, pubescent and with deciduous glandular bristles; bracts up to .6 in. long, lanceolate-caudate, glandular. *Calyx tube* .25-.3 in. long, broadly obovoid, pubescent outside; lobes .5-.8 in. long, ovate or lanceolate with a caudate apex often with a few long teeth on the margins, pubescent and glandular outside, tomentose within. *Petals* .6-1 by .5-.7 in., broadly obovate or obcordate, silkily tomentose outside. *Styles* connate, exserted, column villous; stigmas expanded. *Fruit* obovoid or globose, .4-.5 in. across, brown when ripe, crowned by the calyx lobes; achenes .15 in. long.

KHASI HILLS, 5-6000 ft., usually in cool situations.

Flrs. 4-5. Fr. 10.

2. *Rosa involucrata* Roxb. Vern. *Nahor-katani*.

A compact bush; bark almost black, thin, blaze brown; young parts and inflorescence grey or brownish tomentose. *Leaves* 2-4 in. long; rachis pubescent or ultimately glabrescent, sometimes prickly, usually with a pair of infrastipular, straight, compressed, prickles; stipules .2-.3 in. long, laciniate, adnate to the common petiole. *Leaflets* 7-9, shortly stalked, .6-1.25 by .2-.6 in., oblong to elliptic-lanceolate, broadly acute or obtuse, finely serrate with

deciduous bristly tips, coriaceous, dark-green and glabrous above, usually pubescent along the midrib beneath; lateral nerves fine, rather indistinct. *Flowers* white, 1·5-2 in. across, in short few flowered terminal corymbs or solitary; peduncles stout, much shorter than the leaves; pedicels short; bracts up to ·7 in. long, lanceolate in outline, densely tomentose, irregularly cut up along the margins into setose teeth or segments. *Calyx* tube globose, ·2·3 in. across, brown or greyish velvety outside; lobes ·5·7 in. long, lanceolate or ovate-acuminate, pubescent within, deciduous in fruit. *Petals* ·7·1·2 in. long, broadly obovate, retuse at the apex, glabrous. *Styles* free; stigmas discoid hairy, collected together into a cushion-like mass. *Fruit* ·4·5 in. long, globose, tomentose.

Edge of sluggish streams in SIBSAGAR, SYLHET, GARO HILLS, GOALPARA, probably in other Districts as well.

The stipules, peduncles and bracts are sometimes glandular. The trunk is quite stout and the wood is cream coloured.

Flrs. 2-4. Fr. 5-7.

A concise synopsis of roses ordinarily cultivated in India is given in Brandis Forest Flora p. 199-201 and reproduced with few modifications by Hooker in Flora of British India Vol. II. P. 364. The climate of Assam does not seem to be so well suited for the growing of European roses as that of the other provinces of Northern India. Of the many kinds which thrive the following may be mentioned :—

1. **Rosa damascena** Mill. Vern. *Golap*. Prickles unequal, mixed with a few glandular bristles, larger ones hooked. *Flowers* scented, pink; sepals reflexed after flowering.

The commonest garden rose in the province.

2. **Rosa centifolia** Linn. Vern. *Golap*, Cabbage, Moss or Provence rose. *Prickles* unequal, mixed with numerous glandular bristles; leaflets and calyx glandular-ciliate. *Flowers* scented.

In this province it has a tendency to become very leafy with few flowers. Commonly used as stock for grafting better class roses on.

3. **Rosa microphylla** Lindl. *Branchlets* weak, prickles infrastipular; leaflets small, 9-15. *Flowers* pale pink, double. *Calyx* densely clothed with long bristly prickles.

Grown often in the hills, quite hardy.

4. **Rosa Banksiæ** R. Brown. Lady Banks' rose. Scandent and almost unarmed; leaflets 3-5; flowers white or yellow in dense corymbs. Common in Shillong.

5. Rosa multiflora Thunb. Climbing, prickly. *Flowers* pink to deep red in dense massive corymbs. *Petioles*, peduncles and calyx tube pubescent.

Common in hedges and gardens in KHASI HILLS where it is a conspicuous feature during May. It also seems to be spreading in the vicinity of the town as a naturalized plant.

6. Rosa indica Linn. Syn. *R. chinensis* Jacq. Vern. Kanta golap, Beng. Glabrous, prickles equal, evergreen; stipules adnate nearly to the apex; flowers large, double to single, white rose purple or yellow on long pedicels; calyx segments reflexed. The numerous hybrid perpetuals of florists, the tea roses and the Bengal and China roses belong here. The last two groups are usually strongly scented.

Some of the roses commonly found are hybrids between this *R. damascena* and *R. centifolia*.

7. Rosa alba Linn. Vern. *Shwet golap*, Beng.—A spreading subsucculent shrub; prickles scattered, unequal; leaflets 5-7, large, greyish, rugose, downy and pale beneath. *Flowers* white or of a delicate blush tint, usually double; calyx segments pinnatifid.

8. DOCYNIA Dcne.

Trees, young parts usually woolly. *Leaves* deciduous, simple lobed in young plants; stipules deciduous, subulate. *Flowers* white, solitary or fascicled. *Calyx tube* tubular at the free end, lobes ultimately reflexed. *Petals* 5, with long woolly claws. *Stamens* 30-50, inserted at the throat of the corolla tube; anthers dorsifixed. *Ovary* adnate to the calyx tube, 5-celled; styles connate and woolly below the middle, upper portion free; ovules superposed, 3 in each cell, lowest basilar. *Fruit* a pyriform rounded or ovoid pome; endocarp tough; seeds plano-convex, testa coriaceous.

Pedicels .4-1 in. long; calyx tube elongated clavate; fruit longer than broad. 1. *D. indica*.

Pedicels .2-.4 in. long, stout; calyx tube turbinate or pyriform, short; fruit not longer than broad. 2. *D. Hookeriana*.

1. Docynia indica Dcne. Vern. *Soh-phoh*, *Dieng-soh-phoh-soh*, *Saw*, Kh. The Indian crab apple.

A moderate sized to tall deciduous tree, young parts and inflorescence woolly. *Bark* cinereous brown or grey usually with white blotches, warty with lenticels, nearly smooth on upper parts of stems, rough with dark patches on older parts towards the base; blaze light dun brown with white bands,

deeper layers, whitish brittle, about .25 in. thick. *Leaves* 2.4 by .9-2.2 in., ovate or oblong lanceolate, acuminate, serrate or serrulate or almost entire, coriaceous and glabrous when mature; lateral nerves 6-9 on either half, obliquely arcuate; base rounded and often entire; petiole .5-1.2 in., ultimately sparsely hairy or glabrescent; stipules .15-.2 in. long, subulate, reddish, early deciduous. *Flowers* about 1 in. across in fascicles of 2-3 or solitary; pedicels .4-1 in. long, dilated upwards. *Calyx* woolly outside; tube .25-.3 in. long, elongated, clavate; lobes narrow lanceolate, acuminate, sometimes with minute deciduous glands on the margin, woolly at the base, thinly pubescent or glabrescent upwards, .5-.6 in. long. *Petals* spreading, obovate-oblong, .5-.6 in. long, claw about .1 in. long. *Filaments* unequal, subulate, glabrous. *Pome* pyriform, 1-1.5 in. long, rugose when young, smooth with age, crowned with the remains of the calyx lobes. *Seeds* 3 in each cell.

KHASI HILLS, wild and cultivated.

The acid fruits are eaten both raw and cooked. It is sometimes used as stock for grafting apple on.

The wood is used for tool handles and the branches make good walking sticks.

Young plants are spinescent and have lobed and coarsely serrate leaves.

Flrs. 2-3. Fr. 8-9.

2. *Docynia Hookeriana* Dcne. Vern. *Soh-phoh-heh*, *Dieng-soh-pho*, Kh.

A large tree with spreading branches; young parts and inflorescence densely covered with deciduous wool. *Bark* dark-grey or black, rough, exfoliating in roundish flakes, .5-.75 in. thick; blaze cheesy lightbrown, with vertical lines, turning dark-brown on exposure. *Leaves* 1.7-3.5 by .6-1 in., (4-5 in. long according to Hooker) narrow oblong or ovate lanceolate, long acuminate, serrate on the upper $\frac{3}{4}$ rd, coriaceous; lateral nerves 7-10 on either half, obliquely arcuate; petiole .2-.7 in. long; stipules caducous, subulate, .15-.2 in. long. *Flowers* 1 in. across, solitary or in fascicles of 2-3; pedicels stout, .2-.4 in. long. *Calyx tube* densely woolly, 1.5-2 in. long, broad, turbinate or pyriform, constricted at the top, lobes .3-.4 in. long, often with minute

deciduous glands on the margin. *Petals* .4 in., broadly elliptic or suborbicular, abruptly narrowed to the minute claw. *Pome* contracted below the remains of the sepals, broad pyriform?

Hardly more than a variety of the last species which it closely resembles. The fruit is of different shape and much broader.

The wood is used for tomtoms and drums and the fruit is eaten.

Flrs. 2-3. Fr. 9.

9. ERIBOTRYA Lindl.

Small or large trees or sometimes shrubs. *Leaves* simple, serrate or entire, coriaceous; stipules lanceolate or broad. *Flowers* pentamerous, white, in dense panicles. *Calyx* tube adnate to the ovary, lobes small, erect or spreading, persistent. *Petals* 5, contorted or imbricate in bud, obovate, orbicular, usually notched and oblique, margins sinuate, claw woolly or glabrous; stamens many. *Ovary* 2-5 celled; styles 2-5, connate and woolly below; ovules 2 in each cell, basal, ascending. *Fruit* a succulent or dry berry, rarely 2-celled; endocarp membranous, usually 1, less often 2-3 seeded. *Seeds* large, angled, cotyledons very thick.

I. Indigenous species. Style 2-3.

a. A stiff shrub. Leaves linear-oblongate or lanceolate, pointing upwards.

1. *E. angustissima*.

b. Trees:—

Leaves thickly coriaceous, usually over 2 in. broad, long petioled, small to mod. sized trees.

2. *E. bengalensis*.

II. Cultivated species. Styles 5.

3. *E. japonica*.

1. *Eriobotrya angustissima* Hk. f. Vern. *Soh-thyllong*, *Dieng-sarang*, *Dieng-soh-thlong*, Kh.

A rigid evergreen shrub up to 10 ft. high, often gregarious on river banks. *Stem* brown plain; blaze light-brown, turning yellowish brown; branchlets often prominently marked with leaf scars; young parts rusty or brown woolly, soon becoming glabrous. *Leaves* often close together and appearing subopposite, usually pointing upwards, 2.4-5 by .4-.8 in., linear oblongate or lanceolate, subacute, bluntly short, acuminate, obtuse or rounded, distantly serrate on the upper half, stiffly coriaceous, glabrous, dark-green above;

lateral nerves 8-11 on either half, upper usually ending in serratures, base attenuated to the short petiole, dilated at the base; stipules minute, subulate. *Flowers* white, about .3 in. across in dense terminal corymbose panicles, 1.2-2.2 in. long, buds rusty or brown tomentose, ovoid or subglobose; bracts and bracteoles rusty pubescent; lowermost linear spatulate up to .6 in. long, gradually smaller upwards; bracteoles ovate to subulate, uppermost opposite at the base of the calyx, tube minute; pedicels .1-.15 in. long, stout. *Calyx tube* turbinate, about .15 in. long, pubescent or puberulous, glabrous with age; lobes very short, oblong-obtuse, densely woolly along the margins. *Petals* contorted, imbricate in bud, white, .15-.2 in. long, broadly obovate or suborbicular, usually notched at the apex, villous at the base (claw) inside. *Stamens* 20; filaments subulate, glabrous. *Styles* 3, shorter than the stamens, base and crown of ovary woolly. *Berry* pyriform, yellow when ripe, speckled, .6-.75 by .4-.5 in., 2-3 celled, not more than 2-seeded, edible.

KHASI and JAINTIA HILLS, 4500-5500 ft., Rongangiri, GARO HILLS, DC.

Old leaves yellow to red.

Flrs. 3-4. Fr. 10.

2. *Eriobotrya bengalensis* Hook. f. Vern. *Dieng-sijnerei*, *Dieng-la-bysu*, Kh.; *Ching-nei-lei*, Naga; *Theng-okri-arong*, Mik.; *Laru-bandha*? Ass.; *Bolanchin*, Garo.

A medium sized or large tree; bark grey or dark-grey, plain or with shallow vertical furrows about 1 in. thick and warty about .15-.2 in. thick. *Blaze* yellowish with white lines, turning brown on exposure; branchlets stoutish, young parts brown tomentose. *Leaves* very variable, 4.5-10.5 by 2.2-5 in., elliptic-oblong, lanceolate or obovate, short acuminate, often abruptly, sometimes obtuse, coarsely serrate, thickly coriaceous, glabrous and shining above, glabrate or slightly puberulous along the nerves beneath when mature; lateral nerves 8-15 on either half, forked near the margin, branches usually ending in serratures; base abruptly cuneate or gradually attenuate; petiole .8-2 in., dilated at the base; stipules linear-oblong, acute or acuminate with persistent broad bases, up to .8 in. long. *Flowers* white, fragrant,

·3 in. across. *Panicles* terminal, 3-5 in. long, pubescent, ultimately glabrous. *Bracts* caducous; pedicels tomentose, ·15 in. long, glabrous in fruit. *Calyx tube* ·15-·2 in. across, densely pubescent, obconic, lobes ovate acute or obtuse, woolly on the margins. Petals broad ovate or orbicular, contorted in bud, claw woolly, about ·15 in. long. *Stamens* about 20; filaments subulate. *Styles* usually 3, sometimes 2, base of the style and crown of ovary woolly. *Berry* 1-celled, glabrous, ·75 in. long.

KHASI and JAINTIA HILLS, up to about 4500 ft., CACHAR, SIBSAGAR, LAKHIMPUR? (sheet No. 6865), GARO HILLS.

Wood light reddish-brown, even grained, medullary rays of two kinds—several very fine between comparatively broader rays, takes a good polish.

Flrs. 9-10. Fr. 3-4.

Var. *parvifolia*.—Leaves comparatively narrower, 3-7 by ·5-2 in., narrow lanceolate to oblong-lanceolate, sometimes oblanceolate, acuminate or caudate-acuminate, thinly coriaceous; base gradually attenuate; petiole ·5-·9 in. long, lower bracts 3-lobed, up to ·3 in. long; styles woolly nearly to the top. *Berry* not seen.

SIBSAGAR-Mikir Hills, N. CACHAR HILLS, GARO HILLS-Sanitarium Hill (sheet No. 5238). A remarkable form growing to a much larger size and with rather different leaves than the type.

3. *Eriobotrya japonica* Lindl. Vern. *loquat* Hin.

A moderate sized tree with stout branches; young shoots, leaves beneath and inflorescence densely covered with tawny or brown wool. *Leaves* 6-11 by 1·5-3·2 in., oblanceolate, acuminate or acute, subentire or distantly serrate, glabrous above, toughly coriaceous; lateral nerves 12-16 on either half ending in serratures; base narrowed into a very short, stout, woolly petiole. *Panicle* shorter than the leaves, branches stout. *Flowers* ·4-·5 in. across, crowded; bracts and bracteoles ovate. *Calyx* densely woolly outside, tube short, lobes ovate, obtuse or subacute. *Petals* ·3 in. long, broad ovate or orbicular, with a woolly claw. *Styles* 5. *Berry* 1-1·5 in., pyriform, intruded at the top, yellow or orange when ripe, 1-5 seeded.

Cultivated up to 5000 ft.; does fairly well in most districts.

10. PYRUS Linn.

Trees or shrubs with deciduous usually simple, less often pinnate leaves; stipules deciduous. *Flowers* white, red or pink, in terminal cymes or corymbs, bracteate. *Calyx tube* urceolate, turbinate or obconic; lobes 5, erect or reflexed, persistent or deciduous. *Petals* 5, imbricate in bud. *Stamens* 20 or more. *Disk* annular or lining the calyx tube. *Carpels* 2-5, connate, adnate to the calyx tube; styles 2-5, free or connate below; ovules 2 in each cell. *Fruits* 2-5 celled pome, cells lined with a cartilaginous or coriaceous, often 2-valved endocarp, each with 1-2 seeds.

I. Styles 3-5 :—

A. Mature leaves glabrous or glabrescent beneath :—

Calyx lobes deciduous in fruit :—

Styles united towards the base,
fruit red when ripe, .3 in. across. 1. *P. baccata*.

Styles free; fruit brown, spotted,
.5-1.5 in. across. .. 2. *P. Pashia*.

B. Mature leaves woolly-tomentose beneath; calyx lobes persistent in fruit;
fruit .5-.75 in. across. .. 3. *P. vestita*.

II. Styles 2-3 :—

Calyx lobes deciduous; fruit umbonate :—

Fruit obtusely 3-4 angled, warted. .. 4. *P. khasiana*.

Fruit not angled nor warted :—

Umbo less than third of the
diameter of the fruit; fruiting
corymb densely warted. .. 5. *P. cuspidata*.

Umbo about half the diameter of
the fruit; fruiting corymb with
small lenticels. .. 6. *P. polycarpa*.

1. *Pyrus baccata* Linn. Vern. *Soh-shur-um*, Kh.

A small tree branched from near the ground; bark dark-brown, almost black, splitting in rectangular flakes, pale dun-brown, turning deeper yellow to brown on exposure; branchlets hairy, soon becoming glabrous. *Leaves* 1.5-3 in. by .8-1.5 in., elliptic, lanceolate or oblong-lanceolate, sometimes suborbicular, acute or acuminate, serrate, thinly coriaceous, glabrous or pubescent beneath on the main nerves; lateral nerves 5-7, distant, arcuate; petiole .5-1.5 in. long, slender or glabrescent with age. *Flowers*

white, 1-1.5 in. across in umbels or fascicles at the ends of short branches; pedicels slender, 1-2 in. long, glabrous or with few hairs. *Calyx tube* urceolate, .2 in long, glabrous or tomentose; lobes deciduous, about as long as or slightly exceeding the tube, lanceolate acuminate, tomentose within. *Petals* variable in length and breadth. *Styles* 3-5, united and woolly towards the base. *Fruit* about .3 in. across (in the form found in our area), scarlet when ripe, globose, depressed at the apex, endocarp crustaceous.

KHASI and JAINTIA HILLS.

Flrs. 3-4. Fr. 9-10.

2. *Pyrus Pashia* Ham. Vern. *Soh-shur*, *Soh-jhur*, Kh.

A medium sized deciduous tree, bark rough, dark-grey to almost black, furrowed on old stems, nearly smooth and dark-brown on branches; blaze light red, turning light yellowish-brown; young parts and inflorescence covered with dense white wool. *Leaves* 1.8-4 by .9-1.5 in., ovate-elliptic, lanceolate or lanceolate-acuminate or sometimes caudate, finely serrate to crenate, specially when young, glabrous or glabrescent beneath when mature, subcoriaceous; lateral nerves 7-10 on either half, more prominent above; petioles .8-2 in. long, slender; stipules caducous, .4-.5 in. long, setaceous. *Flowers* white, .8-1 in. across in short corymbs, umbels or fascicles at the ends of short lateral branches. *Pedicels* .5-2 in. long, woolly when young; bracts resembling the stipules. *Calyx tube* about .15 in. long, woolly or glabrate, urceolate, deciduous, .1-.15 in. long, ovate acute, woolly within; disk nearly closing the mouth of the calyx tube. *Petals* obovate or suborbicular, .3-.4 in. long. *Stamens* 25-30. *Carpels* 3-5. *Styles* free, more or less woolly at the base. *Fruit* .5-1.5 in. across, globose, depressed at the top, somewhat rough with raised white specks, dark-brown when ripe, endocarp crustaceous.

KHASI & JAINTIA HILLS, 5000-6500 ft.

The fruit is eaten when nearly half-rotten.

Flowers with new leaves 3-4. Fr. ripen 12-1. Old leaves dry black.

The young plant is armed strong, often leaf-bearing spines and has 3-5 lobed leaves. It is very suitable stock for grafting pears on.

P. sinensis Lindl. Vern. *Naspati rit*, Kh.; *Naspati*, Beng., Ass., Nep. The Chinese or sand pear.

A medium sized deciduous tree with rough grey bark. *Leaves* 2.5-6 by 1.5-3.5 in., broadly ovate to elliptic lanceolate or elliptic, acuminate, finely serrate, glabrous, glossy and dark-green above; lateral nerves ascending, 7-10 on either half, more prominent above; petiole 1-2 in. long, slender, channelled above; stipules linear, short. *Flowers* white, about 1.25 in. across, corymbose on short lateral shoots; pedicels 1-1.5 in. long, much thickened and lenticellate in fruit. *Calyx* tuberculate, glabrous or puberulous; lobes deciduous. *Petals* suborbicular; styles free, not woolly. *Fruit* 3-5 in. across, globose to pyriform, depressed at the apex, rough with close raised specks, yellowish green, sometimes partly scurfy when ripe; pulp very gritty.

Largely cultivated and bears often profusely in the hills. Sometimes naturalized in the KHASI HILLS. The serratures are tipped with minute deciduous bristles.

Flrs. 3-4. Fr. 7-9.

P. communis Linn. Vern. *Naspati*. The pear.

Very similar and probably not specifically distinct. A deciduous tree sometimes with spinescent branches. *Fruit* usually pyriform, smoother and more yellowish outside, pulp not gritty.

Cultivated with some success at Shillong but the fruit does not attain the same quality as it does in other hill stations.

P. Malus Linn. The apple. Vern. *Seb*, Hin.; *Aple* Beng., Ass.

A small deciduous tree; branchlets tomentose. *Leaves* 2-3 in. long, ovate, acuminate, serrate or crenate, more or less tomentose beneath. *Flower* pale pink. *Fruit* globose, depressed at each end, and crowned with the persistent calyx lobes.

Cultivated at Shillong, with some success, but the fruit is much inferior to those produced in the hills of N. W. India.

3. **Pyrus vestita** Wall. Var. *khasiana* Hk. f.

A tree with densely ferruginous or greyish woolly young parts. *Leaves* 3.5-4.5 by .8-1.2 in., lanceolate or oblanceolate, acuminate, somewhat distantly dentate-serrate, entire towards the base, glabrescent above, densely felted beneath; lateral nerves 10-12; base cuneate; petiole .3-.6 in. long, channelled; stipules linear, about .4 in. long. *Flowers* about .3 in. across, in terminal and subterminal woolly corymbose panicles, broader than long. *Calyx* woolly, turbinate, lobes short, persistent. *Petals* woolly within; styles 3-5, hairy only at the base. *Fruit* globose or pyriform, about .7 in. across.

KHASI HILLS, 5000 ft.—*Mann*. There are no specimens at Sibpur.

The type has larger leaves which are 4-8 in. by 2-5.5 in., ovate-elliptic, oblong or lanceolate. Of this there is no record from our area.

Flrs. 5-6. Fr. 10-11.

4. *Pyrus khasiana* Dcne.

A small tree (according to Hooker a tolerably large tree); young parts and inflorescence cottony floccose; branchlets glabrous, speckled with lenticels. *Leaves* 2.7-6 by 1.2-3 in., lanceolate to elliptic ovate, often abruptly sharp-acuminate, acute or cuneate at the base, sharply serrate, coriaceous, glabrous with age; lateral nerves prominent beneath, 8-12 on either half, subparallel, nearly straight, tertiaries fine; petiole .5-1 in. long, dilated towards the base. *Corymbs* branched, the lower arising in upper leaf axil. *Flowers* white, .3-.4 in. across when fully opened; pedicels stout, .1-.15 in. long, much enlarging and glabrous in fruit. *Calyx tube* .2 in. long, at first cottony tomentose, .2 in. long; calyx lobes deciduous, broadly triangular; petals about .15 in. long, suborbicular-obovate. *Styles* 3-4, glabrous. *Fruit* about .3-.4 in. across, globose, obtusely 3-4 angled, somewhat rough and dotted with raised specks outside, crowned by a depressed umbo with a conical centre, 3-4 celled, pulp granular, endocarp crustaceous, cells 1 seeded.

KHASI & JAINTIA HILLS, Laitkor, Nungbru Wood-Griffith, Myrung, 4500-6000 ft., MANIUR;—not common.

Fr. 7-8.

Pyrus granulosa Bertol. Vern. *Dieng-soh-iong-throng*, Kh.

A moderate sized deciduous tree with thin pale, grey and rather rough bark; young parts and inflorescence flocculent cottony. *Leaves* 3.5-5.5 by 1.5-2.5 in., ovate-lanceolate to ovate-elliptic, acuminate; base acute, rounded or cuneate, sharply serrate, nearly entire towards the base, glabrous with age; lateral nerves 8-10, slightly curved; petiole .6-1 in. long, ultimately glabrous. *Flowers* white, about .25 in. across in terminal, compound corymbs, the lower branches sometimes from upper leaf axils. *Calyx* at first cottony tomentose, ultimately glabrous; pedicels much enlarged in fruit. *Fruit* .5-.7 in. across, globose or subpyriform, warty, turning purplish black in ripening—Kurz,—3-4 celled, obtusely angled when dry, with a depressed umbo with a short blunt cone in the centre, flesh granular.

KHASI HILLS 5-6500 ft.—not common, sometimes epiphytic.

Hardly more than a variety of *P. khasiana*. The leaves have usually fewer nerves, and the fruits are larger, and not angled. The shape and venation of the leaf on which separation of the two species is based in F. B. I. are not constant characters.

Fr. 5-7.

5. *Pyrus cuspidata* Bertol.

A medium sized deciduous tree. *Bark* dark-brown or pale-grey, rough, hard, fibrous and pale to reddish-brown inside; branchlets stout with prominent oblong-lenticels, which coalesce in old branches and often form raised transverse lines; young parts and inflorescence clothed with flocculent wool. *Leaves* 3-5 by 1-2 in., ovate to oblong-lanceolate or elliptic ovate, somewhat coarsely cuspidate-serrate; base rounded to suddenly cuneate, subcoriaceous, glabrous when mature; lateral nerves 10-12 on either side, slightly bent, tertiaries subparallel, close; petiole .8-1.5 in. long; stipules caducous, about .2 in. long, subulate. *Flowers* .25 in. across, white in terminal pyramidal panicles of corymbs, 1.5-3 in. long, densely warted with raised lenticels in fruit; pedicels slender. *Calyx* tube .1 in. long, turbinate at first, woolly glabrescent with age; lobes deciduous, about as long as the tube, triangular, acuminate, often with somewhat blunt tip, glabrous within except for the woolly tip. *Petals* about .1-.12 in. long, obovate to suborbicular, caducous, woolly inside, with a short puberulous claw. *Style* 2-3, united at the base, glabrous; stigmas with a central groove. *Fruit* .2-.3 in. across, globose or subpyriform, glabrous, not dotted, 2- less often 3-celled, apex with a depression and conical umbo.

KHASI & JAINTIA HILLS 4000 ft.

Wood reddish-brown, hard, seasons and polishes well; pores uniform, medullary rays fine.

Flrs. 3-4. Second flush (?) 10-11. Fr. 11-12.

6. *Pyrus polycarpa* Hk. f. Vern. *Dieng-loporam*, Synt.

A small tree; young parts clothed with flocculent tomentum. *Bark* rough grey; blaze fibrous, light-red, turning brown; branchlets with elongated lenticels. *Leaves* 2.5-5 by 1-2.5 in., lanceolate to ovate lanceolate, acuminate or caudate, closely and often unequally serrate; base cuneate,

often thin, slightly unequal, connate-often abruptly, entirely glabrous when mature, thinly coriaceous; lateral nerves 8-12 on either half; petioles $\cdot 6\text{--}1\cdot 3$ in. long, slender, finely channelled. *Flowers* not seen, but according to Hooker $\cdot 3$ in. across in glabrous and smooth corymbs; pedicels slender. *Calyx tube* rather pyriform, limb expanded, lobes deciduous in fruit. *Petals* obovate, sessile, glabrous; styles 2, united to above middle, glabrous. *Fruiting* corvmb branched, more or less bearing at the ends of the branches, dotted with small raised lenticels, which are not so prominent as in *P. cuspidata*. *Fruit* $\cdot 15\text{--}\cdot 25$ in. with a large depressed umbo about half the diameter of the fruit with a bluntly conical centre.

KHASI HILLS 4500-6500 ft.

Flrs. 3-4. Fr. 11-2?

11. STRANVÆSIA Lindl.

Stranvæsia glaucescens Lindl. Vern. *Dieng-sia-saw*, *Dieng-soh-sao-chi*, Kh.

A small or medium sized tree with a spreading crown attaining 80 ft. in height and 8 ft. in girth. *Bark* brown to dark-grey or almost black and rather rough, exfoliating in irregular pieces; blaze pinkish, turning reddish-brown, arrested shoots sometimes ending in spines; young parts and inflorescence clothed with deciduous tomentum. *Leaves* $2\cdot 4\text{--}5$ by $\cdot 7\text{--}1\cdot 7$ in., obovate-lanceolate or oblong-ob lanceolate, acuminate, acute or obtuse and apiculate serrulate or finely serrate, sometimes entire, coriaceous, dark-green and shining above undersurface paler, pubescent beneath when young, glabrous with age, coriaceous; lateral nerves 10-14, very slender; base narrowed to the petiole, which is $\cdot 4\text{--}\cdot 75$ in. long, glabrous or sometimes puberulous; stipules deciduous, subulate, up to $\cdot 2$ in. long. *Flowers* white, about $\cdot 5$ in. across, many in terminal spreading compound corymbs, $2\text{--}4$ in. across; primary branches floriferous at the ends, lower axillary; pedicels up to $\cdot 3$ in. long. *Calyx tube* obconic, woolly; limb spreading, 5 lobed; lobes erect, acute, persistent in fruit. *Petals* 5, overlapping in bud, spreading, broadly obovate, clawed, claw glabrous. *Stamens* about 20. *Ovary*

5-celled, crown short, villous; styles 5, connate to more than half way up, column villous at the base; stigma capitate; ovules 2 in each cell, collateral, basal. *Fruit* about .3 in. across, globose, rather fleshy, orange yellow and glabrous or sparsely hairy when ripe, with a 5-celled, crustaceous, loculicidally dehiscent endocarp, the crown of which is exserted; cells 1-seeded.

KHASI HILLS 4000-5000 ft.,—3000-4000 ft., (locality not mentioned) according to a sheet of Mann's.

Timber pinkish when freshly cut, turning afterwards to reddish-brown, pores numerous, small, med. rays fine, uniform, seasons and polishes well.

Flrs. 5-6. Fr. 10-1.

12. PHOTINIA Lindl.

Evergreen trees or shrubs. *Leaves* simple, coriaceous, entire or serrulate; stipules subulate. *Flowers* small in spreading corymbose terminal panicles, white; bracts deciduous. *Hypanthium* obconic, enlarging in fruit; sepals 5, short, persistent. *Petals* 5, obovate or suborbicular, spreading. *Stamens* 20 or more. *Ovary* $\frac{1}{2}$ inferior, free portion hirsute, usually 2, rarely 3-celled; styles 2, rarely 3, free or combined at the base; stigmas broad; ovules 2 in each cell, collateral, ascending. *Fruit* a small, globose or ovoid, drupe with 1-2 pyrenes each in a membranous or crustaceous endocarp. *Seeds* 1-2 in each pyrene, obovoid, triquetrous or compressed, testa coriaceous.

Leaves 4.5-9 in. long. 1. *P. Notoniana*.

Leaves 1.5-4.25 in. long; petioles under

.7 in. 2. *P. integrifolia*.

1. Photinia Notoniana W & A. Vern. *Dieng-khau-soh-riu*, *Dieng-soh-lar-maw*, *dieng-biai*, Kh.; *dieng-soh-laklong*, *Dieng-sa-halim-blai*, Synt.

A handsome moderate sized to large tree according to locality, all parts glabrous except the inflorescence. *Bark* greenish-grey or brown, somewhat rough, exfoliating in thin scales, irregularly warty, thin, blaze yellowish or light brown with white lines, turning darker on exposure. *Leaves* variable, 4.5-9 by 1.5-3 in., elliptic, lanceolate or oblanceolate to

oblong, entire, obliquely acuminate, sometimes caudate, margins irregularly undulate, coriaceous, dark glossy green above, paler beneath, turning coppery to bright red before falling, midrib stout; main lateral nerves fine, about 10-15 pairs mixed with many minor ones; base sub-acute or rounded, often unequal; petiole .6-1.5 in., stout, more or less channelled; stipules minute, subulate, long persistent. *Flowers* white, .25-.35 in. across in spreading terminal corymbose panicles, up to 8 in. across, broader than long, panicle branches glabrate to hoary pubescent; bracts about .1 in. long, caducous, reddish-brown, tricuspidate with a central subulate awn much exceeding the others, woolly at the apex, broadened and concave at the base. *Calyx* .1 in. long, (including the hypanthium) whitish, glabrous; segments minute, triangular, acute. *Petals* .1 in. long, imbricate in bud, broadly obovate or suborbicular with a very minute claw, glabrous, ultimately reflexed. *Stamens* subulate; free portion of the ovary villous; styles 2, glabrous. *Drupe* .2 in. across, globose or ovoid, yellow when ripe, crowned by the calyx teeth, somewhat rough, endocarp soft, rarely both seeds in each pyrene developing.

KHASI & JAINTIA HILLS, 4-6000 ft.

Wood reddish-brown, hard, close grained, with fine medullary rays, capable of taking fine polish but liable to crack, weight 57 lbs. per c. ft. (Gamble).

Sometimes an epiphyte in early life. Young leaves deep pink along the nerves.

Flrs. 2-3. Fr. 6-7.

Var. *eugenifolia*, *P. eugenifolia* Lindl. *P. micrantha* Dcne.—Panicle branches hoary pubescent.

Var. *macrophylla*—leaves caudate-acuminate, panicle glabrous or nearly so.

2. *Photinia integrifolia* Lindl. Vern. *Soh-lar-maw*, *Dieng-soh-lar-maw*, *Dieng-ngiang-risiong*, *Dieng-lar-maw*, Kh.

A small or moderate sized branchy tree attaining about 50 ft. in height, all parts glabrous. *Bark* dark-brown or grey rough, thin; blaze yellowish, turning brown. *Leaves* 1.5-4.25 by .7-1.2 in., oblanceolate or obovate, shortly blunt acuminate, quite entire, margins slightly recurved, thinly

coriaceous, glabrous, secondary nerves fine, about 6-9 on each half, mixed with intermediate minor nerves; base narrowed, sometimes cuneate, tapering to the petiole; petiole .4-.7 in. long; channelled, swollen at the base; stipules minute, subulate with a broad base. *Flowers* white, .15 in. across, in spreading corymbs. *Sepals* minute, lobes triangular, persistent; styles glabrous. *Drupe* globose, .15 in. across, blackish-brown when ripe.

KHASI & JAINTIA HILLS above 3000 ft.

As in the last species the old leaves turn coppery and then bright red before falling.

Flrs. 3? Fr. 2.

Fruit like galls are sometimes formed from the young ovary by insects which are larger than ordinary fruits.

13. POURTHIÆA Dcne.

Pourthiæa arguta Dcne. Vern. *Dieng-snam-dieng-um*, *Dieng-soh-dikhiew*, *Dieng-tyrkhim*, Kh.; *Dieng-soh-ryng-kham-um*, *Dieng-soh-pho-blai*, Synt.

A very variable erect shrub or small tree; bark grey to almost black, somewhat rough; blaze yellowish light-red or light-brown, turning yellowish brown, twigs often closely lenticellate; young parts and inflorescence at first woolly, glabrescent with age. *Leaves* 1.5-5.5 by .6-1.8 in., simple, lanceolate, oblong to elliptic-lanceolate, acuminate or sometimes acute, finely serrate or serrulate; lateral nerves 7-10, in some forms up to 12, on either half, impressed above, curved; base cuneate or acute; petiole .15-.4 in. long, glabrous or ultimately glabrescent; stipules minute, subulate. *Inflorescence* terminal, very rarely axillary, lenticellate. *Flowers* white, .25-.3 in. across, in few flowered dense corymbs or few together on the dense or lax corymbosely arranged branches of the inflorescence, the latter up to 1 in. long; pedicels up to .3 in. long; bracts and bracteoles setaceous. *Calyx tube* broadly obconic, densely or thinly woolly outside, lobes 5, triangular acute, as long as the tube, persistent in fruit, glabrous inside, except at the tips. *Petals* 5, contorted in bud, clawed, obovate or suborbicular, entire or notched, hairy or woolly within about the claw;

stamens about 20; filaments slender. *Ovary* 3 or 2 celled, nearly free and adnate to the calyx tube at the base, often only on one side, villous at the apex; ovules 2 in each cell, collateral, basal. *Styles* 3 or 2, connate half way or more up; stigma capitate, 2-fid. *Fruiting* corymb glabrous or glabrate, warty with lenticels. *Fruit* .25-.3 in. across, globose or obovoid-globose, 1-2 seeded with granular pulp; endocarp membranous. *Seeds* usually 1-2, plano-convex; testa coriaceous, closely marked on the convex side.

KHASI HILLS 2500-6500 ft.

According to Hooker the claw of the petals is glabrous, but in the large number of specimens examined by me I have found them always more or less hairy.

The timber is reddish-brown, seasons well and takes a fine polish; medullary rays fine, pores larger than in *Pyrus*. It should prove suitable for cabinet work if it could be obtained in sufficiently large size.

Flrs. 4. Fr. 12-1.

The following forms may be separated :—

1. **Var. *Wallichii*** F. B. I. Syn. *P. arguta* Dcne.—*Leave* 1.5-5 by .6-1.3 in., quite glabrous with age, coriaceous; pedicels stout, rugose with raised lenticels; fruit .25 in. across.

Commonest form, 3000-5500 ft.

2. **Var. *Hookeri*** F. B. I. Syn. *P. Hookeri* Dcne.—*Leaves* 3.5-5 in. long, oblong-lanceolate, acuminate, sometimes caudate; petiole long, up to .4 in.; corymbs lax; pedicels more slender than in var. *Wallichii*. *Fruit* .3 in. across, globose.

Mynso—2500 ft., Umpani 3500 ft. (KHASI HILLS.)

3. **Var. *latifolia***. *Leaves* 2.7-5 by 1-2 in., elliptic to oblong lanceolate, acuminate or caudate, midrib more or less persistently woolly; lateral nerves up to 12; petiole short. *Corymb* branches spreading, subumbellately collected on the axis, soon glabrescent. *Calyx* thinly woolly at the time flowers open, glabrate later on. *Fruit* ovoid-globose, up to .35 by .3 in.

KHASI HILLS 5000-6000 ft., e.g. Chang-chong forest, etc.

4. **Var. *membranacea*** Hk. f. *Leaves* oblong to ovate lanceolate, sharply acuminate, sharply serrate. *Inflorescence* very woolly. *Corymb* branches lax.

Surarim, etc. (KHASI HILLS.)

5. **Var. *Parvifolia*.**—*Leaves* 1·5-2·5 in. long, narrow lanceolate, coriaceous, acuminate. *Corymbs* contracted, fruit $\frac{1}{4}$ in., rather ovoid.

KHASI HILLS—Jowai—C. B. Clarke.

***Pourthiæa salicifolia* Dcne.** *P. arguta* Dcne. *Var. salicifolia* Hk. f. Vern. *Dieng-soh-dikhiu*, Kh.

A large shrub; young shoots, petiole, midrib of leaves and inflorescence subpersistently flocculent, tomentose. *Leaves* 2·5 by ·6-1 in., narrow-lanceolate, oblanceolate or oblong lanceolate, finely acuminate, finely cuspidate serrate; base attenuate-cuneate, subcoriaceous, glabrous or glabrate with age above, more or less floccose beneath, specially along the midrib; lateral nerves 10 on either side, arcuate, prominent beneath, nervules much more laxly reticulate between than in the last species; petiole ·15-3 in. long. *Flowers* creamy white, ·25-·3 in. across, either few together (often 3) at the ends of the lax branches of a corymb or on simple corymbs; flower buds almost hidden in cotton. *Calyx* hoary with matted hairs, lobes woolly within at the apex only. *Petals* suborbicular, woolly inside about the claw; styles and ovary as *P. arguta*. *Fruit* obovoid, globose, about ·2-·25 in. long on lenticellate pedicels.

Rongengiri—GARO HILLS.

This form is so markedly different that it seems best to separate it.

14. COTONEASTER Linn.

***Cotoneaster Simonsii* Baker.** Vern. *Dieng-jik-rai*. Kh.

A rigid shrub attaining 8 ft. in height; young parts densely pubescent or villous. *Leaves* subdistichous, ·5-·9 in. long, rhombic-orbicular to ovate, abruptly short acute or acuminate, mucronate, entire, margins subrecurved, subcoriaceous, at first thinly pubescent with long adpressed hairs on both surfaces, sparsely pubescent or glabrous with age except along the midrib; lateral nerves 4-5, very slender, arched; petiole ·1-·15 in. long, adpressed pubescent; stipules subulate from a broad base up to ·25 in. long. *Flowers* not seen. *Fruit* subsessile or shortly pedicellate, solitary or in pairs on the leaf axils, bright scarlet and glabrous when ripe, oblong turbinate, crowned with the incurved calyx lobes with 2-3, bony, 1-seeded stones.

Laitlyngkot—KHASI HILLS.

Fr. 11.

FAM. 52. SAXIFRAGACEÆ.

Trees, shrubs or herbs. *Leaves* alternate; stipules 0, or the stipules adnate to the base of the petiole or opposite and exstipulate. *Flowers* hermaphrodite or polygamodiceous, regular, usually 5, sometimes 4 merous. *Calyx* more or less adnate to the ovary, sometimes quite free; lobes imbricate or valvate. *Petals* rarely 0, perigynous or epigynous, rarely subhypogynous, imbricate or valvate. *Stamens* inserted with the petals, equalling or double the number, rarely numerous. *Disk* cup-like or sometimes reduced to intrastaminal glands. *Ovary* of 2 or 3-5 carpels, usually 2 or 3-celled with axile placentas, sometimes 1-celled with parietal placentas; styles as many as the carpels, free or combined nearly to the top; stigmas capitate or lateral and subcapitate; ovules numerous, erect or pendulous. *Fruit* capsular or baccate. *Seeds* numerous or few, rarely solitary, usually albuminous.

I. Shrubs or trees :—

A. Leaves opposite or subopposite :—

1. Stamens 8-12. Seeds many :—

a. Styles 2-4 :—

Calyx segments of sterile
flowers much enlarged in fruit;

fruit capsular, dry.

1. Hydrangea.

All flowers fertile; fruit

baccate, intensely blue.

2. Dichroa.

b. Style 1; petals falling off in a cap.

3. Pileostegia.

2. Stamens 4, seeds 1.

4. Polyosma.

3. Stamens 20-40.

Philadelphus.

B. Leaves alternate :—

Ovary nearly free of 2 carpels,
almost wholly superior :—

Fruit a capsule. No basal nerve. **5. Itea.**

Ovary inferior :—

Fruit a berry; leaf base 3-5
nerved.

6. Ribes.

Herbs with perennial rootstocks :—

Ovary of two carpels :—

Leaves simple.	Saxifraga.
Leaves pinnate.	Astilbe.

1. HYDRANGEA Linn.

Hydrangea vestita Wall. Vern. *Siw-pakha* or *Pakha-khalaw*, *Dieng-lap-masi* (bullock's kidney), *Dieng-jariet-iong*, Kh.

A small crooked deciduous tree or a large shrub. *Bark* greyish, exfoliating in thin flakes, soft and corky; blaze greenish-white, smooth; young parts and inflorescence rather rough with papillose hairs with persistent bases, the latter ultimately forming raised dots; branchlets stout with a large pith. *Leaves* 4·5-9 by 2·5-5 in., broadly ovate or elliptic to suborbicular, acute or obtuse, unequally dentate, subcoriaceous, thinly hairy or glabrescent above, tersellated and thinly clothed with white papillose hairs beneath; petiole ·8-2 in. long, channelled with subamplexicaul bases. *Flowers* greenish-white, about ·2 in. across, outer sterile, in many flowered-flat-topped terminal, corymbose panicles, lower branches from upper leaf axils; lower bracts leafy, upper gradually smaller, ultimately spathulate, subulate or setaceous; bracteoles resembling the upper bracts; pedicels about ·05 in. long, hairy. *Calyx* adnate to the ovary, glabrous; lobes 5, about equalling the tube or slightly longer, ovate—acute, those of the sterile flowers sub-petaloid, greenish, ovate—elliptic, elliptic or orbicular, entire, veinose, thin, usually 3-4 developing, ·4-·8 in. long. *Petals* valvate, expanding, (not falling off in a piece), about ·1 in. long, exceeding the calyx lobes, oblong. *Stamens* 10. *Ovary* somewhat imperfectly 3 celled; ovules many, axile at the ends of the partitions; styles 3, persistent. *Capsule* crowned by a conical cap formed by the styles and opening by an aperture at their base; seeds minute; testa hyaline, tailed at either end.

KHASI HILLS 5-6000 ft., on shady banks of streams.

Hydrangea robusta Hk. f. & T. Var. *Griffithii* C. B. Clarke?

A large shrub or a small tree; young parts pubescent. *Leaves* 4·5-9 by 3-5 in., ovate or elliptic, acuminate, serrate-dentate; base rounded or in upper leaves narrowed to the petiole; lateral nerves about 8 on either half, arcuate, with few scattered hairs above thinly

hirsute on the nerves beneath, (undersurface not tersellated); petiole 1·2-2 in., channelled, upper margined. *Flowers* blue; panicles spreading, corymbose. *Sepals* of sterile flowers 1·1-5 in., elliptic or elliptic obovate, narrowed to a very short stalk at the base, serrate or coarsely few toothed. *Calyx* teeth of fertile flowers, minute. *Styles* 2. *Capsule* subhemispheric, broader than long, slightly compressed, ribbed.

Mishmi Hills near Dilai.

Fr. 10.

Hydrangea hortensia Sieb.—A large very spreading shrub. *Leaves* about elliptic-acuminate, serrate, dark green, glabrous, except along nerve axils. *Flowers* in large compact head-like compound cymes, all sterile, blue, turning pink.

Largely grown in Shillong in gardens.

2. DICHROA Lour.

Dichroa febrifuga Lour. Vern. *Kaliangeri*, *Ban-suk*, Nep.

An erect shrub 5-8 ft. in height; stems grey with large pith; young shoots and inflorescence pubescent with short curled hairs. *Leaves* opposite, 3·5-8 in. by 1·2-3 in., lanceolate or oblanceolate, acuminate, dentate, tapering at the base to the petiole, chartaceous, thinly pubescent along the nerves on both surfaces and with few scattered hairs above between the nerves; lateral nerves 7-9 on either half, arcuate; petiole usually ·5-1·5 in., sometimes up to 2 in. long, channelled, dilated at the base. *Flowers* blue, ·3 in. across in terminal panicles of cymes; pedicels slender, ·2-·4 in. long. *Calyx* tube adnate to the ovary, thinly hairy; limb 5-6 toothed. *Petals* valvate, 5-6, expanding, oblong, thick, about ·3 in. long. *Stamens* 10 or 12, epigynous; anthers clavate, blue. *Ovary* $\frac{3}{4}$ inferior, 1-celled; styles 3-5; stigmas blue, resembling the anthers; ovules numerous on 3-5 parietal placentas. *Berry* ·2 in. across, globose, deep blue when ripe, crowned by the persistent calyx lobes, 3-5 styles in the centre; seeds numerous, small; testa with large reticulations.

KHASI HILLS 4500-6000 ft.

The Nepalese use as a decoction from the shoots and bark of the roots as a febrifuge often in sufficient quantities to make them sick which not improbably aids indirectly in curing. It appears to have no active effect in ordinary doses.

Flrs. 7-8. Fr. 11-12.

3. **PILEOSTEGIA** Hk. f. & T.**Pileostegia viburnoides** Hk. f. & T.

An evergreen shrub or small tree attaining about 25 ft. in height, with rather stout decussate branches. *Leaves* decussate, 3-6 by 1-2 in., obovate or elliptic, oblong, acute or acuminate, gradually narrowed to the base, entire or sometimes serrulate, coriaceous, glabrous; lateral nerves 6-8 on either side, oblique, arched; petiole .3-.5 in. long, channelled and flattened. *Cymes* in terminal panicles, which are 5-6 by 4-5 in. with decussate branches. *Flowers* .2 in. across; calyx teeth very broadly triangular; petals imbricate, white, obovate, connate at the base and falling off as a cap; stamens 5, 8 or 10; filaments .2-.35 in. long. *Ovary* inferior, 4-6 celled with numerous ovules; style thick with a pyramid at the apex, the 4-6 angles of which are stigmatic; ovules numerous, pendulous. *Fruit* ovoid, .3 in. long, capsular.

4. **POLYOSMA** Blume.**Polyosma integrifolia** Blume.

A middle sized evergreen tree; young shoots tawny pubescent; twigs lenticellate; branchlets lenticellate. *Leaves* nearly opposite, 3-8 in. long, lanceolate or oblanceolate, acuminate, entire or distantly toothed, cuneate at the base, more or less pubescent on the nerves, more persistently beneath; petiole .5-1 in. long, pubescent. *Flowers* greenish-white, tetramerous in terminal pubescent racemes; pedicels very short; bracteoles 3, small, subulate; buds densely pubescent, cylindrical, .3-.5 in. long. *Calyx tube* adnate to the ovary; lobes small, persistent, deltoid. *Petals* valvate, linear, often cohering, hairy within. *Stamens* 4, epigynous; filaments thick, hairy. *Ovary* inferior, 1-celled; ovules numerous on two parietal placentæ, which intrude considerably in the cells. *Fruit* sub-baccate, .3-.5 in. long, smooth, ellipsoid, 1-seeded. *Seed* ascending with fleshy albumen and small embryo.

KHASI HILLS 3,000-4,000 ft. *De Silva, Hooker*, ASSAM—Griffith.

Flrs. 5, rainy season (Brandis).

Var. typica C. B. Clarke.—Leaves entire.

Var. Wallichii C. B. Clarke.—Leaves denticulate.

KHASI HILLS—Mann.

Philadelphus coronarius Linn.

A shrub with grey stems. *Leaves* opposite, 2·3-75 in. long, ovate-lanceolate, acuminate, distantly minute-toothed, thin, dark-green and glabrous above, paler and pubescent along the nerves or glabrescent beneath, strongest pair of lateral nerves sub-basal; petiole about ·2-·3 in. long. *Flowers* tetramerous, white, up to 1 in. across, fragrant, usually 3 terminal and 1-2 pairs from upper leaf axils; pedicels up to ·3 in. long. *Calyx* glabrous outside, tomentose at the apex within. *Petals* obovate. *Stamens* 20-40; filaments subulate. *Ovary* inferior; styles 3-4, united for about third their length.

Sometimes grown at Shillong for the flowers.

Flrs. 5.

5. ITEA Linn.

Shrubs or trees. *Leaves* alternate, glabrous, dentate or crenate. *Flowers* pentamerous, small, white, in many flowered terminal and axillary racemes. *Calyx tube* short, adnate to the base of the ovary; petals valvate. *Stamens* 5, perigynous. *Ovary* nearly superior, 2-celled; style short, simple; ovules many, axile. *Capsule* nearly free, conical or elongate; base only adnate to the persistent calyx, dehiscent through the styles and the dissepiments. *Seeds* elongate, with loose testa, which is more or less produced at their end.

Leaves usually large; petals recurved to the pedicel, never persistent in fruit; ovary glabrous.

1. *I. macrophylla*.

Leaves small to medium sized; petals erect, persistent in fruit; ovary pilose.

2. *I. chinensis*.

1. Itea macrophylla Wall. Vern. *Dieng-soh-tartet-shang-um*, *Dieng-la-met-heh*, *Dieng-lieh*, *Dieng-la-myllon*, Kh.; *Dieng-saru*, Synt.; *Phui-thing*, Lushai.

A small tree or large shrub. *Bark* greyish or brown to almost black with vertical fissures; blaze light red. *Leaves* 4·5-9 by 2·4·5 in., elliptic, elliptic-oblong or broad ovate, shortly acuminate, glandular-serrate, rounded to subacute at the base, glabrous, coriaceous; lateral nerves 8-12 on either half, tertiaries fine, subparallel; petiole stout, ·5-1 in. long, stout, glabrous. *Racemes* 1-5 from upper leaf axils up to 8 in. long, pubescent when young, later on puberulous. *Flowers* white, ·2 in. across; bracts subulate, up to ·1 in. long, caducous; pedicels ·05 in. long. *Calyx tube* puberulous,

obconic; teeth acute. *Petals* .1 in. long, oblong-lanceolate, closely reflexed on the pedicel between the calyx lobes. *Disk* intrastaminal, prominent, glabrous. *Ovary* glabrous. *Capsule* tapering to the style, .25-.4 in. long; base of the carpels usually sunk in the calyx tube; stigmas often cohering long after the splitting of the style; calyx teeth often ultimately weaving off.

KHASI HILLS 2-5,000 ft., LUSHAI HILLS (Tepaimukh), NORTH CACHAR HILLS (near Mahur), KAMRUP—Barduar Reserve.

Flrs. 4-6. Fr. 11-2.

2. *Itea chinensis* Hook and Arn. Vern. *Dieng-la-met-rit*, *Dieng-soh-tyrtet-nong-shang*, *Dieng-niarli*, *Dieng-tem-sro*, Khasi.

A small tree (a shrub according to C. B. Clarke) with grey to almost black rough bark; blaze yellowish, turning brown. *Leaves* 2-4.5 by .7-2.2 in., elliptic, oblong, obovate or oblanceolate, usually shortly acuminate, distantly glandular, serrulate, acuminate, often abruptly cuneate at the base, glabrous, subcoriaceous; lateral nerves 5-8 on either side, tertiaries subparallel; petiole channelled, .3-.5 in. long. *Flowers* white, about .15 in. across, yellowish white. *Racemes* 1-3 together on leaf axils, 1.2-2.5 in. long, puberulous; bracts up to .15 in. long, subulate, often with 1 or 2 linear lobes; pedicels up to .1 in. long. *Calyx tube* puberulous; teeth acute. *Petals* .1 in. long, erect in flower, lanceolate, persistent and often adpressed to the fruit. *Disk* thin, like the ovary, pilose. *Capsule* .3-.4 in. long, tapering, scarcely sunk in the calyx tube; calyx teeth persisting.

KHASI & JAINTIA HILLS—2,500-5,500 ft.

Flrs. 4-5. Fr. 10.

6. RIBES Linn.

Shrubs, usually unarmed, sometimes prickly. *Leaves* alternate, simple, usually lobed, exstipulate. *Flowers* 1-2 sexual in racemes, solitary or clustered. *Calyx* 4-5 merous, superior; tube often produced beyond the ovary. *Petals* 4-5, inserted at the mouth of the calyx tube. *Stamens* 4-5. *Ovary* inferior, 1-celled; styles 2, free or connate; ovules numerous,

on 2 parietal placentas. *Fruit* ovoid or globose, crowned by the marcescent calyx.

Unarmed :—

Flowers unisexual (polygamo-diœcious,
Parker) :—

Racemes 1-3 in. long, erect in
flowers, drooping in fruit. .. 1. *R. glaciale*.

Flowers bisexual :—

Racemes 3-8 in. long, pendent. .. 2. *R. Griffithii*.

1. *Ribes glaciale* Wall.

An erect shrub 5-8 ft. in height; stem shining, glabrous. *Leaves* 1-3 by 1-1·5 in., 3-5 lobed (not lobed Dr. N. L. Bor), ovate; lobes sharply inciso-serrate, acute or acuminate, membranous, glabrous or with scattered hairs above, pubescent along the nerves beneath; lateral nerves 2-4 on either half; base 3-5 nerved, cordate or occasionally truncate; petiole slender, ·5-1·5 in. long. *Racemes* pubescent, erect and glandular, 1·5-3 in. long. *Flowers* about ·15-·2 in. across, greenish (drying brownish or reddish); bracts ·2-·25 in. long, longer than the pedicels. *Calyx* minutely pubescent; petals minute, clawed; limb obtuse; stamens exceeding the petals; style bifid. *Berries* acid, ·2-·25 in. across, smooth, glabrous.

MANIPUR (Watt No. 6587). NAGA HILLS (Sibpur No. 11420), AKA HILLS, PIRI MOUNTAIN—BALIPARA FRONTIER TRACT (Dr. N. L. Bor No. 774 & 788), (800-1,000 ft.).

Flrs. 5-6. Fr. 7-8.

2. *Ribes Griffithii* Hk. f. & T.

A shrub or a small tree. *Leaves* 2-3·5 in. long, often as broad, 4-5 lobed (lobes acuminate inciso-serrate), membranous, pubescent on the nerves beneath; base 5 nerved, cordate; petiole 2-3·5 in. long. *Racemes* 3-8 in. long, lax, pendent. *Flowers* ·15 in. across; pedicels about ·07 in. long; bracts linear, lanceolate, exceeding the pedicels. *Calyx* campanulate, produced beyond the ovary. *Berries* ovoid or ellipsoid, ·2-·4 in. long, red.

AKA HILLS, PIRI MOUNTAIN, (BALIPARA FRONTIER TRACT), (Dr. N. L. Bor No. 793), (8,500 ft.).

Flrs. 6. Fr. 8.

Saxifraga ligulata Wall. Vern. *Jajaw-maw-ramsang*, Khasi.

A herb with a stout perennial creeping rootstock. *Leaves* simple, very variable in size, usually 6-12 in. long, orbicular to broadly obovate, fleshy, strongly ciliate, often pinkish beneath, glabrous, dotted beneath; petiole with a large sheath at the base. *Flowers* white or pink, waxy, .6-.8 in. across in corymbose scapes. *Calyx* persistent, adnate to the ovary at the base only; lobes 5, erect in fruit. *Stamens* 10, perigynous. *Petals* clawed. *Carpels* 2, united below; styles free, long; ovules numerous. *Ripe* carpels opening at the top on the ventral side.

KHASI HILLS—4,000-5,500 ft., not common, on rocks in cool shady situations.

Flrs. 3-4.

Astilbe rubra Hk. f. & T.

An erect hairy herb up to about 3 ft. high with a perennial creeping rootstock; stem and leaf rachis with long reddish-brown hairs specially at the nodes of the leaf and pinnæ. *Leaves* alternate, 6-12 in. in length, 2-3 pinnate; pinnæ ternate, often with ternate leaves; pinnules towards the base; stipules adnate to the base of the common petiole, sheathing with membranous edges. *Leaflets* 1-2 in. long, ovate or terminal, sometimes rhomboid, acuminate or acute, coarsely biserrate, sometimes lobed; base subcordate or rounded to cuneate with rough hairs on both surfaces. *Flowers* small, about .2 in. long, pink, in long woolly pubescent terminal panicles of spicate racemes. *Calyx* 5 lobed, adnate to the base of the ovary, green at the base; teeth pink, erect. *Petals* 5, perigynous, narrowly strap-shaped, much exceeding the calyx lobes. *Stamens* 10. *Carpels* 2, united below for a great portion narrowed to the short style; ovules numerous. *Ripe* carpels dehiscing ventrally.

KHASI HILLS, 4,000-6,000 ft.

Flrs. 7.

Astilbe rivularis Ham.

An erect herb attaining up to 4 ft. in height; stem and leaf with long reddish hairs. *Leaves* 10-21 in. long, ternately imparipinnate as in the last species with similar stipules. *Leaflets* 1-4 in. long, ovate or elliptic, terminal, sometimes obovate or rhomboid, acuminate, often caudate (in our area), biserrate, sometimes lobed, thinly coriaceous, rough on both surfaces; base cordate, rounded or cuneate, sometimes unequal. *Flowers* greenish-yellow, very small in woolly pubescent terminal panicles. *Calyx* 5 lobed, adnate to the base of the ovary. *Petals* 0. *Stamens* 5. *Carpels* 2, slightly united.

KHASI HILLS, 5-6,000 ft.

Flrs. 7-9.

FAM. 53. DROSERACEÆ.

Perennial glandular hairy herbs, insectivorous. *Leaves* radical or cauline; stipules 0, represented by hairs edging the dilated base of the petiole. *Inflorescence* various. *Flowers* regular, hermaphrodite. *Calyx* 4-5 (8) partite or free, imbricate, persistent. *Petals* as many as the sepals, hypogynous or nearly so, marcescent, imbricate in bud. *Stamens* as many as the petals, hypogynous or nearly so; filaments free or connate at the base. *Ovary* nearly free, globose or ovoid, 1-3 locular; style 3-5; stigma 2-fid or fimbriate; ovules numerous, usually on parietal placenta, anatropous. *Capsule* membranous, 3-5-valved. *Seeds* numerous, albumen fleshy; embryo minute.

DROSERA Linn.

Perennial herbs, scapigerous, glandular—hairy. *Leaves* often rosulate, usually circinate in veneration. *Flowers* white or rosy. *Calyx* 4-8-partite, free from the ovary, imbricate. *Petals* 4-8, hypogynous or nearly so, marcescent. *Stamens* as many as the petals. *Ovary* free, 1-celled, placenta parietal; styles 2-5. *Capsule* loculicidally 2-5-valved. *Seeds* ovoid-ellipsoid; testa black, smooth, reticulate .

Leaves radical, rosulate, spatulate; styles 5, undivided. 1. <i>D. Burmanni.</i>
Leaves cauline, alternate, semiterminate, peltate; styles 3, fimbriate. 2. <i>D. peltata.</i>

1. *Drosera Burmanni* Vahl.

Stem scarcely any. *Leaves* .2-.6 by .16-.3 in., tinged with red, all radical—rosulate, spatulate, clothed with curious gland-tipped tentacles; petioles flat; stipules scarious, scape 2-8 in. long, erect, rachis purplish, glabrous; pedicels slender. *Calyx* papillose, segments linear-oblong, obtuse. *Petals* white, spatulate; styles 5, undivided. *Capsule* 5-valved. *Seeds* numerous, minute, black, reticulate.

KHASI HILLS, SYLHET and GARO HILLS.

Flrs. 1-2.

2. *Drosera peltata* Sm. in Willd.

An erect herb. *Stem* erect, 3-12 in. high, leafy. *Leaves* alternate, peltate, with upturned cusps. *Racemes* subterminal, 2-6 in. long. *Flowers* white; pedicels slender, .2-.5 in. long. *Sepals* ovate, glabrous, erose or fimbriate. *Seed* similar to *D. Burmanni*.

KHASI HILLS 3-5,500 ft.

Flrs. 5-6.

FAM. 54. HAMAMELIDACEÆ.

Trees or shrubs often with stellate or fasciculate hairs. *Leaves* alternate, simple or palmately lobed; stipules 1-2, rarely wanting, usually deciduous. *Flowers* hermaphrodite or unisexual, collected into compact heads or spikes or close racemes, usually bracteate. *Calyx tube* adnate to the ovary, rarely free (Distylium), lobes small or 0. *Petals* 4-5 or 0, perigynous or nearly epigynous. *Stamens* 4-numerous, perigynous, rarely hypogynous (Distylium). *Ovary* 2-celled; styles 2, ultimately divaricate, persistent (deciduous in Altingia); ovules 1 to many, axile, pendulous. *Capsule* woody, dehiscing loculicidally at the apex and often also septicidally, endocarp often horny and separating from the exocarp. *Seeds* 1 or many when usually the lowest in cell is perfect, testa shining, endosperm usually thin.

All Indian genera of this family have bordered pits on the walls of wood prosenchyma like the conifers.

I. Ovules solitary in each cell of ovary :—

A. Petals 0 :—

Ovary superior.	1. Distylium.
Ovary half inferior.	2. Sycopsis.

B. Petals 4-5 :—

Calyx tube adnate to the ovary :—

Leaves hazel-like, toothed. Flowers in spike-like racemes. Petals

obovate-oblong under .3 in. .. 3. *Corylopsis*.

Leaves entire. Flowers in heads.

petals linear, .4-.6 in. long, much exceeding the calyx. .. 4. *Loropetalum*.

II. Ovules many in each cell of ovary :—

Leaves serrate. Petals 0 in both male and female flowers; stipules small, subulate; styles deciduous. .. 5. *Altingia*.Leaves entire. Petals present in hermaphrodite flowers; stipules large, persistent. .. 6. *Bucklandia*.1. *DISTYLIUM* Sieb & Zucc.*Distylium indicum* Benth.

A small tree, ends of twigs rusty pubescent. *Leaves* 2.5-4 by 1-1.5 in., obovate or elliptic, tip rounded or gradually or abruptly acuminate, entire, coriaceous, glabrous (more or less stellate pubescent—*F. B. I.*); lateral nerves about 6 on either half, very faint above, the first pair subbasal and very oblique; base cuneate; petiole .2-.3 in. long, margined; stipules lanceolate, pubescent. *Racemes* axillary, upright, 1.5-2 in. long. *Flowers* polygamous. *Calyx* free, early deciduous; pedicels .3-.5 in. long (*F.B.I.*). *Stamens* hypogynous; styles 2, very long. *Fruit* immature, about .6 in. long, erect, covered with stellate pubescence.

KHASI HILLS—Griffith—rare.

The above description has been based on a somewhat incomplete sheet (Griffiths 3397) at Calcutta Herbarium.

2. *SYCOPSIS* Oliv.*Sycopsis Griffithiana* Oliv.

A small tree with lenticellate branches; young parts and inflorescence clothed with minutely stellate pubescence. *Leaves* alternate, 2-4 in. by .8-1.6 in., lanceolate, acuminate; base narrowed to the petiole, coriaceous, thinly stellate pubescent along the nerves beneath, soon becoming glabrous or nearly so; lateral nerves rather indistinct, about 7-10 on either side, meeting in loops; petiole thinly stellate—pubescent

or glabrate; stipules about .2 in. long, linear-lanceolate, early deciduous. *Flowers* unisexual in short dense axillary spikes, both sexes in the same spike. *Male* calyx very small; petals 0. *Stamens* 8 (of which number several appear abortive); rudimentary ovary 2-fid—*F.B.I.* *Female flowers*: calyx irregularly 5-lobed; lower portion of calyx tube adnate to the ovary, free portion pubescent within. *Petals* 0. Ovary 2-celled; styles 2, free; ovule solitary in each cell, pendulous. *Fruits* about .5 in. long, globose or ellipsoid with a hard endocarp more or less rugose and with stellate tomentose outside.

KHASI & JAINTIA HILLS—4000 ft., Cherrapunji, rare.

Fr. 6-8.

3. CORYLOPSIS Sieb & Zucc.

Corylopsis himalayana Griff. Vern. *Tiew-lang-lieh*, *Dieng-piur*, *Dieng-la-paiur*, Kh.

A large deciduous shrub or small tree with nearly smooth, grey or nearly white bark; young shoots, inflorescence and petioles silky villous with stellately fasciculate hairs. *Leaves* plicate in bud, 2.5-5 by 1.5-3.2 in., broadly ovate or ovate-oblong to orbicular, often oblique, acute or shortly acuminate; margin with excurrent hairy teeth, subcoriaceous, glabrous above, paler and fasciculate pubescent specially on the nerves beneath; lateral nerves 9-12 on either side, lowest 2 pairs from near the base, straight, sub-parallel, upper unbranched. lower always branching outwards; base more or less cordate, petiole .4-1.5 in. long; stipules lanceolate-membranous, .6-1 in. long, adpressed silky within, deciduous. *Flowers* bisexual, pentamerous, about .3 in. across, pale-yellow in drooping catkin like spikes, 1-2 in. long, which when young are enclosed within membranous, elliptic-acute or lanceolate scales, .5-7 in. long, resembling the stipules, each flower subtended by a villous concave bract up to .2 in. long. *Calyx tube* adnate to the ovary, hairy, ribbed in fruit, lobes acute, deciduous. *Petals* obovate-oblong, or obovate-spathulate, clawed, .2-.25 in. long. *Stamens* 5, with a number of reddish scale like staminodes; anthers separated by broad connectives. *Ovary* free at the top, 2-celled; styles

2, soon divaricate; ovule 1 in each cell, pendulous. *Capsule* woody, about .25 in. across, endocarp separating from the horny endocarp. *Seeds* with black testa.

KHASI HILLS, 5,000- about 6,500 ft.

The flowers are eaten by the Khasis cooked as vegetable.

Flrs. 1-3. Fr. 6.

Corylopsis manipurensis Hemsl. in Hooker's *Icones Plantarum*.

A shrub. *Leaves* appearing with the flowers, (immature only seen) 1.8-2.5 in. long, obovate, acuminate, glabrous or soon glabrescent above, pilose with long hairs on the nerves beneath; petioles slender, .2-.4 in. long; stipules .6-.8 in. long, glabrous outside, sericiopilose within. *Racemes* terminating branches, 1.7-2.25 in. long, pilose; bracts and bracteoles densely silky hairy on both surfaces. *Petals* oblanceolate, .3-.4 in. long, clawed, much exceeding the calyx and stamens; scales 10.

MANIPUR—Watt!

Flowers 4.

Differs from *C. himalayana* by its leaves appearing with the flowers, solitary petal.

4. LOROPETALUM Br.

Loropetalum chinense Oliv. Vern. *Dieng-jala-um*, Kh.

A large evergreen shrub or small tree; bark grey, thin; branchlets and inflorescence densely stellate pubescent. *Leaves* alternate, 1-2.5 in. by .7-1 in., lanceolate to elliptic or obovate acute or acuminate, subentire or minutely toothed, glabrous above, paler and stellate pubescent, more densely on the nerves beneath; lateral nerves 5-7; petiole .1-.2 in. long, soon deciduous. *Flowers* small, greenish white, bisexual, tetramerous, sessile, 6-8 together in heads, which when fully expanded are about 1 in. across. *Heads* terminal or axillary or in short racemes of 2-3; peduncles about .2 in. long. *Calyx* .1 in. long, tube adnate to the ovary, tomentose, lobes longer than the tube, valvate, up to about .15 in. long. *Petals* .4-.6 in. long, linear, much exserted, white. *Stamens* 4, perigynous; filaments very short, connective produced into a horn from the anthers, short, edges of the valves bending and adhering to the connective. *Ovary* half inferior, 2-celled; styles 2, soon divaricate; ovule 1 in each cell. *Capsules*

1-4 per head, subsessile, .3-.4 in. long, rusty, stellate-tomentose, obovoid.

KHASI HILLS, 4-5000 ft. rare, Nongkhlaw, Mawrykneng—Prain.

Flrs. 3-4.

5. ALTINGIA Noronha.

Altingia excelsa Noronha. Vern. *Duang*, *Jutuli*, Ass.; *Jikri*, Mik.; *Yogir-asing*, Miri; *Siri-asing*, Abor; *Sangri-changne*, Duff.

A very tall aromatic tree attaining a girth of over 17 ft. in favourable situations. *Bark* light to dark grey or brown, exfoliating in large flakes; blaze brown; youngest shoots pubescent, soon becoming glabrous; branches with large lenticels. *Leaves* 3-6.5 by 1.3-2.5 in., lanceolate, elliptic or ovate, caudate or sharply acuminate, serrate; base rounded or narrowed, glabrous, but usually with tufts of hair on the nerve axils; lateral nerves 7-10 on either half, meeting in loops near the margin; petiole .5-1.5 in. long, slender; stipules up to .3 in. long, adnate at the base, free end subulate, deciduous. *Flowers* unisexual in dense heads in short spikes or racemes, supported by large silky bracts, each consisting of a fleshy axis supporting a mass of closely packed anthers with very short filaments. *Female* heads on long peduncles, solitary, axillary at the ends of branches, many flowered. *Calyces* confluent, limb 0. *Petals* 0. *Ovary* free only at the top, 2-celled; styles 2, deciduous; ovules numerous, axile. *Fruit* head globose, rough, woody, about .5 in. across. *Capsules* brown, tomentose; seeds numerous, only 1-2 in each cell, fertile; fertile seeds winged.

UPPER ASSAM from N. E. FRONTIER to SIBSAGAR, sometimes gregarious, e.g., Charduar in DARRANG.

The wood is hard, cross grained. It is cut up into planks when green which is very good for indoor work when not in contact with moisture. The weight (Assam) is about 45 lbs. per c. ft.

The young leaves are red. It yields the resin known as "Storax," which is contained in canals, which accompany the vascular bundles to the last ramifications and in the stem run along the circumference of the pith—Brandis.

Flrs. rainy season. Fr. 2-5.

6. BUCKLANDIA Br.

Bucklandia populnea Br. Vern. *Dieng-doh*, *Dieng-myntat*, Kh.; *Dieng-soh-ryndoh*, Synt.

A medium-sized to tall handsome tree; bark grey or brown to almost black, rough, coarse fibred, hard; blaze reddish-brown with white lines. *Branchlets* green, glabrous. *Leaves* 4·5-7 by 3·5-8 in., broadly ovate to nearly orbicular, sharply acuminate, sometimes 3-cuspidate, specially in young plants, entire with a semitransparent cartilaginous margin, dark glossy green above, silky when very young, but soon glabrous on both surfaces or sometimes with few dark reddish, adpressed hairs, persisting on the nerves beneath, coriaceous; lateral nerves 3-4 (excluding basal); base truncate, subtruncate or retuse, 5-7 nerved; petiole 1-3 in. long, terete, stout; stipules ·7-1·5 in. by ·4-·75 in., coriaceous, somewhat obliquely obovate-oblong, often minutely punctate, concealing the silky buds, deciduous. *Inflorescence* of 2-5 peduncled heads on a very short axis, enclosed at first by the stipules, densely rusty pubescent, when young, nearly glabrate with age; peduncles ·6-1 in. long. *Flowers* polygamous, 8-20 in a head, more or less connate by their calyces. *Calyx tube* adnate to the ovary; limb of 5 lobes. *Petals* in the hermaphrodite flowers variable in number, linear—spathulate, rudimentary in the female flowers. *Stamens* 10-14, absent in female flrs.; filaments long. *Ovary* half inferior, 2-celled, exposed portion brown silky; styles 2, free, soon divaricate; ovules 6-8 in each cell. *Capsule* free, except at the base, woody, subglobose with horny endocarp, which has a tendency to separate from the exocarp; upper seeds in each cell not winged, sterile, lowest winged and fertile.

KHASI HILLS—5000-6000 ft.; common but nowhere plentiful.

Wood weighs about 45 lbs. per c. ft. (Gamble). It is reddish-brown, close grained, with very fine and close medullary rays. The timber is durable and is in considerable demand in the Darjeeling District for planking and door and window frames. It does not ordinarily grow to much size in our area. About 7000 seeds weigh 1 oz.

Flrs. & Fr. 11-12, but also at other times of the year.

FAM. 55. RHIZOPHORACEÆ.

Trees or shrubs, generally glabrous. *Leaves* opposite, entire, coriaceous; stipules interpetiolar, deciduous. *Flowers* regular, usually bisexual. *Calyx* more or less adnate to the ovary, less often free, 4-14 toothed or lobed, persistent. *Petals* as many as the calyx lobes, often 2 fid or lacinate; stamens usually twice as many as the petals, rarely indefinite; filaments free. *Ovary* 5-1 celled by disappearance of the septa; styles usually connate; ovules pendulous, usually 2 in each cell. *Fruit* coriaceous, usually 1-celled, 1-seeded.

CARALLIA Roxb.

Carallia lucida Roxb. Syn. *C. integerrima* DC. Vern. *Mahi-thekra*, *Kathal-boula*, *Daini-jam*, Ass.; *Thai-daukri-phang*, *Kala-jam*, *Oima-thepo-baphang*, Cach.; *Thengu-thung-arong*, *Thengbu-thung*, Mik.; *Theiril*, *Thei-lai-kol*, Kuki; *Saksimaring*, *Chok-chim-arong*, *Bol-neng-rang*, *Thekra-aga*, Garo; *Dieng-soh-lang-bali*, *Dieng-soh-syllih*, *Matam*, Kh.; *Matang*, Sylh.

A medium sized to small tree, often with branches of adventitious roots on the trunk; bark brownish, often with horizontal wrinkles, nearly smooth on old trees, light grey and corky on younger stems; blaze pale light or orange brown, turning dark brown on exposure. *Leaves* 3-7 by 1·3-3·2 in., elliptic or elliptic obovate, usually bluntly and rather abruptly short acuminate or sometimes obtuse, entire or serrulate near the apex, margins usually recurved, coriaceous, glabrous, shining, with dark dots on the undersurface; lateral nerves fine, 10-14 on either side, indistinct until dry with many intermediates, arching; petiole ·2-·4 in. long, stout, margined. *Flowers* sessile, creamy white, 6-8 merous, about ·2 in. across, in short peduncled compound trichotomous cymes; peduncles and pedicels stout. *Calyx tube* minutely bracteate at the base; limb 5-8 lobed; lobes erect, valvate. *Petals* 5-8, orbicular, erose, inserted on the calyx, on the

margin of a crenulated 10-16 lobed disk, which lines the latter. *Stamens* 10-16, inserted with the petals; filaments filiform. *Ovary* inferior. *Fruit* about .2 in. across, globose, 1-celled, 1 seeded.

Wood handsome, hard, red with broad prominent regular medullary rays with few fine short ones between, said to be good for furniture and cabinet making. 840-980 seeds weigh 1 oz.

Sometimes large depressed globose gall fruits about 1 in. across are formed. These become very succulent before dropping off and are then eaten. The epithet *Thekra* to the name may not inconveniently have arisen from mistaking this for a species of *Garcinia*.

Flrs. 12-2.

FAM. 56. COMBRETACEÆ.

Trees or shrubs, sometimes scandent. *Leaves* opposite, subopposite, less often quite alternate, extipulate, sometimes with peltate scales or dots beneath. *Flowers* generally small, bracteolate at the base, sometimes polygamous in spikes, heads or racemes, the latter often paniced. *Calyx tube* adnate to the ovary and often prolonged above it, sometimes to a great length, often broadened towards the end; lobes 4-5, valvate. *Petals* 4-5 or 0, inserted between the calyx lobes. *Stamens* 4-5 or twice the number. *Ovary* totally inferior, 1-celled; style simple; ovules few, pendulous from the apex of the cell. *Fruit* indehiscent, drupaceous or coriaceous, angled or commonly winged, sometimes crowned by an accrescent calyx. *Seed* 1; endosperm 0. *Cotyledons* often convolute.

I. Calyx limb deciduous :—

A. Trees, leaves alternate or subopposite.

Petals 0 :—

Flowers in spikes.	1. Terminalia.
Flowers in globose heads.	2. Anogeissus.

- B. Scandent or straggling shrubs; leaves opposite, petals as many as calyx lobes :—
 Flowers 4-5 merous; petals small, tube of calyx limb above the ovary not long. 3. *Combretum*.
 Flowers 5 merous; petals conspicuous, tube of calyx limb above the ovary, usually long and slender. .. 4. *Quisqualis*.
 II. Calyx limb accrescent in fruit :—
 Petals 0. Diffuse scandent shrub. 5. *Calycopteris*.
Illigera has been included under *Hernandiaceæ*.

1. TERMINALIA Linn.

Large trees. *Leaves* subopposite, opposite or alternate, sometimes crowded at the ends of branches, entire or slightly crenulate, often with glands at the base of the blade or on the petiole. *Flowers* small, hermaphrodite or sometimes the upper flowers of the spike male, greenish, in simple or paniced spikes; bracts narrow, caducous. *Calyx* tube constricted and produced above the ovary with a campanulate limb and 5 short lobes. *Petals* 0. *Stamens* 10, in two series, inserted on the calyx tube; filaments exerted; disk epigynous, hairy, lobed within the stamens. *Ovules* 2-3, pendulous. *Fruit* drupaceous or dry, smooth or angular or with 2-5 wings.

I. Fruits not winged :—

- A. Drupes tomentose globose; leaves clustered at the ends of branches. Spikes never paniced. 1. *T. belerica*.

- B. Drupes smooth not globose, leaves not clustered at the ends of branches. Spikes often paniced :—

Glands on the petioles not prominent, areoles between nervules of leaves not felted. 2. *T. Chebula*.

Glands on the petioles prominent, areoles between the nervules of leaves white with minute felt. .. 3. *T. citrina*.

II. Drupes winged :—

Deciduous; drupe large over 1.5 in. long with broad wings. 4. *T. tomentosa*.

Evergreen; drupe very small, scarcely .15 in. long with small wings. .. 5. *T. Myriocarpa*.

1. *Terminalia belerica* Roxb. Vern. *Bibhitaki*, *Bahe-ruka*, Sans.; *Bondoureja*; *Babraiphang*, Kach.; *Kuru*, Garu-

arong, Mik.; *Logio-asing*, Miri; *Bhamora*, Bowa, *Bhoira*, *Dubong*, *Silli*, Ass.; *Dieng rinyan*, *Dieng-soh-khoru*, *Dieng-soh-kong-khru*, Kh.; *Khung-khli-thing*, *Bakhalla*, Kuki; *Bakhla*, Tipp.; *Baura*, Mech; *Churi*, *Bol-churi*, *Bolsuiri*, *Bolbadok*, *Bol-chiroke*, Garo; *Bhengragota*, Jharua; *Barra*, Nep.; *Bahera*, Hind.; *Bohera*, Beng.

A large deciduous tree, sometimes buttressed at the base. *Bark* ashy dark-grey or brown, rough, exfoliating in irregular brownish small scales. *Blaze* pale yellow, turning brownish on exposure; young parts and inflorescence rusty tomentose. *Leaves* alternate, clustered at the ends of branches, 3-10 by 2-5 in., obovate to broadly elliptic, obtuse, subacute or apiculate at the apex, margin with a pellucid rim, coriaceous, puberulous when young, dark green and glabrous when mature, often punctate above when mature; lateral nerves 5-8—sometimes up to 10 on either half; base narrowed, often inequal; petiole 1-3·5 in. long, glands absent or inconspicuous. *Flowers* ·25 in. across, greenish yellow with an unpleasant smell, in slender axillary and extra-axillary interrupted drooping spikes from new shoots, 3-6 in. long, and hermaphrodite upper flowers often male; bracts minute, villous, caducous. *Calyx* hairy outside, woolly within, about ·25 in. across; limb cup-shaped, expanded, teeth 5, triangular. *Drupe* about 1 in. long, globose, often abruptly narrowed to a short stalk, grey velvety, obscurely ribbed when dry.

Throughout the province.

The fruit is the Belleric Myrobalan of commerce. It is largely used in indigenous medical practice. The kernel is edible but it is said to have narcotic properties. It yields an oil. The wood is yellow when freshly cut, turning yellowish or greyish brown. Medullary rays fine, pores joined by fine concentric lines. The timber is not durable but can be used for packing cases, posts for buildings, etc.

New leaves often copper coloured. Flrs. hot season after new leaves. Fr. 12-2.

2. Terminalia Chebula Retz. Vern. *Silikha*, Mech; *Artak*, Garo; *Halagach*—, Jharua; *Haritaki*, Beng. and Sans.; *Harra*, Hind.

A medium sized deciduous tree; bark grey or almost black, rough and furrowed outside; inside fibrous and reddish-brown, with a thin yellow layer near the cambium; young

parts shining, rusty, pubescent. *Leaves* 3-7·5 by 2-3·75 in., sub-opposite or alternate, acute, elliptic or ovate-oblong or shortly acuminate, silky when very young, glabrous with age; coriaceous; lateral nerves 6-12 on either half, arcuate, prominent; base rounded or cuneate, sometimes unequal; petiole ·5-1 in. long, usually with two sometimes more glands towards the top. *Spikes* usually 2-5·5 in. long, terminal or from upper leaf axils on new shoots, often paniced, sometimes fascicled, rusty pubescent when young. *Flowers* about ·1-·15 in. across with an offensive smell, all hermaphrodite; **bracts linear**, deciduous. *Limb* of calyx tube expanded and cup-shaped, glabrescent outside, villous inside. *Drupe* 1-2 in. long, obovoid or ellipsoid, smooth, more or less 5 ribbed, yellowish green when ripe; stone obscurely angled, rough, bony with gum vessels in the Walls.

Deciduous forests—GOALPARA, GARO-HILLS, KAMRUP.

The fruit is the Chebulic Myrobalan of commerce and is one of the best tanning materials we have. It is also largely used in medicine as a laxative, alterative and tonic. The unripe fruit on account of its astringent and aperient properties is a useful medicine for diarrhoea and dysentery. Water in which the fruits have been steeped overnight is a cooling wash for eyes affording relief in conjunctivitis and similar affections of the eye. The kernel yields a transparent oil. Wood very hard "brownish grey" with greenish or yellowish touch, heartwood dark purple, durable—it is used for furniture, carts, agricultural implements and house building—*Gamble*. The wood takes a good polish.

The tree varies a great deal in the pubescence of leaves and calyx and size and angularity of the fruit and apparently several forms if not varieties exist. 60-75 dry seeds go to the lb.

Flrs. hot season. Fr. 2-3 next year.

3. Terminalia citrina Roxb. Vern. *Senemphang*, *Suluka-baphong*, *Silika*, *Hartaki*, Cach., *Meng-suri-arong*, *Cheluka-arong*, Mik., *Soh-salukah*, *Soh-kykat*,? *Soh-Hardudiengartaki*, Kh.; *Logio-asing*, *Hilkang-asing*, Miri & Abor; *Hilikha*, Ass.; *Monalu*, Manip.; *Rerora*, Lush.; *Bekhla*, Tipp.; *Phakala*, *bakhla-rahtol*, Kuki; *Hartaki*, Sylh.; *Aritok*, *Bolomit*, Garo.

A medium sized to large deciduous tree, often with buttressed stem attaining 80 ft. in height. *Bark* grey or brown, slightly vertically fissured outside, light yellow, turning

brown and fibrous inside, about .3 in. thick. *Young* shoots shining, rusty or brown pubescent, soon glabrate. *Leaves* subopposite, 3.7-5 by 1.3-4 in., lanceolate or oblong-lanceolate to elliptic, acute or shortly acuminate; pubescent when young, glabrous and shining when mature; lateral nerves 8-12 on either half, curving upwards, nervules very finely reticulated, areoles white with very minute felt; base cuneate or rounded; petiole .4-1 in. long, biglandular, glands prominent, round. *Spikes* deciduously rusty puberulous, paniced at the ends of shoots with lower branches axillary or sometimes solitary and axillary. *Flowers* about .2 in. across, sessile, all hermaphrodite, each with a small linear silky pubescent deciduous bract, those towards the bottom of the spikes spatulate and larger downwards. *Calyx* glabrous outside, rusty villous within; limb broad, cupular; teeth 5, erect. *Drupe* 2-3 by .75-1 in., oblong-lanceolate, slightly clavate, smooth, glabrous, obscurely 5-ridged.

Throughout the province ascending to about 1500 ft. in the KHASI HILLS, often confused with *T. Chebula*.

Fruits are used medicinally similar to those of *T. Chebula*.

Flrs. 6-7. Fr. 1-2.

4. *Terminalia tomentosa* W & A. *Terminalia tomentosa* Bedd. Var. *typica*. Vern. *Kushi-bom-phang*, Mech.

A large to medium sized deciduous tree. *Bark* brown or grey, sometimes almost black, deeply furrowed, 1-1.5 in. thick; inside red, deeper layers paler, fibrous. *Young* parts rusty tomentose. *Leaves* subopposite, 4.5-9 by 2.5-4 in., oblong or elliptic or obovate-oblong, apex obtuse, broadly acute or short acuminate; entire or sometimes serrulate, silky pubescent and glabrescent with age above, more or less hairy specially along the nerves (in the form found in our area) beneath; lateral nerves 12-20 on either side; base often unequally cordate; petiole .25-.4 in. long, usually with 1-2 turbinate often stipitate glands at the junction with the midrib. *Flowers* about .15 in. across, dull yellow, bisexual; spikes erect, pubescent, paniced on the new shoots, lower branches from leaf axils; bracts subulate. *Calyx* hairy or glabrescent outside; limb cup-shaped, usually broader than long; teeth acute, hairy inside. *Drupe* 1.5-2.5 in. long,

with 5 coriaceous wings, .5-1 in. broad and marked with close horizontally parallel striations.

GOALPARA in mixed forests.

Heart-wood dark purplish-brown with darker streaks bleaching to a greyer tint on exposure. It polishes well and is then very handsome. It is generally used for house-building, agricultural implements, etc., in many parts of India but could be used also for panelling, decorative and furniture work. It is however liable to crack unless thoroughly seasoned. 150-250 seeds weigh a lb.

New leaves 3-5. Flrs. 4-6. Fr. 2-3.

5. Terminalia myriocarpa Heurek et Muell. Vern. *Holok*, Ass.; *Jhaluka*, Ass.; *Dieng-marao-ditar*, *Dieng-lang-sing-d-khar*, *Dieng-tal*, kh.; *Silok*, Miri and Abor; *Chalabophong*, *Jhalna*, Cach.; *Turtung arong*, Mik.; *Jhalna*, Manipur; *Chorpui*, Lush.; *Rakseng*, Garo.

A very large evergreen tree with pendulous branchlets; outer bark grey or brown, rough, peeling in vertical flakes; inside red, pale yellow towards the cambium, fibrous. *Young* parts and inflorescence rusty pubescent. *Leaves* 4-9 by 1.5-3 in., oblong-lanceolate to elliptic oblong, acute or shortly acuminate, denticulate or entire; lateral nerves many, about 25-36 on either side, subparallel, those near the base more straight; base inequal, narrowed, often subcordate, coriaceous, glabrous or with few hairs along the nerves; petiole thick, about .25-.3 in. long with 1-2 elongated glands near the top. *Flowers* .15 in. across, pink, each in the axils of a small lanceolate or deltoid subulate bracteoles. *Spikes* slender, lax, arranged in ample panicles, which are terminal and from upper leaf axils; upper bracts spathulate, lower gradually larger and leafy. *Limb* of calyx tube expanded, glabrous or nearly so outside, pubescent within; teeth erect; disk with few or no hairs; ovary pubescent. *Drupe* .15 in. long, yellow, 3 cornered, the lateral corners developing into short wings; .3-.5 in. across the wings.

In evergreen forests throughout ascending to about 2,000 ft. in the KHASI HILLS. "A very handsome tree in flower or fruit that is either loaded on its pendent boughs with pink flowers or yellow fruit"—Gamble.

Heart-wood brown with dark streaks, polishes well. The timber is fairly durable and is well adapted for cheap furniture, doors, windows,

railway carriages, tea boxes, house-building, etc. It makes excellent charcoal. Av. weight about 53 lbs. per c. ft. About 4,000-5,000 seeds weigh 1 oz.

Flrs. 10-11. Fr. 2-5.

Terminalia Catappa Linn. The Indian Almond Tree.—A tall tree with rough bark, stem often buttressed. *Leaves* 6-9 in. by 3-5-5 in., obovate or obovate-oblong from a narrow cordate base, softly hairy when young, glabrescent with age; midrib sometimes with 2 depressions near the base on the under side; petiole .5-.75 in. long, short, stout, channelled. *Flowers* white; spikes axillary, upper flowers male and shortly pedicelled, lower bisexual. *Calyx* glabrous outside. *Drupe* 1-2 in. long, glabrous, ellipsoid, slightly compressed, keeled all round, endocarp hard, kernel edible, oily.

Sometimes cultivated for fruits in plains districts.

Flrs. 3-5. Old leaves turn a beautiful crimson colour before dropping in January and February.

2. ANOGEISSUS Wall.

Anogeissus acuminata Wall.

A large graceful tree usually with pendulous branches. *Bark* grey, rough, about .75-1 in. thick; inside reddish brown, fibrous; shoots, branchlets and inflorescence softly adpressed tomentose. *Leaves* 1-5-3 by .5-1-2 in., sub-opposite, bifarious, oblong- to ovate-lanceolate, acute or sharply acuminate, entire, punctate, clothed with soft spreading hairs or nearly glabrescent above, with age, thin, translucent dotted (due to crystal cells); lateral nerves 5-7 on either side, arcuate; petiole up to .25 in. long, pubescent. *Flowers* very small, bisexual in globose peduncled heads up to .75 in. across. *Peduncles* axillary, solitary or sometimes two together, as long as the heads. *Bracts* at the base of the head, ovate-lanceolate to spatulate up to .15 in. long, brown tomentose; bracteoles minute, woolly, spatulate. *Calyx* superior, calyx tube pubescent, narrowed and prolonged above the ovary as a persistent beak with an expanded and deciduous campanulate 5-cleft limb, which is glabrate outside and woolly within. *Petals* 0. *Stamens* 10 in 2 series; filaments exserted. *Ovary* 1 celled with 2 pendulous ovules; style simple. *Fruit* .15-.3 in. across, samaroid, broader than long (with wings), coriaceous, broadly 2 winged with a beak, which is slightly longer than or about as long as the fruit,

glabrous except for the villous apical portion at the base of the beak, wings membranous, often irregularly denticulate at the edges; seed 1.

Chatta-chura Hill, NORTH CACHAR, Lambabak-LUSHAI HILLS.

Wood is used for cart axles and ploughs. It is moderately hard grey or yellow grey, warps and cracks in seasoning, not durable when exposed to wet. Av. weight about 50 lbs. per c. ft.

A. sericea Brandis.

A large tree; young shoots silvery; fl. heads axillary, generally single on long peduncles, frequently bearing leafy bracts. *Fruits* (not seen), tomentose with wings broader than long; wings jagged. *Calyx* often persistent at the end of the long tube.

Longai Reserve—SYLHET.—C. S. Purkayastha.

Flrs. 3.

3. COMBRETUM Linn.

Usually large straggling or scandent shrubs. *Leaves* usually opposite, rarely ternate or alternate, entire, petiolate. *Flowers* 4-5 merous, hermaphrodite or polygamo-diœcious, usually in paniced or simple spikes; bracts often large; bracteoles small. *Base* of calyx tube adnate to the ovary, 4-5 angled, constricted and more or less produced above the ovary; limb expanded, cup-shaped, funnel-shaped or campanulate, deciduous. *Disk* at the base of the calyx limb or lining it and then ending in a hairy ring. *Petals* inserted between the calyx teeth, rarely 0. *Stamens* twice as many as the petals, inserted on the disk. *Ovary* 1-celled; style subulate; ovules 2-5, pendulous from the top of the cell. *Fruit* 4-5 winged or ridged, dry, generally indehiscent; wings membranous.

I. Flowers 5-merous with 5 membranous wings :—

Bracts creamy white; calyx limb abruptly cup-shaped.

1. *C. decandrum*.

Bracts greenish, calyx limb gradually broader upwards and funnel-shaped.

2. *C. pilosum*.

II. Flowers 4-merous—fruit with 4 ridges :—

Disk at the base of the calyx limb not ending in a villous ring; calyx squamose outside.

3. *C. acuminatum*.

III. Flowers 4-merous, fruit with 4 wings :--

Disk lining the calyx limb and ending in a villous ring at the throat :—

A. Surface of fruits with fibrillar scales; calyx squamose; petals obovate, much longer than the calyx teeth.

4. *C. flagrocarpum*.

B. Surface of fruits without elongated fibrillar scales :—

1. Limb of calyx squamose, petals longer than or about as long as calyx teeth :—

a. Base of leaves never cordate :—

Young parts and inflorescence densely covered with copper coloured pale or peltate scales; calyx limb with a short tube; petals linear—spatulate, acute at apex.

5. *C. squamosum*.

Young parts and inflorescence sparsely dotted with glands, mature leaves slightly squamose or without glands; petals obovate.

6. *C. chinense*.

b. Base of leaves narrowed and cordate :—

Young parts villous, petals obovate.

7. *C. dasystachyum*.

2. Limb of calyx not squamose; petals minute and shorter than the calyx teeth, oblong-truncate and usually notched at apex :—

Tube of calyx limb much elongated, mature leaves not squamose, never cordate at the base.

8. *C. extensum*.

1. Combretum decandrum Roxb. Vern. *Lota-chali*, *Jonari-lewa*, *Jangta*, *Dhuna-sali*, *Tita-sali*, *Dhenai-sali*, *Droa-chali*, *Dhoba-lota*, *Bain-lewa*, Ass., *Arkeng-arong*, *Namarkeng*. Mik.; *Ther-sali*, *Mei-long-kha-saw*, Kh.; *Dugi-shing*, *Du-grak*, Garo; *Bandarebhra*, Nep.; *Koldam-hrui*, Lush.; *Damkol*, Tipp.

A large evergreen woody climber; young parts and inflorescence brown, silky-villous. *Bark* reddish-brown, peel-

ing off in thin flakes. *Leaves* opposite, 3-6 by 1·3-3 in., elliptic or elliptic to lanceolate, oblong, abruptly short acuminate, coriaceous, glabrous or with tufts of hair on the nerve axils, sometimes also sparsely pubescent on the midrib and the nerves beneath; lateral nerves 6-8 pairs, prominent beneath, arcuate, joined by numerous subparallel fine tertiaries; petiole ·2-·4 in. long. *Flowers* greenish-white, pentamerous, about ·2-·25 in. across, in dense spikes up to 3 in. long, usually arranged in terminal and axillary panicles, sometimes simple and fascicled from leaf axils. *Bracts* opposite, creamy-white, leaf-like, up to 3 in. long, upper gradually smaller, pubescent; bracteoles sub-persistent, villous, linear spatulate, acuminate, up to about 2 in. long. *Calyx* about ·15 in. long, hairy outside, expanded above the ovary into a cup-shaped limb, which is pubescent within, lobes abruptly linear acuminate from a broad base. *Disk* lining the base of the calyx limb, pubescent. *Petals* 5, slightly exceeding the calyx lobes, oblong or oblong-lanceolate, acute or acuminate, hairy. *Fruit* about 1 in. long with 5, less often 4 papery wings, each ·25-·3 in. broad.

Throughout the province, ascending to 1,500 ft. in the KHASI HILLS.

The bark is said to be chewed as substitute for betel nut.

Flrs. 11-1. Fr. 3-4.

2. *Combretum pilosum* Roxb.

A scandent shrub; branchlets clothed with soft rusty or brownish spreading hairs. *Leaves* opposite, 3·8-8 by 2·3 in., oblong-lanceolate to elliptic oblong, shortly acuminate, entire; coriaceous, shining, pubescent on the mid-rib and the nerves or glabrescent above and more thinly beneath, punctate and minutely papillose on the upper surface; lateral nerves 6-8 on either side, ascending, curved; base-cordate or retuse, slightly narrowed; petiole stout, ·2-·3 in., hairy. *Flowers* ·6-·7 in. long, 2-sexual, 5-merous, densely crowded in rusty or fulvous, silky-villous spikes, which are paniced at the ends of branches or from upper axils; bracteoles densely pilose, lanceolate or subulate-lanceolate up to ·25 in. long. *Calyx* limb ·4-·5 in. long, funnel-shaped from a shortly constricted base, 5-ridged and pubescent with soft hairs outside and below the

throat inside. *Calyx lobes* triangular, acuminate, about $\cdot 1\cdot 12$ in. long. *Disk* lining the base of the tube. *Petals* exceeding the calyx lobes about $\cdot 2$ in. long, oblong or narrow-obovate-obtuse, light pink, silky pubescent on the backs. *Stamens* 10, unequal, exserted, in 2 series, upper opposite the petals inserted between the calyx-lobes, lower alternating with them, basal portions adherent to the grooves formed by ridges of the calyx limb. *Ovary* 1-celled, pilose outside with spreading hairs; style exserted, pilose, slightly adnate to the calyx limb; ovules 2-or 1 by suppression, from the apex of the cell, suspended by long funicles. *Fruit* $1\cdot 1\cdot 25$ in. long, elliptic or ovate oblong with 5 chartaceous wings almost as broad as or broader than long.

Foot of KHASI and JAINTIA HILLS—Tharia, Bholaganj; SIB-SAGAR, Ranga-pahar Reserve.

Flrs. 1-2.

Var. *spinescens* with stout spines at the base of the branchlets—Keenan.

3. *Combretum acuminatum* Roxb. Vern. *Nahar-lata*, Ass.

Large woody climber with grey bark; young parts puberulous. *Leaves* opposite, $4\cdot 7\cdot 5$ by $1\cdot 3\cdot 4$ in., ovate or elliptic, oblong to oblong-lanceolate, acuminate, coriaceous, glabrous or puberulous along the midrib and nerves on the under surface, which is also minutely glandular or scaly punctate; lateral nerves 10-15 on either side, tertiaries strong, scalariform; base rounded, subcordate or acute; petiole $\cdot 2\cdot 4$ in. long, stout. *Spikes* usually 1-3 in. long, axillary and simple or forming leafy panicles at the ends of branches, pubescent and more or less dotted with minute round scales; bracteoles small, caducous. *Flowers* 4-merous, $\cdot 25$ in. across. *Calyx* dotted with minute round scales, puberulous and more densely scaly at the base; limb scarcely constricted above the ovary, campanulate; teeth erect, acute; disk at the base of the limb, glabrous or nearly so. *Petals* narrowly oblanceolate, acute, a little longer than the calyx teeth. *Fruit* 1-2 in. long, $\cdot 4\cdot 6$ in. broad, narrowly ellipsoid-narrowed at either end, bluntly 4 ridged, fluted between the ridges, brown.

SIBSAGAR, GOALPARA, Guma Reserve, LAKHIMPUR, KHASI HILLS up to 2,000 ft.

Flrs. 2-3. Fr. 7.

4. **Combretum flagrocarpum** Herb. Cal. *Tilli-lieh*, Synt.; *Arkeng-rekang*, Mik.; *Dugrak*, Garo; *Dukha-gajao*, Cach.; *Tairel*, *Rhui-keng-rathol*, Kuki.

A large straggling or scandent shrub; young parts and inflorescence pubescent or tomentose and also covered with round copper coloured or pale peltate scales. *Leaves* opposite, 3·7-7 by 1·7-3·5 in., elliptic to elliptic-oblong or ovate to obovate-lanceolate, more or less abruptly acuminate; thinly coriaceous with resinous dots on both surfaces—more numerous beneath, pubescent along the nerves or glabrescent above with age, tomentose or pubescent at least along the nerves beneath, sometimes nearly glabrous with age; lateral nerves arcuate, 10-12 on either side; base rounded or narrowed; petiole stout, up to ·4 in. long. *Spikes* usually paniced, terminal or axillary, in the latter case sometimes simple; panicle branches opposite, sometimes 2 together. *Flowers* 4-merous, ·25-·4 in. long (excluding the stamens) each in the axil of a bracteole; bracteoles linear to linear spathulate, gradually larger downwards, ·15-·4 in. long. *Calyx* densely covered with scales; limb funnel-shaped with an abruptly dilated cupular mouth. *Calyx teeth* erect, triangular. *Petals* white (drying yellow), about ·1 in. long, much larger than the calyx teeth, broadly obovate, shortly clawed. *Disk* lining the free portion of calyx tube and ending in a villous ring. *Fruit* 1-1·5 in. long, 4-winged, dotted with resinous glands, densely beset on the space between the wings with linear-lanceolate scales.

N. E. FRONTIER, LAKHIMPUR, SIBSAGAR, CACHAR, KHASI HILLS up to 4,000 ft., GARO HILLS. Probably all over UPPER ASSAM.

Flrs. 4-6. Fr. 12.

5. **Combretum squamosum** Roxb. Vern. *Thlai-riel*, Lush.; *Soh-risang*, Kh.; *Setta-abung-taru*, Duff.

A large woody climber with dark brown or grey bark; softer parts covered all over with minute peltate, round,

coppery, pale or ultimately greyish white scales, more densely when young, pale to coppery. *Leaves* opposite, 4-8 by 2-4 in., usually oblong to suborbicular-elliptic or obovate to elliptic, sometimes orbicular, upper leaves smaller and narrower, short-acuminate or apiculate; coriaceous, sometimes glands disappearing with age; lateral nerves 5-7, distant; base cuneate or rounded; petiole .5-1 in. long, stout, channelled. *Spikes* paniced at the ends of branches or from upper axils, the latter often branched; panicle branches usually opposite, lower bracts leafy, upper gradually smaller; bracteoles subulate. *Flowers* 4-merous, about .3 in. long, bisexual. *Free* portion of calyx tube funnel-shaped with a cupular mouth. *Calyx* teeth triangular. *Petals* minute, spathulate, tapering to the claw, slightly longer than or the same size as the calyx teeth. *Disk* thin, lining the base of the calyx limb and ending in a fulvous woolly ring. *Fruit* 1-1.5 in. long with 4 wings covered with scales or glabrous with age; wings .3-.5 in. broad.

UPPER ASSAM, GARO HILLS, ascending to 2,500 ft. in the KHASI HILLS.

Flrs. 10-1. Fr. 4.

6. *Combretum chinense* Roxb. Vern. *Dukha-rau-thau-di*, Cach.?

A large woody climber, branchlets and inflorescence sparsely dotted with minute scales. *Leaves* opposite or 3 in a whorl, 2.5-5 by 1.5-2.5 in., elliptic, elliptic oblong or obovate, shortly blunt acuminate; glabrous or glabrescent and punctate on both surfaces, often with minute scales; main nerves 5-9 on either side, arched; base acute, abruptly cuneate or narrowed; petiole .2-.5 in. long, pubescent. *Spikes* axillary, 1.5-3 in. long, many flowered, pubescent; bracteoles linear, deciduous. *Flowers* 4-merous. *Calyx* dotted with scales and minutely pubescent outside; limb .25 in. long, slender at the base and then funnel-shaped. *Petals* broadly obovate, clawed, exceeding the calyx teeth. *Calyx* teeth acute, erect. *Disk* and the limb inside fulvous pubescent. *Fruit* about 1.2-1.5 in., long and 1-1.2 in. broad;

wings slightly unequal, horizontally striate, dotted with few glands.

CACHAR; Dehing river—LAKHIMPUR—Gammie, KAMRUP—Mann.

7. *Combretum dasystachyum* Kurz. Vern. *Dugrak*, Garo; *Holoklota*, Miri & Ass.; *Arkeng-ket*, Mik.; *Mei-ju-ne*, Kh.

A stout woody climber; young parts and inflorescence usually rusty hirsute or villous. *Leaves* 2·5-8 (sometimes up to 10 in. long) by 1·2-3·7 in., opposite or sometimes ternate, oblong-lanceolate to elliptic, oblanceolate or obovate from a narrowed cordate or subcordate base, acuminate, thin, somewhat rough with minute punctulate dots, glabrous above, undersurface glabrate except of hairs along the nerves axils; lateral nerves 7-10 on either side; petiole stout, short, up to ·3 in. long, glabrate or hairy. *Spikes* simple, sometimes branched, axillary, much shorter than the leaves. *Flowers* bisexual, 4-merous, about ·5 in. long; bracteoles linear, shorter than the flowers. *Calyx* densely covered outside with copper coloured or pale round scales; free portion constricted above the ovary and then funnel-shaped with the disk lining the bottom and ending in a villous ring, teeth triangular. *Petals* small, obovate-narrowed into the claw, slightly longer than the calyx teeth or about as long. *Fruit* 1-1·5 in. long, stipitate with the wings, broader than or as broad as long, shining, usually dotted with scattered glands or sometimes without glands; wings ·3-·75 in. broad.

All over UPPER ASSAM, GARO HILLS, ascending to 2,500 ft. in KHASI HILLS.

Flrs. 3-6. Fr. 12-2.

8. *Combretum extensum* Roxb. Vern. *Rekang-uphang*, Mik.

A large woody climber. *Bark* dark-brown with close but very shallow vertical furrows; branchlets glabrous. *Leaves* opposite or sub-opposite, 4-7 by 2·2-4·5 in., broadly or sub-orbicular-elliptic, elliptic-oblong or broad ovate, shortly

and often abruptly acuminate or sub-acute; base broad and abruptly narrowed on the petiole or cuneate, coriaceous, glabrous on both surfaces, somewhat rough and punctate beneath; lateral nerves 6-8 on either side, arched near the margin, upper meeting in loops; petiole .6-1 in. long, stout. *Spikes* from axils of existing or fallen leaves, simple or paniced, pubescent or puberulous. *Flowers* 4-merous, about .35-.45 in. long and .25-.3 in. across. *Ovary* downy. *Calyx* constricted above the ovary into an elongated tube and then expanded into a funnel-shaped puberulous limb; lobes acuminate, reflexed, about .1 in. long; disk lining the limb of the calyx and ending in a hairy ring at the throat. *Petals* shorter than the calyx lobes, truncate-oblong or sometimes obovate, usually notched at the apex. *Fruit* 1.25-1.5 in. long and nearly as broad (with wings); wings scariose.

SIBSAGAR—Bokajan reserve, CACHAR, Chatta-cherra, low elevations in KHASI HILLS—Thleu syryngam.

Flrs. 12-1.

C. sundaicum Miq. Vern. *Dukhar-rau*, *Thaudi*, Cach. Closely allied to the above and doubtful if a distinct species. *Leaves* 3-5 in., ovate or oblong, suddenly acuminate, nearly glabrous when mature, punctulate on both surfaces; petiole about .5 in. long. *Spikes* dense, paniced. *Calyx* with a ring of hairs at the base. *Fruit* as in *C. extensum*.

N. CACHAR HILLS, Langting. Sheet No. 5574—rather incomplete.

4. QUISQUALIS Linn.

Quisqualis indica Linn. Vern. *Malati*, Beng. The Rangoon creeper.

A large scandent shrub. *Leaves* 2-4 by 1.5-2 in., elliptic-acuminate, softly pubescent at least on the beneath; petiole .2-.4 in. *Flowers* 5-merous, handsome, scented, at first white and then turning red. *Calyx* limb slender up to about 2.5 in. long; petals about .5 in. long.

A native of Eastern Burma, Malay Peninsula and Java; often cultivated as an ornamental plant.

Flrs. hot and rainy season.

5. CALYCOPTERIS Lamk.

Calycopteris floribunda Lamk.

A somewhat variable diffuse scandent shrub with drooping branches. *Bark* corky, light brownish grey, reticulately but very irregularly fissured outside, about .3 in. thick on old stems. *Branchlets* terete, rusty tomentose or glabrous. *Leaves* opposite, 2.5 by 1.2.5 in., elliptic to lanceolate or ovate-oblong, acute or acuminate, rusty tomentose or glabrous beneath, with minute pits containing resinous glands, thinly coriaceous, entire; lateral nerves 7-9 on either side; tertiaries reticulate; petiole .2-.3 in. long, slightly channelled, rusty tomentose. *Flowers* bisexual, .5 in. across, rusty tomentose all over in axillary and terminal panicles, crowded towards the ends of branches; bracts leaf like. *Calyx* 5, striate and produced above the ovary; limb 5 fid, .2-.3 in. long, persistent and accrescent in fruit. *Petals* 0. *Stamens* 10, unequal, 5 upper ones between the calyx lobes, remaining 5 lower down on the calyx tube and alternating with the upper stamens, all shorter than the calyx lobes. *Ovary* 1-celled, inferior; style subulate; ovules pendulous from the top of the cell. *Fruit* narrowly ellipsoid-oblong, obtusely 5-angled; limb about .15 in. deep; wings .5-.6 by .2 in., oblanceolate or obovate, membranous, 3-veined.

ASSAM—*C. B. Clarke in F. B. I.*

There are no specimens at Calcutta from our area.

Flrs. 1-3. Fr. 2-4.

FAM. 57. MYRTACEÆ.

Trees or shrubs, rarely herbs. *Leaves* entire, opposite, rarely alternate (*Eucalyptus*), usually with an intramarginal nerve and dotted with oil glands, as are usually also young branchlet, parts of the flower and fruit; stipules 0 or minute,

deciduous. *Flowers* regular, hermaphrodite or rarely polygamous, axillary or terminal, solitary or in cymes or corymbs; bracteoles usually 2, sometimes 0. *Calyx-tube* more or less adnate to the ovary and sometimes produced above it, often with a disk lining the limb; calyx-lobes 4-5, persistent or deciduous, imbricate and often closed in bud. *Petals* as many as the lobes of the calyx, rarely 0, inserted on the margin of the disk or on the mouth of the calyx-tube, imbricate, sometimes connate and falling off as a cap. *Stamens* numerous in one or more rows within the petals, often inflexed in bud; anthers 2-celled. *Ovary* inferior or $\frac{1}{2}$ inferior, usually 2, or 1-many celled; style simple; stigma small; ovules axile, usually numerous. *Fruit* crowned with the calyx-limb, baccate or capsular; seeds many or 1 or few by abortion, exalbuminous.

I. Leaves usually opposite; fruit baccate :—

Calyx 4-lobed; ovary 2-celled; seeds

1 or few.

Calyx 4-5 lobed; ovary usually

4-celled; seeds many.

1. **Eugenia.**

2. **Decaspermum.**

II. Leaves (of older plants alternate); fruit

capsular.

3. **Eucalyptus.**

1. EUGENIA Linn.

Trees or shrubs, evergreen or nearly so; young branchlets, leaves, parts of the flower and the fruit usually dotted with pellucid oil cavities. *Leaves* opposite, penninerved, exstipulate. *Flowers* solitary and axillary or in simple, racemed or dichotomously branched panicles. *Calyx-tube* usually articulated to the pedicel, often with two bracteoles at the base, adnate to the ovary, produced above the ovary or not, with 4-5 (rarely 5) lobes or segments or limb, subtruncate. *Petals* 4, rarely 5 or more or 0, free and spreading or united into a cap (calyptra). *Stamens* numerous in several series; filaments free or slightly combined into 4 bundles, inserted on the edge of the disk at the mouth of the calyx-tube; anthers small, versatile, often with a gland at the tip, dehiscing longitudinally. *Ovary* 2-rarely 3-celled; ovules many in each cell but only 1-few developing; style simple. *Berry* drupe-like, rarely dry and fibrous, crowned with the remains of the persistent calyx-limb; seeds 1 or few; embryo

fleshy, thick with a short radicle; cotyledons thick, free or more or less united.

The genus *Eugenia* is often broken up into several genera. As the common characters of the group are easy to recognise in the field, the old arrangement of including these plants under one genus has been adhered to. These new genera have been referred to as sections in the key.

Sect. I. JAMBOSA. *Flowers* in cymes, usually large. *Calyx-tube* produced beyond the ovary, usually with a thickened disk at the mouth and with 4 persistent rounded lobes. *Petals* free. *Stamens* bent inwards in the middle in bud. *Berry* crowned by the calyx-limb and the thickened disk; seeds large, angled :—

I. Flowers one inch or more across, showy :—

A. Petals usually 4 :—

1. Leaves rounded or cordate at the base; petioles very short :—

a. Fruit globose :—

i. Flowers pedicellate; pedicels exceeding .3 in., not stout; inflorescence lateral from axils of fallen leaves. ..

1. *E. formosa.*

ii. Flowers sessile or subsessile; pedicel when present stout; cymes usually terminal. ..

2. *E. macrocarpa.*

iii. Flowers on very short pedicels, .3 in. and less long; pedicels slender; inflorescence terminal. ..

3. *E. diospyrifolia.*

b. Fruit depressed, turbinate, flattened at both ends; cymes terminal and from upper leaf axils. ..

4. *E. aquea.*

2. Leaves narrowed at both ends :—

Leaves 3 in. and over across, elliptic or ovate; flowers pink or purple, solitary or in few flowered cymes from the axils of fallen leaves. ..

5. *E. malaccensis.*

Leaves 2 in. and under across, lanceolate or oblong lanceolate; flowers white, in raceme-like or paniced cymes. ..

6. *E. Jambos.*

B. Petals usually 12-16; leaves marrow, lanceolate, usually ternate. ..

7. *E. polypetala.*

II. Flowers under 1 in. across :—

A. Lateral nerves of leaves usually 20 pairs or less :—

1. Petals 4 :—

a. Leaves not abruptly acuminate :—

- i. Flowers sessile; calyx tube .25-.3 in. long, abruptly narrowed from a wide limb; calyx lobes minute, .1 in. or less across; berry obovoid-oblong, about .6 in. long. 8. *E. Wallichii*.

- ii. Flowers pedicellate, calyx-tube .3-.4 in. long, clavate, turbinate, attenuated to the basal portion; calyx lobes .2 in. across; berry globose, about .5 in. long. 9. *E. Kurzii*.

- iii. Flowers on long slender pedicels; calyx tube .5-.6 in. long, obconic, narrowed to a very slender pedicel-like basal portion, covered with conspicuous raised glands; berry about 1 in. long, ovoid or ellipsoid. 10. *E. bifaria*.

b. Leaves usually abruptly acuminate or shortly caudate :—

- i. Leaves over 5 in. long, thickly coriaceous; lateral nerves 13-20 pairs; inflorescence with stout branches; flowers sessile; calyx-tube broadly turbinate. 11. *E. grandis*.

- ii. Leaves 4.5 in. and less in length, thin; lateral nerves 8-10 pairs; inflorescence branches slender; flowers pedicellate; calyx-tube obconic. 12. *E. ramosissima*.

2. Petals usually 8. 13. *E. anisopetala*.

- B. Lateral nerves of leaves numerous and parallel. 14. *E. mangifolia*

Sect. II. *Syzygium*. Flowers usually small in cymes, often corymbose. Calyx-tube produced beyond the ovary, but without a thickened staminal disk at the mouth, 4-rarely 5-lobed or sub-truncate. Petals falling off in one piece as a lid or less often free. Stamens bent inwards in the middle in the bud. Berry crowned by the calyx-limb.

I. Petals free, usually not falling off as one piece :—

Lateral nerves of leaves close and sub-parallel :—

- A. Calyx-tube hemispheric, turbinate or campanulate, .2 in. or less long :—
 - 1. Petals 4, fruit globose :—
 - a. Berry .25-.3 in. across; calyx-limb campanulate. .. 15. *E. cymosa.*
 - b. Berry .5 in. across; calyx-limb hemispheric, turbinate. .. 16. *E. saligna.*
 - 2. Petals 5-6, fruit ovoid. .. 17. *E. prætermissa.*
 - B. Calyx-tube cylindrical; .5-.7 in. long; buds clavate. .. 18. *E. claviflora.*
- II. Petals falling off mostly in a calyptra :—
- A. Flowers mostly from axils of fallen leaves and lower leaf axils :—
 - 1. Lateral nerves distant, 8-20 pairs :—
 - a. Tree; branchlets sharply 4-angled; panicles up to 1.5 in. long, with stout branches; calyx-tube usually with minute lobes. .. 19. *E. tetragona.*
 - b. Shrub; panicles up to 2.5 in. long, with slender brachiate branches; calyx-tube usually truncate. .. 20. *E. balsamea.*
 - c. Tree; branchlets compressed, panicles 2-6 in. long, with spreading branches; calyx-tube with distinct lobes. .. 21. *E. operculata*
 - 2. Lateral nerves of leaves numerous, slender, closely sub-parallel :—
 - a. Panicle branches not sharply angled; flowers over .25 in. across, fruit up to 1.5 in. long, oblong, usually curved. .. 22. *E. Jambolana.*
 - b. Panicle branches sharply 4-angled; flowers very small, under .2 in. across; fruit more or less globose not curved. .. 23. *E. fruticosa.*
 - B. Flowers mostly terminal and axillary :—
 Lateral nerves numerous, slender and closely subparallel :—
 - I. Leaves 3 in. and above long :—
 - a. Flowers very small, about .25 in. across when fully formed; calyx-tube truncate or nearly so. .. 24. *E. khasyana.*
 - b. Flowers about .5 in. across when fully expanded; calyx-tube with distinct persistent lobes. .. 25. *E. oblata.*
 - 2. Leaves small, less than 3 in. long. 26. *E. cuneata.*

Sect. III. *Eugenia proper*. Flowers solitary, fascicled or sub-racemose. *Calyx-tube* not produced above the ovary, nearly globose; lobes 4, rarely 5, persistent. *Petals* 4, rarely 5, distinct. *Stamens* erect or incurved, not bent inwards at the middle in buds:—

Flowers solitary or in fascicles; young
parts pubescent. 27. *E. bracteata*.

1. *Eugenia formosa* Wall. Vern. *Ankhi-siphak*, *Ankhi-siphasi*, *Bor-subok*, Garo; *Bamthair-angoli*, *Lohajam* (?), *Bhukua-chepa*, *Labung-garai*, Ass.; *Bomkhang-khrai*, Mech; *Mirtephong*, *Chahar-long-arong*, Mik.; *Kurak*, Daffla; *Dieng-Sa-ludong*, Synt.

A moderate or medium-sized tree, stem sometimes buttressed. *Bark* light grey, nearly smooth, green under the corky layers; blaze light brown and fibrous; branchlets more or less compressed. *Leaves* 6-15 by 2·5-6 in., shortly petioled or nearly sessile, obovate-to elliptic-oblong or oblong-lanceolate, long or bluntly short acuminate, coriaceous, glabrous, shining above, under-surface paler, midrib stout; lateral nerves 12-15, rarely more on either side, with strong intermediates in between, prominent beneath, meeting to form a wavy intramarginal nerve which is somewhat discontinuous towards the base; base usually narrowed, cordate or sub-amplexicaul. *Flowers* about 1·5 in. across, rosy pink or nearly white in corymbose cymes, usually from the axils of fallen or sometimes of existing leaves; pedicels ·3-1·5 in. long—rarely longer, slightly thickened upwards, with two minute deciduous bracteoles at the articulation with the calyx-tube. *Calyx* purplish, ·6-·9 in. long; calyx-tube broadly-turbinate, ·5-·7 in. long, abruptly narrowed to the pedicel; limb much produced; calyx lobes in unequal pairs, broader than long, ·3-·4 in. across, spreading. *Petals* free, about ·5 in. across, orbicular, shortly clawed; filaments 1-2 in. long. *Berry* globose, 1-2 in. across, white or pinkish when ripe, crowned with the persistent calyx-limb and the style; seeds rugose, greenish.

LAKHIMPUR, DARRANG, NOWGONG, KHASI HILLS, GARO HILLS—C. B. Clarke!—ascending to 4,500 ft. in the Hills.

The calyx is said to be eaten cooked. Wood hard, about 61 lbs. per c. ft.

Flrs. 3-4.

Var. *ternifolia* F. B. I. Leaves in threes, sessile or nearly so.

A form with long acuminate narrow leaves, which are sometimes only 5 by 1·5 in. with more sharply defined and continuous intramarginal nerves than in the type should perhaps be separated as a variety. This, however, passes through intermediate forms into the type. This is the commoner form in hilly country.

2. *Eugenia macrocarpa* Roxb. Vern. *Selua*, *Kachal-pabok*, Kuki; *Kechal-pare-bung*, Tipp.; *Shishong-phong*, Cach.; *Prandab*, Mik.

A moderate or middle-sized tree. *Bark* grey or greenish grey, nearly smooth or with shallow fissures; blaze reddish-brown, fibrous. *Leaves* 6-14 by 2·2-5·2 in., oblong-lanceolate to—elliptic or oblanceolate, shortly acuminate; coriaceous, glabrous; lateral nerves 15-25, with intermediates between, prominent beneath, joined by a somewhat wavy but continuous intramarginal nerve; base often narrowed, rounded or subcordate; petiole very short, up to ·5 in. long, thick. *Cymes* subcorymbose, few flowered, terminal, rarely axillary. *Flowers* sessile or subsessile, about 2·25 in. across, pale pink; pedicel when present very short and stout, with a pair of deciduous bracteoles upto ·15 in. long on the joint. *Calyx-tube* ·6-1·2 in. long, turbinate, longitudinally striate in dry specimens; calyx-lobes 4, unequal, broader than long, rounded, larger pair ·4·6 in. across. *Petals* 4, free, orbicular, up to 1 in. across with a broad base. *Filaments* 1·1-1·6 in. long; style exceeding the filaments. *Berry* “about the size of an orange”—Brandis—globose, several seeded, crowned by the inflexed calyx lobes, edible.

CACHAR; N. C. HILLS; SYLHET, KHASI AND JAINTIA HILLS up to 1,000 ft., *e.g.*, Hatmawdan; SIBSAGAR; N. E. FRONTIER; LAKHIMPUR.

The timber is considered to be hard and durable.

Flrs. 3-4. Fr. 8.

A tree (Kanjilal's Sheet No. 3254—Assam Herbarium from Rajgarhali in Lakhimpur Dist.) with large obovate coriaceous leaves apex and 12-15 somewhat distant lateral nerves on either side of midrib and oblong fruits 1·5 in. long may be an extreme form of this, unless it is a new species. The material is insufficient for ascertaining its correct position

3. *Eugenia diospyrifolia* Wall. Cat. 3617.

A small tree. *Leaves* 4-7 by 1·2-2·2 in., oblong-lanceolate or lanceolate, acuminate, with a cordate or sub-amplexicaul base, coriaceous, glabrous; main lateral nerves 12-14 on either side, somewhat indistinct on the upper surface uniting in a wavy intra-marginal nerve, tertiaries indistinct; petiole 0 or very short. *Flowers* white, sessile or sub-sessile, about 1 in. across, in few flowered terminal cymes; pedicels 0·3 in. long, not stout, jointed to the calyx, with 2 minute bracteoles at the joint. *Calyx-tube* ·5-·7 in. long, turbinate, much attenuated towards the base; calyx-lobes ·3-·4 in. across, orbicular. *Petals* orbicular, ·4 in. across; style exceeding the stamens, about 1 in. long. *Berry* more or less globose, 1-1·5 in. across.

Rangma reserve, SIBSAGAR, SYLHET. Wallich! KHASI HILLS, GARO HILLS.

Flrs. 8-11. Fr. 1-4.

E. Munronii Wight, Ic. II-14.

A middle-sized (?) handsome tree. *Leaves* 5-8·5 in., lanceolate, somewhat bluntly acuminate; base cordate, coriaceous, glabrous; main lateral nerves 12-17 on either side of midrib; pedicels short, up to ·3 in. long, stout. *Flowers* white, 1·5 in. across in terminal, usually compound cymes. *Calyx-tube* ·5-·6 in. long, obconic, attenuated to a slender pedicel upto ·3 in. long. *Fruit* globose, about ·7 in. long.

The only specimen under this name in Herb. Cal. is Burkill's 733 from Khasi Hills. This has neither flowers nor fruit and I am unable to distinguish it in this state from *E. diospyrifolia*. Hooker and Thompson's sheets are not represented in the herbarium.

4. *Eugenia aquea* Burm. *E. aquea* F. B. I. in part. Vern. *Dieng-soh-liwa*. Kh.; *Dieng-sa-li-dong*, Synt.

A moderate-sized tree with grey-bark; branchlets 4-angled. *Leaves* 5-12 by 1-3·2 in., oblong-lanceolate or lanceolate, acuminate; base narrowed, cordate or rounded, coriaceous, glabrous; midrib channelled above, prominent beneath; main lateral nerves 15-20 on either half, often with a few intermediates, all meeting in a prominent intramarginal nerve, ·15-·3 in. from the margin; petiole ·1-·2 in. long, stout. *Flowers* 1-1·5 in. across, greenish white ("white, red

or pale purple"—Duthie in F. B. I.), solitary or in few flowered cymes, which are terminal or from upper leaf axils; pedicels slender, .25-.4 in. long. *Calyx-tube* turbinate, attenuated to the base, .75-1 in. long; lobes unequal, broader than long, larger pair .4-.6 in. across, rounded. *Petals* 4, free, rounded, about .4 in. long. *Berry* .6-1 (?) in. across, depressed, turbinate, flattened at both ends, crowned by the calyx-lobes, 1-4 seeded.

LAKHIMPUR, KHASI HILLS, upto 4,500 ft., CACHAR—Prazer!

Flrs. 3-4, also 10—a second flush?

The Assam sheets in Calcutta Herbarium do not agree with the Burma and S. India sheets. They differ mainly by their narrower leaves, larger number of lateral nerves and fewer flowered cymes. The Burma sheets have broader—elliptic or elliptic lanceolate leaves with 8-12 pairs of distant lateral nerves and somewhat lax, corymbose, peduncled branched cymes. There is little to distinguish the Assam plant from *E. diospyrifolia*, except the larger number of lateral nerves and the shape of the fruit. Further field studies are necessary to settle if these represent two forms of the same species. In the Calcutta herbarium more than one species have apparently been included under this name. Wall. Cat. 3613 agrees with description in F. B. I. but this does not appear to be the plant illustrated in Wight's Icones t.550 and described by Roxburgh in *Flora Indica* and by Kurz in his *Forest Flora of British Burma* or referred in Wight's Illustrations ii-14.

5. *Eugenia malaccansis* Linn. Vern. *Pani-jamuk*, Ass.; *Lal-jamrul*, Beng.

A handsome tree with compressed branchlets. *Leaves* 6-12 by 3-4.5 in., oblanceolate, obovate-lanceolate or elliptic-oblong, short acuminate, glossy above, coriaceous; lateral nerves 10-15 on either side of midrib, all except the lowest anastomosing to form a wavy intramarginal nerve, intermediates rather indistinct; base narrowed or tapering to the short stout petiole; petiole stout, .3-.5 in. long. *Flowers* red or purple, 1-1.5 in. across, sessile or sub-sessile, solitary or in short peduncled cymes from the axils of fallen leaves. *Calyx* .5-.7 in. long; calyx-tube clavate-turbinate; base narrowed and solid; lobes rounded, unequal, broader than long, larger pair .3-.4 in. across. *Petals* free, about .5 in. long with a broad claw, nearly as broad as or broader

than long. *Stamens* about 1 in. long. *Berries* 2 in. long, obovoid or depressed, turbinate, crowned by the inflexed calyx-lobes, pink or purple when ripe.

Cultivated.

Flrs. 4-5. Fr. 5-6.

Eugenia javanica Lamk. Vern. *Jamrul*, Beng.

A moderate to medium-sized tree. *Leaves* 5-10 in. long, elliptic-oblong, shortly acuminate or rounded; base rounded or subcordate, thinly coriaceous, glabrous; lateral nerves prominent beneath, looped within the margins. *Flowers* 4-merous, white, about 1·5 in. across, in peduncled, compound and lax cymes, which are shorter than the leaves and terminal or lateral, often from axils of fallen leaves. *Calyx-tube* turbinate. *Berries* about 2 in. across, depressed, turbinate, crowned by the inflexed calyx-lobes, white or pinkish-white, juicy and slightly acid, flavourless.

Often cultivated for the fruits, which are considered cooling.

Flrs. 3-4. Fr. 5.

6. Eugenia Jambos Linn. Vern. *Golapi-jamuk*, *bangali-jamuk*, *boga-jamuk*, Ass.; *Golapjam*, Beng. The rose apple.

A medium-sized handsome evergreen tree. *Bark* grey to almost black; blaze brownish. *Leaves* 4·5-8 by 1·2 in., narrowly oblong-lanceolate to lanceolate, tapering to an acuminate apex and also at the base, coriaceous, glabrous; lateral nerves distinct beneath, 10-20 on either half, slender, often with intermediates between, joined by a prominent intramarginal nerve; petiole ·2-·4 in. long, stout, channelled. *Flowers* white, about 1·5 in. across, in few flowered terminal raceme-like cymes or sometimes paniced; pedicels upto ·4 in long; lateral largest, with a pair of small caducous bracteoles at the top. *Calyx* turbinate, ·6 in. long; lobes sub-equal, rounded, upto ·4 in. across. *Petals* 4, free, about ·6 in. across, as broad as or broader than long. *Filaments* 1·25 in. long, subulate. *Berry* 1·2 in. across, white or yellowish when ripe, sometimes winged with pink, globose or pyriform, crowned by the inflexed calyx-lobes, delicately rose-scented, and sweet but rather dry.

Cultivated for the fruits in the plains and low elevations in most districts, sometimes found as an escape, *e.g.*, SIBSAGAR—Gaurisagar, Bez Barua's grant; DARRANG; LAKHIMPUR—Jokai reserve.

Flrs. 2-4, sometimes a little later in hilly country. Fr. 6-7.

7. *Eugenia polypetala* Wight.

A small tree with grey bark; branchlets whitish, prominently marked with scars of fallen leaves. *Leaves* ternate or sometimes 4 in a whorl, nearly opposite, 3·5-6 by ·3-1 in., narrow to linear lanceolate, bluntly acuminate, sub-coriaceous, with thickened recurved margins; main lateral nerves slender, about 10-12 on either side, all except the lowest anastomosing to form the intramarginal nerve, tertiary nerves laxly reticulate; base narrowed, often attenuate to the petiole; petiole ·1-·2 in. long, stout, margined. *Inflorescence* of peduncled, few flowered corymbose cymes, 1-2 in. long or solitary from the axils of fallen leaves. *Flowers* 1-1·5 in. across, white, "scented"—Brandis; pedicels ·4-1 in. long, slender with 3 or 2 deciduous lanceolate or spatulate bracteoles, up to ·15 in. long at the top. *Calyx-tube* ·6-·8 in. long, reddish brown; limb broadly campanulate; calyx-lobes 4 or 6, rounded, broader than long, about ·4 in. across. *Petals* orbicular, free, many, usually 12-16;* style about 1·5 in. long. *Fruit* not seen.

Rocky river banks at low elevations.

Panduah—SYLHET, Wall. Cat. 3616! KHASI HILLS—Griffith!
Ghangail—LUSHAI HILLS, Prazer!

Flrs. 3-4.

8. *Eugenia præcox* Roxb. Syn. *E. Wallichii* Wight. III. ii. 17. Ic. t. 536. Vern. *Serbai-boga-jamuk*, Ass.; *Khorjam*, *Jam-biphang*, Cach.; *Panijam*, Cach. and Manipur; *Dieng-mirchangkh*, *Manhumi*, Kuki; *Ramui*, Tipp.

A tree attaining large dimensions under favourable conditions. *Bark* grey or pale white, outermost layers of thin papery cork, reddish-brown and fibrous inside; branchlets compressed. *Leaves* 4-10·3 by 1·5-2·5 in., oblong-

* 4-16—Brandis.

lanceolate or lanceolate, acuminate, thinly coriaceous, under-surface brownish; lateral nerves 10-14 on either half, prominent on both surfaces—at least in dry specimens, uniting twice within the margin, outer reticulations slender, intramarginal nerve usually discontinuous towards the base; petiole .4-.5 in. long. *Cymes* usually compound, sub-corymbosely paniced, often branched from near the base or fasciculate, 1-2.5 in. long, axillary, terminal or sometimes from axils of fallen leaves. *Flowers* white, .4-.5 in. across, usually sessile or nearly so. *Calyx-tube* turbinate, .25-.3 in. long, abruptly narrowed to the pedicel like basal portion; calyx-lobes unequal, broad ovate to orbicular, up to .1 in. across. *Petals* white, rounded, about .15 in. across, free. *Stamens* up to about .5 in. long; style long, persistent. *Berry* about .6 in. long, obovoid-oblong, crowned by the incurved calyx-lobes.

Nearly all over the Province ascending to about 1,000 ft. in the KHASI HILLS.

The fruit is edible.

Flrs. 12-2. Fr. 4.

Var. *lancæfolia* F. B. I. Leaves narrower-lanceolate than in the type, rounded or subacute at the base; petiole .3-.4 in. long.

GARO HILLS—Fisher! SYLHET—Roxburgh.

9. *Eugenia Kurzii* Duthie. Vern. *Girgum-dotke-asing*, Miri; *Bogi-jamuk*, Ass.; *Sel-bel*, Garo.

A moderate-sized to large tree with pale grey compressed branchlets. *Bark* brownish-grey, exfoliating in thin flakes. *Leaves* 4-8 by 1.5-3 in., lanceolate to elliptic lanceolate or oblanceolate, usually somewhat bluntly acuminate at the apex and attenuate or acute at the base, glabrous, under-surface paler, thinly coriaceous, gland dots small, pellucid; lateral nerves 8-14 on either half, slender, meeting in loops and forming a very wavy intramarginal nerve often discontinuous towards the base; petiole .5-.8 in. long. *Flowers* white, .6 in. across. *Cymes* branched or paniced, .3-2.7 in. long, solitary or fascicled in leaf-axils or axils of fallen leaves; pedicels up to .5 in. long. *Calyx-tube* .3-.4 in.

long, clavate-turbinate, attenuated to the basal portion; calyx-lobes up to .2 in. across, rounded, ultimately reflexed. *Petals* free, .2-.25 in. across; style persistent. *Berry* globose, up to .5 in. long, crowned by the spreading calyx-limb.

N. E. FRONTIER, LAKHIMPUR, SIBSAGAR, KHASI AND JAINTIA HILLS, ascending to 2,500 ft., GARO HILLS, CACHAR—*Keenan*, probably also in other Districts in UPPER ASSAM.

The timber is used for tea boxes.

Flrs. 3-6.

10. *Eugenia bifaria* Wall. Syn. *E. laurifolia* Roxb.

A tree; all parts glabrous. *Leaves* 2-4 by 8-2 in., elliptic, sub-acute or shortly blunt acuminate, entire, membranous or chartaceous; lateral nerves slender, 8-12 on either side of the channelled midrib, meeting in two intra-marginal nerves, the first .15-.2 in. from, and the second close and parallel to, the margin; petiole about .2 in. long, channelled. *Cymes* lax, usually branched, trichotomous or corymbose, axillary or terminal, few flowered, up to 3 in. long; peduncles and pedicels slender, the latter up to .7 in. long. *Flowers* about .5 in. across, white; calyx-tube .5-.6 in. long, obconic with conspicuous raised glands, narrowed to a slender basal portion; calyx-lobes obtuse, continuous with the limb. *Petals* orbicular, prominent, gland dotted. *Berry* .8-1 in. long, ovoid or ellipsoid, yellow, crowned by the inflexed calyx-lobes.

KHASI HILLS—*Wallich*, *Brandis*.

11. *Eugenia grandis* Wight. Vern. *Manmahui* (a name apparently used for many species of *Eugenia*) Kuki; *Moiyalong*, Tipp.; *Jam*, Syl.

A medium-sized to tall tree attaining in favourable situations 100 ft. in height and about 8 ft. in girth, sometimes with buttressed stems; branchlets terete, with close horizontal wrinkles, lenticellate; bark about .5 in. thick, greyish brown or grey, outer layers soft and peeling in thin corky-flakes; blaze reddish-brown. *Leaves* 5.5-8 by 2.7-5.7

in., broadly elliptic to ovate elliptic or suborbicular, rarely elliptic-lanceolate, abruptly short and blunt acuminate or apiculate; thickly coriaceous, shining; lateral nerves usually 12-20 on either side with conspicuous intermediate between, sub-parallel, joined by a wavy intramarginal nerve, often with another slender and rather obscure nerve near the margin; base acute, cuneate or nearly rounded; petiole .6-.8 in. long, stout. *Inflorescence* of dense corymbose stout peduncled panicles of cymes with stout branches, usually 3-5.5 in., terminal or from upper axils, often fascicled. *Flowers* white, 4-merous, sessile, about .6 in. across. *Calyx tube* .3-.4 in. long, turbinate, abruptly narrowed to the cylindric pedicel-like base of the calyx-tube; calyx-lobes in unequal pairs, larger, about .2 in. across, whitish, broadly orbicular; petals about .25 in. long, free; filaments long. *Berry* ovoid, obovoid or nearly subglobose, 1-1.5 in. long, crowned by the calyx-limb.

CACHAR, SYLHET, KHASI AND JAINTIA HILLS on the SYLHET slope, upto 1,000 ft.

Wood reddish brown, hard; pores joined by fine wavy concentric lines, medullary rays fine, weight about 51 lbs. per c. ft., not used.

Flrs. 12-2. Fr. 5.

12. *Eugenia ramosissima* Wall. Cat. 3604.

A middle-sized tree with spreading crown. *Bark* grey, nearly smooth, thin; blaze ultimately chocolate brown. *Leaves* 3-4.5 by 1-1.9 in., oblong to elliptic-lanceolate, usually more or less abruptly, but rather bluntly acuminate; lateral nerves 8-10 on either side, slender, forming intramarginal loops, tertiaries indistinct, generally more or less transverse to the midrib and sub-parallel; base abruptly or gradually narrowed to the petiole; petiole .2-.3 in. long, channelled. *Cymes* usually terminal and compound, peduncled, 1-2.5 in. long. *Flowers* .6-.7 in. across, when fully open; pedicels .2-.4 in. long. *Calyx-tube* .4-.5 in. long, narrowly obconic—gradually narrowed to a slender base, which is jointed to the pedicel; calyx-lobes .15-.2 in. across, two slightly larger, gland punctate like the petals,

which are free and $\cdot 3\cdot 4$ in. across; stamens up to $\cdot 7$ in. long. *Fruit* not seen.

GARO HILLS, Sanitarium hill; Thlen-syryngum at the foot of KHASI HILLS; EAST SYLHET, Pandua, (Wall Catalogue 3,604.)

13. *Eugenia (Jambosa) anisopetala* Parker. Fedde Report. Spec. Nov. XXXI (1932). Vern. *Paharejam*, Cach.

A medium-sized tree, with pale brown, glabrous, 4-angled branchlets which are shortly winged at the angles. *Bark* grey, about $\cdot 25$ in. thick; blaze fibrous and light brown. *Leaves* $4\cdot 5\text{--}8\cdot 25$ by $2\cdot 2\text{--}7$ in., oblanceolate-oblong to narrow elliptic-oblong, short-acuminate, or subacute, sometimes slightly falcate, glabrous, shining above, midnerve impressed, under-surface pale; lateral nerves usually 15-22, prominent beneath, with several irregular intermediates; intramarginal nerve $\cdot 1\cdot 2$ in. from the margin, wavy; base rounded or subcordate; petiole fleshy, $\cdot 15\cdot 3$ in. long, *Cymes* few-flowered in terminal and axillary panicles, which are $2\cdot 5\text{--}5$ in. and often branched from near the base or fasciculate; panicle branches and peduncles angled. *Flowers* subsessile, white, about $\cdot 4$ in. across. *Calyx-tube* $\cdot 25\cdot 35$ in. long, broad, campanulate, narrowed to a pedicel like base, about $\cdot 25$ in. across; calyx-lobes 4, rounded, about $\cdot 1$ in. long, broader than long, subpersistent in fruit. *Petals* 8, free, 4 outer suborbicular, nearly $\cdot 2$ in. across, sparsely glandular punctate, crenulate, 4 inner slightly smaller, rather unequal. *Filaments* up to $\cdot 35$ in. long; style nearly $\cdot 37$ in. long. *Berry* $\cdot 6\cdot 8$ in. diameter, subglobose, 1-2 seeded, crowned by the inflexed calyx-lobes.

CACHAR, Loharband—Owden, Das! Aijal Road! N. E. FRONTIER—Kanjilal 3,236. (If the identification of the sheet is correct.)

Flrs. 11-12. Fr. 2 ripen 8?.

14. *Eugenia mangifolia* Wall. Catalogue 3619. Syn. *E. reticulata* Wight III.

A medium-sized tree. *Leaves* 3-5 by 1-2 in., oblong to ovate lanceolate or elliptic-oblong, gradually or suddenly

and somewhat bluntly acuminate, coriaceous, shining above; lateral nerves numerous, prominent, close with laxly reticulating tertiaries, intramarginal nerves close to the margin, slender, wavy; base usually cuneate; petiole $\cdot 3\text{--}\cdot 5$ in. long, channelled and margined. *Cymes* arranged in axillary and terminal usually fascicled panicles up to $2\cdot 5$ in. long, often branched close to the base. *Flowers* about $\cdot 6\text{--}\cdot 7$ in. across when fully open (including the stamens), sessile or subsessile. *Calyx* $\cdot 3\text{--}\cdot 4$ in. long, broadly obconical, tapering to the solid base; limb much produced above the ovary; lobes small, ovate-acute or sub-acute. *Petals* $\cdot 15$ in. across, free. *Fruit* not seen.

KHASI HILLS—Hooker and Thompson; *Griffith* 2378! SYLHET—*Wall. Cat.* 3619! *Mann*, BRAHMAPUTRA VALLEY, *Kurz*! NAGA HILLS, *Prain's collector*!

Flrs. 3-4.

***Eugenia inophylla* Roxb.**

A tree with straight trunk. *Leaves* $3\text{--}5$ by $1\cdot 5\text{--}2\cdot 5$ in., elliptic, elliptic-oblong or oblong-lanceolate, obtusely acuminate, coriaceous; lateral nerves wavy, close and subparallel, transverse to the midrib; petiole about $\cdot 25$ in. long. *Cymes* compound, terminal and from upper leaf axils—with stout long peduncles, arranged in spreading corymbose panicles, attaining 6 in. *Flowers* sessile, about $\cdot 4$ in. across. *Calyx* $\cdot 25\text{--}\cdot 3$ in. long, clavate-turbinate, narrowed to the solid base, obscurely 4-5 lobed. *Petals* 4-5, free. *Berries* pyriform.

SYLHET—Wallich; EAST BENGAL—*Griffith* No. 2579!

I have seen no specimen from our area at Calcutta herbarium. Differs from the preceding by its larger long peduncled panicles and more clavate calyx.

Flrs. 4-8.

***Eugenia lanceolaria* Roxb.**

A small tree. *Leaves* $3\text{--}4$ by $1\text{--}1\cdot 5$ in., lanceolate or oblanceolate, bluntly acuminate; base cuneate or attenuate, coriaceous; lateral nerves slender and somewhat indistinct, 10-13 on either side of the midrib, looping to form a slender intramarginal nerve close to the margin; petiole $\cdot 4\text{--}\cdot 6$ in. long. *Cymes* in short corymbose panicle, terminal or from upper leaf axils; pedicels $\cdot 2\text{--}\cdot 5$ in. long, thick. *Flowers* $\cdot 6$ in. across. *Calyx-tube* $\cdot 25\text{--}\cdot 4$ in. long, campanulate with a sub-hemispheric limb; base pedicel-like; lobes 4, unequal, larger pair $\cdot 1\text{--}\cdot 15$ in. across, broader than long, rounded. *Petals* orbicular, about $\cdot 25$ in. across. *Stamens* about $\cdot 5$ in. long; style exceeding

the stamens. *Berry* "irregularly round, lobate, size of small apple, not eaten"—Roxb. in F. B. I. *Flora Indica*.

"SYLHET"—Roxburgh.

There is only sheet in Calcutta without fruit from Travancore (Bourdillon) under this name. This closely resembles some of the sheets named *E. hemispherica*. According to Roxb. the flowers are "very large, rosy and somewhat fragrant." The flowers in the Calcutta sheet are decidedly smaller than in the illustration in Wight Ic. t. 613.

Flrs. 5. Fr. 12.

15. *Eugenia cymosa* Lam. Vern. *Mui-sentel*, Tipp.; *Pani-jam*, Ass.

A middle-sized to large tree (large shrub according to F.B.I.), old stems often buttressed at the base. *Bark* thin, greyish; blaze ultimately turning reddish-brown. *Leaves* 2.3-5 by .7-1.7 in., elliptic to lanceolate or ovate-lanceolate, obtusely long acuminate or caudate, cuneate or acute, coriaceous, glabrous, shining above; lateral nerves very slender, numerous, indistinct above, distinct beneath, close, subparallel, joining in a fine wavy intramarginal nerve close to the margin; petiole .2-.3 in. long. *Cymes* peduncled, arranged in terminal or axillary subcorymbose panicles, with spreading branches on the axils of minute triangular bracts. *Flowers* white, small, about .25 in. across, usually sessile; bracteoles minute, resembling bracts. *Calyx-tube* .15 in. long, upper portion broad, campanulate, narrowed to the pedicel-like solid base, which is nearly as long; lobes 4, unequal, minute, broader pair rounded. *Petals* 4, small, orbicular, white, free. *Berry* .25-.3 in. across, globose, crowned by the calyx-limb.

SYLHET, N. CACHAR HILLS, SIBSAGAR—Barpathar, Deroi Reserve.

The wood is used for posts, etc.

Flrs. 10-12.

Var. *rostrata*. Leaves long acuminate; lateral nerves prominent on both surfaces; petiole usually larger than in the type; calyx truncate.

CACHAR, if Assam herbarium sheet No. 10916, has been correctly named.

16. *Eugenia saligna* (Miq.) Robinson incl. *E. acuminatissima* Kurz. *E. Cumingiana* Vedal. Vern. *Muijol-ong*, Tipp.

A tree with brownish grey thin bark and reddish-brown blaze, all parts glabrous. *Leaves* 3-6 by 1·2-2 in., lanceolate to oblong-lanceolate, caudate-acuminate, coriaceous, shining above; lateral nerves slender, often irregularly anastomosing, intramarginal nerve close to the margin; base cuneate or attenuated to the petiole; petiole ·2·3 in. long. *Cymes* in lax terminal and axillary, sometimes fascicled panicles up to ·3 in. long, with angular, spreading, opposite branches. *Flowers* sessile, small, ·2 in. across, white. *Calyx* ·12 in. long, hemispheric-turbinate, narrowed to a pedicel-like base; limb almost truncate at the top or with 5 very short lobes. *Petals* 5-6, free, suborbicular, about ·1 in. long; anthers didymous. *Fruit* ·5 in. across, globose, depressed at both ends, red to black when ripe, acid, deep red inside.

SYLHET—Longai reserve.

Fr. 12-1.

In the Index Kewensis *E. Thumra* Roxb. has been made synonymous with *E. acuminatissima* Kurz and given precedence over the latter. I have carefully compared the sheets included under these names in Calcutta herbarium, and find that there is no justification for the combination, as they represent two very distinct species.

The name given by Kurz to the Indo-Malayan sheets is however untenable as it had been given to a Brazilian species before he adopted it. C. B. Robinson has compared the Java and Calcutta sheets named *E. acuminatissima* with the Phillipine plant named *E. Cumingiana* by Vedal (1885) and with Miquels' *Jambosa saligna* (1858) and has been unable to separate them. He has therefore transferred the earliest specific name *saligna* to *Eugenia* according to International Rules of nomenclature, and has called the species *E. saligna* (Miq.) Rob. which appears to be the correct name for the plant hitherto known as *E. acuminatissima* Kurz.

I am much indebted to Mr. V. Narayanswami of the Botanical Survey of India for a critical note on the species.

17. *Eugenia prætermissa* Gage. Indian Forester Vol. XXXII, p. 6.

A moderate sized tree with greyish white bark; young branches terete. *Leaves* opposite, 2·7 by 1·2·5 in., lanceo-

late, elliptic-lanceolate or sometimes oblanceolate, somewhat bluntly and often abruptly acuminate; coriaceous, glabrous, shining above; lateral nerves close, numerous, very slender, sub-parallel, intramarginal nerve slender, wavy, often with a second rather faint nerve close to the margin; base cuneate; petiole $\cdot 3\text{--}\cdot 5$ in. long; cymes 2-3 flowered, arranged in somewhat lax, sub-corymbose, axillary and terminal panicles up to $4\cdot 5$ in. long. *Flowers* sessile or sub-sessile, $\cdot 25\text{--}\cdot 3$ in. across. *Calyx* about $\cdot 2$ in. long, broadly campanulate, narrowed to the pedicel-like basal portion. *Calyx-lobes* 4, broadly triangular, slightly inflexed, nearly $\cdot 1$ in. broad at the base. *Petals* 4, white, free, sub-orbicular, about $\cdot 15$ in. long, dotted; stamens about $\cdot 3$ in. long. *Fruit* about $\cdot 5$ by $\cdot 3$ in., ovoid, crowned by the calyx-limb, black when ripe.

SIBSAGAR—Jamuguri; S. LUSHAI HILLS—Gage; KHASI HILLS, Griffith. The fruit is edible.

Flrs. 11-12. Fr. 4.

18. *Eugenia claviflora* Roxb. Vern. *Bor-srem*, *Chambu*, *Chambu* or *Sambu-sirsang*, Garo.

A small to medium-sized handsome tree with grey or brownish nearly smooth bark, all parts quite glabrous. *Leaves* $2\cdot 7\text{--}6$ by $\cdot 7\text{--}2$ in., oblong-lanceolate to lanceolate or elliptic-oblong, acuminate, coriaceous; lateral nerves slender, numerous, intramarginal nerve slender; base acute or cuneate; petiole $\cdot 2\text{--}\cdot 3$ in. long. *Flowers* sessile, about $\cdot 4$ in. across; buds clavate. *Cymes* usually axillary or sometimes from axils of fallen leaves, compact, with short axis, often branched and fascicled; calyx-tube $\cdot 5\text{--}\cdot 7$ in. long, cylindrical, tapering to the pedicel-like base; limb expanded, $\cdot 15\text{--}\cdot 25$ in. across; lobes 4-5, very small, broad and rounded or sub-acute. *Petals* 4-5, free, about $\cdot 15\text{--}\cdot 2$ in. across, orbicular; stamens $\cdot 6$ in. long. *Berry* bluish black when ripe, $\cdot 7\text{--}1\cdot 5$ by $\cdot 5$ in., ovoid-oblong, crowned at the apex by the produced and more or less truncate calyx-limb and the incurved calyx-lobes.

GARO HILLS, KHASI HILLS—2,400 ft.—*Hooker and Thompson!*
GOALPARA—Saral-bhanga.

The fruit is said to be edible. In some forms many of the leaves are narrowly lanceolate.

Flrs. 3-4. Fr. 5.

19. *Eugenia tetragona* Wight. Vern. *Dieng-soh-um-kynthai*, *Dieng-soh-thiang-um*, Kh.; *Dieng-soh-sarlei*, Synt.; *Jongmi-supin-um-arong*, Cach.

A medium sized or large evergreen glabrous tree. *Bark* grey to almost black, pale brown on branches, nearly smooth; blaze brown or reddish brown; branchlets stout, quadrangular, often margined. *Leaves* 4·5-9 by 1·5-3 in., oblanceolate or oblong-lanceolate to elliptic, shortly acuminate; dark-green, coriaceous, gland dots minute; lateral nerves prominent beneath, about 15-20 on either half, with intermediates between, joined by a distinct intramarginal nerve; base cuneate or acute; petiole stout, ·4-1 in. long. *Cymes* arranged in short sub-corymbose panicles up to 1·5 in. long, which are solitary or few together, from axils of fallen leaves or from lower leaf axils; panicles branches stout. *Buds* globose, about ·15 in. across; flowers polygamodioecious, scented, greenish white, small, about ·25 in. across, sessile; bracteoles minute. *Calyx* turbinate, about ·15 in. long; tube narrowed to the somewhat stout pedicel-like base; lobes minute or obscure, deciduous in fruit lined by the thin disk. *Petals* white, ·1·15 in. across, orbicular-obovate, broader than or as broad as long, falling off in a piece; filaments about ·15 in. long; style short, none in male flowers. *Fruit* globose, about ·25 in. long, red and black, crowned by the calyx-limb, 'edible'—Brandis.

KHASI AND JAINTIA HILLS, 3-5,500 ft.; CACHAR—Bhuban Hills.

A pair of deciduous acuminate bud scales are often present between the petioles of uppermost leaves.

Flrs. 7-12, according to elevation. Fr. 5.

Kanjilal's Sheet No. 4538 in Assam Herbarium from Serarim (KHASI HILLS) altitude 5,500 ft. has been referred to this species at Sibpur, but as it differs in several important characters from the plant described above it is doubtful if the sheet has been correctly named.

20. *Eugenia balsamea* Wight. Vern. *Thoiranguni*, *Thoiranguli*, *Joldubuli*, Ass.; *Bol-thibrong*, Garo; *Min-chal*, Lush.; *Dieng-soh-une*, Kh.

A large shrub or a small tree. *Bark* light grey—nearly white or greenish grey; branchlets whitish. *Leaves* 3·5-7 by 1·2-2·7 in., elliptic-lanceolate to obovate-lanceolate, shortly acuminate or apiculate; sub-coriaceous, glabrous; midrib and lateral nerves prominent beneath, the latter 10-12, sometimes 14 on either side, meeting in a wavy intramarginal nerve, a second somewhat indistinct nerve close to the margin; base cuneate, narrowed to the petiole; petiole ·2-·4 in. long. *Cymes* in sub-corymbose panicles, ·8-2·5 in. long, usually from the axils of fallen leaves, rarely axillary, often fascicled; panicle branches brachiate. *Flowers* sessile, very small. *Calyx* about ·1 in. long, base of calyx-tube solid, pedicel-like; limb turbinate-truncate. *Petals* 4, usually calyptrate, sometimes nearly free. *Berry* globose, about ·2 in. across, red or black when ripe, crowned by the calyx-limb.

Recorded from all Districts except NOWGONG, where it also probably occurs, ascending to low elevations in KHASI HILLS.

Flrs. 10-11. Fr. 3.

Var. *angustifolia* F. B. I. Leaves up to 9 in. long, narrowly lanceolate or oblong-lanceolate, long acuminate, ·5-1·2 in. broad; petiole much shorter than the type—up to ·2 in. long.

Low elevations in KHASI HILLS, CACHAR, Prazer!

21. *Eugenia operculata* Roxb. Vern. *Bol-rujol*, *Thot-kak*, Garo; *Mokra-jam*, Jharua; *Godhajam*, Ass.; *Sumuk-arong*, *Thengpi-botepbhang*, Cach.

A moderate to medium-sized evergreen tree, all parts glabrous. *Bark* about 1 in. thick, pale brown or grey, rough, exfoliating in irregular hard plates; branchlets more or less compressed. *Leaves* 3-8 by 1·7-4 in., elliptic or obovate, obtusely acuminate, apiculate or rounded at the apex, glabrous, sub-coriaceous; lateral nerves 8-12 on either side, the upper joining in loops near the margin; tertiaries laxly reticulate; petiole ·5-1 in. long. *Flowers* ·25 in.

across, greenish-white, sessile. *Cymes* arranged in corymbose lateral panicles, 2-6 in. long, with trichotomous spreading branches from leafless nodes below the current year's shoot. *Calyx* .2 in. long, campanulate, gland dotted, limb with 4 short obtuse deciduous lobes. *Petals* white, sub-orbicular, calyptrate; connective of anthers with deciduous apical glands. *Berry* .3-.5 in. long, globose or ovoid with a truncated tip.

Common in all plains forests—except in the N. E. FRONTIER.

The leaves have a pleasant aromatic smell when bruised and turn red before falling. The fruit is said to be edible. The wood is greyish red or brown, close grained; heart wood not distinct. It could be used for agricultural implements.

Flrs. 4-5. Fr. 6-7.

Var. *Paniala* F. B. I. Leaves acute; berries oval, larger than in the type.

SYLHET—Wallich!

22. *Eugenia Jambolana* Lam. *E. Cumini* Linn. *Druce*. *Sizygium Jambolanum* DC. Vern. *Jambu*, Sans.; *Jamum*, Hind.; *Kala-jam*, Beng.; *Lal-shabaj-jam*, *Kur-kuri-jam*, *Boro-jam*, Beng. (Sylh.); *Thing-seng-tel*, *Ramui*, Tipp.; *Khorjam*, Mech.; *Sambu*, *Chambi*, *Khimkhol*, *Chambu-dalgappa*, Garo; *Kothia-jam*; *Kutai* or *Katahi-jamuk*, *Lohajam*, *Barjamuk*, Ass.; *Jambu-shi*, Cach.; *Kosoi*, *Jharua*; *Dieng-soh-thang-um*, *Dieng-ramai*, Kh.; *Jonkeng-asing*, Abor; *Jam-asing*, Miri; *Jangmi-arong*, *Ren-reng-arong*, Mikir.

A large evergreen tree. *Bark* rather thick, light grey or brown, somewhat rough with cracks and pits in old stem; inner substance fibrous, reddish brown; branchlets pale. *Leaves* variable in size and shape, usually 2.6-6 by 1.3-3.5 in., elliptic-oblong or ovate, acuminate, acute or sub-obtuse, narrowed—often abruptly to the base, smooth, glossy when young; lateral nerves close, very fine, meeting near the margin in an intramarginal nerve; petiole .3-1 in. long, channelled. *Flowers* greenish white, sessile, .25-.5 in. across, fragrant, usually in threes in brachiate panicles of compound cymes; lateral from leafless nodes below current year's shoots or rarely axillary or terminal. *Calyx* broad-turbinate, about

·15·2 in. long, with a truncate or very obscurely lobed limb and a pedicel-like solid basal portion. *Petals* dirty white, clayprate, suborbicular, dotted with large pellucid glands; anthers with minute apical glands. *Berry* variable in size and shape, usually up to 1 in. long—sometimes larger in cultivation—oblong or ellipsoid, often somewhat curved, black, juicy and shining when thoroughly ripe, usually crowned with the cup-like limb of the clayx-tube, purple inside; seed usually 1.

Throughout the area; often gregarious in swamps; often cultivated for fruits. In cultivation the leaves tend to become wider and larger.

The fruit is largely eaten, the juice is sometimes made into vinegar, which is considered very efficacious in dyspepsia, enlargement of spleen, etc. The seed is used in treatment of diabetes. The bark is a possible tanning material, and is also used in the preparation of astringent decoctions, gargles and washes. The wood is reddish grey, there is no distinct heartwood but the central portion is darker. It is coarse-grained, moderately hard and durable, and is specially suitable for use under water. It is used in many parts of India for buildings.

Flrs. 4-5. Fr. 6-7.

Var. *caryophyllifolia* Duthie. Syn. *Syzigium Jambolanum* Var. *microcarpum* Thwaites. Vern. *Khude-jam*, Beng.; *Kutai-januk*, *Kothia jam*, Ass.; *Jamuk-arong*, Mik.; *Ramoi-thing*, Kuki.

Leaves usually lanceolate, acuminate with cuneate base, smaller and narrower than in the type; panicles shorter and sometimes irregularly branched; calyx with 4 short lobes. *Berry* roundish, size of a pepper-corn or pea. It is usually a more branchy and smaller tree.

23. *Eugenia fruticosa* Roxb. Vern. *Dieng-cherumi*, Synt.; *Kathiya-jamuk*, Ass.

A shrub or a low branched tree; all parts glabrous. *Bark* grey or brownish-grey with minute vertical fissures. *Leaves* 2·5-5 by 1-2·2 in., elliptic, elliptic-oblong to oblong-lanceolate or gradually acuminate; base cuneate or acute, thinly coriaceous; lateral nerves slender, numerous, sub-parallel, intramarginal nerve wavy, slender; petiole ·3·6 in. long. *Cymes* paniced; panicles up to 3·5 in. long with brachiate, usually trichotomous, sharply 4-angled branches. *Flowers* small, sessile; bracteoles minute; calyx about ·1 in. long, turbinate, gradually narrowed to the base; limb

truncate or very obscurely 4-lobed. *Petals* white, calyptrate, sometimes free. *Berry* .2-.3 in. long, globose or ellipsoid.

SIBSAGAR, NOWGONG, N. CACHAR HILLS, KHASI AND JAINTIA HILLS—ascending to 3,000 ft.

Very closely resembles small fruited varieties of *E. Jambolana*.

Flrs. 3-4. Fr. 5-6.

24. *Eugenia khasyana* Duthie. Vern. *Kosoi*, Jharua.

A middle-sized spreading tree; branchlets terete. *Leaves* 3-5 by .7-1.5 in., lanceolate or acuminate, attenuate or cuneate at the base, thinly coriaceous; lateral nerves numerous, slender, tertiaries laxly reticulate; petiole .25-.7 in. long, channelled. *Cymes* paniced; panicles mostly axillary or terminal, shorter than the leaves; panicle branches angular, opposite, spreading. *Flower-buds* pyriform, .15 in. long. *Flowers* about .25 in. across; pedicels 0 or very short; calyx with a short solid base, and spreading truncate or obscurely toothed limb. *Petals* 4, calyptrate, rarely free. "*Fruit* cylindric, .25 in. long, crowned by the cup-shaped limb"—Brandis.

GARO HILLS—Dalu, Northern Range; KHASI HILLS—Hooker and Thompson, Griffith 2383! Thariaghat—Clarke!

Flrs. 10-11.

25. *Eugenia oblata* Roxb. Vern. *Chhambu-akhompha*, Garo; *Mirchube*, Mik.; *Ir-mui-thing*, Kuki; *Jambu-phang*, *Jambusi-phang*, Cach.; *Dieng-sa-rumi*, Synt.

A medium-sized tree, all parts glabrous. *Bark* brownish to ashy-grey or nearly white-thin, smoothish; blaze reddish brown; branches terete; branchlets and petioles often reddish. *Leaves* 3-6 by 1.2-2.2 in., elliptic-lanceolate or oblong-lanceolate, acuminate; base cuneate or acute, coriaceous, pink when young, dark green and shining above, when mature, gland dots distinct, small; lateral nerves numerous, slender, meeting in a slender intramarginal nerve close to the margin; petiole .2-.3 in. long. *Cymes* corymbosely paniced or trichotomously compound with angular branches, up to 3.5 in. long, terminal or from upper axils.

Flowers white, scented, sessile or very shortly pedicelled, .5 in. across, when fully expanded; buds clavate, about .3 in. long. *Calyx-tube* .25 in. long, with a solid pedicel like narrowed base; limb expanded, free portion nearly hemispheric; lobes 4 or 5, unequal, short, persistent. *Petals* usually calyptrate; calyptra about .2 in. across; stamens white, .3-.5 in. long, connective minutely apiculate above the anthers. *Berry* .5 in. across, globose.

Recorded from all Districts except SYLHET, where it also probably occurs; extending to lower elevations in the KHASI, GARO and N. CACHAR HILLS.

Flrs. 1-4.

26. *Eugenia cuneata* Wall. Vern. *Lari*, Sylh.; *Dieng-soh-saw*, *um-kynthei*, Kh.

A shrub or a small tree with brownish grey bark; all parts glabrous. *Leaves* 1.5-2.7 by .5-.7 in., narrowly lanceolate-oblong-lanceolate or elliptic-lanceolate, shortly acuminate, sub-acute or obtuse; base acute or cuneate, thinly coriaceous; lateral nerves numerous, slender, sub-parallel, intramarginal nerve close to the margin, indistinct; petiole .2-.25 in. long. *Cymes* compound, sub-corymbose or trichotomous, terminal or from upper axils, upto 3.5 in. long. *Flowers* small, about .25 in. across, sessile or with very short pedicels. *Calyx* .2-.25 in. long, turbinate; limb truncate, narrowed to a pedicel like base. *Petals* calyptrate. *Berries* globose or ellipsoid, .35-.5 in. long, black when ripe, crowned by the calyx-limb.

SYLHET—edges of rocky streams; KHASI HILLS, ascending to 5,500 ft.

Flrs. 10-11. Fr. 12.

***Eugenia cyanophylla* Kanjilal et Das.** Nov. sp.

A shrub attaining about 12 ft. in height with grey branchlets. *Leaves* 1.5-3.5 by .3-.75 in., narrowly oblong-lanceolate or lanceolate, subacute, margins recurved, gradually tapering to the petiole, glabrous, coriaceous; secondary nerves fine, rather indistinct and comparatively distant with secondaries between intramarginal nerve close to the margins; petiole very short, about .12 in. long, channelled. *Cymes*

terminal, shortly peduncled, usually corymbose on a short axis, .4-.6 in. long. *Flowers* .6-.8 in. long, subsessile. *Hypanthium* clavate; lower portion solid; calyx-limb narrow, campanulate, .25-.3 in. long, produced above the ovary; calyx segments 5, broader than long, .05-.1 in. across, gland punctate. *Petals* 8, in two series, outer broader, .1-.12 in. by about .1 in., inner narrower and unequal, glandular. *Stamens* unequal, upto .4 in. long, smallest about .2 in. long, in several series, infolded in bud. *Ovary* 2-celled; style subulate, exserted, .53-.4 in.; ovules numerous. *Fruit* not seen.

Assam Herbarium, Sheet No. 601P and 6786. Dehing bank-elevation about (460 metres) 1,500 ft.—N. CACHAR HILLS.

The leaves dry on the upper surface a beautiful prussian blue from which it is easy to distinguish from all other *Eugenias*.

Flrs. 1.

***Eugenia grata* Wall. Cat. 3585.**

A small tree. *Leaves* 2.5-5 by .7-2 in., oblong-lanceolate, ovate-lanceolate or elliptic-lanceolate, acuminate, rounded or cuneate at the base, coriaceous, upper surface punctate; lateral nerves slender, 15-20 on either side, indistinct above, intramarginal nerve close to the margin; petiole .1-.25 in. long, channelled. *Inflorescence* terminal and axillary of dense clusters of cymes racemously arranged on a common axis, 1.5-4 in. long, the whole often forming a leafy panicle; peduncles of cymes 0-.3 in. long. *Flowers* sessile; calyx-tube narrowly campanulate with an attenuate pedicel-like base about .3 in. long; lobes 5, very small, broad-ovate, broader than long. *Petals* 5, orbicular, about .1 in. across, free. *Stamens* about .2 in. long; style about .3 in. long. *Fruit* ellipsoid or ovoid, .3 in. long, on a short stalk, crowned by the calyx-limb, 1 seeded.

ASSAM—*Jenkins*; KHASI Mts.—*Griffith*. There are no sheets in herbarium—Calcutta from the area of the Flora.

In some of the sheets in Calcutta herbarium from Burma Shaik Mokim 343 also Curtis No. 756 from Penang, the cyme peduncles are borne in the axils of caducous spathulate or oblanceolate membranous bracts, .2 in. long and the flowers are borne in the axils of similar bracteoles, .15 in. long.

27. *Eugenia bracteata* Roxb. Vern. *Misi-ia-thep*, *Lukluki-jam*, Cach.; *Reng-reng-kung*, *Ingnar-arong-kong-arong*, Mik.; *Minsentel*, Tipp.; *Harch*, Nep.; *Thing-senti*, Kuki.

A small to moderate-sized tree (in our area*). *Young* parts and inflorescence rusty or fuscous silky villous. *Bark* thin, pale-brown, almost white to light grey, finely fissured. *Leaves* 1.5-4 by .7-2 in., oblong-lanceolate to elliptic,

* In most (*vide* Haines Botany of Bihar) parts of India it is only a shrub.

sub-rhomboid or oblanceolate, bluntly acuminate; base cuneate, thinly coriaceous, closely gland-dotted, glabrous or pubescent or puberulous along the midrib beneath, nerves faint, slender, about 10-14 on either side, intra-marginal nerve wavy; petiole about .2 in. long. *Peduncles* up to .5 in. long, 1-flowered, axillary or extra-axillary, fascicled or solitary, and often opposite, sometimes apparently terminal being crowded on new shoots with undeveloped leaves; bracteoles small, linear, deciduous, a pair at the base of the calyx. *Flowers* about .4 in. across, handsome, white. *Calyx* about .15 in. long, rusty pubescent outside, basal portion hemispheric; limb dilated; disk pubescent; calyx-lobes broadly oblong or sub-orbicular, reflexed after flowering. *Petals* about .15 in. long, orbicular, pubescent outside, margins ciliate. *Berry* .25 in. across, orange or red, globose, crowned by the persistent calyx-lobes.

N. E. FRONTIER-Dist. SIBSAGAR, NOWGONG, CACHAR, SYLHET, KHASI HILLS—near the foot on the SYLHET slopes. Probably in other Districts also. Grown in many parts of India as an ornamental plant, its myrtle like flowers adding to its beauty.

The fruit is said to be edible. The wood is reddish or purplish brown, fairly close grained and capable of taking a good polish. It is used for tool handles, posts and pestles for pounding rice.

Flrs. 1-5—according to Haines—Flrs. and Fr. all the year round.

Eugenia Mooniana Wight. Vern. *Sonapati-jam*, *Muisentel*, Ass.

A small (or middle-sized?) tree; all parts glabrous. *Leaves* very variable in size and shape, 1.5-2.5 by .7-1.25 in., lanceolate, ovate or elliptic, acuminate; base cuneate or acute or rounded, thinly coriaceous, nerves inconspicuous; lateral nerves many, intramarginal nerve close to the margin; petiole .2-.25 in. long. *Flowers* white, about .25 in. across, solitary or fasciculate; pedicels filiform, about .5 in. long, axillary or from old wood; bracteoles small, lanceolate, subulate. *Calyx* .15 in. long, pubescent outside; calyx-tube not produced beyond the ovary; lobes 4, lanceolate or oblong. *Petals* 4, longer than the calyx-lobes, free. *Fruit* .5-.7 in. long, scarlet or crimson, globose.

Sheet No. 4927 from Longai reserve in leaf only—has been referred to this species with which it agrees in foliage but more material is necessary for confirmation of the record. Our specimen attains a girth of 6 ft. but *E. Mooniana* is described as a shrub or a small tree by Brandis (Ind. Trees, p. 326); a shrub by Cooke (Flora of

the Bombay Presidency, p. 494), and a small tree by Gamble (Madras Flora, p. 484).

Flrs. 2-3.

Eugenia aborensis Dunn. Kew Bulletin 1920. XV., p. 109 Vern. *Pankalasing*, Abor.

A middle-sized glabrous tree, about 25 ft. high; bark whitish, fibrous, brown inside. *Leaves* sub-sessile, 5·5-9 in. by 1·2-2 in., oblong-lanceolate, acuminate, membranous, gland punctate; lateral nerves many, about 20-25 on either side, slender, prominent beneath, intramarginal nerve wavy, ·1-·2 in. from the margin with another faint one between; base narrowed, cordate and often amplexicaul. *Cymes* few flowered, terminal and axillary from axils of fallen leaves, sometimes fascicled. *Flowers* about ·8 in. across; pedicels and calyx-tube rusty puberulous; pedicels ·2-·5 in. long, slender. *Calyx* broad, turbinate or campanulate, ·3-·35 in. across, rugose with raised glands, narrowed to a pedicel like base; lobes broad, ovate, ·2 in. across, broader than long. *Petals* 5, rotundate, about ·25 in. across; stamens ·35 in. long; style about ·5 in. *Immature fruit* globose, about ·5 in. long, crowned by the incurved calyx-lobes.

ABOR HILLS about 2,000 ft.; N. E. FRONTIER—between Pasi-ghat and Pillung.

Flrs. 12-1.

DECASPERMUM Forst.

Decaspermum paniculatum Kurz. Syn. *Nelitris paniculata* Lindl. Vern. *Dieng-auro-la-pyrno*, *Dieng-la-phynia*, Synt.

A small tree with rough brown or grey bark, exfoliating in thin pieces; young parts and inflorescence covered with adpressed silvery or greyish white silky-hairs. *Leaves* 1·5-4 by ·5-1 in., lanceolate, oblong-lanceolate or ovate lanceolate, cuspidate-acuminate; base gradually or abruptly narrowed to the petiole, thinly coriaceous, closely pellucid-dotted, dark glossy green above, paler and pubescent or puberulous on the midrib beneath, nerves indistinct, intramarginal nerve close to the margin; petiole ·1-·2 in. long, silky. *Flowers* white, ·3-·4 in. across, polygamous, in terminal and axillary panicles of cymes, about 2·5 in. long or sometimes in simple peduncled cymes; bracts leaf-like, lanceolate to subulate, upto ·5 in. long, smaller upwards; bracteoles minute, linear at the top of the pedicels, which

are slender and up to .25 in. long. *Calyx* .1 in. long; calyx-tube usually densely clothed with white or greyish adpressed hairs, adnate to the ovary, limb usually 5-lobed, persistent, broadly acute, less hairy than the calyx-tube; lobes broadly ovate or sub-orbicular, broadly acute or obtuse. *Petals* white, up to .2 in. long, ciliate, gland dotted. *Stamens* numerous, in several series; filaments filiform; anthers versatile. *Ovary* usually 4-celled, inferior, with 2-ovules in each cell; style exserted; stigma peltate. *Berry* globose, about .15 in. across, crowned by the persistent calyx-lobes; seeds few, reniform; testa hard.

KHASI HILLS.

Flrs. 7. Fr. 11.

EUCALYPTUS L' Herit.

Ever-green glabrous trees, sometimes attaining gigantic size, usually secreting red aromatic gum. *Leaves* gland dotted, entire, with an intramarginal nerve, in young plants opposite, horizontal, usually sessile, later on usually alternate, different in shape, petiolate, vertical, more or less falcate and coriaceous. *Flowers* bisexual, usually on axillary peduncles, in umbels or heads of 3-many or sometimes solitary; pedicels not jointed; calyx-tube turbinate or campanulate, adnate to the base of the ovary and continued beyond it, usually truncate at the apex; the orifice of the calyx-tube closed in bud, by a cap consisting of the united petals, which falls off by the pressure of growing stamens. *Stamens* numerous in many rows, infolded in bud. *Ovary* inferior, 3-6 celled; ovules numerous, axile; style undivided; stigma small. *Fruit* a hardened capsule, opening at the top by 3-6 valves; seeds numerous, minute, angular, cuneate, a large percentage sterile, these being smaller than the fertile ones.

Calyx-tube not angled or rugose, .15 in. across,
not produced beyond the ovary. Flowers in
umbels.

1. *E. teretecornis*.

Calyx-tube angled and rugose, .6 in. across,
produced beyond the ovary. Flowers 1-3
together in leaf axils.

2. *E. globulus*.

1. *Eucalyptus teretecornis* Sm. Forest red gum.

A large tree with long branches and an open crown. *Bark* smooth, ash coloured. *Leaves* 4-9 by $\cdot 6\text{--}1\cdot 5$ in., usually falcate, few, ovate-lanceolate, juvenile leaves ovate, coriaceous, narrowed to the stout petiole, which is $\cdot 5\text{--}1\cdot 5$ in. long; nerves slender, somewhat indistinct. *Umbels* 4-9 flowered, axillary, simple or paniced; common peduncle stout, $\cdot 5\text{--}1$ in. long; pedicels short, stout; buds about $\cdot 5$ in. long. *Calyx-tube* turbinate, $\cdot 15$ in. across; operculum conical, longer than the calyx-tube, about $\cdot 3$ in. long; filaments about $\cdot 3$ in. long; anthers opening by slits. *Capsules* about $\cdot 2$ in. across; valves prominently exserted.

Cultivated in Shillong, where it succeeds fairly well.

2. *Eucalyptus globulus* Labill. Blue Gum.

A lofty aromatic tree; young shoots and foliage glaucous-grey or bluish. *Bark* peeling off in long strips, which persist for a long time, exposing a smooth surface underneath. *Leaves* 6-10 by $\cdot 7\text{--}1\cdot 5$ in., falcate, linear to narrow-lanceolate, abruptly narrowed at the base to the rather stout petiole, punctate with black dots, nerves slender but distinct; juvenile leaves ovate, nearly sessile; petioles up to $1\cdot 5$ in. long, broader upwards. *Flowers* large, 1-3 together in leaf axils; pedicels angled, very short. *Calyx-tube* covered with a whitish grey bloom, warty and angular, about $\cdot 5$ in. long, $\cdot 6\text{--}\cdot 8$ in. across, rim produced beyond the ovary; operculum low, abruptly pointed, rugose. *Stamens* about $\cdot 6$ in. long; anthers opening by slits. *Capsules* $\cdot 7\text{--}1$ in. across; valves exserted.

Frequently cultivated in Shillong, where its growth is fast and attains large dimensions.

Flrs. 10. Fr. 12-1.

Eucalyptus maculata Hook. (Syn. *E. citriodora*). Lemon-scented gum.

A tree with bark smooth, whitish or slightly greyish. *Leaves* 4-7 in. long; lanceolate, often somewhat falcate, bright green. *Flowers* usually in 3-flowered umbels, arranged in panicles; operculum hemispheric. *Stamens* opening by slits. *Fruits* ovoid, about $\cdot 5$ by $\cdot 4$ in.

LUSHAI HILLS, cultivated. Gives a lemon scent when the leaves are bruised.

Wood strong, tough, elastic, liable to warp (Troup).

Flrs. and Fr. 1-3.

A few other species of *Eucalyptus* are also cultivated in gardens, but they are not of sufficient importance for inclusion.

Callistemon linearis DC. Vern. The bottle brush tree.

A small aromatic evergreen tree with rough fissured bark and drooping branches; young parts covered with soft spreading hairs. *Leaves* alternate, 1·7-3·2 by ·15-·25 in., linear-lanceolate, sharply pointed, narrowed at the base, coriaceous, glabrous with age, closely gland dotted, intramarginal nerve conspicuous; petiole very short. *Flowers* crimson, in terminal leaf bearing spikes; bracts linear. *Calyx* ·2 in. long, campanulate, hairy; lobes 5. obtuse. *Petals* 5, suborbicular; stamens numerous, long exserted, ·5-·7 in. long. *Ovary* 3-4 celled; ovules numerous. *Fruit* capsular, woody, with a truncate apex, about ·2 in. long.

Often cultivated.

Flrs. 3-12.

Psidium Guyava Linn. The Guava. Vern. *Sophri*, *Sophriam*, (Sylh.); *Paiṛa*, Beng.; *Madhuram*, Ass.; *Amrua*, Hind.; *Shu-khren*, Cach.; *Choupri*, Kuki; *Soh-pyriam*, Kh.

A large small evergreen or sub-deciduous tree with smooth pinkish brown bark exfoliating in thin flakes. *Leaves* opposite, 2·5-6 in. long, oblong or elliptic oblong, entire, glabrous above, pubescent beneath, faintly aromatic and pellucid dotted; lateral nerves prominent; petiole up to ·3 in. long. *Flowers* 1-1·5 in. across, white on 1-3 flowered axillary peduncles; calyx urceolate, lower portion adnate to the ovary, upper portion free and irregularly lobed. *Petals* free. *Berry* globose or pyriform, varying in size and shape, ordinarily about 2·5 in. in length, containing numerous seeds, immersed in a pleasantly flavoured sweet pulp.

Largely grown in gardens, sometimes found as an escape.

Flrs. and Fr. almost throughout the year but flrs. mainly hot season and fr. rainy and cold season.

FAM. 58. LECYTHIDACEÆ.

Trees. *Leaves* alternate, usually crowded at the ends of branchlets, exstipulate, entire or shortly toothed, without oil glands. *Flowers* solitary, in racemes or spikes, hermaphrodite. *Calyx-tube* adnate to the ovary; lobes 4-6, rarely 2-3, valvate or imbricate. *Petals* 4-6, rarely 0 or more. *Stamens* many, in several series; filaments more or less connate at the base, and sometimes arranged on one side of the flower; anthers sometimes wanting or some of the stamens modified to staminodes. *Ovary* inferior, 2-6, rarely more-celled, usually many ovuled; style long, slender; stigma capitate. *Fruit* a woody fleshy or fibrous berry with 1-many seeds; seed exalbuminous.

Flowers in short spikes. Fruit globose, many-seeded; stamens some without anthers. ..

1. **Careya.**

Flowers in pendulous racemes. Fruit angular, 1-seeded; stamens all perfect. ..

2. **Barringtonia.**

1. CAREYA Roxb.

Careya arborea Roxb. Vern. *Kumbhi*, Sans.; *Kumbhi*, Beng., Hin. and Ass.; *Waiduphang*, *Bon-appi*, *Bon-iaphi*, Cach.; *Loring*, Mik.; *Khum*, Mech; *Soh-kyndur*, *Ka-mahir*, Kh.; *Panibhela*, (Darrang), *Godhajam*, *Kum*, *Kumrenga*, *Kumari*, Ass.; *Gambel*, *Bol-dimbel*, Garo; *Thing-poi*, Kuki, *Bhola-changne*; Daff.

A moderate to medium-sized deciduous tree. *Bark* dark grey or brown, thick, fibrous, exfoliating in narrow flakes, brownish-red inside. *Leaves* alternate, 6-12 by 3-7 in., obovate or oblanceolate, shortly acuminate or obtuse; base narrowed to a short margined petiole, crenulate-denticulate, glabrous, thin; lateral nerves 10-15, looping near the margins. *Flowers* 2.5-4 in. across, with an unpleasant smell, white and pink in few flowered stiff terminal spikes; bracts 3, unequal, central elliptic, 2 lateral linear. *Calyx* about 1 in. long; calyx-tube campanulate, not produced beyond the ovary; lobes 4, a little shorter than the tube, rounded, stiff. *Petals* 4, white, caducous,

about 2 in. long, imbricate, elliptic. *Stamens* numerous in several series; filaments up to 3 in. long; gradually longer outwards, those of the innermost and outermost series without anthers. *Ovary* inferior, usually 4-celled with an annular disk at the top; ovules numerous, in 2 series on axile placentæ; style long, stiff. *Berry* 2·5-3 in. across, globose or ovoid, crowned with the limb of the calyx-tube; seeds numerous, up to 4 in. long, immersed in pulp.

SYLHET, CACHAR, GOALPARA, GARO HILLS, NOWGONG, DARRANG, KHASI HILLS up to about 2,500 ft.

Sapwood large, whitish, nearwood reddish, even grained. medullary rays fine, numerous, uniform. The timber is durable, stands well under water and takes a good polish. It is mainly used for oars and tool handles in this province, weight about 50 lbs. per c. ft. It could be used for planking, cart furniture and cabinet work. The bark, flowers, juice and fruit are considered medicinal.

Flrs. 4-5. Fr. 7. Leaves turn red or purple before falling.

2. BARRINGTONIA Forst.

Barringtonia acutangula Gært. Vern. *Ijul*, Sans.; *Hinsol*, Sylh. & Ass.; *Hijal*, Sylh.; *Hinyol*, *Pani-amra Bheh*, Ass.; *Chin-chong-arong*, Mik.

A small to medium-sized tree. *Bark* dark grey to almost black, longitudinal, but reticulate furrowed, 5-1 in. thick, inner substance light pinkish, soft. *Leaves* 3-6 by 1·3 to 3·3 in., alternate, crowded at the ends or branches, obovate or oblanceolate, apex rounded or subacute, minutely denticulate, thinly coriaceous, glabrous; lateral nerves distinct, 8-13 on either half, curved near the margin; tertiaries reticulate; base narrowed; petiole up to 25 in. long, margined. *Flowers* about 5 in. across, deep red, delicately fragrant, in slender, drooping, glabrous racemes 6-18 in. long. *Pedicels* 1-15 in. long; bracts oblong; bracteoles lanceolate, both caducous. *Calyx-tube* funnel-shaped, not produced beyond the ovary; lobes 4, rounded, equalling the tube, minutely denticulate. *Petals* 4, about 2 in. long, adnate to the base of the staminal tube, imbricate, falling off early along with the stamens in one piece. *Stamens* in several series, red, connate below; filaments dilated at the base. Disk annular, epigynous, within the staminal tube. *Ovary* inferior, 2-celled, with 2 pendulous ovules in each cell; style filiform.

Fruit about 1·5 in. long, oblong, bluntly quadrangular, crowned with the persistent calyx lobes, somewhat narrowed and truncate at both ends, fibrous, 1-seeded.

Throughout ASSAM ascending to 2,500 ft., usually on banks of streams, edges of swamps, and moist places.

Wood pale or reddish brown, soft, medullary rays broad and very broad, numerous, no distinct heartwood—but fairly tough and durable. It is considered suitable for cabinet making, boat building, wells, carts, etc. Wt.—about 40 lbs. per c. ft.

The bark is used for intoxicating fish.

The cotyledons are rudimentary and the embryo and seedlings have swollen hypocotyl.

Flrs. 3-6. Fr. 9-10. Flowering and fruiting also in the cold weather—R. N. De.

Couroupita guianensis Aubl. The cannon ball tree.

A tree with pubescent young parts. *Leaves* 6-9·5 by 2·2-3·2 in., oblanceolate or obovate-lanceolate, shortly acuminate, thin, glabrescent above, thinly pubescent beneath; lateral nerves 18-20 on either side, looped near the margin. *Flowers* large, showy; pinkish, about 3·5-5 in. across, from old wood. *Calyx* lobes rounded. *Petals* 6, obovate subequal, 1·5-2 in. long, connate at the base with the staminal tube. *Fertile* stamens borne on an outgrowth of the tube, which is bent over the staminode bearing tube; filaments of fertile flowers dilated, up to ¼ in. long. *Fruit* large, woody, globose (whence the English name) with an extremely unpleasant smell when ripe.

Cultivated, e.g., Gauhati.

The timber is said to be good.

Flrs. 7. Fr. 1-2.

FAM. 59. MELASTOMACEÆ.

Herbs or shrubs, rarely trees or climbers. *Leaves* exstipulate, opposite or whorled, generally petioled, entire or nearly so, often 3-7 nerved from or from near the base, which approximate near the apex, rarely penninerved (Memecylon). *Inflorescence* various. *Flowers* regular, hermaphrodite, often showy. *Calyx-tube* tubular or campanulate, partially (often by septa like vertical walls) or entirely adnate to the ovary and more or less prolonged beyond it, rarely free; limb

usually 4-5 (rarely 3 or 6) lobed, sometimes truncate, rarely falling off as a cap. *Petals* as many as calyx lobes, contorted in bud. *Stamens* as many to twice as many as the petals, and inserted with them on the edge of the calyx-tube; alternate stamens sometimes shorter, sometimes rudimentary; filaments inflexed in bud, often geniculate; anthers 2-celled, usually opening by pores, rarely by longitudinal slits; connective often appendaged at the base. *Ovary* usually 4-5, sometimes 3-6 celled (1 celled in *Memecylon*); style simple, filiform, rarely short; ovules many (except in *Memecylon*); placentæ usually axile (free central in *Memecylon*). *Fruit* included in the calyx-tube, baccate or capsular, breaking up irregularly or by pores through the top of the cells. *Seeds* minute, many (1 in *Memecylon*), albumen 0.

- I. Leaves with 3 or more prominent basal nerves; ovary 4-5 celled; seeds numerous :—
 - A. *Petals* 4-5 :—
 1. *Stamens* twice as many as petals :—
 - a. Apical portion of ovary bristly harshly hairy or scaly; seeds curved through half a circle :—

Stamens equal; capsule opening at the apex by pores. . .	1. Osbeckia.
Stamens unequal; fruit bursting irregularly. . .	2. Melastoma.
 - b. Apical portion of ovary glabrous; seeds more or less straight or sub-falcate :—
 - i. Fruit capsular :—

Stamens unequal; fruit 8-ribbed. . .	3. Oxyspora.
--------------------------------------	---------------------
 - ii. Fruit baccate :—

Stamens equal. . .	4. Medinilla.
Stamens unequal. . .	5. Anplectrum.
 2. *Stamens* as many as petals; flrs. small. 6. **Blastus.**
 - B. *Petals* 3. *Stamens* equal. 7. **Sonerila.**
- II. Leaves penninerved without prominent basal nerves; ovary 1-celled, few ovuled; seed usually 1. 7. **Memecylon.**

1. OSBECKIA Linn.

Hairy herbs or shrubs, commonly with 4 angled branchlets. *Leaves* opposite or ternate. *Flowers* 4-5 merous,

terminal in capitate cymes or in panicles, sometimes solitary. *Calyx-tube* with stellate hairs or pectinate scales outside. adnate to the lower half of the ovary; segments and usually part of the limb deciduous. *Stamens* 8-10, equal or unequal; anthers oblong, which may be more or less beaked, connective not produced at the base, slightly swollen or with 2 tubercles. *Ovary* 4-5 celled, setose at the apex; ovules numerous on the placentæ radiating from the axis. *Capsule* opening by 4-5 pores from the free top. *Seeds* numerous, curved through half a circle, pitted.

I. Flowers 4 merous :—

A. Flowers panicled; shrubs 3-5 ft.:—

Calyx-tube with dense tufts of stellate hairs. much branched shrubs.

1. *O. crinita*.

Calyx-tube glabrous or with few hairs usually stem undivided.

2. *O. rostrata*.

B. Flowers capitate; perennial herbs or undershrubs up to 2 ft. high :—

Erect, leaves linear oblong-lanceolate; bracts glabrous or nearly so. . .

3. *O. chinensis*.

Diffuse branching from near the base; leaves broad ovate, adpressed pubescent.

O. capitata.

II. Flowers 5 merous :—

4-5 ft. high. Flowers usually white, not nodding, in compound cymes; calyx with bristle fringed scales. Leaves over .5 in. broad.

4. *O. nepalensis*.

2-3 ft. high. Flowers usually mauve, nodding solitary or few together; calyx glabrous or nearly so; leaves under .5 in. broad, linear or narrow lanceolate.

5. *O. nutans*.

1. *Osbeckia crinita* Benth. Vern. *Ja-lang-kthem*. *Dieng-soh-kthem*, Khasi.

A small much branched shrub ordinarily attaining about 5 ft., but sometimes taller; branches covered with spreading bulb based fuscous hairs. *Leaves* 2-4 by .9-1.5 in., ovate to oblong-lanceolate, acuminate, rounded to subcordate, sometimes narrowed at the base, clothed on both surfaces with harsh adpressed hairs, 5-7 nerved; tertiaries fine, sub-parallel; petiole .2-.5 in. long. *Flowers* purple (according to C. B.

Clarke—sometimes pure white), about 1.25 in. across, 4 (rarely 5) merous, in corymbs of cymes; pedicels up to .25 in. long; bracts ovate or suborbicular, densely hairy on the back or sometimes glabrate with a dense fringe of hairs along the margin. *Calyx* .4 in. long with stiff stellate hairs; sometimes borne on minute, linear scales, upper portion of limb deciduous along with petals and stamens, a truncate fruiting calyx persisting; lobes subulate, usually alternating with linear scales, often pectinate with bristles and crowned by stellate bristles. *Petals* obovate, about .6 in. long; stamens 8; anthers large, produced into long incurved beaks; base of the connective tubercled. *Bristles* on the apex of the ovary 18-20. *Fruit* including the neck .5 in. (.75 in. according to F.B.I.) long, suddenly narrowed to a neck; fruiting calyx ultimately hairless, free portion about equalling, narrower than the fruit.

KHASI HILLS 4-6,000 ft.

Flrs. 7-10. Fr. 11-1.

Osbeckia septeminervia Ham. in notes of the Royal Botanic Garden Edin. Vol. X (1917), p. 55.

Branchlets quadrangular, hirsute with spreading hairs. *Leaves* 3-5 by .8-1.3 in., lanceolate to oblong-lanceolate, gradually attenuated to the acute apex, chartaceous, thinly adpressed hirsute above, pale and with long hairs on the nerves; base 7 nerved; petiole .3-.45 in. long, densely hairy. *Cymes* axillary or terminal and paniced, densely covered with harsh hairs; bracts sub-rotundate to ovate, often acuminate, .25-.35 in. long, dorsally adpressed setose, glabrous within, margin long ciliate. *Calyx* segments 4, linear-lanceolate, subacuminate or long acuminate, .5-.6 in. long, sparsely clothed with long setose and whitish adpressed short hairs, margins setose-ciliate; hairs never glandular. *Petals* 4, about 1 in. by .8 in., obovate to orbicular-ovate, more or less shortly clawed, ciliate. *Stamens* up to 1.5 in. long; anthers slightly longer than filaments. *Ovary* included; style up to 1.2 in. long.

Allied to *O. crinita* from which it differs mainly by its large flowers.

GOALPARA—Hamilton.

2. **Osbeckia rostrata** Don. Vern. *Phutki*, Assamese.

An erect almost unbranched shrub attaining 5 ft.; stem herbaceous, nearly glabrous or with scattered bristly ascending hairs. *Leaves* opposite or sometimes ternate, 3-8

by 1·2·5 in., lanceolate to ovate-lanceolate or elliptic-oblong, acuminate, subcordate, rounded or narrowed at the base; thin, almost glabrous to strigose, specially along the nerves, basal nerves 5, sometimes 7; petiole ·12·6 in. long. *Flowers* about 1·5 in. across, 4 merous, rose purple, in long paniced cymes; pedicels quadrangular, 0·1 in.; bracts ·25 in. long, ovate-ciliate, glabrous or hairy along the nerves on the back. *Calyx* ·6·8 in. long, glabrous or with scattered bristles or rarely stellate hairs; lobes ·25·4 in. long, lanceolate or elliptic-lanceolate, ciliate, alternating with subulate, usually bristle pectinate processes and deciduous along with the rim of the calyx-limb. *Petals* ·6·8 in. long, usually more or less ciliate. *Anthers* 8 with long incurved beaks; base of the connective tubercled. *Ovary* without or with short bristles at the top. *Fruits* ·5·8 in. long, narrowed into a long cylindric neck. *Fruiting calyx* glabrous or nearly so, rarely with scattered stellate hairs; free portion of calyx as long as or longer and narrowed than the fruit, truncate at the apex. Very variable as regards hairiness.

In swampy ground all over the province ascending to 4,500 ft. in the KHASI HILLS.

Flrs. 7-9, Fr. 10-12.

Var. *pulchella* Benth. Stem glabrous, 4-angled. *Leaves* lanceolate or ovate lanceolate, glabrous or slightly strigose on the nerves specially on the outermost; petioles long, scales between the calyx lobes glabrous, obscure or absent. *Fruits* large, ·7·8 in. long; seeds buff.

GOALPARA; Mamloo—K. & J. HILLS—probably all over the Province.

3. *Osbeckia chinensis* Linn.

A weak erect undershrub attaining up to 2 ft. in height, branches pubescent with ascending adpressed hairs. *Leaves* 1-2 in. by ·2·5 in., oblong to linear-lanceolate; base narrowed, 3-5 nerved, adpressed pubescent on both surfaces; petiole 0 to very short. *Flowers* capitate at the ends of the branches, mauve or purple, 1 in. across, 4-merous; bracts ·2·25 in. long, elliptic or ovate ciliate, glabrous on the back. *Calyx* ·5 in. long. *Calyx-tube* glabrous; lobes lanceolate, ciliate, alternating with scales tipped with long spreading bristles, deciduous with the rim of the limb.

Petals about .5 in. long. *Stamens* 8; anthers long beaked; ovary with about 16 erect bristles at the top. *Fruit* about .25 in. long; fruiting calyx .2 in. across with a short neck, glabrous.

Common specially on the hills ascending to 5,000 ft. in the KHASI HILLS.

Flrs. 7-11.

Osbeckia capitata Benth. Vern. *Soh-pythem*, Khasi.

A perennial herb attaining about 20 in. in length, branches from near the base; branches weak, 4 angled, strigose with ascending adpressed bulb-based bristly hairs. *Leaves* .5-1 by .3-.5 in., subsessile, ovate to elliptic ovate, with a broad or subcordate, 3-5 nerved; (up to 9 nerved according to F.B.I.), base adpressed pubescent on both surfaces. *Flowers* .8-1 in. across, pinkish purple, capitate on the ends of branches, sometimes on short peduncles from upper axils. *Bracts* .2-.25 in. long, ovate, acute, adpressed pubescent, ciliate. *Calyx* .5 in. long, glabrous; lobes lanceolate, ciliate, alternating with minute bristle fringed scales, deciduous along with the rim of the limb. *Petals* about .5 in. long with a few cilia at the apex; anthers with a long beak. *Ovary* with 16-20 bristles at the apex. *Fruit* .3 in. long, .2 in. across with a short neck. *Fruiting calyx* glabrous.

KHASI HILLS 4,000—6,000 ft. Very common in forest undergrowth and in grass.

Flrs. 6-10. Fr. 11.

4. Osbeckia nepalensis Hk. f.

A small shrub attaining about 5 ft. in height with sharply 4 angular, sometimes shortly winged stem and branches, covered with adpressed ascending stiff hairs. *Leaves* 2.5-5.5 by .7-1.7 in., oblong-lanceolate to lanceolate, broadly acute to shortly acuminate; base broadly cordate to rounded, 5 nerved, pubescent on both surfaces with rather harsh hairs; petiole very short upto .1 in. long. *Flowers* white (or mauve according to C. B. Clarke), 5 merous, about 1.5 in. across in compound corymbose cymes, terminal and sometimes from upper axils; cymes compact; pedicels upto .1 in. long, stout; bracts .5 in. long, ovate or elliptic,

scarious, ciliate along the margins, villous along the centre of the back and the base glabrous elsewhere. *Calyx* with persistent scales fringed with bristles, of which 5 alternate with the lobes; rim of the calyx-tube deciduous; lobes .4 in. long, broadly lanceolate, glabrous, ciliate along the margins. *Petals* about .7 in. long, broadly obovate, usually with a few cilia at the apex. *Stamens* 10; filaments dilated in the middle; apex constricted and crowned by a rim formed by the dilated base of the connective, anthers attenuated to a pointed tip (not beaked). *Free portion* of the ovary strigose and with a ring of bristles on the 5 crenate crown. *Fruit* about .5 by .3 in., free portion of fruiting calyx very short; apex of the capsule slightly protruding beyond the rim.

Almost all over ASSAM, ascending to 4,500 ft. in the KHASI HILLS.

Flrs. mainly 4-11.

5. *Osbeckia nutans* Wall.

A small much branched shrub about 2-3 ft. high with wiry, strigose branches. *Leaves* 2.2 by .15-.45 in., narrow or linear-lanceolate, 3 nerved, very prettily lineolate along nervules above (when dry), and glabrous and pale or sometimes golden yellow beneath between the strigose main nerves and margins. *Flowers* usually 5-merous, sometimes 4-merous (Kanjilal's Sheet No. 7450 in Assam Herbarium), rose purple, about 1 in. across, 1-3 together on short terminal and axillary peduncles; pedicels strigose, nodding up to with a line of adpressed bristles along the centre of the back, otherwise glabrous. *Calyx* .5 in. long, glabrous or with few caducous bristles; lobes lanceolate, .3 in. long, ciliate and with minute bristle-fringed scales in between, deciduous along with the rim of the calyx-limb. *Petals* .4-.5 in. long, with few cilia at the apex. *Stamens* twice as many as the petals; filaments dilated in the middle, connective ending in a rim; anthers attenuate. *Free part* of the ovary persistently strigose. *Fruit* .2 in. long, about .2 in. across, top extruded from the hemispheric fruiting calyx.

GOALPARA, probably extending along the Sub-Himalayan Tracts to DARRANG and KAMRUP.

Flrs. 10-12. Fr. 11-1.

2. MELASTOMA Linn.

Strigose or villous shrubs. *Leaves* 3-7 nerved, *Flowers* 5 (rarely 6-7 merous). *Calyx-tube* with simple hairs or scales; lobes deciduous. *Stamens* twice as many as the petals, alternate ones long with purple anthers and connective produced at base and terminating in two lobes, the remaining shorter ones with yellow anthers, connective not produced but with two tubercles in front. *Ovary* as in *Osbeckia*. *Fruit* coriaceous or somewhat baccate, bursting irregularly. *Seeds* numerous, curved through half a circle, minutely punctate.

Young parts rather rough; stem adpressed scaly, not shaggy, upper surface of leaves thinly pubescent with hairs adpressed for their entire lengths; buds usually completely enclosed within the bracts; calyx lobes glabrous inside.

1. *M. malabathricum*.

Young parts silky; stems shaggy, upper surface of leaves more or less densely adpressed pubescent; hairs free at one end; bracts usually not enclosing the buds; calyx lobes generally more or less hairy.

2. *M. normale*.

1. *Melastoma malabathricum* Linn. Vern. *Khakkhi*, *Khakkhu*, *Bol-khakhu*, *Khakhuchi*, Garo; *Tokle-gach*, Jharua; *Phutuka*, *Phutkala*, *Phutki*, Ass.; *Khusemphan*, Kach., *Bit-bit-arong*, Mik.; *Leidum*, *Mulkong*, Kuki; *Murkong*, Tipp.; *Syntew-soh-pyandang*, *Ka-dieng-kum*, *Dieng-soh-khing*, Kh.; *Phutuli*, Sylh.; *Thung-khu*, Mech.

A handsome bushy shrub attaining up to 15 ft. in height; young parts densely adpressed bristly; stem and petioles strigose with long and subulate to short echinate scales. *Leaves* 2.5-5 by .7-2 in., oblong-lanceolate, lanceolate or elliptic, acuminate, scabrous with hairs adpressed for their entire lengths above, undersurface scaly strigose on main nerves and harshly adpressed pubescent or bristly on the tertiary nerves and on the space between basal nerves 3-5; petiole .2-1 in. long, scaly strigose. *Flowers* mauve-purple, 1.5-3 in. across, usually in clusters of 1-5 at the ends of branchlets; bracts .4-.75 in. long, enclosing the buds, elliptic or obovate, obtuse or acute, narrowed into a broad stalk, adpressed scaly outside; pedicels up to .3 in. long, stout,

clothed with serrulate scales. *Calyx* .6-.75 in. long. *Calyx-tube* densely covered with pale brown, linear acuminate, and usually serrulate scales; calyx-lobes lanceolate, .25-.35 in. long, deciduous, thinly pilose outside, glabrous with a few hairs towards the apex within. *Petals* .7-1.25 in. long. *Fruit* about .25 in. across, truncate, rather pulpy inside with fleshy purple placentæ and breaking up transversely outside.

Throughout the area ascending to 5,000 ft. in the KHASI HILLS. Sometimes gregarious in waste lands.

The fruits are eaten and the leaves are applied over cuts to stop bleeding.

Flrs. 2-7. Fr. 11-12—probably all the year round.

2. *Melastoma normale* Don Vern. *Ja-long-kythem-heh*, *Dieng-slidong*, *Dieng-soh-klong*, Khasi.

An erect shrub attaining about 15 ft. in height; branches densely shaggy with spreading hairs, usually with subulate bristles at the nodes; young shoots fuscous, silky villous. *Leaves* 2.5-5 by 1-2 in., oblong-lanceolate to ovate-lanceolate, shortly acuminate or acute; base 3-7 nerved, pubescent above with long adpressed hairs, free at one end, undersurface pubescent or villous, midrib and often the main nerves with subulate serrulate scales; petiole .25-.8 in. long, with bristly hairs and scales. *Flowers* rose purple, about 2 in. across, 3-10 together in terminal clusters, sometimes a few from upper axils; pedicels up to .4 in. long, densely clothed with adpressed acuminate serrulate scales like the calyx; bracts caducous, ovate acuminate to linear-lanceolate, up to .5 in. long, not enclosing the buds, villous outside. *Calyx* .5-.75 in. long; lobes .2-.3 in. long, less densely pubescent than the calyx-tube outside, more or less pubescent inside. *Fruit* as in the last species.

Difficult to distinctly distinguish from the last species of which it is not improbably a variety. It is more softly pubescent and generally more hairy than the last species but I have seen forms intermediate in hairiness between the two species.

KHASI HILLS 2-5,000 ft.

Flrs. and Fr. most of the year, mainly 5-1.

Melastoma imbricatum Wall Cat.—Branches, petiole, peduncles and calyx covered with adpressed serrulate scales. *Leaves* 4-9 in. long, broad elliptic, strigose on both surfaces; nerves on the undersurface with adpressed scales. *Flowers* in terminal clusters, about 1.25 in. across. *Fruit* .3-.6 in. long, ovoid, the margin at the top somewhat dilated.

ASSAM, KHASI HILLS—Brandis. I have seen no specimens of the species from our area.

Pleroma macaranthum D. Don.—A shrub or a small tree; branchlets, petiole and axis of inflorescence clothed with soft spreading hairs; young parts silky, villous. *Leaves* 3-5 by 1.2-2.2 in., elliptic to lanceolate-acuminate or acute, 5-7 nerved, softly hairy on both surfaces, more densely beneath; petioles .3-.5 in. long. *Flowers* 3-3.5 in. across, purplish-blue, very showy, sessile or nearly so in compound cymes from ends of branches or upper leaf axils; bracts about 1 in. long, somewhat harshly pubescent outside, red with age enclosing the buds, caducous. *Calyx* adpressed pubescent; calyx-tube .5 in. long; lobes 5, oblong-lanceolate, as long as the tube or slightly longer, deciduous, glabrous inside, often bordered with red on the margins. *Petals* 5, broadly obovate, about 1.5 in. long. *Stamens* 10, 5 long and 5 short; filaments declinate, glandular hairy except at the top; anthers bluish purple, narrowed at apex, connective produced at the base, 2-tubercled. *Ovary* 5 celled; ovules numerous on radiating placentæ.

A native of Tropical America. Cultivated in Shillong, where apparently the fruit does not ripen. Very handsome striking when in flower.

Flrs. 7-11.

3. OXYSPORA DC.

Large spreading shrubs with drooping branches. *Leaves* long petioled, large, 5-7 nerved, secondary nerves parallel. *Flowers* in long terminal panicles with decussate branches; bracts very small. *Calyx-tube* cylindric, turbinate; teeth 4, short, triangular. *Petals* 4, sub-acute. *Stamens* 8, 4 with long filaments and purple, the others yellow; anthers narrowed upwards, opening by single apical pore. *Ovary* inferior, 4-celled; apex glabrous; style simple, elongate; ovules numerous on radiating axile placentæ. *Capsule* fusiform, dry, 8 ribbed. *Seeds* numerous, minute, often falcate.

1. Not glabrous; connectives of shorter anthers at least spurred :—

Young parts with spreading hairs,
larger anthers shortly lobed, connectives of all spurred.

.. .. 1. *O. vagans*.

Young parts tomentose with fugacious stellate scurf, also with soft deciduous bristles; larger anthers deeply lobed, connective of shorter anthers spurred; of larger anthers with minute protuberance. 2. *O. paniculata*.

II. All parts glabrous, connective of anthers not spurred. 3. *O. cernua*.

1. *Oxyspora vagans* Wall. Vern. *Sinka-asing, Jogirmigjir*, Abor; *Dieng-soh-ladoukhlaw*, Synt.; *Tew-soh-kthem*, Kh.

A moderate-sized shrub attaining about 4 ft. in height; branchlets, petioles, undersurface of leaves along the nerves clothed with spreading hairs. *Leaves* 3·5-7 by 1·7-3·7 in., those near the panicle very small, elliptic or ovate-lanceolate to suborbicular ovate or acuminate; base subcordate, 5-7 nerved, entire or shortly dentate, membranous, more or less ciliate along the margins, otherwise glabrate above; petioles up to 3 in. long, shorter upwards. *Panicles* stellate pubescent, branches ending in cymes. *Flowers* purplish red; pedicels short, slender; bracts up to ·2 in. long, linear-lanceolate or spathulate. *Calyx* ·25 in. long, stellate pubescent with a constricted neck; teeth acute, distant. *Petals* ·25 in. long, shortly acuminate. *Base* of longer anthers shortly 2 lobed, connectives spurred. *Capsule* about ·3 in. long, narrowed and produced to the base, crowned by the enlarged limb of the calyx-tube. *Seeds* minute, truncate at the apex, falcate or sub-falcate with two sharp-points bent at right angles in front and back, the former usually shorter, dark-coloured and continuous with a lateral ridge-(raphe).

N. E. FRONTIER, SIBSAGAR, KHASI HILLS up to 3,500 ft.
Flrs. 10-11. Fr. 2.

2. *Oxyspora paniculata* DC. Vern. *Lang-tang*, Khasi.

A shrub attaining 8 ft. in height; young shoots and petioles with dense fugacious, stellate scurf and soft spreading bristles, undersurface of leaves, inflorescence and calyx outside, thinly stellate, scurfy. *Leaves* 5-9 by 2·5-6 in.,

elliptic-broad or suborbicular-ovate, acuminate; base subcordate and 5-7 nerved, denticulate, membranous, nearly glabrate above; petiole up to 3 in. long with a tuft of bristly hairs at the top. *Panicles* copious, branches ending in cymes. *Flowers* with purple pedicels, calyx and petals; pedicels slender, short. *Calyx* .4 in. long, teeth triangular, acute. *Petals* .3 in. long, ovate, apex, acuminate and slightly pubescent outside. *Longer* anthers deeply 2-cleft at the base, connectives with minute protuberance. shorter anthers not 2-cleft at the base but the connective spurred. *Capsule* about .4 in. long, crowned by the accrescent calyx limb; seeds minute, falcate or nearly so with a truncate apex with 2 unequal beaks at either end, the one on the back long, the other short and continuous with the lateral ridge (raphe).

LAKHIMPUR, KHASI HILLS up to 4,500 ft.

Flrs. and Fr. most of the year, mainly 7-3?

3. *Oxyspora cernua* Triana.

A straggling evergreen glabrous shrub (scandent according to Kurz and Brandis), attaining about 12 ft. with long drooping branches, affecting rocky localities. *Leaves* opposite, those of the same pairs often dissimilar in size and to some extent also in shape, uppermost passing into bracts. commonly 4-15 in. long, ovate-lanceolate, acuminate, 5-7 nerved and rounded or cordate at the base, subcoriaceous, dark green and shining above, paler or reddish-brown beneath (in dried state?); petiole .5-2 in. long. *Panicles* lax, up to 20 in. long; rachis sharply quadrangular at the base. *Bracts* and bracteoles persistent. *Flowers* rose coloured, on slender pedicels, .3-.5 in. long. *Calyx* about .4 in. long; lobes broadly ovate, acute. *Petals* .5 in. long, oblong, acute; anthers not spurred, those of the longer stamens slightly diverging at the base. *Capsule* .3-.4 in. long.

KHASI HILLS—Kurz, DAFFLA HILLS—King's Collector-Jamunamukh (ABOR HILLS), Burkhil, NAGA HILLS—Masters.

Flrs. 10-11 (Kurz). Fr. 2-3 (Do.).

4. MEDINILLA Gaud.

Branching shrubs or small trees, erect or scandent. *Leaves* opposite or whorled, entire, usually glabrous and 3-9 nerved from the base. *Flowers* somewhat fleshy in lateral or terminal paniced cymes, pink or white, 4 or 5, rarely 6-merous. *Calyx-limb* obscurely toothed or truncate. *Stamens* twice as many as petals, sub-equal, rarely unequal; anthers opening at the top by a single pore; base of the connective not or very shortly produced with two tubercles in the front and often a spur behind. *Ovary* inferior, 4-5, rarely 6-celled; apex glabrous; style filiform; ovules numerous; placentæ axile. *Berry* crowned by the limb of the calyx; seeds very many, ovoid or subfalcate, often with thickened raphe.

Cymes axillary; peduncles very short or 0. .. 1. *M. rubicunda*.
 Cymes usually terminal; peduncles long. .. 2. *M. himalayana*.

1. *Medinilla rubicunda* Bl. Vern. *Bogitenga*, Ass.; *Jajaotler*, Synt.

A shrub or small tree attaining 15 ft. *Branchlets* subterete, somewhat striated; young shoots minutely puberulous, beautifully pink. *Leaves* 2·5-5 by 1·2-3 in., elliptic to lanceolate, shortly rather bluntly acuminate: base narrowed, 3-5 nerved, the stronger pair arising ·2·5 in. above the base, pink when young, glabrous with age, minutely punctulate beneath, somewhat fleshy; petiole short, up to ·25 in. long. *Flowers* 4-merous, pink in glabrous very short peduncled cymes from axils of existing or fallen leaves; pedicels up to ·2 in. long, jointed towards the base with two minute bracteoles from the joint; buds with a conical apex. *Calyx* about ·2 in. long; teeth obscure, obtuse. *Petals* rose pink, ovate, ·2 in. long. *Stamens* 8, sub-equal, connective shortly produced at the base, spur very short. *Berry* ·12·2 in. across, black when ripe, ovoid or subglobose, the short persistent limb of the calyx broader than the narrowed apex; seeds covered with minute raised points, raphe not produced.

KHASI HILLS—3-5,000 ft.; LAKHIMPUR, Upper Dihing Reserve. The leaves are eaten cooked. The fruits though insipid are edible.

Flrs. 8-10. Fr. 1-2.

2. *Medinilla himalayana* Hk. f.

A glabrous shrub, sometimes sub-epiphytic. *Bark* pale-brown; branchlets striate. *Leaves* 2·5-4 by 1·1-1·7 in., elliptic to broadly elliptic, shortly and rather bluntly acuminate; basal nerves 3-5, stronger pair sub-basal; petiole almost 0·1 in. *Flowers* about ·6 in. across, rose, in terminal compound, peduncled cymes. *Peduncles* ·7-1·5 in. long; pedicels up to ·2 in. long, jointed and with a pair of minute bracteoles. *Calyx* about ·2 in. long; limb short; teeth obscure. *Petals* ·25 in. long, ovate. *Stamens* 8; anthers without spur. *Berry* ·3 in. across, spherical; seeds usually subfalcate covered with minute elevated points, raphe not extruded.

KHASI HILLS—5-6,000 ft.

Flrs. 7. Fr. 11.

5. ANPLECTRUM A. Gray.

Anplectrum assamicum C. B. Clarke. Vern. *Lota-phutkola*, Ass.

A shrub 8-10 ft. in height; stem, petiole, under surface of leaves along the main nerves and rachis of inflorescence clothed with spreading bristly hairs. *Leaves* opposite, 4·5-7·2 by 1·2-2·6 in., oblong-lanceolate or ovate oblong, sometimes elliptic-lanceolate, acuminate, minutely and distantly denticulate, ultimately nearly entire; base 3-5-nerved, subcordate, narrowed or rounded, often somewhat unequal, subcoriaceous, glabrous above; petiole very short up to ·15 in. long. *Flowers* 4-merous in pyramidal terminal panicles; branches opposite, ending in trichotomous cymes; bracteoles lanceolate to ovate, ciliate, ·2-·25 in. long; pedicels short up to ·2 in. long, pubescent. *Calyx* up to ·15 in. long, oblong, glabrous or nearly so with a long limb; teeth obscure, but accrescent. *Petals* 4, whitish, contorted in bud, ·25-·3 in. long, ovate with a bluntly pointed and bristle tipped apex. *Stamens* 8, inserted at the base of the limb; filaments 4, bearing long anthers and 4 with shorter anthers; anthers attenuated upwards and opening by one pore (?); connectives of long anthers ending in a cordate appendage, usually with auricled base, those

of short anthers acute with 2 rounded lateral lobes. *Ovary* adnate at the base only, free portion of ovary glabrous 4-celled with a fleshy axile peltate placenta in each, bearing numerous ovules; style subulate, .3 in. long. *Fruit* about .2 in. long, ovoid, baccate; seeds numerous, subfalcate with a dark-brown raphe and parallel lines of minute tubercles.

LAKHIMPUR—common between Gogaldubi and Dulongmukh—SIBSAGAR.

Flrs. 4-5. Fr. 12.

A little known species, the plant described above matches with sheets in Calcutta herbarium.

6. BLASTUS Lour.

Blastus cochinchinensis Lour. Vern. *Phutkala*, Ass.; *Bigbik*, Mik.

A shrub attaining 15 ft.; branches terete; young parts inflorescence and calyx outside densely covered with reddish brown or yellowish-white round scales. *Leaves* 3-5 by .7-1.5 in., oblong to elliptic lanceolate, acuminate, cuneate at the 3-5 nerved base, membranous, covered with minute scales beneath, sometimes also sparsely above; petiole .5-.75 in. long. *Flowers* 4-merous, very small, clustered on protuberances from the axils of existing or fallen leaves; pedicels about .1 in. long, elongating in fruit to about .25 in., slender; bracts 0. *Calyx* about .1 in. long; teeth short. *Petals* equal, much exceeding the calyx teeth. *Stamens* 4, equal; anthers attenuate at the top opening by a terminal pore, cells produced and 2-lobed at the base, connective not appendaged. *Ovary* 4-celled, pubescent at the apex; ovules many on axile placentæ. *Capsule* about .15 in. long, opening towards the summit by 4 slits. *Seeds* minute; testa produced into linear arms at either end.

LAKHIMPUR, SIBSAGAR—probably also in other districts.

Flrs. 1-2.

Sonerila maculata Roxb.—A small herb, stem with spreading hairs. *Leaves* opposite, 2-4 by 1.2-2.2 in., broadly ovate to lanceolate, serrulate and ciliate on the margins, with spreading hairs on both surfaces or nearly glabrous, membranous, penninerved; base often unequal; petiole 1-2 in. long, hairy. *Flowers* 3-merous, about .5 in. across, mauve, secund at the ends of peduncles, which are up to 3 in.

long. *Calyx* thinly hairy. *Petals* elliptic, acute. *Stamens* 3, equal, connective not appendaged. *Ovary* 3-celled, inferior. *Capsule* slightly angled, glabrous, about .25 in. long; seeds numerous, with a slightly excurrent lateral ridge (raphe).

KHASI HILLS—1-6,000 ft.

Flrs. 8-10.

7. MEMECYLON Linn.

Evergreen glabrous shrubs or trees. *Leaves* opposite, sessile or short petioled, coriaceous, penninerved, rarely 3 nerved; nerves inconspicuous. *Flowers* blue or white. tetramerous in simple or paniced often umbelliform cymes or compact sessile fascicles from axils of fallen or existing leaves, rarely terminal. *Bracteoles* 2 or more at or near the base of the pedicels. *Calyx* campanulate, glabrous, dilated and produced far above the ovary, truncate or shortly 4-lobed. *Stamens* 8, equal; filaments long; anthers short, opening by slits, connective thickened at the back and ending in a horn. *Ovary* inferior, 1-celled; apex glabrous, surmounted by disk, usually with 8 radiating grooves; style long, filiform; ovules usually 6-12, sometimes more on a free central placenta. *Fruit* a more or less fleshy globose or ellipsoid, 1, rarely 2-seeded berry crowned by the calyx limbs; cotyledons convolute, foliaceous.

Berry large usually .5 in. and over in length. . . . 1. *M. cerasiforme*.

Berry usually .25-.3 in. in length. . . . 2. *M. edule*.

1. *Memecylon cerasiforme* Kurz. Vern. *Kakoi-chera*, Ass.; *Pandauje*, Kach.; *Narakong*, Mik.

A small tree; bark grey with vertical fissures about .4 in. thick. *Leaves* 2.5-6.5 by 1.8-2.5 in., oblong to elliptic, acuminate at both ends, coriaceous, drying, greenish-yellow; lateral nerves faint, obscure; petiole short, up to .3 in. long, stout. *Flowers* not seen.* *Peduncle* of fruiting cyme .2-.7 in. long, axillary or from axils of fallen leaves; pedicels .2-.25 in. long. *Berries* .5-.6 in. long, broadly ovoid or subglobose, succulent, black when ripe.

* Flrs. 3-5. Fr. 6-9 since collected—R. N. De.

SIBSAGAR—Barpathar, Garampani, Noajan, etc.
Wood reddish brown, tough, used for axe handles.

Fr. 10-12.

Memecylon plebejum Kurz. Var. *silhetense* C. B. Clarke. Small tree up to 40 ft. in height. *Leaves* 1·5-3 by ·5-1·5 in., lanceolate or elliptic-lanceolate, acuminate, midrib prominent beneath; lateral nerves quite invisible; petiole ·12-·2 in. long. Flowers light blue; peduncles 0·12 in., clustered; inflorescence hardly exceeding ·5 in. *Calyx* at the time of flowering saucer-shaped, small disk on the apex of the ovary prominently rayed. *Berries* not seen.

SYLHET—Chhatak—Hk. f. and T.; CACHAR—Prazer.
An imperfectly known plant.

2. Memecylon edule Roxb. Var. *ovata* Clarke. Syn. *Memecylon edule* Roxb. (1995), *M. edule* Var. Thwaites. Vern. *Lali-dimabophang*, Kach.; *Theihadum*, Kuki & Tipp.

A small to moderate sized tree, attaining in favourable situations a height of 50 ft. *Bark* grey, corky with vertical furrows. *Leaves* 3-6 by 1·2-2·2 in., lanceolate-elliptic or ovate-acuminate; base acute, nearly rounded or cuneate; lateral nerves more or less indistinct; petiole ·2-·25 in. long. *Flowers* bright blue, ·25 in. across. *Cymes* umbellate, usually compound; peduncles 1-several together from the axils of fallen or less frequently existing leaves ·2-·4 in. long, elongating in fruit; pedicels ·2-·25 in. long. *Calyx* subrotate when expanded, often pinkish; limb truncate or with rounded obscure teeth. *Petals* 4, about ·1 in. long, blue, fugacious, broadly ovate. *Stamens* blue; filaments long, exserted. *Disk* with about 8 radiating lines usually joined a marginal one. *Berry* globose, ·25-·3 in. across, blue, 1-2 seeded.

SIBSAGAR, NOWGONG, SYLHET, CACHAR, GOALPARA, probably occurs in most districts in low elevations.

The ripe fruits are eaten. The wood is very hard and is said to be used for pestles.

Flrs. 3-6. Fr. 12-2(?).

Var. cuneata Thwaites (sp.) *Leaves* lanceolate or oblong, 2·5-4·2 by 1-2 in., shortly acuminate or obtuse, attenuate at the base to the very short petiole; fruit the size of a pea.

NOWGONG.

Var. *scutellata* Triana. incl. *M. punctatum Presel.*, and *M. scutellatum* Naud. ex Kurz For. Fl. I. 513. Small tree with corky reticulately furrowed dark-grey almost black bark. *Branchlets* with raised decurrent lines from the insertion of the petioles. *Leaves* 2-3 in. by 1·7 in., elliptic or ovate lanceolate, shortly blunt acuminate, subacute or obtuse at apex; base narrowed, punctate on both surfaces; petioles very short, 1·2 in. long. *Cymes* almost sessile or with very short peduncles. *Disk* rays prominent, of raised lines. *Petals* acute. *Berries* "size of a pea"—Kurz.

SIBSAGAR.

Memecylon elegans Kurz.

A small tree or shrub; bark dark grey to blackish, corky, reticulately deeply furrowed; branchlets more or less terete; young branchlets quadrangular or 4 winged. *Leaves* entire, ovate, oblong or elliptic, 1-3 in. by 5-1 in., coriaceous, narrowed into a short petiole; lateral nerves obscure. *Flowers* pinkish in bud (blue-Kurz) in lax cymes sometimes in pairs; peduncles longer than petiole. *Calyx* (free), wider than the ovary; tube truncate. *Disk* rayed. *Berry* small, spherical.

SIBSAGAR (Barpathar), 270 ft.

Flrs. 11. Fr. 5.

M. grande Retz. Var. *Horsfieldii* Miq. (sp.) cum Var. *khasiana* F. B. I. Syn. *M. celastrinum* Kurz. Vern. *Koyo-asing*, Miri and Abor.

A small tree. *Leaves* 2·5-5 by 1·3-2·2 in., elliptic-lanceolate, acuminate, often caudate; base acute or cuneate, secondary nerves first visible (in dry specimens?) beneath; petiole 2·25 in. long. *Peduncles* 2·1 in. long, compressed, 1-2 together on leaf axils, bearing cymose umbellules; pedicels 1·15 in. long. *Flowers* sky blue, small. *Calyx* about 1 in. long, cup-shaped, broadening afterwards, teeth minute, obscure or truncate. *Petals* 1 in. long, ovate, acute. *Disk* rays prominent. *Berries* 25-4 in. across, 1-seeded, crowned by the short calyx limb.

SIBSAGAR—Diphu Reserve; KHASI HILLS—Griffith; GARO HILLS—Sugiri Valley; DARRANG, N.-E. FRONTIER—Nizamghat.

Flrs. 5. Fr. 6.

The plant appears to be scarcely more than a variety of *M. edule*. The forms with larger fruit do not match with any sheets either at Calcutta or Dehra Dun and it is possible that two species have been included here, but this cannot be definitely ascertained till more material is available. In the Calcutta herbarium both var. *Horsfieldii*

and var. *khasyana* of *M. grande* have been grouped together under *M. celsastrinum* Kurz—by King.

Tibouchina semidecandra Cogn.—A shrub or a small tree; branchlets, petiole and axis of inflorescence clothed with soft spreading hairs; young parts silky, villous. *Leaves* 3-5 by 1.2-2.2 in., elliptic to lanceolate-acuminate or acute, 5-7 nerved, softly hairy on both surfaces, more densely beneath; petioles .3-.5 in. long. *Flowers* 3.3-5 in. across, purplish-blue, very showy, sessile or nearly so in compound cymes from ends of branches or upper leaf axils; bracts about 1 in. long, somewhat harshly pubescent outside, red with age enclosing the buds, caducous. *Calyx* adpressed pubescent; calyx tube .5 in. long; lobes 5, oblong-lanceolate, as long as the tube or slightly longer, deciduous, glabrous inside, often bordered with red on the margins. *Petals* 5, broadly obovate, about 1.5 in. long. *Stamens* 10, alternately short and long; filaments declinate, glandular hairy except at the top; anthers bluish purple, narrowed at apex, connective produced at the base, 2-tubercled. *Ovary* 5-celled; ovules numerous on radiating placentæ.

A native of Tropical America. Cultivated in Shillong, where apparently the fruit does not ripen. Very handsome when in flower.

Flrs. 7-11.

Sarcopyramis nepalensis Wall.

An erect glabrous herb; stem quadrangular, succulent. *Leaves* 2.3-5 in. long, ovate, long-acuminate, membranous; petiole .5-2 in. long, often longer; base 3-nerved. *Stamens* 8, equal; style filiform. *Capsules* open by 4 valves crowned with four large scales. *Seeds* numerous.

KHASI HILLS—46,000 ft.

Flrs. and Fr. 9-12.

FAM. 60. LYTHRACEÆ.

Trees, shrubs or herbs often with quadrangular branches. *Leaves* entire, opposite, sometimes whorled, rarely alternate; stipules 0. *Inflorescence* various, often cymose or paniced. *Flowers* 2-sexual, rarely unisexual (*Crypteronia*). *Calyx-tube* usually free, persistent; lobes 3-6, often with few accessory teeth, valvate. *Petals* as many as calyx teeth,

often crumpled and imbricate in bud, rarely 0, inserted on the top of the calyx tube. *Stamens* inflexed in bud, very many or definite, inserted on the calyx tube. *Ovary* free, rarely inferior; style usually long; stigma capitate, rarely 2-lobed; ovules numerous, usually on axile rarely parietal placentæ. *Fruit* dehiscent or not, free or adnate to the base of the calyx, 2-6 celled or 1-celled by the absorption of the dissepiments. *Seeds* many, sometimes winged, albumen 0.

I. Petals present; flowers bisexual :—

A. Calyx tube not coloured, leaves not gland dotted :—

Flowers 6-merous; seeds winged. 1. **Lagerstrœmia.**

Flowers 4-8-merous; seeds minute, tailed at either end. .. 2. **Duabanga.**

B. Calyx tube scarlet; leaves dotted with black glands :—

Flowers zygomorphic, calyx tube tubular. .. 3. **Woodfordia.**

II. Petals 0 :—

Flowers minute, greenish, polygamous; capsule 2-valved. .. 4. **Crypteronia.**

1. **LAGERSTRŒMIA** Linn.

Trees or shrubs. *Leaves* opposite or subopposite, distichous, entire; petiole short. *Flowers* handsome, bracteate, in terminal and axillary panicles; bracts and bracteoles usually paired. *Calyx-tube* cupular or campanulate, coriaceous, smooth or ribbed outside, persistent; lobes valvate, 6 or more. *Petals* 6 or more, wrinkled or crisped, alternating with the calyx lobes. *Stamens* numerous, inserted at the base of the calyx-tube; filaments often curled, filiform, usually some sterile; anthers versatile. *Ovary* 3-6 celled, superior; style long, filiform; stigma capitate; ovules numerous on axile placentæ. *Capsule* coriaceous, more or less adnate to the base of the calyx, loculicidally dehiscent, 3-6 celled; seeds numerous, winged at the apex, erect, compressed.

Capsules over .5 in. long :—

Flowers white, .3-.5 in. across; calyx tube not ribbed; leaves greyish beneath. .. 1. *L. parviflora.*

Flowers mauve, 2-3 in. across; calyx tube prominently ribbed; leaves green beneath. 2. *L. Flos-Reginæ*.

Capsules under .3 in. long :—

Flowers white; calyx ribbed. 3. *L. minuticarpa*.

1. *Lagerstroemia parviflora* Roxb. Var. *bengalensis* Clarke. Vern. *Sida*, *Dhau*, Ass.; *Thengkri*, *Thengkiri*, *Theng-khri-arong*, Mik.; *Bonshitha*, *Bongurudi-phang*, Ajrai, Kach.; *Jarol*, Kuki; *Sidai*, *Bolsidai*, Garo; *Dieng-lang-sing*, Kh.; *Bordhiera*, Nep.

A large to medium sized deciduous tree; branchlets sharply 4 angled, often slightly winged. *Bark* grey or brown, peeling off in thin strips, .5-1 in. thick, reddish-brown and fibrous inside; young parts pubescent. *Leaves* 2-4 by 1-1.5 in., elliptic, oblong or ovate, acuminate or acute, glabrous above, grey and more or less pubescent or puberulous, specially along the nerves beneath, coriaceous; lateral nerves 5-7 on either half, upper meeting in loops, tertiaries prominently reticulate above; petiole very short. *Flowers* .3-.5 in. across, white, fragrant in lax axillary and terminal, downy panicles of cymes; cymes 2-5 flowered, peduncled; pedicels slender up to .25 in. long; bracts leafy, grading into leaves; bracteoles setose. *Calyx-tube* broadly cupular, enlarging and woody in fruit, lobes 6, triangular or lanceolate acute. *Petals* 6, membranous, about .25 in. long, ovate-oblong, margin undulate; outer 6 stamens longer than the rest. *Capsules* .6-.9 in. long, ovoid or ellipsoid, polished, about a quarter immersed in the accrescent calyx, 3 sometimes 4 valved; seeds with a terminal wing which is thickened and somewhat curved on the back, .65-.75 in. long, including the wing.

All over the province except LAKHIMPUR and N.-E. FRONTIER DISTRICTS, ascending to 2,000 ft. in the KHASI HILLS.

Wood greyish brown, hard, annual rings absent. It polishes well and could be used for agricultural implements, country boats, house posts, etc.

Flrs. with new leaves 3-6. Fr. 11-12, long persistent on the tree.

The small fruited form with pubescent leaves has been grouped under Var. *bengalensis* by C. B. Clarke in F. B. I., but as intermediates with larger fruits and pubescent to glabrescent leaves are common in our area, I have not separated the form.

2. Lagerstroemia Flos-Reginæ Retz. Vern. *Ajar*, *Ajhar*, Ass.; *Jarul*, Beng. (Sylh.); *Thing-dou*, Kuki and Lushai; *Jaroi*, *Thing-doi-thing*, Tipp.; *Aojar*, Mech.; *Ajakari*, *Bolasari*, Garo; *Chehar-arong*, *Ojhar*, Mik.; *Ajar-asing*, Mik.; *Dieng-ther*, Kh.

A large and rather branchy tree. *Bark* light grey or pale brown, smooth, peeling off in irregular flakes. *Leaves* usually 4·8·5 in. by 1·5·3·2 in., elliptic, oblong-elliptic or oblong-lanceolate, acuminate, glabrous on both surfaces, nerves prominent beneath, 10-12 on either half, joining to form an intramarginal nerve which becomes discontinuous towards the base; petiole 2·4 in. long. *Flowers* very handsome, mauve purple, 2-3 in. across in downy terminal panicles up to 1 ft. long, ultimate branches cymosely 1-3 flowered; pedicels stout, pubescent, jointed below, the middle. *Calyx* 5·6 in. long, turbinate, covered with grey or brown tomentum, tube ribbed, ribs 12-14, alternately broad and narrow; teeth 6-7, spreading, acute. *Petals* 6-7, 1·1·5 in. long, much crumpled and wavy with deeper coloured veins, margins erose, claw 25·3 in. long. *Capsules* 75·1·25 in. long, oblong-ovoid or subglobose, smooth, seated on the persistent somewhat woody and prominently ribbed enlarged calyx tube, 5-6 valved; seeds including the wing about 5 in.

Throughout the province chiefly found along river banks, old alluvial soils and edges of swamps, sometimes gregarious. Very handsome when in flower for which it is cultivated in most parts of India.

The wood is light reddish brown with very fine medullary rays and pores joined by very fine concentric bands of softer tissue. The timber is excellent and is used for buildings, carts, furniture, etc.

Flrs. 6-8. Fr. cold season.

3. Lagerstroemia minuticarpa Debbarman ex P. C. kanjilal. Vern. *Sinkrit-asing*, *Kunari-asing*, Miri; *Singkut-polut*, Abor.

A large tree 100-130 ft. tall, often with very irregularly fluted stem. *Bark* greenish brown or nearly white, thin, about 12 in. thick, exfoliating in large thin pieces. *Bark* of branchlets peeling off in narrow membranous shreds. *Leaves* opposite, rarely alternate, deciduous, 4·5·5 by 2·2·7 in., elliptic or oblong, ovate-lanceolate, acuminate, subcoriaceous,

puberulous along the midrib and with tufts of hair along nerve axils beneath, otherwise glabrous when mature; lateral nerves 9-12 on either half, arched, upper meeting in loops, tertiaries somewhat laxly sub-parallel, quarternaries reticulate; base often unequal, cuneate or rounded, areoles $\cdot 025$ to $\cdot 05$ in. across; petiole $\cdot 3\text{--}\cdot 5$ in. long. *Panicles* $3\text{--}5\text{--}5$ in. long, terminal, densely pubescent; lower bracts leaf-like; bracteoles lanceolate or subulate, about $\cdot 1$ in. long, caducous; buds clavate or turbinate with a short projection at the apex, 12 ribbed, pubescent; pedicels $\cdot 075$ to $\cdot 15$ in. long. *Calyx* whitish, about $\cdot 15$ in. long, broadly campanulate, thinly pubescent, tube about $\cdot 1$ in. long, ribbed along the sinuses and the back of the teeth; calyx-teeth 6, deltoid, acuminate, thinly pubescent towards the apex within. *Petals* 6, white, oblong, about $\cdot 27$ in. long, crumpled, margins crisped, claw minute. *Stamens* about 12; filaments filiform, 6 stouter than the rest. *Ovary* 6-celled; style curved, exserted, $\cdot 2\text{--}\cdot 25$ in. long; stigma capitate; ovules numerous on 6 axile placentæ. *Capsule* ellipsoid or oblong, $\cdot 21\text{--}\cdot 28$ in. by $\cdot 1\text{--}\cdot 15$ in., 4-valved. *Seeds* $\cdot 15\text{--}\cdot 2$ in. long, wings dorsally ridged, subfalcate, pellucid, $\cdot 1\text{--}\cdot 12$ by $\cdot 04\text{--}\cdot 06$ in.

N.-E. FRONTIER, near Bomjur, Lali, Bereng, Kherempani.

Wood light brown, fairly hard; pores usually in short strings, joined together by softer tissue, medullary rays very fine, annual rings distinct.

Flrs. 8-10. Fr. Cold season— long persistent.

Lagerstroemia indica Linn. *Parul*, Sans. The crepe plant or crepe myrtle.—A handsome small tree with smooth ashy or nearly white bark, peeling off in thin pieces; branchlets sharply quadrangular. *Leaves* 1-3 in. long, elliptic or obovate, subobtuse or subacute, glabrous. *Flowers* very handsome in several shades of white, rose or mauve, $1\text{--}5\text{--}2$ in. across, when open, in dense small panicles. *Calyx* not ribbed. *Petals* long clawed and with much crisped blades, outer whorl of 5-7 stamens larger than the others. *Capsules* less than $\cdot 5$ in. across.

Cultivated throughout the province.

The leaves turn red before falling.

Flrs. rainy season.

2. DUABANGA Ham.

Duabanga sonneratioides Ham. Vern. *Thora* (Kamrup), *Khukan*, *Hokol*, Ass.; *Ramdalu*, Sylh.; *Yaglongphang*,

Iao glau, Cach.; *Banthang*, Tipp. & Kuki; *Manjuong*, Kuki; *Munjinarong*, Mik.; *Dieng-moloi*, *Dieng-bai*, *Dieng-param*, Kh.; *Pi-arong*, Mik.; *Jong*, Lushai; *Kaliangshi*, *Bol-chhim*, Garo; *Lompatia*, Nep.; *Kobo-asing*, Abor & Miri; *Kisadi*, Naga; *Bandar-kanda*, Mech.

A tall handsome tree with drooping branchlets. *Bark* rough, grey, with vertical fissures, thick in old trees; blaze dirty brown. *Leaves* opposite, distichous, red when young, 6-11 by 2·5-4·5 in., oblong to ovate-oblong, shortly acuminate, cordate, coriaceous, glabrous on both surface; lateral nerves 20-25 on either side, subparallel, meeting in an intramarginal nerve close to the margins; tertiary nerves prominent; petiole stout, ·1-·25 in. long, margined. *Flowers* 2-3 in. across with an unpleasant smell, in glabrous compound terminal corymbs; buds globose; pedicels ·7-1 in. long, stout. *Calyx* cup-shaped, persistent, deeply 6-8 lobed; segments ·7-·8 in. long, thick, ultimately spreading. *Petals* creamy-white, falling off early with the stamens, about 1-1·25 in. long, obovate, clawed, crumpled, margins erose, delicately veined. *Stamens* numerous in one series; filaments exserted, inflexed in bud. *Ovary* adnate to the calyx at its base, 4-8 celled; ovules numerous, ascending on thick placenta; style exserted, incurved in bud; stigma clavate, 4-8 lobed. *Capsule* coriaceous, about 2·5 in. across, loculicidally splitting into 4-8 valves. *Seeds* minute; testa produced at both ends into pointed tails.

All over the province ascending to 2,000 ft., in the KHASI HILLS, sometimes gregarious in river banks.

Wood greyish-brown, soft, weighing about 32 lbs. per c. ft. It was formerly used for tea boxes for which it was found unsuitable on account of the yellowish stain it gives rise to and its unpleasant smell. It is, however, well suited for manufacture of ply wood.

3. WOODFORDIA Salish.

Woodfordia fruticosa Kurz. Syn. *W. floribunda* Salish. Sans. *Agni-jwala*, *dhatiri*, Vern. *Dheira*, Nep.

A large spreading shrub with reddish brown bark, peeling off in thin strips; blaze pink; young parts hairy; leaves and branchlets covered with black dots. *Leaves* sessile or subsessile, opposite, sometimes in whorls of three,

distichous, 2.5 by .6-1.5 in., lanceolate or ovate-lanceolate, acuminate; puberulous above, grey and pubescent with more numerous glandular dots beneath; lateral nerves 6-12, meeting in an intramarginal nerve, base rounded or cordate. *Flowers* scarlet, shortly pedicellate, zygomorphic, in short panicles of closely clustered cymes, usually from the axils of fallen or existing leaves; peduncles and pedicels pubescent, usually glandular; lower bracts more or less leafy, upper smaller, brownish; bracteoles minute. *Calyx* scarlet, .4-.6 in. long, persistent, tubular, somewhat curved, oblique at the mouth; lobes 6, about .07 in. long or deltoid, alternating with 6 rudimentary hairy teeth. *Petals* 6, white, acute, scarcely exceeding the calyx lobes. *Stamens* 12, inserted at the base of the calyx tube, exserted, declinate; filaments red; anthers versatile. *Ovary* superior, 2-celled; ovules numerous; style filiform, exserted. *Capsule* with very thin walls, ellipsoid, splitting irregularly, included within the persistent calyx tube. *Seeds* numerous, minute.

KAMRUP, GOALPARA, not common.

The flowers give reddish or yellowish dye which is used in many parts of India for dyeing silk. The leaves and flowers also contain a large percentage of tannin.

Flrs. 1-3. Fr. 4-5, nearly leafless in 2-3.

Leaves on seedlings are alternate, very young seedlings are red.

4. CRYPTERONIA Bl.

Crypteronia paniculata Bl. Incl. *C. glabra* Bl. Vern. *Goru-mora*, Ass.; *Bol-luen*, *Masuging-sep*, Garo; *Dieng-saw-kyr-reng*, *Dieng-oy*, Kh.; *Thengpi-torete-arong*, Mik.

A large tree with spreading crown and fluted stem. *Bark* pale grey or brown, exfoliating in long curled up, somewhat brittle strips, exposing a cinnamon brown surface, chocolate or reddish-brown inside, about .15-.2 in. thick. *Branchlets* glabrous. *Leaves* opposite, 2-farious, 4-7 by 1.3-2.5 in., lanceolate or elliptic to ovate-lanceolate, entire, acuminate; base acute or tapering to the petiole, subcoriaceous, glabrous. (in our area); lateral nerves 6-8, except the lower, arcuate and meeting in loops; petiole about .25 in. long. *Flowers* greenish-white, polygamo-diœcious, minute, about .1 in.

across, in elongate, puberulous paniced racemes, branched from near the base or fascicled at the ends of branches or on the nodes, 3·5-7 in. long; pedicels ·05 in. long, filiform; bracts minute, setose, shorter than the pedicels. *Calyx-tube* short, puberulous, persistent, cup-shaped, spreading in fruit. *Calyx* teeth usually 5, rarely 4, triangular, acute. *Petals* 0. *Stamens* usually 5, alternating with the calyx teeth, and inserted near the top, often unequal. *Ovary* free, globose, grey pubescent, 2-celled; style long; stigma capitate, sub 2-lobed; ovules numerous on axile placentas. *Capsule* 2-celled, small, about ·07 in. across, globose, pubescent, crowned by the persistent style, dehiscing at the top, across the dissepiment, and the style. *Seeds* numerous, minute; testa produced at each end.

LAKHIMPUR, KAMRUP, CACHAR, SIBSAGAR, GARO HILLS, foot of the KHASI HILLS. probably also in DARRANG.

The wood is reddish-brown. soft. pores distant, medullary rays fine, annual rings indistinct. It is being used for sleepers after antiseptic treatment.

Flrs. 11-12. Fr. 2-3.

Like Brandis I have followed C. B. Clarke's suggestion in including under this species Blume's *C. glabra*, which is the form occurring in our area.

The genus has been excluded from Lythraceæ in Engler's Pflanzenfamilien.

Punica Granatum Linn. The pomegranate. *Darimba*, Sans.; Vern. *Dalim*, Beng. and Ass.; *Darmi*, Nep.; *Anar*, Hind.; *U. soh-pomegranate*, Kh.

A large deciduous shrub, often armed. *Leaves* opposite, 1-2·5 in. long, oblong-oblancoate or oblong-lanceolate, shining, glabrous, entire, pellucid-punctate, narrowed at the base to a very short petiole. *Flowers* bright scarlet, about 1·5-2 in. across, solitary or 2-4 together. *Calyx* campanulate, adnate to and produced beyond the ovary, accrescent in fruit, 5-7 lobed. *Petals* crumpled. *Stamens* numerous. *Ovary* inferior, many celled in two whorls. *Berry* globose, many celled. *Seeds* angular with a pinkish or red watery outer coat.

Cultivated in most Districts.

AMMANNIA Linn.

Annual glabrous, acquatic herbs with minute flowers in trichotomous cymes. *Calyx* membranous. *Stamens* 2-8.

The following species occur in the Province :—

Flowers axillary, in spikes :—

Calyx in fruit campanulate, larger than broad :—

1. **A. peploides** Spreng.

Herb.

Capsule 2-valved

Cauline leaves elliptic.

GOALPARA.

Fr. 1.

2. **A. rotundifolia** Ham.

Herb.

Capsule 4-valved.

Leaves orbicular.

SHILLONG.

Fr. 3.

Flowers in cymes.

3. **A. baccifera** Linn.

Herb.

Leaves oblong or narrow elliptic;

cauline leaves 2 ft. by 4 in. (or less).

Capsule globose and imperfectly circumsciss.

4. **A. multiflora** Roxb.

Herb.

Leaves oblong, elongate, sub-auriculate.

Cauline leaves 1-1.5 in. long.

Capsule globose, not enclosed by the calyx.

KHASI HILLS. (Kaling.)

Fr. 12.

FAM. 61. ONAGRACEÆ.

Herbs, rarely undershrubs, sometimes aquatic. *Leaves* opposite or alternate, extipulate. *Flowers* bisexual, regular or sometimes irregular. *Calyx-tube* wholly adnate to the ovary (half adnate in *Trapa*), lobes 2-5, usually 4. *Petals* alternating with the calyx lobes, rarely 0. *Stamens* as many or twice as many as the petals inserted with them. *Ovary* inferior (half inferior in *Trapa*), 1-6, usually 4-celled; style simple or with 2-4 lobed stigma; ovules 1-many in each cell

on axile placentas. *Fruit* dehiscent or indehiscent 1 (Trapa) or many seeded.

- I. Seeds many; fruit capsular :—
 Seeds comose. 1. **Epilobium.**
 Seeds not comose :—
 Stamens twice as many as calyx
 lobes. 2. **Jussiaea.**
- II. Seeds 1; fruit with spiny pericarp :—
 Aquatic herb. 3. **Trapa.**

1. EPILOBIUM Linn.

Herbs or undershrubs. *Leaves* alternate or opposite, simple entire or toothed. *Flowers* axillary and solitary or racemed or spiked at the ends of the branches, pink, purple or white, regular or irregular. *Calyx-tube* linear, scarcely produced above the ovary, teeth 4, lanceolate, deciduous. *Petals* 4, obovate, retuse or notched. *Stamens* 8, epigynous, alternate ones shorter. *Ovary* inferior, 4-celled; style cylindric; stigma 4 lobed or more or less combined; ovules many, axile. *Capsule* linear, 4-celled, valves separating from the seeds bearing central column. *Seeds* numerous, obovoid or ellipsoid, crowned by long silky hairs.

Stems not sharply quadrangular :—

- Stem pubescent with curled hairs; leaves
 thinly pubescent on the nerves only;
 flowers about .4 in. across. 1. *E. Hookeri.*
 Stem villose; leaves adpressed villous on
 both surfaces; flowers 1 in. or more across. 2. *E. khasianum.*
 Stems sharply quadrangular. 3. *E. tetragonum.*

1. **Epilobium Hookeri** C. B. Clarke.

A perennial herb or undershrub attaining 3 ft.; stem and inflorescence pubescent with curled hairs, terete, upper leaves alternate, lower opposite, 1.2-1.7 by .4-.8 in., elliptic or ovate to oblong lanceolate or oblong, subacute; base more or less rounded, denticulate; nerves about 6 on either side, impressed above, thinly pubescent, specially on the nerves; petiole very short, margined. *Flowers* purple, about .4 in. across, in paniced racemes; bracts leafy; pedicels slender, up to .25 in. long. *Calyx-tube* .7-.8 in. long, adpressed, villous; lobes oblong-lanceolate, about .25

in. long. *Petals* obovate, .3 in. long; stigma clavate, elongate. *Capsules* 2-3 in. long. *Seeds* obtuse at the apex, oblong; coma silky.

KHASI HILLS, 4-6,000 ft.

Flrs. 9-10.

2. *Epilobium khasianum* C. B. Clarke.

An undershrub with villous stem. *Leaves* 1.2-1.7 by .4-.7 in., upper alternate, lower opposite, subsessile, elliptic lanceolate to oblong, subacute; base narrowed, denticulate, adpressed villous with tawny hairs on both surfaces; lateral nerves impressed, 5-6 on either side. *Flowers* rose purple in paniced racemes. *Calyx-tube* about .7 in. long, villous; lobes lanceolate acuminate, about .3 in. long. *Petals* about .5 in. long. *Stigma* clavate. *Capsule* 2-3 in. long, fruiting pedicels up to 1 in. long. *Seeds* obtuse at the apex, coma pale brown, silky.

KHASI HILLS 4,500-5,500 ft.

Flrs. 9-10.

3. *Epilobium tetragonum* Linn.

A herb up to 3 ft. high, stem quadrangular with curled hairs on the four angles. *Leaves* .5-2 in., subsessile, oblong or narrow elliptic, denticulate-serrulate; nerves prominent on the undersurface, crisped-hairy. *Flowers* rose or purple, small. *Capsule* 1.5-2 in. long.

KHASI HILLS 4,500-6,000 ft.—C. B. Clarke.

***Epilobium angustifolium* Linn.** Herbaceous. *Leaves* narrow or linear, lanceolate, 2-4 in. long, acuminate. *Flowers* irregular; petals purplish. *Stamens* deflexed on one side. *Style* bent, hairy; stigmas 4. *Capsule* 2-3 in. *Seed* obovoid.

(Mann's No. 319).

2. JUSSIÆA Linn.

***Jussiaea suffruticosa* L. Var. *exaltata* Roxb.**

An erect undershrub attaining 4-5 ft. in height, stem with raised decurrent lines from leaf bases, usually more or less hairy; young parts pilose. *Leaves* 1.5-3.7 in. long, linear or

narrow-lanceolate, acute or acuminate, thinly pubescent or hairy, usually along the nerves; lateral nerves 12-20 meeting to form an intramarginal nerve; base narrowed. *Flowers* yellow, .66-.7 in. across, about .9 in. long, solitary in leaf axils, usually tetramerous, shortly pedicelled. *Calyx-tube* linear, wholly adnate to the ovary, pubescent, lobes ovate-elliptic, about .3 in. long. *Stamens* twice as many as petals, epigynous. *Capsule* cylindric 1-1.5 in. long, ribbed, more or less pubescent, thin-walled, irregularly breaking up between the ribs. *Seeds* minute, reddish-brown, grooved.

In water-logged situation—up to 3,000 ft. in the KHASI HILLS.

Flrs. and Fr. probably throughout the year.

Ridley states in the Journal of Botany, p. 259, Vol. LIX (1921) that the plant called *J. fissendocarpa* by Haines in Journal of Asiatic Society, Vol. XV, No. 7, is the real *J. suffruticosa*. Our plant is probably *J. erecta* L. Var. *exaltata*. The older name has been retained for the present as the exact name is difficult to determine from Ridley's paper.

Flrs. and Fr. throughout the year.

Circæa alpina Linn.

An erect herb. *Leaves* .5-.9 in. long, ovate, almost glabrous, membranaceous. *Flowers* small, in terminal peduncled racemes. *Bracts* minute. *Calyx* limb bipartite. *Petals* 2, white. *Stamens* 2, epigynous; ovary inferior, 1-celled. *Fruit* very small, pyriform with hooked hairs.

KHASI HILLS, 5,000 ft.

Flrs. 8.

3. **TRAPA** Linn.

Trapa bispinosa Roxb. Vern. *Singara*, Beng., Hin.; *Paniphal*, Beng.; *Sringataka*, Sans. The water chestnut.

An aquatic floating, herb. *Leaves* dimorphic, submerged leaves opposite, pinnately cut into thread like segments, looking like roots, floating leaves in rosettes, green, mottled with brown, broadly rhomboid, 1.2-2 by 1.5-2.2 in., toothed except towards the base, densely hairy and reddish purple beneath; petiole up to 5 in. long, swollen and spongy near the top, the inflated portion about 1 in. long, hairy. *Flowers* few, white, tetramerous, close to the surface of water; pedicels stout, short and incurved at first, afterwards elongated and submerged. *Calyx* hairy, half superior, 2 of

the lobes enlarging and becoming spinescent in fruit. *Petals* obovate. *Stamens* 4. *Fruit* single seeded, 1-1.5 in. long, hard, obovoid with a short beak and two lateral sharp spines, dark brown or black when ripe, surface uneven.

In jhils.

The fruit is largely eaten and finds a ready sale.

Flrs. and Fr. cold season.

Trapa natans Linn.—Floating leaves about 1 in. across, sparingly hairy beneath on the nerves; fruit with spines on all the 4 angles.

SYLHET—*Roxburgh*, but does not appear to have been collected since.

Several species of *Cenothera* are cultivated in gardens for their showy flowers.

Cenothera rosea Soland—A small plant about 1 ft. high with pink flowers with obovate petals—has run wild in Shillong. A native of Mexico.

Fuchsias of several species are grown in Shillong and thrive fairly well.

Cenothera Drummondii Linn.

Herbaceous, hairy, more so in young parts. *Leaves* lanceolate or oblong-lanceolate, acute or shortly acuminate, membranaceous, hairy on both sides; lateral nerves 8-10 on either side. *Flowers* solitary, axillary, irregular. *Calyx* tube about 1-2 in. long, wholly adnate to the ovary. *Segments* 4, reddish. *Petals* bright yellow, 4, broadly ovate, epigynous. *Stamens* 8; anthers versatile. *Ovary* inferior; style about 1.5 in. long; stigma 4-partite. *Capsule* 4-celled, about 1 in. long, ellipsoid. *Seeds* numerous, blackish.

KHASI HILLS, 4-5,000 ft. Cultivated, running wild.

Flrs. and Fr. 7-9.

FAM. 62. PASSIFLORACEÆ.

Herbs or shrubs usually climbing by tendrils, rarely erect. *Leaves* alternate, stipulate, simple or lobed, palmi- or penni-nerved, frequently glandular beneath or on the petiole; stipules foliaceous or minute. *Flowers* in axillary cyme, sometimes with one or more of the branches ending in a tendril, rarely solitary. *Bracteoles* 3, rarely solitary,

minute and scattered or forming an epicalyx, rarely 0. *Flowers* regular uni or bisexual. *Calyx* tubular or campanulate; segments 5, imbricate, corona of one or more rows of thread-like filaments or scales or annular from the calyx-tube, sometimes absent. *Stamens* usually 5, springing from the gynophore or free at the base; anthers oblong, 2-celled, basifixed or versatile, introrse. *Ovary* superior on a gynophore or sessile, 1-celled, usually with 2, rarely 4 or 5 parietal placentas; ovules numerous, 2-many seriate; styles free or connate; stigmas usually more or less capitate. *Fruit* a berry or capsule. *Seeds* numerous ovoid or flattened, testa usually pitted with a fleshy cotyledon, foliaceous.

Flowers hermaphrodite; stamens hypogynous .. 1. *Passiflora*.
 Flowers unisexual; stamens perigynous. .. 2. *Modecca*.

1. *Passiflora* Linn. The Passion flowers.

Climbers. *Flowers* 2-sexual. *Calyx-tube* fleshy, segments often coloured within. *Petals* free, inserted on the throat of the calyx. *Corona* usually of one or more rows of filiform segments, springing from the mouth of the calyx-tube and of one or more membranous folds arising lower down the shallow basal cup surrounding the gonophore. *Stamens* 5 on the gonophore; anthers dorsifixed. *Styles* usually 3. *Fruit* baccate.

Petals present :—

Leaves semiorbicular, truncate and 3 cuspidate at the apex; fruit 2 in. long. .. 1. *P. Leschenaultii*.
 Leaves ovate-lanceolate, not lobed, fruit .5 in. across not lobed. 2. *P. nepalensis*.

Leaves 3 lobed :—

Flowers with conspicuous pectinate bracts—whole plant fœtid when bruised. 3. *P. fœtida*.

Petals 0 :—

Leaves lanceolate. 4. *P. suberosa*.

1. *Passiflora Leschenaultii* DC.

A climbing shrub. *Leaves* semiorbicular, broader than long, truncate and 3 cuspidate at the apex, 3-nerved, glabrous or more or less pubescent on the nerves beneath, thinly

subcoriaceous; base rounded; petiole about 1 in. long with 2 glands below the middle. *Flowers* about 2 in. across, white, usually solitary on slender elongate peduncles; bracteoles remote, linear. *Calyx-tube* subrotate with a short tube, lobes oblong. *Petals* as long as the sepals. *Outer corona* of two rows, filiform; *inner corona* short, tubular, membranous, plicated; *basilar corona* small, cup-shaped, surrounding the base of the gynophore. *Fruit* about 2 in. long, glabrous, leathery.

MANIPUR Watt, KHASI HILLS—C. B. Clarke (in F. B. I.).

2. *Passiflora nepalensis* Wall. Vern. *Mi-soh-lah, Soh-ksem*, Khasi.

A glabrous climber with slender angular branches. *Leaves* 2-4 by 1·5-2 in., ovate-lanceolate, acute or acuminate, apiculate, more or less 3 nerved, other lateral nerves weak, arched glabrous or somewhat glaucous beneath; base truncate or subcordate; petiole 1-3 in. long, usually with 2 raised glands. *Peduncles* 4-5 from each axil, 1-1·5 in. long; petioles jointed above the middle, usually 1-flowered. *Flowers* about ·5 in. long, pale yellow. *Calyx-tube* about ·2 in. long, cylindric; lobes nearly equalling the petals; *corona* filiform of several rows. *Fruit* ·5 in. across, globose, purplish.

KHASI HILLS—3-6,000 ft.

Flrs. 7-9. Fr. 10.

3. *Passiflora foetida* Linn.

A slender climbing shrub, foetid smelling when bruised. *Leaves* 1·5-3·5 in. long, usually 3-lobed; lobes shortly acuminate or acute; lateral shorter, usually 5 nerved, membranous, margins ciliate with gland tipped setaceous hairs, similar hairs on the petiole along the margin above; retuse; base broadly cordate or petiole 1-2 in. long; stipules laciniate with gland tipped segments. *Flowers* 1·25 in. across, greenish-white, mostly solitary with an epicalyx of pinnatifid bracteoles cut up into moss-like gland tipped pectinate segments, about ·5 in. long enlarging with age. *Coronal* processes filiform, white and purple. *Fruit* globose, about ·7 in. across, greenish, invested by the epicalyx.

Fairly common as an escape in most districts in the plains along roadsides and in vicinity of habitations. An inhabitant of Tropical America.

Flrs. hot and rainy season. Fr. 11.

4. *Passiflora suberosa* Linn.

A climbing herb. *Leaves* lanceolate, 3-4 by 1-1.5 in., subcoriaceous, strongly nerved; petiole jointed in the middle. *Flowers* small; bracteoles absent or if present not forming an epicalyx under the flower. *Petals* absent.

A native of Tropical America, sometimes occurring as an escape in village hedges.

P. adenophylla Mast.

A slender but fairly extensive climber. *Leaves* pale green, 3 lobed, 2.3 by 2.5-4.5 in.; lobes sub-obtuse, mucronate, membranous, entire, except for few glandular serratures near the sinuses; base sub-truncate or broadly retuse, 5 nerved; petiole 1-2 in. long with glands; stipules large, leafy, about 1.25 in. long, broadly subfalcate, auricled at the base. *Flowers* 2-3 in. across, solitary; peduncles with 3 leafy bracteoles near the top. *Petals* purplish blue; *coronal* filaments blue and white.

A native of Madagascar. Naturalized in the KHASI HILLS, 4-5,000 ft.

Flrs. 8.

P. edulis Sims. The passion fruit from Brazil. Vern. *Khasia Bel.* Beng.—A perennial climber with 3-lobed, toothed, glabrous leaves; large bluish purple flowers and purplish edible fruits. The pulp has strong *bael* like smell whence the Bengali name.

Besides the above several other species are cultivated in gardens in our area.

P. laurifolia Linn.

A climber, herbaceous, entirely glabrous, but fairly extensive; tendrils simple, axillary, long. *Leaves* 4.5-6 by 1.7-2.5 in., entire, ovate, oblong; petiole short. *Flowers* large, blue, fragrant, solitary or in axillary peduncles. *Involucre* 3-leaved. *Corona* 3-plex. *Berry* greenish yellow, white punctate. *Seeds* compressed, cordate.

Cultivated, but is naturalized in some places, e.g. Gogong Bil (Kulsi reserve), KAMRUP, NOWGONG (Kukrakata Reserve).

2. MODECCA Lam.

Modecca trilobata Roxb.

A large glabrous climber; branchlets sulcate. *Leaves* distant, 6-8 in. long, palmately 3-5 lobed, upper lobes with

deep sinuses, cordate, sub-truncate or hastate at the base, membranous; main lateral nerves 2 on either side, lowest sub-basal, connected by more or less subparallel tertiaries, 2 circular glands on the undersurface near the base; lobes acuminate; petiole 2·5-4 in. long with two glands at the apex. *Flowers* unisexual; peduncle axillary, 6-10 in. long, divided into 2-3 branches near the top, one of which ends in tendrils and the others in many flowered often cirrhose cymes. *Male flowers*:—*Calyx* less than ·5 in. (Masters)—campanulate, 5 lobed. *Petals* obovate-oblong, springing from the base of the calyx-tube. *Stamens* 5, united at the base; filaments slender; anthers obtuse. *Glands* of the disk ligulate, incurved, opposite the sepals. *Pistillode* minute. *Calyx* and petals as in the male but larger. *Glands* of disk ribbon-like, recurved. *Staminodes* 5, united at the base into a membranous cup. *Gynophore* short. *Ovary* elongate, ovoid; style short; stigma large, capitate, 3 lobed. *Fruit* scarlet, 2·5 by 1·25 in., on carpophore about ·6 in. long, capsular, 3 valved. *Seeds* many, flat; testa reticulate; aril-sweetish.

KHASI HILLS 3-5,500 ft.

Flrs. 7. Fr. 8.

Modecca cardiophylla Mast.—A glabrous climber. *Leaves* 6-8 by 4-5 in., ovate-cordate, acute or shortly acuminate, entire, rarely palmately lobed, membranous; petiole 2-3 in. long with a sessile gland on either side of the apex. *Peduncles* about as long as the petioles, bearing many flowered cymes, one branch cirrhose. *Male flrs.* ·12 in. across. *Petals* 5, springing from about the middle of the calyx tube; anthers obtuse. *Female flower* larger. *Staminodes* cohering in a membranous tube towards the base. *Ovary* on a short gynophore; stigma large, peltate with 3 wedge-shaped lacinate lobes.

KHASI MOUNTAINS & ASSAM—Masters; above Barapani, KHASI HILLS.

Flrs. 6-7. Fr. 8.

FAM. 63. CUCURBITACEÆ.

Climbing or prostrate herbs or shrubs, tendrils mostly present, spirally coiled. *Leaves* alternate, simple, lobed or pedately divided. *Flowers* unisexual, monœcious or diœcious, solitary, axillary or in cymes or racemose, yellow or white, regular. *Calyx* limb rotate, tubular or campanulate, lobes imbricate or open. *Petals* 5, united in a tube or nearly or quite free, sometimes with fimbriated margins, imbricate or induplicate-valvate in bud. *Male flowers* :—*Stamens* inserted at various levels in the calyx-tube, free or variously united, mostly 3, rarely 1-5, one anther usually 1-celled and the others 2-celled; anther cells straight, flexuous or conduplicate, extrorse, the connective sometimes produced beyond pistil-lodes, sometimes present. *Female flowers* :—*Calyx-tube* usually wholly adnate to the ovary and sometimes produced beyond. *Ovary* usually inferior, 3 carpellary placentæ parietal which often intrude in the middle and filled the ovary and thus make it spuriously 3-celled; ovules numerous, rarely few; style 1 with 3 thick stigmas, rarely styles 2-4. *Fruit* generally baccate and fleshy or finally with a hard rind, indehiscent or dehiscing by valves or circumciss, the seeds often packed in pulp or fibre. *Seeds* many, compressed; testa often corrugated or margined, exalbuminous.

I. Flowers white :—

1. **HODGSONIA** Hk. f. & T.

Hodgsonia hiteroclita Hk. f. & T. Vern. *Til-lau*, Mech.; *Thi-be*, Garo; *Darsani*, *Ghinphal*, Nep.; *Hanthar-angphar*, Mik.; *Mei-soh-mynthar*, Kh.; *Tatar-riube*, Miri; *Thebou-lata*, *Tapouguti*, Ass.; *Thaibai doukha*, Kach.; *Hokta*, Sylh.; *Kathai*, Manip.; *Kha-um*, Lush.; *Khankra*, Cach.

An extensive woody climber with extremely bitter bark. *Leaves* 6-9·5 in. across, each way deeply 3-5 lobed, glabrous, coriaceous; lobes entire or sparingly denticulate, sharply short acuminate or acute; petiole up to 3 in. long; tendrils 2-3 fid from the top, 5-10 in. long. *Flowers* large, diœcious, buds brown tomentose, males in elongate stout racemes up to 10 in. long, brown tomentose when young; bracts ·5 in. long, oblong, entire, acute, deciduous. *Female flowers* solitary. *Calyx* long, tubular, mouth shortly campanulate, brown tomentose outside; tube 3-4, mouth ·4-·5 in. across, teeth 5, short. *Petals* 5, about 2 in. long, connate at the base, long, fimbriate, 4 in. long, and 3 nerved outside, brown villous, white, tinged with yellow within. *Stamens* 3; filaments very short; anthers exserted, linear, connate, cells conduplicate. *Ovary* globose; stigmas 3, oblong, bifid, exserted, placentæ parietal near the base of the ovary. *Fruit* 4-6 in. wide, depressed, globose, red brown, closely tomentose, 12 grooved, flesh hard, extremely bitter; perfect seeds usually six, each usually having a barren one attached to its side, flat, ellipsoid, with sunk veins, 2-3 by 1-1·5 in.

Throughout the province ascending to 3,000 ft., in the hills.

The kernel of the seeds is eaten after roasting. Silk worms are fed on the leaves.

Flrs. 2-3. Fr. 11 ?

2. **TRICHOSANTHES** Linn.

Herbaceous or woody climbers. *Leaves* entire or 3-9 lobed, more or less toothed, tendrils usually 2-5 fid. *Flowers* usually diœcious, less often monœcious. *Males* usually in peduncled racemes with a solitary male less often female flowers from the same axil or female flowers solitary. *Calyx* tubular, dilated towards the top; teeth 5, lanceolate, entire or laciniate. *Petals* 5, connate at the base, lobes long, fimbriate.

Stamens 3; anthers usually connate. *Ovary* inferior; style filiform, 3-6 fid at the apex; placentas 3, parietal; ovules many. *Fruit* lanceolate or globose, smooth, seeds many, compressed, packed in pulp, sometimes angular on the margin.

1. *Trichosanthes palmata* Roxb. Vern. *U-soh-lyn-shang*, Khasi.

An extensive climber, often forming dense masses, stems woody below, with pale grey bark spotted with rows of circular lenticels. *Tendrils* 3, less often 2 fid, 1-2 in. up to the fork. *Leaves* 3-7 in. across, slightly longer or as long, variable, usually palmately 3-7 lobed, 3 nerved outer, forked, close to the base; lobes acuminate or acute, nerves often ending in teeth, dark green with deep pits when fresh and rough with raised cystoliths above, lower surface paler and with cystoliths on the nerves when dry, glabrous or puberulous on the nerves; base deeply cordate; petiole 1-3 in. long, striate, puberulous or ultimately glabrous. *Flowers* 1.5-2.5 in. across; male flowers in elongate racemes, 6-12 in. long, sometimes a solitary flowers from the same axil; bracts leafy, 1-1.5 in. long, broadly obovate, many nerved, fimbriate. *Calyx-tube* up to 1.5 in. long; lobes caudate, lanceolate, sometimes toothed or subpinnatifid. *Petals* 1 in. long, cuneate, long, fimbriate. *Female* flowers on short peduncles. *Fruit* 1.5-2 in. across, ellipsoid or globose, at first red with orange streaks, ultimately deep red; pericarp thick, tough. *Seeds* numerous, reddish-brown not margined, packed in greyish green pulp.

All over the area up to 6,000 ft.

Flrs. 7-9. Fr. 10-11.

Var. *laciniosa* Wall.—Leaves lobed nearly to the base, segments narrow, toothed and sometimes pinnatifid.

KHASI HILLS—up to 6,500 ft.

***Trichosanthes Wallichiana* Wight.**—An extensive herbaceous climber; tendrils 3. *Leaves* 3-7 in. across, digitately 5-7 partite, sometimes close to the base, the outermost segments also often lobed or angled; segments very variable in outline, more or less lanceolate to linear-lanceolate, acuminate, nervules usually excurrent into distant teeth or irregularly pinnatifid, basal nerves 3, outer pair strongly forked

from nearly the base, both surfaces with cystoliths as in *T. palmata*; petiole 1-3 in. long, striate. *Flowers* white, 1.5-2.5 in. across. *Male* flowers in elongate axillary racemes up to 14 in. long; with often a solitary flower from the same axil. *Bracts* leafy, about 1 in. long or longer (?), broadly obovate, fimbriate, many nerved. *Calyx-tube* about 1 in. long; lobes lanceolate, caudate-acuminate. *Petals* long, fimbriate. *Female* flowers on short peduncles. *Fruit* as in *To palmata* (?).

KHASI HILLS 4,500-6,500 ft.

Flrs. 7-9. Fr. 10-11.

Probably only a variety of *T. palmata*.

Trichosanthes multiloba Miq.

An extensive climber. *Tendrils* 2-3 fid. *Leaves* 3-6 in. across, 3-9 usually 5 lobed, about half way down; segments somewhat narrowed towards the base, glabrous or scabrous with scattered bristly hairs on the nerves and cystoliths (at least when dry); base subcordate, lobes toothed; petiole 1-3 in. long. *Flowers* diœcious. *Male peduncles* paired, the racemed one about 6 in. long (or in some varieties longer). *Bracts* deeply toothed. *Calyx-tube* 1-2.5 in., teeth lanceolate, subulate, entire. *Fruit* bright red with orange stripes, 2-4 in., ovoid or oblong acute; seeds .6-.8 in. long, more or less angular on the margins.

KHASI HILLS 2-6,000 ft.

Scarcely more than a variety of the last species. In some forms the leaves are very large.

Trichosanthes cordata Roxb.

An extensive climber. *Leaves* 6-8 in. across, ovate-cordate in outline, entire, angled or obscurely lobed, dentate-serrate. *Flowers* diœcious; bracts obovate, pubescent, entire or scarcely serrate. *Male peduncles* paired, the racemed one stout, up to 8 in. long. *Calyx-tube* 1.5 in. long, densely pubescent outside. *Fruit* globose, similar to those of *T. palmata*; seeds .5 in. long, scarcely angled on the margins.

KHASI HILLS, CACHAR—C. B. Clarke, probably throughout the province.

Trichosanthes truncata C. B. Clarke.

An extensive herbaceous climber, tendrils 2-3 fid. *Leaves* 4.5-5 by 2.5-3 in., ovate acuminate; base rounded or truncate (never sometimes subpeltate, distantly denticulate or entire, glabrous; flowers thinly coriaceous, cordate); petiole up to 1.7 in. long. *Male flowers* white, solitary in leaf axils or in peduncled cymes; peduncles 2-6 in. long; bracts narrowed at the base not sheathing. *Calyx-tube* tomentose outside, about .75 in. long (.75-1.5 in. according to F. B. I.); lobes reflexed, linear lanceolate.

Female plant not seen.

Mamloo—KHASI HILLS, 4,500 ft.

Flrs. 9-10.

Trichosanthes dioica Roxb. Vern. *Potol*, Beng., Ass., Sans.; *Parwal*, Hind.—A climber with perennial rootstock with scabrous and more or less woody stems. *Leaves* about 3 by 2 in., ovate-oblong, cordate, acute, sinuate dentate, not lobed, nor angled, rough on both surfaces; petiole .75 in. long. *Male peduncles* paired but not racemed, male flowers woolly outside. *Calyx-tube* about 1.75 in. long, narrow, lobes erect, anthers free. *Fruit* 1.5-3 in., oblong or nearly spherical, often with light green stripes, red when ripe. *Seeds* half ellipsoid, corrugate on the margins.

The wild form in submontane tracts has often bitter fruit. The fruit of cultivated form is a very wholesome vegetable and sometimes 4.5 in. in length in some races. The fruits are medicinal.

Flrs. hot season. Fr. rainy season.

Trichosanthes anguina Linn. Vern. *Chichinga*, *Chichinda*, Beng. The snake gourd.—A large climbing herb with suborbicular often 5 lobed or angled leaves and long elongate cylindric, sometimes contorted fruits, pointed at either end and 1-3 ft., long, at first glaucous green, streaked with white, ultimately bright orange.

Sometimes cultivated for the fruits which are used as vegetable.

Fr. rainy season.

CEPHALANDRA Schrader.

Cephalandra indica Naud. Syn. *Coccinia indica*, W. & A. Vern. *Bimbadhar*, Sans.; *Telakucha*, Beng.; *Kundru*, Hin.—A perennial with tuberous roots. *Leaves* 1.5-4 in. across, 3-5 angled or lobed, cordate, marked with numerous disks and more or less rough above; petiole .5-1.5 in. long. *Flowers* white; male peduncle .7-1.5 in. long, 1-flowered; female peduncle short. *Calyx-tube* campanulate, short, limb 5-lobed. *Corolla* about 1 in. long, campanulate, 5-lobed, $\frac{1}{2}$ way down, lobes papillosely hairy within. *Ovary* smooth. *Fruit* 1-2 in. long, ovoid or oblong, beaked, red when ripe, marked with white or greenish stripes; seeds many.

Common in hedges.

The fruit is eaten, the plant is also used medicinally.

Flrs. hot and end of rainy season.

THLADIANTHA Bunge.

Thladiantha calcarata C. B. Clarke. Syn. *T. dubia* F. B. I.

A large climber with sulcate pubescent branches. *Leaves* 3-4 by 2.2-7 in., deeply cordate-ovate, neither angled nor lobed, acute or shortly acuminate, denticulate, somewhat rough above with cystoliths tipped with sharp points, villous beneath, basal nerves 3-5; petiole about 1.7-2.2 in. long. *Tendrils* usually simple. *Flowers* about 1.5 in. across, golden yellow, dioecious; male peduncles often paired, one 1-flowered, ebracteate, caducous, the other racemed with inciso-

serrate bracts, .6-.7 in. long. *Calyx-tube* short, campanulate, the bottom shut by a horizontal scale. *Corolla* campanulate, 5-partite, the lobes revolute. *Stamens* 5; anthers one celled, straight. *Ovary* woolly when young. *Fruit* 1.5 in. long, oblong, glabrous, fleshy with many seeds.

KHASI HILLS, 4-5,000 ft., Mann.

Flrs. rainy season. Fr. cold season.

Thladiantha Hookeri C. B. Clarke.—Large climber with sulcate branches. *Leaves* 3-4 in. long, acute or acuminate, polymorphic, simple and ovate-cordate to digitately tripartite with oblique lateral segments, often auricled at the outer edge, membranous and hispidulous on both surfaces. *Tendrils* simple. *Flowers* golden yellow; male peduncles in pairs, both one flowered and racemed, one ebracteate with lax pedicels. *Petals* .5-.6 in. long. *Fruit* about 1.25 in. long, oblong.

KHASI HILLS—Mann. ASSAM—Griffith.

MOMORDICA Linn.

Momordica dioica Roxb.

Perennial climber with tuberous root, stems slender. *Leaves* 1.5-4 in. long, cordate, ovate, acute more or less 3-5 lobed, distantly denticulate, glabrous, punctate beneath; petiole 1-2 in. long. *Flowers* large, dioecious, yellow, male peduncles 1.5-6 in. long, 1-flowered with a persistent hooding pubescent bract, .5-.7 in. across, embracing the flower. *Female peduncle* nearly as long as the male with a small bract below the middle. *Calyx-tube* short, campanulate; lobes linear lanceolate, acute. *Corolla* 6-partite nearly to the base; lobes .5-1 in. long, prominently veined. *Stamens* 3; anther cells horse shoe-shaped. *Ovary* clothed with long soft papillæ. *Fruit* 1-3 in. long, shortly beaked, densely covered with soft spines; seeds many.

KHASI HILLS, 5,000 ft., Mann, probably throughout the plains. The young fruit is eaten in curries.

Flrs. rainy season.

Momordica Charantia Linn. Vern. *Karala*, Beng.; *Karela*, Hin.; *Tita karela*, Ass.—A short climber. *Leaves* 1-3 in. across, deeply 5-7 lobed; lobes lobulate or sinuate-dentate. *Flowers* monœcious, yellow. *Fruit* 1-5 in. long, tapering at both ends, longitudinally ribbed with rows of triangular tubercles, fleshy but dehiscent; seeds immersed in bright red pulp.

Cultivated and sometimes apparently wild.

The bitter fruits are largely used as vegetable.

Momordica cochinchinensis Spreng. Vern. *Kankrol*, Beng.; *Bhat karela*, Ass.

A large climber with perennial rootstock and tuberous root.

Leaves 4-5 in. across, suborbicular in outline, usually 3-lobed, glabrous or nearly so, firm, punctate beneath. *Flowers* diœcious, large, whitish. *Fruit* 3-5 in. long, ovate or oblong, covered with conical points, bright red when ripe.

Cultivated and often apparently wild.

The tender fruits are much esteemed as vegetable.

Flrs. & Fr. hot and rainy season.

Zehneria umbellata Thw. Vern. *Soh-khia-phlang*, Kh.

A herbaceous climber with angular glabrous stem; tendril climbing. *Leaves* usually hastate, narrow-lobed, polymorphous, 4-6 in. long; acute or acuminate, chartaceous, beneath. *Flowers* diœcious, small, dull white; male corymbose. *Calyx* teeth 5, small. *Corolla* lobes 5, triangular. *Stamens* 3, the female solitary. *Ovary* narrow-oblong; style cylindric. *Fruit* globose. *Seeds* small, obovate, smooth.

KHASI HILLS, GARO HILLS, 1-4,000 ft.

Flrs. 3. Fr. 9.

Gynostemma pedata Bl.

A herbaceous slender climber; tendrils simple. *Leaves* usually pedately 3-foliolate. *Leaflets* vine-like, ovate-lanceolate, usually oblique, crenate-serrate. *Flowers* minute, in diffuse long, axillary panicles; branchlets not pubescent. *Calyx* white, 5-partite. *Corolla* lobes lanceolate. *Stamens* 5, inserted at the bottom of the calyx. *Ovary* spherical. *Fruit* globose; berry greenish.

KHASI HILLS, 3,000 ft.

Flrs. & Fr. 8-9.

The following are also cultivated :—

1. **Luffa ægyptiaca** Mill. Vern. *Dhundul*, Hind.; *Ghiyatori*, *Bhol*, Ass. Large climber; leaves reniform, orbicular, 5-angled or lobed, about 4 in. across. *Flowers* monœcious, yellow on long peduncles. *Fruit* 5-12 in. long, smooth, ultimately filled with fibre and 3-celled inside, circumciss at the top.

The young fruit is esteemed as a vegetable and the fibres are used as a flesh brush. Sometimes apparently wild.

2. **Luffa acutangula** Roxb. Vern. *Jhinga*, Beng., Ass.; *Tori*, Hind. Very similar to the above but the fruit is acutely 10-ridged and the seeds are more prominently tubercled. The young fruit is esteemed as a vegetable.

Var. amara Clarke. *Leaves* smaller, ribs of fruit not so sharp; seeds smaller.

The fruit is intensely bitter and emetic.

3. **Benincasa cerifera** Savi. Vern. *Chalkumra*, Beng.—A large climber with hispid stem. *Leaves* 4-6 in. across, reniform, orbicular, more or less 5 lobed or angled, cordate, hispid beneath. *Flowers*

large, yellow, monœcious. *Fruit* 1-1.5 ft. long, oblong, hairy when young, ultimately covered with a waxy bloom.

4. **Cucumis melo** Linn. Var. *ultissimus* Duthie, Vern. *Kankur*, Beng. An annual with orbicular reniform 5 angled or lobed leaves about 3 in. across, rough on both surfaces. *Flowers* yellow, monœcious. *Fruit* fleshy cylindrical to elongate or contorted, often quite long.

Var. **Momordica** Duthie. Vern. *Phuti*, Beng.—*Fruit* 1-2 ft. by 3-6 in., cylindrical to oblong, bursting spontaneously when ripe.

5. **Cucumis sativus** Linn. The cucumber. Vern. *Sasha*, Beng.; *Khira*, Tiyanish, Hind.

6. **Citrullus vulgaris** Schrad. The water melon. Vern. *Tormuj*, Beng.; *Tarbuza*. *Kharmuja*, Hind.

Cultivated along sandy banks of rivers.

7. **Lagenaria vulgaris** Ser. The bottle gourd. Vern. *Lau*, *Panilau*, Beng. A softly pubescent climber with large bottle or dumbbell-shaped fruits.

Largely cultivated throughout the area for the fruits.

The dried shell of the fruit is much used for holding water.

8. **Cucurbita moschata** Duchesne. The musk melon. Vern. *Kumra*, Beng.; *Lal-kumra*, *Mitha-lau*, Ass.; *Mitha-kadu*, *Kadu*, Hin.

Extensively cultivated as a rainy season vegetable. The indumentum on the leaves is even the calyx lobes of the female flowers have usually foliaceous tip or are spatulate and fruiting peduncle is slightly expanded below the fruit. The flesh of the fruit is reddish and has a faint musk-like scent.

9. **Cucurbita Pepo** DC. Vern. *Kumra*, Beng.; *Pathao*, Kh.

A more hispid plan than the last; the petiole is pubescent and has also rigid prickly hairs, the calyx lobes are subulate; the fruiting peduncle is grooved and the flesh of the fruit is pale and not scented.

Often grown in hilly districts.

10. **Sechium edule** S. W. Vern. *Chayote* or *Chocho*, *Soh-kwash*, Khasi; *Quash*, *Eskoch* (Beng., probably from Eng. squash). An extensive climber with perennial rootstock. *Flowers* yellow, monœcious. *Fruit* pyriform, up to 4.5 in. long, with distant soft spines containing one large seed.

A native of Tropical America. Cultivated very commonly in the KHASI HILLS, where in certain season it is the most plentiful vegetable.

Flrs. and Fr. 7-11.

FAM. 64. BEGONIACEÆ.

Mostly perennial herbs with thick rhizome or tuber, several climb by aid of roots like ivy; may be cultivated for handsome flowers and foliage. *Leaves* radical or alternate, more or less inequilateral, entire, lobed or digitately partite, usually toothed; stipules 2, large, often deciduous. *Flowers* showy, unsymmetrical, monœcious, in axillary peduncles, bracteate at base, divided above in dichotomous cymes; bracts and bracteoles opposite. *Male flowers*: perianth segments petaloid, usually 2, outer pair valvate. *Stamens* numerous; filaments free or connate in a bundle; anthers linear oblong or clavate. *Female flowers*: perianth segments 2-5. *Ovary* inferior, 2-4-celled (usually 3); style 2-4, free or connate at the base; ovules numerous, placentæ axile. *Fruit* capsular, usually winged, usually loculicidally dehiscent or breaking up irregularly. *Seeds* minute; albumen scanty or 0.

Placentas 2-fid :—

Fruit more or less fleshy (not dehiscing
on the faces) 4-celled :—

Anthers narrowly oblong :—

Connective slightly produced. .. 1. **B. Roxburghii.**

Capsule 2-celled, compressed :—

Anthers obovoid :—

Connective produced above the anther
cells. 2. **B. laciniata.**

This family is of no forest importance but very widely represented in the province. Few species are only described below. Many are cultivated.

1. **Begonia Roxburghii** A. DC. Prodr.

A stout succulent plant, root fibrous. *Leaves* 6-12 by 4-8 in., ovate acuminate, irregularly toothed, glabrous or minutely pubescent on the nerves, very obliquely cordate at

base and unequal, strongly nerved; petiole 3-9 in. long. *Flowers* fragrant. *Ovary* 4-celled.

KHASI HILLS, 4,000 ft.

Flrs. 7.

2. *Begonia laciniata* Roxb.

Stem 6-24 in. long, brownish. *Leaves* 3-8 by 2-6 in., acutely lobed; lobes caudate-acuminate, ciliate, distantly serrate, softly pubescent; base shallowly cordate; petiole 2-4 in. long, brownish tomentose; stipules persistent, pubescent, outer perianth segments pinkish, connective produced above the anther cells. *Fruit* 1 by .5 in., pinkish, 3 winged, the posterior being much larger than the others; 2-celled.

KHASI HILLS, 4-6,000 ft.

Flrs. 8-9. Fr. Cold season.

Begonia Josephi A. DC. A variable herb usually stemless. *Leaves* peltate, ovate, lobed, crenulate. *Flowers* whitish or rose purplish. *Capsule* 3-winged, one wing much the larger.

KHASI HILLS, 3-4,000 ft.

Flrs. 8-9. Fr. Cold season.

Begonia picta Sm. Exot. Bot. A herb. *Leaves* ovate, acuminate, somewhat cordate, doubly serrate. *Ovary* and young capsule very pubescent. *Capsule* 3-celled, triquetrous with one wing more elongated.

KHASI HILLS, 3-4,000 ft.

Flrs. & Fr. 7-8.

Begonia Thomsonii A. DC. A caulescent hairy herb. *Leaves* ovate, usually acuminate, somewhat cordate and oblique, hispid ciliate; petioles densely rusty-pubescent. *Capsule* hairy with a descending wing.

KHASI HILLS, 3-4,000 ft.

Flrs. 8. Fr. 10.

FAM. 65. DATISCACEÆ.

Trees or herbs. *Leaves* simple or pinnate, exstipulate. *Flowers* small, diœcious, apetalous, racemed or paniced or clustered. *Male flowers*: *Calyx-tube* short, teeth 3-9; petals 0. *Stamens* 4-25; pistillode sometimes present. *Female flowers*: *Calyx-tube* adnate to the ovary, lobes 3-8, short; ovary 1-celled, closed or open at the top, placentæ parietal; styles as many as placentæ, simple or 2 partite; ovules numerous, ascending or horizontal. *Capsules* coriaceous or membranous, opening at the apex between the styles. *Seeds* numerous, albuminous.

1. TETrameLES R. Br.

Tetrameles nudiflora R. Br. Vern. *Pagarang*, *Pak-arong*, Mik.; *Bolam*, Mech.; *Dieng sharet*, *Dieng-sarapi*, *Dieng-Taro*, Kh.; *Bong-lep*, Kach.; *Telo*, *Tula*, Cach.; *Thing-dol*, Lushai, Tipp.; *Oang-phop*, Manip.; *Bhelu*, *Dubong*, Ass.; *Bol-bok*, *Dumbong*, *Awek*, Garo; *Dol-theng*, Kuki; *Chamchola*, Beng. (?).

A very tall deciduous tree, branched very high up, usually buttressed near the base. *Bark* smooth, greyish or greyish-white, spongy, marked with horizontal wrinkles and small lines of lenticels peeling off in thin papery layers about 1 in. thick. *Leaves* 3·5-6 by 2·7-5·5 in., broadly or sub-orbicular ovate acuminate, irregularly toothed, 5-7 nerved, bright green and thinly pubescent or glabrate above, (at least when mature), paler and softly pubescent on the nerves beneath; lateral nerves 3-5 on either side above the basal; base cordate; petiole 2-4 in. long, terete, softly pubescent. *Flowers* diœcious appearing before the leaves in many flowered pubescent racemes or panicles at the ends of branches or axils of fallen leaves, small, yellow. *Male flowers* subsessile, in fasciculate panicles 6-10 in. long. *Calyx-tube* very short, lobes 4, sometimes with an interposed small tooth equal or unequal, linear oblong, subacute, glabrous, exceeding the tube. *Petals* 0. *Stamens* 4, opposite the calyx lobes,

inserted round a flat central disk, exserted; anthers small. *Pistillode* 0, quadrangular. *Female flowers* sessile or nearly so in numerous pendulous spicate, sometimes branched racemes. *Calyx-tube* adnate to the ovary; limb urceolate pubescent outside; teeth 4, short, triangular, acute. *Ovary* 1-celled, 8-ribbed; ovules numerous on 4 parietal placentæ; styles 4, subulate, exserted, persistent; stigmas clavate. *Capsule* .2-.25 in. long, urceolate or obovoid, dotted with minute glands outside, 8 ribbed, truncate at the apex, walls membranous, dehiscing between the styles. *Seeds* minute, numerous.

Throughout ASSAM ascending to nearly 2,000 ft.

Wood white, soft, very light, pores large. Used at present for matches.

Flrs. 2-3. Fr. 5 (?).

FAM. 66. CACTACEÆ.

Succulent plants, stems of various shapes, columnar club-shaped, spherical, compressed, angled etc. *Leaves* rarely well developed, usually reduced to scales in the axils of which are cushions known areoles on which are borne tufts of hairs or spines. *Flowers* usually solitary and axillary on the areoles or terminal between tubercles on the stem. *Perianth* usually regular, rarely somewhat zygomorphic of many whorls which are united and tubular at the base, superior. *Stamens* numerous, inserted usually on the perianth tube. *Ovary* inferior, 1-celled, with several intruded placentæ; styles and stigmas as many as the placentæ. *Fruit* generally baccate, 1-celled; seeds many.

1. OPUNTIA

Opuntia monocantha Haw. Prickly pear. Vern. *Phani-manasha*, Beng., Hind.; *Nagphan*, *Hagar-phana*, Ass.

A large succulent shrub with dark green spiny joints, branched from near the base. *Joints* obovate or oblong,

much compressed. *Leaves* caducous, .2 in. long, lanceolate, brown, terete in section, areoles with dense pale brown shining bristly usually multicelled hairs up to .2 in. long and 1-3 spines of which one is usually larger than others and attains 2 in.; the largest spine and less often a smaller one is persistent and the rest deciduous. *Flowers* 2-2.5 in. long and 3 in. across, yellow or only reddish outside. *Perianth* rotate, outer segments short, ovate-acute, inner spatulate, acute. *Stamens* yellow, short. *Pistil* longer than the stamens. *Berry* pyriform, truncate with a deep obconic depression at the apex and areoles with tufts of brown minutely barbed bristles.

Planted in hedges and apparently run wild near villages up to 4,900 ft. in KHASI HILLS (Shillong).

The fruit is edible but is not relished.

Flrs. hot season.

Opuntia Dillenii Haw. Prickly pear. Vern. *Nag-pheni*, Beng.

A straggling shrub, with grey green or bluish green, oblanceolate or obovate joints; margins entire, lower joints often corky. *Areoles* with 4-6 thorny, sometimes stout spines and numerous barbed bristles. *Flowers* sulphur-yellow-orangish. *Perianth* white. *Berry* pyriform, depressed at the apex bearing tufts of barbed bristles, deep purple when ripe.

KHASI HILLS, 5,000 ft.

Frs. & Fr. 7-9.

AIZOACEÆ (Ficoideæ).

Herbs. *Leaves* simple, often fleshy; sometimes falsely whorled; stipules scarious or absent. *Flowers* usually in cymes or fascicles, regular, bisexual or polygamous (rarely). *Calyx* segments 4-5, free or rarely adnate to the ovary. *Petals* usually absent. *Stamens* 5 or indefinite; filaments usually connate at base; anthers 2-celled. *Ovary* 3-5-celled; ovules numerous. *Fruit* ovate, membranous, circumscissile capsule. *Seeds* reniform.

MOLLUGO Linn.

Branching often dichotomous, herb. *Calyx* deeply 5-partite. *Petals* 0. *Stamens* hypogynous. *Fruit* syncarpous. *Capsule* 3-5-celled, loculicidal. *Seed* sometimes appendaged.

Mollugo pentaphylla Linn. (*M. stricta* Linn) Vern. *Khet-papra*, Beng.

An erect slender glabrous herb. *Leaves* very variable. *Inflores-*

science in compound terminal cymes. *Seeds* not appendaged at the hilum.

KHASI HILLS, 3-4,000 ft.

Flrs. 6.

M. lotoides Okze. (*M. hirta* Thunb.).

A stellately haired prostrate herb. *Leaves* usually almost orbicular. *Inflorescence* in axillary clusters. *Flowers* sessile. *Seed* with a membranous scale with a long curved bristle.

SIBSAGAR.

Flrs. 3.

M. oppositifolia Linn. (*M. Spergula* Linn.).

A slender prostrate herb, glabrous or almost glabrous. *Flowers* pedicelled. *Seeds* with a short bristle.

CACHAR.

Flrs. 4.

FAM. 67. UMBELLIFERÆ.

Herbs (rarely shrubs or trees). *Leaves* usually alternate, simple or compound; petiole generally sheathing at the base, stipules usually 0. *Flowers* regular or irregular, hermaphrodite or polygamous, in simple or compound umbels, rarely in heads or whorls. The peripheral flowers sometimes rayed; umbels and unbellules each furnished with bracts or bracteoles or one or both naked. *Calyx-tube* adnate to the ovary, teeth 5 or 0. *Petals* 5, epigynous, sometimes unequal, often 2-fid with a median fold and inflexed apex, usually imbricate in bud. *Stamens* 5, epigynous, alternating with the petals; anthers versatile. *Ovary* inferior, 2-celled, crowned by the disc; ovules solitary, pendulous, anatropous; style 2, often dilated at the base into stylopods; stigmas capitellate. *Fruit* of 2 indehiscent dorsal or laterally compressed carpels (pericarps) separated by a commissure and attached to and often pendulous from a slender forked axis (carpophore); the

pericarps usually marked by 5 longitudinal ridges; and often traversed by oil canals (vittæ). *Seed* solitary in each carpel, pendulous; testa thin; albumen cartilaginous; embryo minute near hilum, radicle superior.

A very large family of no forest importance, but extensively represented in the province and contains many common economic plants namely :—

Carum copticum Benth., Vern. *Ajowan*, Hind.; *Jamain*, Sans.; *Jowan*, Beng.

Coriandrum sativum Linn., Vern. *Dhonya*, Hind.; *Dhane*, Beng.

Cuminum Cyminum Linn., Vern. *Zira*, Beng.

Fœniculum vulgare Gærtn., Vern. *Sonf*, Hind.; *Mohri*, Beng.; *Madhurica*, Sans.

Daucus Carota Linn., The carrot. *Gazar*.

Apium graveolens Linn., Celery.

Anethum Sowa Roxb. Dill.

1. HYDROCOTYLE Linn.

Hydrocotyle javanica Thunb. Vern. *Manamuni*, Garo.

A prostrate herb, rooting at the nodes. *Leaves* 1-3 in. across, rather broader than long, glabrous, shining above,

cordate crenate or shallowly lobed; petiole 5-7 in. long, laxly pubescent. *Umbels* many-flowered; peduncles leaf opposed. *Petals* entire. *Fruit* .08-.1 in. across, compressed, disk-like.

K. & J. HILLS, GARO HILLS (2-6,000 ft.).

Flrs. Rainy season. Fr. 9-10.

Hydrocotyle asiatica Linn. Vern. *Bor-mani-muni*, Ass.; *Brahma-manduki*, Beng.

A prostrate herb. *Leaves* sub-orbicular, reniform, .5-2.5 in. broad, almost glabrous except the nerves; petiole up to 5 in. long. *Petals* obtuse, imbricate; secondary ridges of fruit as distinct as primary.

SIBSAGAR.

Flrs. 4.

Hydrocotyle rotundifolia Roxb. Vern. *Haru-manimuni*, Ass.

A diffuse prostrate herb. *Leaves* small, orbicular, cordate, lobed or sub-entire, .25-.8 in. broad, hispid; petiole 1-5 in. long. *Petals* acute, valvate; secondary ridges of fruit 0.

SIBSAGAR.

Flrs. 4.

2. ERYNGIUM Linn.

Eryngium foetidum Linn. Vern. *Jongali-memedo*, Ass.; *Podomosolla*, Cach.

A very aromatic glabrous erect perennial herb. *Leaves* 2-4 by .4-1 in., spathulate, spinous-toothed. *Flowers* white in heads; bracts spinulose, stellate. *Calyx-teeth* ridged, acute. *Petals* white. *Fruit* ellipsoid. *Seed* semi-terete.

DARRANG, N. C. HILLS and K. & J. HILLS (upto 5,000 ft.).

Flrs. 5. Fr. Cold season.

3. SANICULA Linn.

Sanicula europæa Linn.

An erect herb. *Leaves* palmately 3-5-partite, glabrous. *Umbels* irregularly compound, rays few. *Flowers* mostly unisexual. *Calyx-tube* villous; teeth lanceolate. *Petals* white, emarginate. *Fruit* echinate, laterally compressed.

KHASI HILLS (3-5,000 ft.).

Flrs. 12-1. Fr. 3.

4. BUPLEURUM Linn.

Bupleurum falcatum Linn.

Soft-wooded glabrous undershrub. *Radical leaves* linear, broader upwards. *Cauline leaves* linear-lanceolate, acute, upto 5 in. long, semi-amplexicaul or sessile. *Umbels* compound. *Calyx-teeth* 0. *Petals* obovate, emarginate. *Fruit* brownish; carpels narrowly oblong, furrows 3-vittate.

KHASI HILLS (3-6,000 ft.) G. Mann.

Flrs. 6.

5. CARUM Linn.

Carum khasianum C. B. Clarke.

A pubescent erect herb 2-4 ft. *Lower leaves* 3-partite or sub-bipinnate; segments oblong, arcuate, serrate. *Umbels* compound. *Flowers* white, polygamous; bracts linear. *Fruit* ovoid, hispidulous, ridges prominent; carpels sub-pentagynous; carpophore 2-fid; vittæ solitary. *Seed* terete, dorsally subcompressed.

KHASI HILLS, 3-5,000 ft. (G. Mann).

Flrs. 6.

6. SESELI Linn.

Seseli daucifolium C. B. Clarke.

An annual erect herb. *Leaves* 2-3-pinnate, alternate segments linear or narrowly lanceolate, margins minutely serrulate. *Umbels* compound. *Flowers* white. *Calyx-teeth* obsolete. *Petals* 5, emarginate; carpels 2; style usually short. *Fruit* glabrous, globose. *Seed* semi-terete.

ASSAM (G. Mann).

7. ÆNANTHE Linn.

Ænanthe stolonifera Wall.

A stoloniferous herb, growing in wet places. *Leaves* 1-2 pinnate or 3 partite. *Umbels* compound, rays 6-30. *Flowers* white. *Calyx-teeth* small. *Petals* emarginate. *Fruit* subquadrate, commissure broad, lateral ridge large,

triangular corky, furrows 1-vittate; carpophore 0. *Seed* almost rounded.

KHASI HILLS up to 6,000 ft.

Flrs. 3. Fr. 10.

Ænanthe benghalensis Benth.

A herb growing in moist places almost glabrous, usually erect. *Leaves* pinnately de-compound. *Peduncles* 2·2·5 in. *Seeds* nearly rounded.

K. & J. HILLS (9458 Fisher 1879).

Ænanthe linearis Wall.

A straggling herb, almost glabrous; nodes often rooting. *Leaves* bipinnate. *Peduncles* about 5·5 in. long. *Seeds* almost circular.

K. & J. HILLS (9303).

There is another sheet of *Ænanthe* (Mann No. 372 K. & J. Hills—3·4,000 feet, June 1876) which appears to be intermediate between *O. hookeri* and *O. linearis*.

8. SELINUM Linn.

Selinum striatum Benth. Vern. *Jakseh*, Khasi; *Bhutkis*, Nep.

Perennial herbs, glabrous or nearly so. *Leaves* 4·8 in., oblong lanceolate, or ovate, 3·4-pinnate, upper-most sheath often exceeding the whole length of the petiole. *Fruit* dorsally compressed, ridges subequally winged; vittæ solitary. *Seeds* obscurely 2-grooved.

KHASI HILLS, 4·6,000 ft. Common.

Flrs. 6·7. Fr. Early cold season.

9. PEUCEDANUM Linn.

Peucedanum ramosissimum Wall.

Perennial glabrous herbs. *Leaves* 2·4-pinnate; segments of lower leaves ovate lanceolate of the upper narrow lanceolate. *Umbels* compound, rays usually numerous. *Calyx-teeth* minute. *Petals* obovate. *Ovary* glabrous; style very short. *Fruit* much dorsally compressed, mericarps slightly convex on the back, margin more or less acutely winged,

dorsal and intermediate ridges obscure, furrows 1-vittate, Commissure evittate.

K. and J. HILLS (4-6,000 ft.).

Flrs. Rainy season. Fr. 9.

Heracleum candicans Wall.

A large erect herb. *Stem* hollow, almost glabrous; young parts pubescent. *Leaves* bipinnate. *Leaflets* lobed, doubly serrate or crenate. *Fruit* obovate, about .4 in. long, commissure 2-vittate.

K. & J. HILLS (10576).

Heracleum obtusifolium Wall.

An erect herb, hairy. *Leaves* 3-fid or 3-5 partite, tomentose beneath. *Fruit* obovate, .2 in. long, 4-vittate.

K. & J. HILLS 6,000 ft. (9458).

FAM. 68. ARALIACEÆ.

Trees or shrubs, rarely herbs, erect or climbing, sometimes epiphytic. *Leaves* alternate or whorled, simple or compound; petiole usually long; stipules adnate to the petiole, sometimes conspicuous or absent. *Flowers* regular, small, sometimes polygamous, usually umbellate, less often racemose or in paniced heads; bracts and bracteoles present; pedicels sometimes jointed. *Calyx-tube* adnate to the ovary; limb truncate, obsolete or with small teeth. *Petals* 5, rarely 6-7, free or falling off in a cap. *Stamens* usually 4, alternating with the calyx lobes, rarely many, inserted round an epigynous disk. *Ovary* inferior, 2 or more celled; ovule 1 in each cell, pendulous. *Fruit* a drupe or berry; seeds pendulous, albuminous.

- I. Stamens less than 15; petals not connate;
ovary 2-12 celled :—

- A. Ovary 2-5 celled. Pedicels jointed;
petals imbricate in bud, albumen
uniform.

1. **Aralia.**

B. Ovary 5 celled :—

1. Leaves not simple :—

Petals imbricate in bud; leaves usually pinnately compound*; pedicels jointed.

2. **Pentapanax.**

Petals valvate, 5 or 6; leaves digitate; pedicels not jointed.

3. **Heptapleurum.**

2. Leaves simple :—

Erect trees or shrubs; albumen uniform.

4. **Dendropanax.**

Evergreen creeper climbing by adventitious roots; albumen ruminant.

5. **Hedera.**

C. Ovary 2-celled :—

1. Pedicels not jointed :—

Styles distinct :—

Unarmed trees; leaves pinnately decomposed; albumen ruminant.

6. **Heteropanax.**

Armed trees; leaves digitate; albumen uniform.

7. **Acanthopanax.**

Styles united :—

Generally armed trees or shrubs; albumen ruminant.

8. **Brassaiopsis.**

2. Pedicels jointed :—

Styles united; leaves digitate; albumen uniform.

9. **Macropanax.**

D. Ovary 6-12 celled :—

Leaves palmate; flowers large; pedicels not jointed.

10. **Trevesia.**

II. Stamens usually numerous; petals connate and falling off in a cap. Ovary of numerous cells.

11. **Tupidanthus.**

I. ARALIA Linn.

Herbs, shrubs, or small trees. *Leaves* digitate, pinnate or pinnately decomposed; stipules not prominent. *Umbels* solitary or in racemes or panicles, rarely compound; pedicels sometimes jointed under the flowers. *Flowers* often polygamo-monœcious. *Calyx-limb* 5-toothed or truncate. *Petals* 5, ovate, imbricate in bud. *Stamens* 5. *Ovary* 2-5-celled; styles 2-5, free or shortly connate at base. *Fruit* 4-5-celled, 4-5 angular, or sub-globose, 2-3-celled.

1. Erect shrubs. Leaves 1-3 pinnate; styles 4-5 :—
 - a. Inflorescence softly brown tomentose throughout; bracts tomentose, persistent, upto .25 in. long; pedicels tomentose. 1. *A. Thomsonii*.
 - b. Inflorescence pubescent towards the top only; pedicels hairy; bracts caducous. 2. *A. armata*.
 - c. Inflorescence and pedicels glabrous; bracts membranous, upto 1 in. long, glabrous. 3. *A. foliosa*.
2. Herb. Leaves digitate; styles 2-3. .. 4. *A. pseudo-ginseng*.

1. *Aralia Thomsonii* Seem. Vern. *Dieng-sir-ah*, Kh.

Usually unbranched prickly shrub, younger parts, inflorescence, leaf rachis and leaflets softly fulvous tomentose. *Prickles* usually short, strong, weaker on pinnæ. *Leaves* large, 2-3 pinnate, with a pair of leaflets at each division of the rachis, pinnæ 4-5 pairs; leaflets 5-11 on each, pinnate, 3-5 by 1·2-3 in., ovate or ovate-lanceolate, acuminate, serrulate, often unequal, scabrid above, tomentose beneath; lateral nerves 6-10 on either side of midrib, arcuate; base subcordate or rounded; petiolules 0·1 in. long. *Umbels* panicked; panicles 18-36 in. long; umbels .6·8 in. across. *Bracts* .2·25 in. long, lanceolate or narrow lanceolate; bracteoles similar but smaller; pedicels .2·4 in. long, tomentose, jointed towards the top. *Calyx* glabrate; teeth distinct. *Petals* ovate. *Style* arms 5, often 4 by fusion of two. *Fruit* .15 in. long, deeply ribbed.

GOALPARA, KHASI & JAINTIA HILLS 2-5,000 ft., Haflong—CACHAR—Craib.

Flrs. 2-6. Fr. 6-8.

2. *Aralia armata* Seem. Vern. *Santok-arong*, Mik.; *Thing-chuk-chu*, Kuki; *Dieng-la-tymphu*, Synt.

A shrub or a small prickly tree with large pith. *Bark* grey; blaze white. *Leaves* very large, 3-4 pinnate, often up to 7 ft. long; rachis and its ramifications armed with short prickles; primary pinnæ 6-8 pairs, secondary 3-8 pairs, sometimes with a hair of small pinnæ at the base; leaflets 5-9 on the ultimate pinnules, also often a hair at the ramifica-

tion of the rachis, 2·5-4·5 by ·7-2 in., ovate or ovate-lanceolate, acuminate, bristly serrulate; base rounded or cordate, pilose or harshly hairy with short stiff hairs; lateral petiolules very short, hairy. *Flowers* small, whitish, about ·15 in. across in extensive paniced umbels; panicles much branched (terminal), upper portion hairy; umbels up to 20-flowered; bracts caducous; pedicels roughly hairy up to ·5 in. long. *Calyx* nearly glabrous; teeth distinct. *Petals* 5, imbricate in bud. *Stamens* 5; ovary 4-5 celled; styles free, recurved. *Fruits* the size of pepper-corns, glabrous, 4-5 celled with as many stones.

CACHAR and KHASI HILLS, 2-4,000 ft.

Flrs. 11-12. Fr. 1.

3. *Aralia foliolosa* Seem.

A large shrub or a small tree, armed with numerous spreading prickles. *Leaves* pinnately decompose, about 5 ft. or more in length; rachis glabrous; prickles distant, up to ·3 in. long, often with a pair of leaflets at the ramifications. *Leaflets* on the ultimate pinnules 3-9, terminal largest, 3-5·5 by 1-2 in., ovate-lanceolate or oblong, acuminate or caudate-acuminate, serrulate, glabrous or with minute bristles on the nerves; base cordate or rounded; lateral petiolules short 0-·15 in. long. *Panicles* very large, decompose, 1-3 ft. or more in length, pilose when young, ultimately glabrous with a few weak prickles, scattered; bracts narrow-oblong to oblong-lanceolate, up to 1 in. long; membranous, persistent; pedicels glabrous or nearly so, up to ·45 in. long, very slender with a ring of minute sets at the apical joint. *Flowers* 5-merous, about ·15 in. across, greenish. *Calyx* glabrous; teeth distinct; petals valvate, ovate. *Fruit* of 5-carpels with 5 ridges about ·15 in. long.

KHASI HILLS, Griffith 2659! Nongpoh forest, ASSAM, Jenkins.

Fr. 12.

4. *Aralia Pseudo-ginseng* Benth.

A herb attaining about 2·5 ft. with perennial tuberous or tuberiferous root stock. *Leaves* digitate; petiole 2-6·5 in. long. *Stem* terminated by a whorl of leaves with a deciduous

scale at the base. *Leaflets* 3-9, often 5, 4·2-7·25 by ·6-·85 in., narrowly lanceolate, acuminate, serrate, membranous, covered with scattered bristly hairs on both surfaces; lateral nerves slender, many; base tapering or rounded; petiolules 0·3 in. long. *Peduncles* glabrous or puberulous, simple or 2-4 branched, each branch terminating in an umbel; pedicels ·25-1 in. long, puberulous or pubescent, jointed below the flowers; bracteoles deciduous. *Flowers* polygamo-monœcious. *Calyx* more or less puberulous with short teeth. *Ovary* 2-3-celled; styles 2-3. *Fruit* drupaceous, ·25 in. across, black when ripe, bluntly 2-3-gonous and shallow grooved between the angles.

KHASI HILLS 5500-6500 ft. Usually in shady situations e.g. Dumpep, where it is sometimes gregarious.

Flrs. 5-6. Fr. 9.

2. PENTAPANAX Seem.

Trees or shrubs, often scandent. *Leaves* 1-pinnate, with 3-9 leaflets, glabrous. *Flowers* bisexual, rarely polygamous, in compound racemes or umbels; pedicels jointed close under the flower. *Calyx-teeth* 5; petals 5, imbricate in bud. *Stamens* 5. *Ovary* 5 (or 4)-celled; styles 4-5 combined to the top or free or more than half the length. *Fruit* 4-5 celled or angled; albumen uniform.

1. Flowers in paniced racemes :—

Rachis of panicles unbranched upwards. 1. *P. subcordatum*.

Rachis of panicles bearing racemes to nearly the top. 2. *P. racemosum*.

2. Flowers in umbels :—

Leaflets serrate. 3. *P. Leschenaultii*.

Leaflets entire. 4. *P. parasiticum*.

1. *Pentapanax subcordatum* Seem. Vern. *Dieng-jariat*, *Dieng-soh-baria-um*, *Jariat-lor-mew*, *Ja-riat*, Kh.

A small tree, epiphytic at least in early life. *Bark* greyish-brown outside, exfoliating in irregular flakes, about 3 in. thick; blaze white or cream coloured. *Leaf rachis* 5-9 in. long; common petiole 3-6·5 in. long. *Leaflets* 3-5, 3·5-5 by 1·5-3·5 in., ovate, ovate-oblong or elliptic, shortly caudate-acuminate; sinuate-crenate, glabrous, sub-coriaceous;

main lateral base subcordate or subtruncate, often abruptly narrowed on the petiolule; nerves 6-10 on either half; petiolules $\cdot 5\text{--}1\cdot 7$ in. long, jointed at or near the top. *Flowers* very small, green in paniced racemes. *Panicles* terminal or from below the current year's shoots, 8-11 in. long, often with 3-8 strong ascending branches from the lower half, racemes borne on the lower portion of the main panicle branches, upper portion of rachis unbranched. *Racemes* $1\cdot 5\text{--}4$ in. long, flowering down to the bases; pedicels $\cdot 1\text{--}\cdot 2$ in. long, each with a minute linear bract at the base. *Flowers* bisexual, very small, greenish. *Styles* combined nearly to the top. *Fruits* about $\cdot 2$ in. across, subglobose, obscurely 5 angled.

Wood white, not used.

Flrs. 5-6. Fr. 7.

2. *Pentapanax racemosum* Seem.

Straggling or a small erect tree. *Leaves* 12-20 in. long, pinnately 3-5 foliolate; leaflets 2-5 by $1\cdot 2\text{--}3\cdot 5$ in., ovate-acuminate, distinctly cuspidate-serrate, glabrous; main lateral nerves about 5 on either half; lateral petiolule $\cdot 1\text{--}1$ in. long. *Flowers* unisexual, small, in terminal clustered panicles 6-9 in. long; racemes $1\cdot 5\text{--}2$ in. long, nearly to the top of the panicle branches, bractiate; pedicels $\cdot 08$ in. long, slender. *Styles* in female flowers recurved, in male flowers combined to nearly the top. *Fruit* subglobose.

KHASI HILLS—Brandis. There is no record from our area at Calcutta.

Flrs. 6-7.

3. *Pentapanax Leschenaultii* Seem. Var. *umbellatum* Seem.

An unarmed small tree or subscandent shrub, sometimes epiphytic, often trailing on rocks. *Leaf rachis* 5-9 in. long; common petiole 3-6 in. long. *Leaflets* 3 or 5, $2\cdot 5\text{--}4\cdot 5$ by 1-2 in., ovate or lanceolate, sharply acuminate, bristle serrate or serrulate, rounded or subtruncate and often unequal at the base, shining above, subglaucous beneath; main lateral nerves 6-9 on either half; petiolules (of lateral leaflets) $\cdot 2\text{--}1$

in. long, jointed near or at the apex. *Flowers* about .15 in. across, greenish, in peduncled umbels, arranged on a panicle or compound umbel, 2.5-5.5 in. long. *Umbellules* globose; peduncles .5-2 in. long. *Branches* of the inflorescence and pedicels pubescent or puberulous; pedicels slender, usually .3-.6 in. long, sometimes longer. *Bracts* deciduous, narrow-lanceolate. *Calyx* glabrous; disk often conically elongated. *Fruit* about .17 in. long, oblong, sharply 5-ribbed with deep grooves between, crowned by the remains of the style.

KHASI HILLS 5-6,000 ft.

Flrs. 3-4. Fr. 7-8.

The type of the tree with fruits, without prominent ribs and umbels arranged in panicles and does not occur in our area.

4. *Pentapanax parasiticum* Seem. Var. *khasianum* C. B. C.

An epiphytic subscandent shrub or small tree with smooth pale or brownish bark, often sending down stout ærial roots. *Leaves* 4-10 in. long. *Leaflets* 5; 1.5-3 in. by .7-1 in., ovate-lanceolate, entire, acuminate; base rounded or subacute, often unequal, subcoriaceous, shining above, glaucous beneath; lateral nerves very slender; lateral petiolules 0-.1 in. long. *Flowers* greenish, .25 in. across in globose umbels; solitary or 2-8 together in simple panicles. *Pedicels* .3-.5 in. long, slender, pubescent. *Styles* combined to the apex. *Fruit* subglobose.

KHASI HILLS—5,000 ft., rare.

Flrs. 10.

***Panax fruticosum* Linn.** A shrub 3-6 ft. high with 3-pinnate leaves; leaflets 2-3 by .5-.25 in., very variable, lanceolate, bristle-serrate. Flowers very small, yellow, 5-merous in paniced umbels; bracts minute; pedicels jointed close under the flowers .12-.2 in. long. *Styles* 3, persistent, recurved. *Fruit* compressed laterally, .15 in. across.

Often cultivated as an ornamental pot plant in verandahs.

3. HEPTAPLEURUM Gærtn.

(Included in *Schefflera* Forst Section-Heptapleurum by Harms in Englers Nat. Pflanzenfamilien).

Large shrubs or trees, sometimes scandent; prickles absent. *Leaves* usually digitate, rarely 1-foliolate or twice digitate; leaflets entire or remotely toothed or sometimes lobed, coriaceous; stipules often connate within the petiole and prominent. *Flowers* often polygamous, usually 5-6, sometimes 10-merous; umbels paniced or in compound racemes; bracts woolly; pedicels not jointed under the flower; bracteoles 0 or few and caducous. *Calyx* margins toothed or truncate. *Petals* valvate, often cohering in a cap, which is raised by the stamens. *Stamens* and ovary cells as many as the petals; disk small or large; styles short or sometimes scarcely developed, connate in a broadly conical or narrow cylindric column. *Fruit* sub-globose, 5-6 angled. *Seeds* compressed; albumen uniform, rarely ruminant.

- I. Fruit crowned by a narrow cylindric column :—
 Leaflets polymorphous, often pinnately lobed. 1. *H. hypoleucum*.
 Leaflets not polymorphous. 2. *H. elatum*.
- II. Fruit crowned by a conical disk; styles very short :—
 Leaflets entire :—
 Nerves indistinct above on leaflets; inflorescence covered with deciduous tomentum; ridges on the fruit rounded. Leaf scars not annulate. . . 3. *H. kahasianum*.
 Nerves distinct above on leaflets; inflorescence glabrous; ridges on the fruit sharp. Leaf scars annulate. . . 4. *H. venulosum*.

1. *Heptapleurum hypoleucum* Kurz. Vern. *Dieng-la-tymphu*, Synt., Kh.

A small unarmed branchy tree. *Bark* nearly smooth, brown or grey, with a soft greenish-white cut; young parts and inflorescence with deciduous brown stellate scurf. *Leaves* digitate; common petiole 12-26 in. long, swollen at the base; stipules connate with acuminate tips, brown felted outside, .3-.5 in. long. *Leaflets* polymorphic, 5-7, very variable in size, 5-15 by 1.5-12 in., central largest, usually oblong or elliptic to ovate oblong in outline, acuminate, pinnately lobed, entire or somewhat distantly serrate, glabrous with age above, undersurface paler with deciduous

scurf and stellate hairs, sometimes glabrescent with age; chartaceous; main lateral nerves 8-14 on either half; petiolule 1-7 in. long, jointed and thickened at the apex. *Flowers* greenish-white, globose; umbels terminating (by the abortion of the lateral umbels) or arranged racemosely on the branches of a terminal subcorymbose panicle, 10-24 in. long; terminal umbels largest, 1·5-2 in. across; lateral umbels with peduncles. *Rachis* stout; panicle branches 1-6·5 in. long; bracts at the base of the peduncles thick, concave, ovate, acuminate, densely brown-felted- gradually small upwards up to 1 in. long; bracteoles similar, but small, a few at the base of pedicels, linear; pedicels ·5-·75 in. long. *Calyx* truncate. *Petals* 5, ultimately reflexed, ·2-·25 in. long, oblong-acute, clothed outside with dense stellate white wool. *Stamens* 5; filaments subulate, much exceeding the petals. *Fruit* globose, ·25 in. across, 5-celled, obtusely 5-ribbed, crowned by the disk and the short column of connate style, which is 5-fid at the apex; albumen ruminant.

KHASI HILLS 2-6,000 ft.

A poultice of leaves is good for swellings.

Flrs. 11-1. Fr. 4.

2. *Heptapleurum elatum* C. B. Clarke. Var. *Griffithii*, Syn. *H. glaucum* Kurz.

A small evergreen tree; young parts and inflorescence felted with deciduous tawny floccose wool, glabrescent with age. *Leaves* digitately 5-7 foliolate; common petiole stout, 12-19 in. or longer; stipules connate, about ·5 in. long. *Leaflets* variable in size, usually 5-10 by 2-5 in., elliptic to oblong or ovate, obtuse or rounded at the base, entire, acuminate or remotely serrate, coriaceous, glabrous above, at first stellate tomentose, ultimately glabrescent, but pale beneath; lateral nerves 8-12 on either half; petiolules 1-3 in. long. *Flowers* small, in umbels terminating or racemosely arranged on, the branches of a terminal corymbose panicle, usually not exceeding the common petioles in length; bracts up to ·6 in., smaller upwards, concave, ovate-acuminate, with a broad suborbicular base; bracteoles small, similar in shape; pedicels woolly, ·5-·7 in. long. *Calyx* truncate. *Petals* 5, stellate-woolly outside, glabrous inside, oblong, acute, about

·2 in. long. *Styles* united in a column, distinctly 5-fid at the top. *Fruit* globose, about ·25 in. across, glabrous with age, 5 grooved, surmounted by the persistent cylindric style.

KHASI HILLS 4-6,000 ft. Mann.

The type has usually glabrous or sparingly woolly buds, pedicels and petals. An incomplete specimen (No. 445) from an epiphyte collected at Dirju along Kananoi in Lakhimpur Dist., with large leaves 9-13 by 4-7 in., elliptic-oblong, short, acuminate, entire, glabrous leaves, may be a form of the plant, but the material is too fragmentary for satisfactory determination.*

Fr. 12.

Heptapleurum glaucum C. B. Clarke (not of Kurz.)

A small tree with stout branchlets. *Leaves* digitately 3-7 foliolate; common petiole 8-10 in. long. *Leaflets* 3-6 by 1-3 in., lanceolate to obovate lanceolate, entire or nearly so, glabrous above, pale and floccose tomentose when young along the nerves, ultimately glabrous beneath; lateral nerves 10-12 on either half; petiolules ·8-2 in. long. *Inflorescence* scurfy tomentose; panicles branched as in *H. elatum*, 6-8 in. long; branches 1-3 in. long; umbels about 1 in. across; pedicels ·25-·4 in. long. *Calyx* and *petals* brown-woolly-tomentose outside. *Fruit* glabrous, about ·25 in. across, 5-grooved, surmounted by the persistent style.

Jowai—King's collector! "Vale of rocks—KHASI HILLS—C. B. Clarke! Kynohi."

The plant is scarcely separable from the last species.

Flrs. 10-11. Fr. 12.

3. Heptapleurum khasianum C. B. Clarke. Vern. *Dieng-tampoh*, *Dieng-la-tang-king*, *Dieng-tanki*, Kh.

A small tree branched from near the base. *Bark* grey or brown, with distant warts, somewhat corky; blaze yellowish or greenish white with faint brown or green dots, darkening and soon changing to greenish-black on exposure; young shoots and inflorescence clothed with deciduous, stellate tomentum. *Leaves* digitately 7-9 foliolate; common petiole 7-10 in. long, lenticellate, usually with many close set warts at insertions; stipules connate; leaflets with a faint resinous smell, 4-9 by 1·5-3·5 in. (sometimes attaining 11 in. C. B. Clarke in F. B. I.), lanceolate or elliptic-lanceolate, acuminate, entire; glabrous, shining above, very coriaceous; main lateral nerves 10-15 on either half, joined near the margin by an

* Since identified at Sibpur as *H. hypoleucum* Kurz.—R. N. De.

undulating intramarginal nerve, indistinct above; base rounded or narrowed; petiolules 1-2 in. long; umbellules up to 10 flowered, recemed on the branches of a terminal or subterminal spreading corymbose panicle, 9-12 in. long. *Panicle* branches ascending, 2.5 in. to nearly as long as the rachis; peduncles .3-.9 in. long. *Flowers* white. *Calyx* at first stellate-tomentose, ultimately glabrous, truncate; petals deciduously stellate pubescent outside, .15 in. long, usually 6, less often 7 or 8? *Stamens* as many as petals. *Fruit* 6-8 grooved, globose, .2 in. long, crowned by the conical disk. *Styles* very short, not connate into a cylindric column; albumen not ruminant.

KHASI HILLS—4-6,000 ft., sometimes on rocks in shady situations, rarely epiphytic.

Flrs. 12.

4. *Heptapleurum venulosum* Seem. Syn. *Schefflera venulosa* Ham. Vern. *Jeng-jil*, *Dorengmi*, Garo; *Dau-nasi*, Mech; *Daini-huka*, Jharua; *Jokhuni-hata*, *Dhobailata*, *Dhovallata*. Ass.; *Dieng-meising-hat*, *Jarmi-mong-boi*, *Dieng-soh-luait*, *Mei-soh-syrkan*, Kh.; *Tille-diyabet*, Synt.

A soft wooded climber attaching itself by means of adventitious roots to supports, rarely a shrub, often epiphytic. *Bark* conspicuously lenticellate, nearly white or pale brown; thick, nearly white or pale yellow, mottled with darker yellow or orange inside; twigs stout. *Leaves* digitate; petiole terete, 4.5-12 in. long; stipules connate, .5 in. long; leaflets 3-7, .3-7.5 by 1-3.5 in., elliptic-oblong or lanceolate-acuminate, entire, coriaceous, glabrous, shining above; lateral nerves about 5-7 on either side; petiolules 1-2 in. long, jointed at the apex. *Flowers* .3 in. across, polygamous, in few flowered (up to 12) umbellules, racemosely arranged on a much branched terminal panicle; rachis purplish; peduncles of umbellules up to .5 in. long; pedicels up to .2 in. long; panicle branches 5-10 in. long; bracts caducous, woolly, enveloping the umbellules. *Calyx* truncate. *Petals* 5, obovate-oblong, acute, in male flowers sometimes cohering in a cap which is uplifted by the stamens. *Fruit* about .3 in. across, 5 ridged.

DARRANG, KAMRUP, SIBSAGAR, NOWGONG, CACHAR, GOALPARA, GARO AND KHASI HILLS—ascending to about 4,000 ft. Probably all over ASSAM.

Flrs. 3-4. Fr. 10-11?

The leaf scars persist on the twigs as nearly annulate raised lines.

The form with large leaflets has been separated under Var. *macrophylla* Wall. Cat. (sp.) in F. B. I.

Schefflera bengalensis Gamble Kew Bulletin 1919. P. 229.

Climbing shrub. *Leaves* digitately 5-foliolate; petioles 4-8 in. long. *Leaflets* 3-8 in. by 1-2-2-75 in., oblong to oblong-lanceolate, cuspidate-acuminate; main lateral nerves about 8-10, curved at the margin; petiolule .75-2 in. long; stipules intrapetiolar, rounded, fleshy. *Flowers* dull red in umbels on terminal paniced racemes; rachis usually stout, glabrous, 3-4 in. long; racemes 4-4-75 in. long; peduncles of umbels .4-8 in. long; pedicels slender; bracts in bud large, orbicular, floccose—puberulous, soon deciduous. *Calyx-tube* glabrous, truncate. *Corolla* falling off in a calyptra; petals about .08 in. long. *Ovary* 5-celled. *Fruit* dry, 5-angled, glabrous.

5. HEDERA Linn.

Hedera Helix Linn. The Ivy. Vern. *Mei-peosree*, *Mei-soh-poram-shre*, *Peu-shri*, *Peu-shrish*, Kh.

A large evergreen woody climber adhering to trees, rocks etc. by numerous fine rootlets. *Bark* light, nearly white or pale brown, somewhat rough, cut yellowish white. *Leaves* alternate, simple, polymorphic, usually 2-5 in. long, very variable in breadth, on flowering shoots usually entire and ovate, ovate-elliptic or lanceolate, others variously lobed, more or less triangular in outline, leathery, dark green and shining above, 3-5 nerved; nerves prominent above; base cordate, rounded or in flowering shoots narrowed or cuneate; petiole slender, .5-3.5 in. long; stipules 0. *Flowers* about .25-.4 in. across, polygamous, yellowish-green, pentamerous in pedunculate globose umbels, which are terminal, solitary or a few together in short subcorymbose panicles; .5-2 in. long; pedicels .5-.8 in. long, both clothed with minute stellate scales. *Calyx* obscurely toothed or nearly truncate. *Petals* about .12 in. long, triangular, valvate with a ridge in the centre inside, ultimately reflexed. *Ovary* 5-celled; disk broadly conical; styles connate in a short column. *Fruit* .25-.3 in. across, globose, yellow, shining when fully ripe,

with fleshy exocarp, pyrenes thin-walled; seeds 3-5, ovoid; albumen ruminant.

KHASI HILLS, 3-6,500 ft.

Flrs. 10-12. Fr. 1-6.

6. HETEROPANAX Seem.

Heteropanax fragrans Seem. Vern. *Kainsra-asing*, *Kanjor-arong*, Mik.; *Gutang-asing*, *Galapak-asing*, Abor; *Keseru*, *Karangiya*, (Kamrup), *Koronda*, Ass.; *Ralung-bu*, Kuki; *Katebel*, Tipp.; *Bolsamphol*, *Bigasargo*, *Mugasalgo*, Garo; *Dieng-kynjar*, *Dieng-mangala*, *Dieng-sohtang-pu*, Kh.

A small soft wooded evergreen tree; bark nearly white to dark grey, rugose, about .5 in. thick, soft and pale to greenish with brown strands inside. *Leaves* enormous up to 4 ft. long, tripinnate, rarely 4-pinnate; rachis often with a pair of leaflets at the nodes, dilated at the base; leaflets 3-5.5 by 1.5-3 in., elliptic, elliptic-ovate or lanceolate, usually short acuminate, entire; base often narrowed and unequal, glabrous, subcoriaceous; main lateral nerves 5-9 on either half, somewhat distant, arcuate, upper often meeting in intramarginal loops; petiolules almost 0.5 in. long. *Flowers* about .2 in. across, polygamous, yellow, fragrant, subsessile or shortly pedicellate in dense subglobose umbels, up to .7 in. across, racemed on the branches of an enormous panicle, 1.5-3 ft. long; flowers and inflorescence covered with more or less rusty, stellate scurf or tomentum. *Bracts* small, concave, persistent; pedicels short, up to .1 in. long, enlarging to .25 in. in fruit, not jointed below the flower. *Calyx* turbinate, nearly truncate. *Petals* 5, valvate, acute. *Stamens* 5, extruded, spreading. *Ovary* 2-celled; styles 2, distinct, persistent and recurved in fruit. *Fruit* compressed at right angles to the septum, .2-.3 by .3-.4 in., glaucous, ultimately glabrescent; endocarp crustaceous; seeds 2, orbicular, compressed with ruminant albumen.

All over the province ascending to about 3,500 ft. Eri silk worms are fed on the leaves.

Flrs. 12-1. Fr. 3-4.

The bisexual flowers are generally pedicellate and borne at ends

of panicle branches, the male flowers are subsessile and usually borne lower in smaller subcapitate umbels.

7. ACANTHOPANAX Dene.

Acanthopanax aculeatum Seem. Vern. *Kenkut*, *Chobolaksinriube*, *Tako-laksim*, Miri; *Shi-soh-sat-khlaw*, *Shiah-ryng-khwari*, Kh.

A prickly straggling or scandent glabrous shrub. *Leaves* digitately 3-5 foliolate; common petiole 1-2·7 in. long, slender, often with 1 or more prickles; base stem clasping. *Leaflets* 1-4 by ·5-1·7 in., lanceolate to elliptic or oblanceolate, acuminate, unequally cuspidate-serrate or denticulate; base attenuated to the short petiolule, thin; main lateral nerves 5-7 on either half, slender, arcuate, sometimes with a few weak prickles on the upper surface; petiolules ·1-·25 in. long, margined. *Flowers* in globose umbels, which are solitary and axillary or terminal and arranged in corymbose or subumbellate panicles; bracts about ·1 in. long, concave, acute; peduncles ·7-2 in. long, not jointed; bracteoles many at the base of the pedicels. *Calyx-teeth* 5, small. *Petals* 5 or 4, lanceolate, acute, about ·1 in. long. *Stamens* as many as the petals. *Ovary* 2-celled; styles 2 at the apex of the conical disk, persistent, lower halves combined; upper halves free and ultimately recurved. *Fruit* ·2 in. across; albumen uniform.

N.-E. FRONTIER, LAKHIMPUR, DARRANG, SIBSAGAR, KHASI HILLS—ascending up to 4,000 ft.

Flrs. 11.

8. BRASSAIOPSIS Dene and Planch.

Large shrubs or trees often armed. *Leaves* digitate or palmately lobed or angled; stipules connate within the petiole not prominent. *Flowers* often polygamous, pentamerous in umbels, which are arranged in large compound panicles, stellate tomentose at least when young; bracts often persistent; pedicels surrounded at the base by a dense cluster of persistent bracteoles, not jointed under the flowers. *Petals* valvate. *Ovary* 2-celled; styles united, long or short. *Fruit* broadly globose or turbinate, 2 or by abortion 1-seeded. *Seed* not compressed; albumen ruminant.

I. Leaves digitately compound :—

Leaflets glabrate, entire or distantly serrulate; petiolules up to 2 in. long.

Leaflets thinly clothed with stiff stellate hairs, sharply serrate; petiolules short, up to 3 in. long. Prickles sharp.

1. *B. speciosa*.
Var. *typica*.

2. *B. aculeata*.

II. Leaves pinnately divided or angled :—

A. Leaflets serrate, undersurface thinly pubescent.

3. *B. mitis*.

B. Leaflets nearly entire, undersurface scurfy.

4. *B. palmata*.

C. Leaflets entire or serrate, woolly tomentose beneath.

5. *B. Hookeri*.

1. **Brassaiopsis speciosa** Dcne. & Planch. Vern. *Kurila* Ass.; *Dieng-lakor*, *La-tyng-krong*, *Dieng-la-tymphu*, Kh.; (a common Khasi name for all araliaceous plants with digitate leaves); *Tong-bahu*, Naga; *Thore*, Nep.

A small tree, upper parts of the stem and sometimes the inflorescence and common petioles prickly. *Bark* whitish-grey to greenish brown outside, green underneath the soft corky layer; blaze greenish-white or yellowish, pith large; young parts stellate-tomentose. *Leaves* digitate with usually 5-7 leaflets; common petiole 12-28 in. long. *Leaflets* 4-12 in. by 2-4.5 in., elliptic-oblong, lanceolate or ovate lanceolate, entire or distantly serrulate or crenulate when young, often with scattered stellate hairs above, glabrate with age; main lateral nerves 6-10 on either side, arching, prominent beneath; petiolules up to 2 in. long. *Panicles* large, terminal; bracts oblong or lanceolate; umbels many flowered, racemed on the branches of the panicle, which are up to 12 in. long, terminal umbel largest; lateral umbels on peduncles .5-1 in. long, often aborted; pedicels .5-.7 in. long with a dense cluster of small rusty-stellate hairy, persistent bracteoles at the base. *Flowers* white, small, stellate tomentose. *Disk* flat, obscurely 5-angled. *Fruit* .3-.4 in. across, often somewhat broader than long, subglobose (or didymo-globose—*C. B. Clarke* in *F. B. I.*) crowned by the disk and the persistent style. *Seeds* 1 or 2 with irregularly pitted surface; albumen uniform or nearly so.

Nearly all over the province ascending to 5,000 ft.

Flrs. 2-4. Fr. 12.

A variable species. The flowering forms may be mentioned.

(i) Var. **rufo-stellata** C. B. C. in F. B. I. Vern. *Arti-sam-phru*, Mik.; *Tembri-ching*, Naga; *Mithai-ju-phang*, Cach.—Leaflets with rounded base, denticulate-serrate with scattered rusty stellate hairs above, rusty villose beneath, when young; panicle densely rusty tomentose.

SIBSAGAR, CACHAR, KHASI HILLS.

(ii) Var. **serrata** C. B. C. in F. B. I. Vern. *Adi-tappor*, Miri. leaflets large, elliptic-lanceolate, dentate, serrate; base acute; panicle sparingly woolly—*F. B. I.*

N.-E. FRONTIER. The pith is sometimes used as cork for bottles.

2. **Brassaiopsis aculeata** Seem.

A very variable plant, usually a small tree armed with stout sharp prickles; branchlets thick; young shoots clothed with rusty brown tomentum and bristly hairs mixed. *Leaves* digitately 3-9 foliolate; common petiole 6-18 in. long. *Leaflets* 4-18 by 2-9 in., oblong, lanceolate or oblanceolate, acuminate, cuspidate-serrate or serrulate; base narrowed or acute, usually oblique, usually rounded on the outer half on the outermost pair, thin, glabrous above and thinly covered with pale stellate stiff hairs when mature; lateral nerves 8-14 on either half; petiolules up to 3 in. long. *Umbels* 1.2-1.7 in. across, racemed or solitary by abortion of lateral ones on the branches of a stout panicle. *Flowers* .25-.3 in. across, yellowish green; pedicels .3-.8 in. long, rusty, floccose, tomentose when young, arising from clusters of numerous hairy minute bracteoles. *Fruit* about .2 in. across, subglobose or broadly turbinate.

KHASI HILLS about 4,000 ft.—Wah Nongksep, etc.

Flrs. 1-3. Fr. 5-6.

3. **Brassaiopsis mitis** C. B. Clarke?

A small tree with broad based short prickles; young parts and inflorescence densely covered with bristly hairs. *Bark* greenish grey, green under the corky layers; blaze greenish white, soft. *Leaves* near the tops of branches; 6-18 in. long across, deeply palmately 9-13 fid; segments oblong-lanceolate,

or somewhat narrowly lanceolate, acuminate, serrate, membranous, upper surface membranous, glabrescent when mature, thinly stellate pubescent beneath; petiole 6-18 in. long with persistent weak bristles at the top, otherwise nearly smooth with age; stipules-lower half adnate, upper half free, lanceolate-subulate, about .5 in. long. *Umbels* in large panicles below the bunch of leaves; bracts on the panicle branches .7 in. long, lanceolate, caducous; pedicels up to .7 in. long. *Calyx* when young more or less stellate tomentose. *Petals* glabrous; disk large, subhemispheric. *Fruit* .2 in. across, globose (in Sikkim specimens in Calcutta Herbarium).

Myntang Valley—KHASI HILLS.

There is a single rather incomplete specimen in the Assam Herbarium (Sheet No. 6572); Watt No. 11470 Japvo, Naga Hills!

4. *Brassaiopsis palmata* Kurz.

A small sparingly branched prickly tree; young petiole, undersurface of leaves and inflorescence tomentose with rusty stellate scurf. *Leaves* up to 15 in. across, deeply palmately 7-9 fid, almost (palmatisect in younger plants); segments lanceolate to elliptic lanceolate, central largest, narrowed towards the base, remotely toothed or nearly entire; petiole up to 15 in. long, unarmed; stipules with adnate basal portion and free upper portion which is subulate-lanceolate. *Panicles* large with branches up to 10 in. long; bracts short, concave, acute with a broad base, deciduous; umbels racemed on the panicle branches, upper largest; lateral peduncles .4-1 in. long; pedicels up to .5 in. long; bracteoles numerous, up to .2 in. long, lanceolate, pubescent. *Calyx* rusty tomentose outside, distinctly 5 toothed. *Fruit* crowned by the short style, ellipsoid, or when 2-seeded .5 by .4 in., turbinate, ellipsoid.

Dulong river, LAKHIMPUR.

Eri silk worms are fed on the leaves.

A flowering specimen collected by Mann in Nov. 78. in Khasi Hills at 4,000 ft., (locality not known) is probably this species. The leaf is almost digitately pedate with 7 segments with petiolules up to .7 in. long, joined together by a narrow rib at the apex of the petiole, probably the specimen was collected from a young plant?

Flrs. 3-4.

5. Brassaiopsis Hookeri C. B. Clarke.

A small prickly tree; young shoots, inflorescence, under-surface of leaves and petioles stellate woolly tomentose. *Leaves* digitately 3-5 foliolate; leaflets 4-18 in. long, oblong-lanceolate, acuminate or serrate or nearly entire; main lateral nerves about 8 on either half, deeply sunk above; petiolules .5-1 in. long. *Umbels* .6-1 in. across, in simple panicles; pedicels .25-.3 in. long. *Flowers* .2 in. across. *Calyx* lobes short. *Petals* scruffy-stellate.

KHASI HILLS—Nunklow—about 4,000 ft.,—J. D. Hooker.

There are no specimens from our area in the Calcutta Herbarium.

Brassaiopsis Griffithii C. B. Clarke.

A small tree about 20 ft. high; bark grey brown with short recurved thorns, pith large. *Leaves* palmatifid, 15-24 in. across, 7 lobed, half-way down, pubescent along the nerves, otherwise glabrous, cuspidate-serrate, sometimes doubly so, thinly coriaceous, pubescent along the nerves, otherwise glabrous; lobes ovate acute at the apex; petiole 12-15 in. long, ribbed. *Umbels* 1.2-1.8 in. across, borne on long axillary panicles; pedicels .6-.8 in. long, filiform, subscabrid; buds .2 in. across. *Calyx limb* distinctly toothed; disk conical. *Fruit* globose, .25-.3 in. across, crowned by the calyx teeth and the short remains of the style.

DUFFLA HILLS, Lister! Abor country—Burkill!

Brassaiopsis hispida Seem.

A shrub armed with prickles on the stem petiole and inflorescence; bristles numerous, close, stout and conical more or less deflexed, compressed and conical prickles and bristles mixed, the latter often falling off with age. *Leaves* 10-12 in. across, simple, deeply digitately 7-9 lobed; segments oblong-lanceolate; margins spinose serrate, glabrous above, thinly hispidulous or glabrescent beneath; petioles 8-16 in. long, stipules with two free linear points. *Flowers* about .25 in. across in umbels arranged in large panicles; panicle branches 3-4 in. long; bracts spatulate or lanceolate, tawny tomentose, up to .3 in. long; pedicels .5-.7 in. long, hispidulous. *Calyx* densely tomentose when young; petals about .15 in. long, lanceolate, at first scurfy-tomentose, glabrescent with age. *Fruit* not seen.

MISHMI HILLS. Griffith!

Differs from *B. mitis* by the numerous prickles on the stem, spinose serratures of the leaves and more conspicuous nerves.

Flrs. 3.

9. MACROPANAX Miq.

Small unarmed trees. *Leaves* digitate, 3-5 foliolate. *Leaflets* entire or serrate, glabrous; stipules connate within the petioles or 0. *Flowers* polygamous, pentamerous, umbelled in large panicles; pedicels articulate under the flowers. *Calyx* 5-toothed; petals valvate; stamens 5. *Ovary* 2-celled; styles united, persistent; disk large, often wider than the top of the fruit, broadly conical. *Fruit* striated or ribbed, but not angled. *Seeds* dorsally compressed, albumen rugose or ruminated.

Panicles	rusty tomentose.	1.	<i>M. oreophilum.</i>
Panicles	glabrous.	2.	<i>M. undulatum.</i>

1. *Macropanax oreophilum* Miq. Vern. *Pani-kesuri*, Ass.; *La-tong-krong*, Kh.; *Diengiarasi*, Synt.

A small or middle-sized evergreen tree. *Bark* grey, warty and somewhat rough, about .4 in. thick; blaze yellowish, turning brown aromatic; common petiole 5-14 in. long; base dilated and stem clasping; leaflets 3-6 by 1-3 in., lanceolate to elliptic-lanceolate-acuminate, denticulate or serrulate, glabrous or nearly so; main lateral nerves about 5-8 on either side, arcuate; petiolules .25-3 in. long. *Panicles* rusty-stellate tomentose; umbels racemed on the branches, up to .7 in. across, terminal largest, lower smaller, often deciduous; bracts small, narrow-lanceolate, acuminate, caducous, pedicels .1-.2 in. long, elongating in fruit, slender, minutely stellate pubescent; bracteoles few, deciduous; disk large, broadly conical. *Fruit* about .25 in. long, ovoid, crowned by the persistent style.

KHASI HILLS up to 4,000 ft., SIBSAGAR, Barpathar, Naojan, GOALPARA, Borjhar.

Flrs. 9-10. Fr. 2-3.

2. *Macropanax undulatum* Seem. Vern. *Dieng-jurasi*, *Dieng-la-ronsei*, Kh.; *Bon-keseru*, Ass.; *Phumber*, Lush.; *Thing-bo*, Mik.; *Sambrang*, Garo; *Mithaiju*, Cach.; *Thing-rem-te*, Kuki.

A small tree. *Bark* nearly smooth, pale grey, nearly white to greenish grey with large prominent raised lenticels;

blaze cream-coloured or white with pleasant mango-like smell. *Common petiole* 3·5-11 in. long. *Leaflets* 2·5-5 by ·7-2 in., oblong, elliptic or narrow-lanceolate, acuminate, margins entire or with fine distant teeth, glabrous, shining above, membranous; lateral nerves arcuate; petiolules ·3-2 in. long. *Panicle* glabrous, ascending; bracts caducous; pedicels ·1-·2 in. long, elongating in fruit. *Fruit* as in the last species.

Practically all over the province, ascending to 3,000 ft., in the KHASI HILLS.

The gum exuding from wounds is also aromatic.

Flrs. 8-9. Fr. 2.

10. TREVESIA Vis.

Trevesia palmata Vis. Vern. *Dieng-la-kor*, *Dieng-soh-kynthur*, Kh.; *Bhotola*, Ass.; *Chena-thong*, Garo; *Tung-jang-ko*, Kuki; *Khim-thao-ji-phang*, Kach.

Generally an unbranched tree armed with incurved short sharp prickles; young shoots rusty pubescent and very prickly. *Leaves* 12-24 in. across, roughly orbicular in outline, deeply palmatifid or palmatisect in young plants, sometimes digitate; lobes acuminate, serrate or irregularly, often unequally pinnately lobed, glabrous or nearly so, subcoriaceous; common petiole 12-24 in. long, densely prickly at the sheathing base, prickles few, absent upwards; stipules adnate. *Flowers* polygamous, white, ·6 in. across in umbels, which are corymbosely arranged in large deciduously rusty tomentose, terminal panicles; bracts about 1 in. long; pedicels 1·25-1·5 in. long. *Calyx* rusty-pubescent outside; limb free, membranous, undulate or unequally toothed. *Petals* 8-12, fleshy valvate, reflexed or cohering and falling off in a cap. *Stamens* and ovary cells as many as petals, the former erect. *Disk* flat; styles united in a short thick column. *Fruit* fleshy, ·5 in. across, crowned by the persistent style, glabrate; seeds compressed; albumen uniform.

KAMRUP, N. CACHAR HILLS, GARO HILLS, KHASI HILLS, ascending to 2,500 ft.

Flower buds are said to be eaten cooked by the Garos.

Flrs. 2-4. Fr. 5.

11. TUPIDANTHUS Hk. f. & T.

Tupidanthus calyptratus Hk. f. & Th. Vern. *Dieng-la-tyng-kung*, *Ja-lang-kum*, *Dieng-la-tyng-krong*, *Dieng-ja-la-tympoh*, Kh.

A small straggling or ultimately scandent tree, often epiphytic. *Bark* grey or greyish-brown, rough; blaze nearly white to dull-brown; young parts clothed with deciduous brown floccose tomentum. *Leaves* digitately 7-10 foliolate; common petiole 8-18 in. long; stipules connate within the petiole. *Leaflets* 4-9 in. by 1.2-3 in., oblong or oblong-lanceolate, shortly acuminate, narrowed at the base, entire, leathery, shining above; main lateral nerves subparallel, up to about 25, rather indistinct, with many intermediates; petioles .7-2.5 in. long. *Flowers* polygamous (?) in few flowered umbels arranged in panicles, which are often sub-umbellate or corymbose with stout branches; peduncles 1.5-2.7 in. long with leathery persistent concave bracts at the base, about 1 in. long; buds subglobose, .6-.8 in. across; pedicels stout, .5-1.2 in. long. *Calyx-tube* leathery, truncate or nearly so. *Petals* connate, falling off in a cap. *Stamens* many, about 50-70 (F. B. I.); filaments somewhat stout. *Ovary* many celled; stigmas many, sessile, radiating. *Fruit* succulent, 1-1.5 in. across; seeds numerous, thinly compressed, about .2 in. long.

KHASI HILLS, 3-5,000 ft.

Wood yellowish, hard for the family. The growing shoots abound in an aromatic resinous gum.

Flrs. 12-2. Fr. 4.

Fatsia papyrifera Benth. The Chinese rice paper plant. A shrub or small tree. *Leaves* large, up to 19 in. across, palmate, 5-7 lobed, felted with greyish stellate tomentum beneath; petioles long. *Flowers* in paniced umbels.

Cultivated in Shillong.

The Chinese rice paper is manufactured from slices of the pith.

FAM. 69. CORNACEÆ.

Trees or shrubs. *Leaves* extipulate, opposite or alternate, simple, entire or occasionally angled or lobed or serrate. *Flowers* small, regular, bisexual or unisexual, in axillary cymes, panicles or heads. *Calyx-tube* adnate to the ovary; limb persistent, truncate or 4-5 (sometimes many) lobed; lobes valvate or open in bud. *Petals* 4-5, sometimes 0, imbricate or valvate. *Stamens* inserted with the petals at the base of the epigynous disk, and usually equalling them, rarely twice or thrice as many. *Ovary* inferior, 1-4 celled, crowned by a usually fleshy sometimes inconspicuous disk; style simple; stigma capitate or divided; ovule usually solitary, rarely 2, pendulous from the apex of the cell. *Fruit* generally drupaceous with a 1-4 celled stone, less often with 2 pyrenes. *Seed* with copious albumen; cotyledons generally thin, leafy.

Flowers 2 sexual :—

1. CORNUS Linn.

Trees or shrubs. *Leaves* opposite, rarely alternate, entire. *Flowers* bisexual, white or yellow in branched usually dichotomous cymes or in involucrate heads. *Calyx-teeth* 4, usually small. *Petals* 4, oblong valvate. *Stamens* 4; anthers oblong. *Ovary* usually 2-celled with a solitary pendulous ovule in each cell; stigma capitate, sub-2-lobed. *Fruit* drupaceous, usually ovoid; endocarp hard, 2-celled, 2-seeded. *Seeds* oblong, compressed; albumen fleshy, cotyledons foliaceous.

Leaves opposite :—

Flowers in compound cymes; drupes free :—

Leaves narrow, oblong or lanceolate, pale green beneath. 1. *C. oblonga*.

Leaves broad-ovate or ovate-elliptic, whitish-grey beneath. 2. *C. macrophylla*.

Flowers in dense globose heads surrounded by large yellow or white petaloid bracts; drupes confluent. 3. *C. capitata*.

Leaves alternate. 4. *C. controversa*.

1. *Cornus oblonga* Wall. Vern. *Dieng-soh-long-law-synrang*, Kh.

A small tree. *Bark* reddish or dark-brown, lenticellate, rather rough outside, light red or cinnamon with pale streaks; young shoots minutely adpressed pubescent. *Leaves* sometimes a few alternate, 1·6 by ·7-1·5 in., oblong or lanceolate-acuminate, subcoriaceous, glabrescent above or minutely adpressed hairy on both side, pale and somewhat glaucous beneath; lateral nerves 3-7 on either half, usually with tumid glands on the axils and sometimes on the axils of the smaller nerves; base narrowed; petioles ·2-·6 in. long. *Cymes* branched, pubescent. *Flowers* pale-yellowish white. ·3 in. across. *Calyx* short, campanulate, slightly hairy. *Petals* about ·2 in. long, oblong, nearly glabrous outside. *Disk* and anthers purple. *Drupe* about ·3 in. long, ovoid, black when ripe, crowned with the remains of the calyx tube and the disk; stone hard.

KHASI HILLS, 4-6,500 ft.

Flrs. 9-12. Fr. 7.

2. *Cornus macrophylla* Wall. Vern. *Dieng-phait*, Khasi.

A medium sized deciduous tree. *Bark* rather rough grey to brown or reddish-brown outside, exfoliating in small polygonal or quadrangular plates in old stems; blaze white or pinkish, soon turning dark brown on exposure. *Leaves* rarely alternate, 8·5-6 by 1·5-4 in., ovate or ovate-elliptic, acuminate, sometimes lanceolate, subacute or sometimes cuneate, often unequal, glabrescent above, lower surface whitish-grey and adpressed pubescent; main lateral nerves

prominent beneath, 5-8 on either half, arcuate, joined by slender sub-parallel tertiaries; base rounded; petiole .5-1.7 in. long. *Flowers* yellowish-white or white in terminal much branched compact pubescent compound cymes arranged on corymbose panicles 2-4 in. across. *Calyx* .1 in. long, urceolate, clothed with white adpressed hairs. *Petals* .2 in. long, strap-shaped, minutely hairy outside. *Disk* prominent, annular. *Drupe* about .2-1 in. long, globose, crowned by the remains of the disk and the calyx tube, black when ripe.

KHASI HILLS, 5-6,000 ft.

Wood light pinkish white, but splits badly in seasoning, wt. 45 lbs. per c. ft.

Flrs. 4-5. Fr. 6-7.

Form a—(Sheet 5868)—A tree attaining 50 ft. *Leaves* alternate, lanceolate to elliptic-lanceolate, acuminate; base very cuneate; petioles up to 3 in. long, often reddish. May prove to be a good variety or subspecies but further examination in the field is necessary before separating it.

3. *Cornus capitata* Wall. Var. khasiana. Vern. Dieng-soh-japhon, Khasi.

A small sized deciduous tree. *Bark* thin brownish grey or almost black, rather rough outside; blaze brown or reddish with deeper coloured streaks; young shoots with short adpressed hairs. *Leaves* approximate at the ends of branches, 2-4 by 1-1.7 in., oblong or elliptic, narrowed at both ends, coriaceous, pale beneath, glabrescent or thinly pubescent with adpressed hairs, specially beneath, nerves 3-5 on either side, arcuate; petiole .5 in. long, channelled with a broad base. *Flowers* .15 in. across, closely packed in globose heads, about .5 in. across, each of which is surrounded by 4 yellowish or white oblong-obovate, petaloid bracts, about 1-1.5 by .6-1 in. *Calyx-teeth* reflexed. *Petals* minute, oblong. *Fruits* coalescing into a red succulent globose head of drupes 1-2 in. across; stones hard, compressed, angular, about .15 in. long.

KHASI & JAINTIA HILLS—not common—5-6,000 ft.

The fruit is edible.

Flrs. 4-6. Fr. 9.

Scarcely separable from the type, which approaches the more hairy forms of our variety very closely.

4. *Cornus controversa* Hemsl. in Kew Bulletin 1909. P. 332.

A small tree; branchlets slender, brown, puberulous, glabrescent. *Leaves* alternate or subopposite, 3-6 by 2-3 in., ovate or elliptic to orbicular-acuminate; base rounded to broadly cuneate, membranous, usually or with few adpressed hairs above when young, glabrescent with age, glaucous beneath, sparsely adpressed pubescent with hairs fixed by the middle; primary nerves on either side, usually 5-8, conspicuous, arcuate; petiole slender, 1-2·7 in. long. *Cymes* compound, terminal, lax, up to 5·2 in. across; branches puberulous. *Flowers* white, about 4·5 in. across. *Calyx-tube* pilose with silvery hairs. *Petals* narrowly oblong, subobtus. *Stamens* slightly exceeding the petals. *Style* cylindric, glabrous. *Drupe* globose, 25-3 in. across, glabrescent, thinly adpressed-pubescent, apex excavate; stone 2-celled, longitudinally furrowed.

KHASI HILLS, 4-5,000 ft. MANIPUR extending to SIKKIM.

Closely allied to *C. macrophylla* from which it differs mainly by its alternate leaves. It may be regarded as the eastern form of the latter—never having been collected hitherto west of Sikkim.

Flrs. 4-5. Fruit 7.

2. ALANGIUM Lamk.

Trees or shrubs, sometimes spinous. *Leaves* alternate, entire or lobed, often unequal at the base. *Flowers* 2-sexual, in axillary cymes or fascicles; pedicels jointed. *Calyx-limb* 5-10 toothed or truncate. *Petals* 5-10. *Stamens* as many as the petals or twice or three times as many; filaments hairy at the base; anthers very long. *Ovary* inferior, 1-2 celled; stigma capitate. *Fruit* baccate, crowned by the calyx tube. *Seed* oblong.

Ovary 2-celled; ovules 1 in each cell.	.. 1.	<i>A. begoniæfolia</i> .
Ovary 1-celled; ovules 2 in each cell.	.. 2.	<i>A. barbata</i> .

1. *Alangium begoniæfolia* Roxb. Syn. *Marlea begoniæfolia* Roxb. Vern. *Dieng-mylliat-lap*, *Dieng-sla-doh*.

Synt.; *Dieng-sla-umpai*, *Dieng-sikhor-khla*, *Dieng-iang-sat-bieit*, *Dieng-sohkympe*, Khasi; *Phagrang*, Garo; *Chika-maruli*, *Chagali-gach*, *Bogamarulia*, *Bodi-dhili*, *Kodal-kania*, *Chorai-hara*, *Bangalmani*, *Chika-amrulia*, Ass.; *Marli*, Sylh.; *Taktong*, *Taktar-ragrang-asing*, Miri; *Rompab-arong*, *Thengjoy-arong*, Mik.; *Musa-mogon*, Mech.; *Bon-khan-khlu*, *Chersem-phang*, Kach.; *Thing-moi-te*, Kuki; *Sangkong-changne*, Duff.

A small rather straggling tree with grey or brown nearly smooth often warty bark; blaze white with green edges; young parts grey or brown silky, glabrous with age. *Leaves* simple, alternate, bifarious, 3-10 in. long, very variable in width, ovate-acuminate to suborbicular or broadly subquadrate, entire, angled or lobed; lobes often acuminate, glabrous above when mature, undersurface more or less pubescent along the nerves and with tufts of hair on the nerve axils, thin but tough; basal nerves 4-8; lateral nerves excluding the basal up to 4 on either half, all joined by intramarginal loops and by subparallel somewhat distant tertiaries; base usually oblique, truncate, cuneate or deeply cordate; petiole 1-1.5 in. long, grooved on the inner side, glabrescent or pubescent. *Flowers* white or cream coloured, .6-.9 in. long, bracteate, in axillary dichotomous usually compound and pedunculate cymes not exceeding the leaves; bracts linear; pedicels up to .2 in. long, pubescent, jointed towards the top. *Calyx* minutely toothed, covered with long scattered hairs. *Petals* 6-8, strap-shaped, puberulous. *Stamens* as many as and alternating with the petals; filaments short, covered with long silky hairs; anthers about .3 in. long and much exceeding the filaments; disk hemispheric. *Ovary* 2-celled; style up to .5 in. long. *Drupe* ovoid, dark purple when ripe, obscurely ribbed, about .3-.5 in. long, crowned by the calyx limb; stone 2-celled, 2-seeded.

Throughout the area ascending to about 4,000 ft. in the KHASI HILLS.

Flrs. 3-6. Fr. 6-9.

2. *Alangium barbata* R. Br. Vern. *Sal-biholom*, Syl.

A straggly small tree or large shrub with greyish-brown smooth bark; young parts, inflorescence and petiole shaggy

with spreading golden hairs which turn brownish with age. *Leaves* 5-9 by 3-4-5 in., obliquely ovate, acuminate, about 5-6 nerved, sometimes angled or obscurely lobulate, entire, membranous, thinly pubescent with rather long brownish hairs above, more densely beneath specially along the nerves; lateral nerves 5-7 on either half, nearly straight, more or less looping near the margin, joined by sub-parallel tertiaries; base subcordate; petioles .9-1.5 in. long. *Cymes* shorter than the leaves, dichotomous; bracts linear. *Calyx* small, shaggy with spreading golden hairs; teeth minute, lanceolate. *Petals* 5 or 6, linear oblong, hairy outside, .3-.5 in. long. *Filaments* short, hairy. *Disk* prominent, rather elongate, with as many grooves (at least in dry specimens) as stamens; style glabrous; stigma subclavate, 2-fid. *Drupe* .3-.4 by .2-.25 in., ovoid, thinly pubescent or glabrescent, slightly striated.

SYLHET, CACHAR—Prazer, Deimara—A. C. Chatterji.

Flrs. and Fr. 12-5—most of the year?

Alangium Lamarckii Thwaites. Vern. *Akola*, Hind. A deciduous shrub or small tree; bark pale-brown. *Leaves* 2-5-6 by .7-2 in., alternate, simple, narrow oblong, entire. *Flowers* fascicled. *Calyx-lobes* 6-10, triangular, minute. *Corolla* woolly outside; petals 5-10, reflexed, linear. *Stamens* up to 30; filaments plumose at the base. *Ovary* 1-celled. *Drupe* .5-.75 in. long, globose or ellipsoidal.

Dhodar Ali (Sibsagar). Introduced from Bihar.

Flrs. 3-4. Fr. 5-8.

3. MASTIXIA Blume.

Mastixia arborea C. B. Clarke. Vern. *Bolong-jigri*, Garo.

A large tree. Bark brown or dark-brown with horizontal wrinkles, about .5 in. thick, tan brown, fibrous inside. *Leaves* alternate or opposite, 3-8 by 1-5-3-5 in., obovate-oblong or elliptic, bluntly, usually abruptly-acuminate, entire, narrowed at the base, glabrous, pale beneath; main lateral nerves 5-8 on either half, arched; nervules delicately reticulated between; petiole .5-1.5 in. long, minutely pubescent when young. *Flowers* green, 2-sexual, .25 in. across, in terminal pubescent panicles of cymes; bracts

about .15 in. long, triangular, acute; pedicels very short or 0, jointed below each flower, 2 bracteolate. *Calyx* campanulate, adpressed pubescent outside, .15 in. long; teeth 5, short, triangular, acute or lanceolate. *Petals* 5, valvate in bud, .1-.15 in. long, ovate acute, leathery, adpressed silky on both faces, more densely outside, with shallow ridge in the middle inside. *Stamens* 5, alternating with the petals. *Disk* fleshy, yellow, with several up to about 10 radiating grooves at the top. *Ovary* inferior, 1-celled, with a solitary ovule, pendulous from the wall of the ovary near its summit; style short, with a somewhat dilated base, obscurely ribbed. *Drupe* purplish-green, ovoid-ellipsoid, about 1-1.2 in. long; endocarp intruded laterally on one side. *Seed* ellipsoid.

LAKHIMPUR, GARO HILLS.

Flrs. 3-4.

Mastixia rostrata Bl. A shrub or a small tree. *Leaves* 2.5-5 by 1-3 in., subopposite or alternate, lanceolate or oblong, acute or acuminate, glabrous; lateral nerves 6-7 on either half, conspicuous underneath; midrib depressed above, prominent beneath; petiole .4-.6 in. long. *Corymbs* somewhat branched, lax, few flowered. *Stamens* 3. *Fruits* about 2 in. long, elongate-ovoid.

AKA HILLS (15160).

Aucuba himalaica Hk. f. A large stout shrub or small tree, evergreen; young parts hairy. *Leaves* opposite, 4-8 by 1.2-2 in., lanceolate, long, acuminate, distantly serrate or denticulate; petiole .6-1 in. long. *Flowers* purplish, diœcious, in axillary hairy paniced fascicles. *Calyx* 4-toothed. *Petals* lanceolate, valvate. *Stamens* 4; disk fleshy, quadrangular. *Calyx-tube* ovoid. *Ovary* 1-celled; stigma capitate; style short. *Berry* ellipsoid, crowned with the calyx, scarlet or orange, .5 in. long (Brandis).

AKA HILLS (15159), MANIPUR, BHUTAN (5,900 ft.).

4. NYSSA Linn.

Nyssa sessiliflora Hk.f. Vern. *Gaharichopa*, Ass.

A large tree; young parts silky pubescent. *Bark* grey or brown, rather rough and warty with lenticels, about 1 in. thick; blaze light brown, mottled with darker brown, turning dirty brown on exposure. *Leaves* alternate, collected at the ends of the branches, 4-9.5 by 1.5-3 in., elliptic to

elliptic-ovate or oblong to elliptic lanceolate, acute or acuminate, narrowed or cuneate at the base, entire, membranous, closely punctate on both surfaces, glabrescent above, glaucous and thinly pubescent specially along the midrib and the nerves beneath; lateral nerves 13-17 on either half; petiole 1-1.5 in. long. *Flowers* green, unisexual, sessile, collected together in many bracteolate dense globose pedunculate heads; peduncles 1-2 in. long, axillary, *Male heads*: *Peduncles* sometimes bearing few flowered clusters below the head, less often branched. *Calyx-tube* solid, pedicel-like, about .2 in. long, pubescent. *Calyx-teeth* 5, rarely 6-7, short, subacute or rounded, ciliate. *Petals* as many as calyx lobes, imbricate in bud, elliptic or elliptic-oblong, silky pubescent outside, except on the margins. *Stamens* 10, alternately long and short. *Disk* fleshy, grooved, opposite the insertion of the stamens. *Female heads* on stouter and shorter peduncles than those of the male heads. *Calyx* campanulate, about .1 in. long; limb 5 toothed, deciduous. *Petals* 0; staminodes 0. *Ovary* 1-celled; ovule solitary, pendulous; style cylindric, short. *Berry* ovoid, glabrous; apex pointed, about .5 by .3 in.; seed with copious albumen.

LAKHIMPUR, SIBSAGAR, N. CACHAR HILLS, SYLHET, KHASI HILLS up to 3,000 ft.

The timber is yellowish, fine grained and takes a good polish, weighing about 39 lbs. per c. ft. It is an important building timber in the Districts where it grows. Commercially it is known as "gohorisopa"—a name which really applied to *Magnolia Griffithii*—probably from a superficial resemblance of the timber to those of "sopas" with which it is often substituted.

The tree coppices well.

Flrs. 4. Fr. 5. Nearly deciduous but never quite leafless.

C. B. Clarke in F. B. I and Brandis state that the heads have few female flowers and many male flowers. All the sheets in the Assam herbarium have unisexual flowers.

N. B.—*Nyssa javanica* Wenger also occurs in the area of the Flora.—R. N. De.

5. HELWINGIA Willd.

Helwingia himalaica Hk. f. & T.

A small glabrous usually epiphytic shrub. *Leaves* alternate, 2-6 by .7-1.5 in., lanceolate, long acuminate,

cuspidate-serrate, membranous; lateral nerves about 6 on either half, much arched; petiole .5-1.5 in. long, slender. *Flowers* minute, 1-sexual, in sessile umbels borne on the midrib of leaves about $\frac{2}{3}$ rd of its length from the base or on the midrib of spatulate-oblong sessile bracts; pedicels slender, about .1 in. long. *Male umbels* with more numerous flowers. *Calyx* truncate. *Petals* and stamens 3-5. *Ovary* 3-4 celled; style combined at the base. *Fruit* sessile or nearly 1-3 together on the same leaf, .25-.3 in. long, red when ripe, 2-3 celled with furrows between the carpels. *Seeds* rugose, compressed; embryo minute in copious albumen.

KHASI HILLS—Mawphlang, C. B. Clarke! Shillong, C. B. Clarke.

Flrs. 4-5. Fr. 6-9.

Helwingia lanceolata Watt. Mss. in Herb. Cal. is hardly a different species. It is a smaller shrub with narrower leaves and fewer flowered umbels.

MANIPUR, NAGA HILLS.

ADDENDA.

Since the drafting of the original manuscript of this Volume, about eight years ago, a considerable number of literature has been published which contains description of new species and new records. It would have been very desirable to include and record all of them here, but as the printing of the present work was in progress, it has not been practicable to do so.

Desmodium rufihirsutum Craib. Vern. *Machrukimei*, Garo. (Leguminosæ-Papilionatæ).

An erect under-shrub. *Leaves* 6-12 in. by 3-8 in., ovate elliptic or elliptic, entire, ciliate, acuminate, rigidly chartaceous; lateral nerves 5-7 on either half; base rotundate, stipules subulate. *Racemes* dense flowered; peduncle short; flowers blue (Mr. N. E. Parry). *Calyx-tube* .05 in. long. *Vexillum* obovate, .3 in. long; *alæ* .12 in. long; *carina* .2 in. long; *ovary* .16 in. adpressed, pubescent; *style* .1 in. long.

GARO HILLS (Baghmara 500 ft.) MANIPUR.

Flrs. 11.

(Kew Bulletin 1936, p. 280).

Desmodium oblongum Wall (*Vide* page 61 of this Volume).

Also NAGA HILLS (3,000 ft.) S. LUSHAI HILLS (5,6,000 ft.).

Flrs. & Fr. 8-12.

(Kew Bulletin 1932, p. 198).

Potentilla microphylla Don. (Rosaceæ.)

A densely tufted dwarfish under-shrub with perennial woody root-stock, very variable in habit. *Leaflets* numerous,

small, oblong or rounded; petiole slender; stipule membranous. *Stamens* 30-40. *Achenes* in globose heads.

DELAIR VALLEY (4000 ft.).

Flrs. & Fr. 6-9.

(Kew Bulletin 1932, p. 348., F. B. I. p. 352).

Potentilla monanthes Lindl. Var. *sibthorthoides* Hk. f.

"A flat rosette plant on Alpine slopes"—stem filiform, prostrate. *Leaves* radical, .06-.25 in. broad. *Flowers* .25 in. across, axillary and sub-terminal; pedicels short; bracteoles narrow. *Calyx* pubescent, narrow. *Petals* bright-yellow. *Achenes* minute, numerous; receptacles globose, villous.

DELAIR VALLEY (13,000 ft.).

Flrs. & Fr. 7-9.

(Kew Bulletin 1932, p. 348., F. B. I. p. 358).

Sorbus foliolosa Spach. (Rosaceæ.)

A shrub 6 in. tall. *Leaflets* 7-11, 6.2 by 1.56 in. narrow, oblanceolate, long acuminate, entire, coriaceous, glabrous; lateral nerves 7-9, conspicuous; nervules obscure; base narrow, cuneate; petiolule .4 in. *Panicles* 8.2 in. long; flowers pentamerous. *Ovary* 5 locular.

Flrs. 9.

The following species of this genus are also recorded from Assam.

Sorbus Expansa Kœhne.

A shrub or small tree.

DELAIR VALLEY (6000 ft.).

(Kew Bulletin 1932, p. 348).

Sorbus Wenzigiana Kœhne.

Flowers reddish crimson.

DELAIR VALLEY (12-13,000 ft.).

Flrs. 6.

(Kew Bulletin 1932, p. 348).

Photinia Wardii C. E. C. Fischer. (Rosaceæ).

A large climber; branchlets purplish brown. *Leaves* 3·9 by 1·5-3·5 in., elliptic, acute, cuspidate, entire, coriaceous, almost glabrous; midrib impressed above, prominent below; lateral nerves 10-14 on either half; petiole 1·2 in. long, flocculant-tomentose when young; stipules caudate-lanceolate, early deciduous, tomentose. *Inflorescence* brachiate; corymbs somewhat flat-copped; flowers cream, very fragrant. *Calyx* glabrous, ·1 in. long; tube funnel-shaped; segments 5, ovate, obtuse. *Petals* 5, oblong or sub-orbicular, obtuse, ·2 in. long, glabrous. *Stamens* about 20, glabrous, slightly bigger than the petals. *Ovary* densely villous, 2-celled; style 2, free, glabrous. *Fruit* not seen.

Flrs. 4.

(Kew Bulletin 1936, p. 281).

Saxifraga brachypoda Don. (Saxifragaceæ).

A small herb. *Stem* simple. *Leaves* about ·5 in. long, linear-lanceolate, half amplexicaul. *Flowers* solitary, terminal. *Calyx-segments* ovate, acute. *Petals* golden yellow, much exceeding the calyx.

DELAIR VALLEY (12,13,000 ft.).

Flrs. & Fr. 7-10.

(Kew Bulletin 1934, p. 91).

Saxifraga diversifolia Wall.

Herb, root-stock perennial, "stem leaves and inflorescence covered with crimson glandular hairs". *Radical leaves* large, ovate, sub-cordate, long petioled; cauline ·8 in, ovate or broadly oblong. *Inflorescence* corymbose; flowers "bright yellow, closely spotted with ochre" (K. Ward). *Calyx* segments ovate, oblong, reflexed. *Petals* with 4-stalked glands at the base, much larger than the calyx segments. *Capsule* ovate-oblong; seeds angular; testa somewhat plaited.

DELAIR VALLEY (11,12,000 ft.).

Flrs. 8-10. Fr. Cold season.

(Kew Bulletin 1934, p. 91).

Saxifraga hispidula Don. Var. *Doniana* Engl.

A small herb in clumps; root-stock perennial and often woody; stem hispid. *Leaves* .3-.5 by .1 in., ovate-oblong, acute. *Flowers* bright-yellow. *Style* short. *Seed* sub-trigonus.

DELAI VALLEY (11,-12,000 ft.).

Flrs. 7-10.

(Kew Bulletin 1934, p. 91).

The following species is also recorded from the region of the "Flora".

Saxifraga sarmentosa Linn.

DELAI VALLEY (6,-7,000) ft.).

Flrs. 4.

(Kew Bulletin 1934, p. 91).

Pottingeria acuminata Prain. (Saxifraceæ).

A small shrub. *Leaves* ovate-lanceolate, rigidly coriaceous, glabrous 5-nerved at the base. *Flowers* in lateral cymes; capsule septicidally 3-valved; the 3 placentæ remain attached to the style when the capsule opens. (Brandis p. 299).

NAGA HILLS.

Flrs. 3.

(Kew Bulletin 1937, p. 474).

Sonerila khasiana C. B. Clarke. (Melastomaceæ).

Small herb with fibrous roots. *Stem* puberulous. *Leaves* fascicled at the apex, .7 by .2 in. ovate, ciliate, more or less crenate-serrate, usually acute with scattered bristly hairs above, rather more hairy beneath specially on the nerves; palmately 5-nerved with 2 more nerves arising a little higher and curving into the apex; base cordate; petiole .6-2.2 in. long, slender. *Inflorescence* terminal; flowers 1-7 in an umbel; bracteoles minute, linear-ensiform. *Calyx* .2 in. long, narrowed, turbinate, more or less trigonus. *Petals* mauve, broadly ovate, acute. *Stamens* equalling the petals;

filaments slender; anthers yellow. *Capsule* narrowly oblong, .3 in. long. *Seeds* minute, rather finely papillose, oblong.

KHASI & JAINTIA HILLS (3,500 ft. Mamloo, Jaraïn).

LUSHAI HILLS (4,000 ft.).

Flrs. 9. Fr. 9-11.

(Kew Bulletin 1932, p. 199).

***Sonerila tenera* Royle.**

Stem weak. *Leaves* .25-.5 in. long, ovate, nearly entire, laxly hairy; petiole about .1 in. *Flowers* pale-pink. *Calyx* puberulous; teeth ovate, acute. *Petals* .1 in. long, rose-purple. *Capsule* trigonous, funnel-shaped, .25 in. long; seeds ovoid, smooth.

LUSHAI HILLS (3,400 ft.).

Flrs. 11.

(Kew Bulletin 1932, p. 199., F. B. I. p. 530).

***Sonerila villosa* C. E. C. Fischer.**

Small herb with creeping rhizome. *Stem* more or less white-villous. *Leaves* crowded at the apex of the stem, 1.4 by .8 in., broadly ovate to orbicular, rounded or narrowed and obtuse or sub-acute, minutely crenate-serrate; upper surface with scattered crisped hairs from bulbous bases; lower more softly hairy, more densely so on the nerves; palmately 5-nerved; base shallow-cordate; petiole 1.5 in. long, slender, more or less white-villous. *Inflorescence* terminal; flowers solitary or 2-3; bracts 1-3, minute. *Calyx* .16 in. long, narrowly turbinate, white, villous; teeth small, triangular, acute. *Petals* more or less elliptic, .25 in. long. *Stamens* slightly exceeding the petals; anthers alternate, deep yellow. *Capsule* .25 in. long, smooth, truncate campanulate.

LUSHAI HILLS (2,500-4,000 ft.).

Flrs. & Fr. 7-8.

(Kew Bulletin 1932, p. 200).

***Begonia Wengeri* C. E. C. Fischer. (Begoniaceæ).**

Herb with small fibrous root stock. *Leaves* .7-2.2 in. in diameter, rotund-ovate, inequilateral, acute, simply or doubly

crenate with cilia between the crenatures and sometimes at their apices, dark green and sparsely hairy above, pale below; 7-8 nerved; base shallow-cordate; petiole slender, 2 in. long, hairy; stipule ensiform, acuminate. *Female-flowers* perianth segments 4, white; outer broadly ovate-obtuse; inner smaller, sub-acute. *Stamens* about 12, twisted below. *Male-flowers* perianth segments 5, white. *Ovary* trigonous .16 in. long; styles 4, shortly united at the base; stigma densely fuscous-hairy. *Capsule* 3-winged, .4 in. long; seeds brown, minute, oblong-ellipsoid.

LUSHAI HILLS (1,500-2,000 ft.).

Flrs. & Fr. 8.

(Kew Bulletin 1932, p. 200).

The following species are also recorded from Assam; but for want of specimens and literature could not be fully described.

Uraria hispida Schindl. (Leguminosæ-Papilionateæ).

A shrub. *Flowers* pink.

NAGA HILLS (Themokedema, 4,500 ft.) (N. L. Bor, 6173).

Flrs. 9.

(Kew Bulletin 1937, p. 474).

Pueraria Yunnanensis Franch. (Leguminosæ-Papilionateæ).

A climber in thickets and clearing along the edge of the jungle. *Flowers* white, tipped with violet.

LOHIT VALLEY (3,500 ft.).

Flrs. 10.

(Kew Bulletin 1932, p. 198).

Rubus pectinarius Focke. (Rosaceæ).

A creeping plant with erect flowering shoots forming a loose carpet on open slopes.

DELAH VALLEY (10,11,000 ft.).

Flrs. 8.

(Kew Bulletin 1932, p. 348).

Deutzia purpurascens (Hk. f. & T.) Engl. (Saxi-fragaceæ).

A long branched bushy shrub. *Flowers* pale-pink.

DELAI VALLEY (9,-10,000 ft.).

Flrs. 6.

(Kew Bulletin 1934, p. 90).

Oxyspora serrata Diels. (Melastomaceæ).

A shrub. *Flowers* mauve.

NAGA HILLS (6,000 ft.).

Flrs. 7.

(Kew Bulletin 1937, p. 474).

Sanicula hacquetoides Franch. (Umbelliferæ).

Flowers white and mauve.

Abundant in Alpine Region. **Delai Valley** (11,-13,000 ft.).

(Kew Bulletin p. 91).

Schefflera shweliensis W. W. Smith. (Araliaceæ).

Medium-sized or small much branched tree having the appearance of a clump of palms.

NAGA HILLS, MANIPUR, **DELAI VALLEY**.

(Kew Bulletin 1934, p. 91).
